Abstracts

Program Abstracts from The GSA 2021 Annual Scientific Meeting, “Disruption to Transformation: Aging in the “New Normal””

Abstracts are arranged numerically by session and in the order of presentation within each session.

Abstracts are published as received.

Session 1000 (Symposium)

A SIMULATION MODEL FOR GERIATRIC EDUCATION: THEORY, VIRTUAL TRANSFORMATION AND QUALITY IMPROVEMENT

Chair: Jennifer Drost

Discussant: Susan Fosnight

Delivery of effective healthcare for the geriatric population is often complex due to the interplay between physical, social, and emotional variables. It is well established that it is the interplay between chronic medical conditions, social determinants of health, function and geriatric syndromes that drives outcomes. This complexity makes it especially important for the healthcare team to take an interprofessional team approach to avoid fragmented care which can lead to patient dissatisfaction, an ineffective plan of care, and low-quality outcomes. However, effective teamwork is not innate to healthcare; it must be learned and developed over time through purposeful education. The literature on team training supports active learning pedagogies such as simulation-based education that has emerged as an effective way to translate teamwork education into practice. Participation in active learning such as simulation, provides learners with authentic experiences that become cognitive frames that can transition into real practice. Education of adult learners should be a scaffolding of experiences that build on one another. This approach can lead the learner from the acquisition of basic knowledge, skills, and attitudes, to higher levels of competency and clinical judgement. Simulation simultaneously engages cognitive, perceptual-motor, and affective learning, and when combined with effective debriefing can lead to higher levels of learning. Effective models with scaffolding of experiences using simulations for geriatric team training are lacking in the literature. We describe here the theoretical framework for such training, adaptations of in-person and virtual training models due to COVID-19 restrictions through rapid cycle quality improvement.

GERIATRIC INTERPROFESSIONAL EDUCATION THEORETICAL FRAMEWORK

Jennifer Drost, *Summa Health System, Akron, Ohio, United States*

The literature is lacking in theoretically grounded techniques to teach interprofessional skills specific to caring for older adults. This presentation details how Wagner's Chronic Care Model and the Constructivist/Active Learning theoretical frameworks were used in the design of an interprofessional education. The content of the education was modeled after Wagner's chronic illness care model that advocates changes in processes and organizational structures

to promote interprofessional team practice. The educational intervention follows a Constructivist/Active learning framework delivered in a simulation format. Constructivist approaches encompass active learning and guided experiential learning procedures, methods well-suited to our scaffolded simulation educational experience.

GERIATRIC INTERPROFESSIONAL EDUCATION: IN-PERSON SIMULATION

Diane Brown, *The University of Akron, Akron, Ohio, United States*

Our in-person geriatric interprofessional training model is layered with scaffolds of active learning, tabletop team meeting simulation, assessment of older adult community members at risk for falls, and reflective feedback. The first step addresses knowledge acquisition via online didactic content. The second step reinforces the knowledge gained in the online didactics through in-person posters and interactive skills practice, followed by a profession-specific huddle to communicate patient assessment findings. The third step is an interprofessional team meeting simulation based on a case study of a complex geriatric patient. The fourth step is performing a supervised assessment on an older adult. The assessment incorporates the assessment tools practiced during the poster/skills session and team skills learned in the didactics and simulation. This is followed by the design of an interprofessional team-developed patient-centered plan of care. The event ends with a reflective debrief focused on interprofessional collaborative competencies.

ADAPTATION OF GERIATRIC INTERPROFESSIONAL EDUCATION FROM IN-PERSON TO VIRTUAL SIMULATION

Cynthia Hovland, *Cleveland State University, Cleveland, Ohio, United States*

We modified an in-person simulation-enhanced interprofessional education model as necessitated by COVID-19 restrictions to a fully virtual education experience. Online prework remained unchanged but adjustments were made related to previously in-person activities. Diverging from the in-person training we held live virtual poster sessions with learner-presenter interaction. In preparation for their role in the team meeting simulation, learners were moved into preassigned profession-specific breakout rooms for a live virtual huddle with facilitators. Next, learners were moved to preassigned interprofessional breakout rooms where they began the simulated team meeting. After initial discussion, a standardized patient joined the breakout room to present the patient/caregiver perspective. The event ends with a virtual reflective debrief focused on interprofessional collaborative competencies.

GERIATRIC INTERPROFESSIONAL SIMULATION EDUCATION RESULTS AND RAPID CYCLE QUALITY IMPROVEMENT

Denise Kropp, *Northeast Ohio Medical University, Rootstown, Ohio, United States*

Following a geriatric interprofessional education event, we measured learner progression in interprofessional collaborative competencies using the Interprofessional Socialization and Valuing Scale (ISVS). We also measured student satisfaction with an investigator generated assessment tool. Through Rapid Cycle Quality Improvement (RCQI) processes, we implemented a number of variations of both the in-person and the virtual events. Variations included differences in case studies, pre work requirements, geriatric didactic topics, poster topics and presentation format, facilitator training, standardized patient or patient presence, huddle format, and demonstration of how to effectively perform teamwork. Results showed gains in interprofessional collaborative competencies between pre- and post-education using this geriatric simulation model. Learner satisfaction was high for all simulation variations. Results of education variations and comparisons of the delivery methods will be presented.

Session 1005 (Paper)

ADRD and Caregiving

A 10-YEAR BEHAVIORAL AND SOCIAL SCIENCES RESEARCH AGENDA FOR ADRD: REFLECTION ON A NEW NATIONAL ACADEMIES REPORT

Tia Powell,¹ David Reuben,² Vincent Mor,³ Deborah Blacker,⁴ and Molly Checksfield,⁵ 1. *Montefiore Medical Center, Bronx, New York, United States*, 2. *UCLA, Los Angeles, California, United States*, 3. *Providence, Rhode Island, United States*, 4. *Mass General Hospital, Charlestown, Massachusetts, United States*, 5. *National Academies of Sciences, Engineering and Medicine, Washington, District of Columbia, United States*

The National Academies of Sciences, Engineering, and Medicine (NASEM) was charged with developing a ten-year agenda for research in the behavioral and social sciences that would substantially contribute to reducing the impact of Alzheimer's disease and related dementias (AD/ADRD). The report, expected to be publicly released in June 2021, has been developed by a committee of individuals with expertise across a range of disciplines and fields, including dementia research. The committee was charged with assessing the role of the social and behavioral sciences in reducing the impact of dementia. The committee held several evidence-gathering sessions, reviewed published literature, commissioned several papers, and engaged individuals living with dementia and caregivers as a part of an Advisory Panel to the committee. This presentation will engage attendees in a discussion about the ten-year behavioral and social science research agenda related to dementia produced by this NASEM committee.

CREATING A PERSON- AND FAMILY-CENTERED PROGRAM OF RESEARCH: LESSONS LEARNED FROM OVER 30 YEARS OF APPLIED RESEARCH

Carol Whitlatch,¹ and Silvia Orsulic-Jeras,² 1. *Benjamin Rose Institute on Aging, Shaker Heights, Ohio, United*

States, 2. *Benjamin Rose Institute on Aging, Cleveland, Ohio, United States*

Approximately 6 million Americans are living with Alzheimer's Disease or related dementia. Due to these alarming statistics, there is an increased need for families to seek out services and supports to not only cope with these devastating diagnoses, but to plan effectively for their future care needs. A plethora of research has shown that both the family care partner and person living with dementia are at-risk for negative outcomes such as depression, anxiety, social isolation, and worsening physical and mental health. Moreover, further and encouraging research supports the development and implementation of empowerment-based, person- and family-centered interventions. When utilized effectively these interventions improve quality of care and well-being in persons living with dementia and their care partners. The purpose of this paper is to provide guidance for researchers interested in making their work more person- and family-centered. Strategies discussed are based on over 30 years of applied research and include: 1) placing individuals at the center of their own care, 2) including persons with dementia as co-investigators, 3) convening diverse professionals and individuals in advisory councils from the start, and 4) conducting focus groups to obtain participant and stakeholder feedback. Demonstrations of select person-and-family-centered, evidence-programs will be included and supplemented with case examples to illustrate person-centered principles in practice.

FAMILY CAREGIVER NEEDS AND PREFERENCES FOR VIRTUAL TRAINING TO MANAGE BEHAVIORAL SYMPTOMS OF DEMENTIA

Maggie Ramirez,¹ Miriana Duran,¹ Chester Pabiniak,² Kelly Hansen,² James Ralston,² Susan McCurry,³ Linda Teri,⁴ and Robert Penfold,² 1. *University of Washington School of Public Health, Seattle, Washington, United States*, 2. *Kaiser Permanente Washington Health Research Institute, Seattle, Washington, United States*, 3. *University of Washington School of Nursing, Seattle, Washington, United States*, 4. *University of Washington, Seattle, Washington, United States*

STAR-Caregivers Virtual Training and Follow-up (STAR-VTF) is adapted from an evidence-based, in-person program that teaches family caregivers to manage behavioral and psychological symptoms of dementia (BPSD). The study objective was to understand the needs of family caregivers for improving BPSD management and the extent to which caregivers perceived that STAR-VTF could address those needs. We conducted 15 semi-structured interviews with family caregivers of people with dementia. We showed caregivers prototypes of STAR-VTF online self-directed materials. We obtained caregiver feedback, focusing on needs and preferences and perceived barriers to using STAR-VTF. We used a hybrid approach of inductive and deductive coding and aggregated codes to develop themes. The idea of a virtual training program for learning to manage BPSD appealed to caregivers. They said healthcare providers did not provide adequate education in the early disease stages about the personality and behavior symptoms that can affect people with dementia. Caregivers found it unexpected and frustrating when the person with dementia began experiencing BPSD, symptoms they felt unprepared to manage. Accordingly, caregivers expressed a strong desire for the healthcare organization to

offer programs such as STAR-VTF much sooner. Many were interested in the virtual aspect of the training due to the convenience of receiving help from home and the perception that help from a virtual program would be timelier than traditional service modalities. Given caregivers' limited time, they suggested dividing the STAR-VTF content into chunks to review as time permitted. Caregivers reported a preference for having the same coach for the program duration.

LONGITUDINAL EFFECTS OF CULTURAL AND PSYCHOSOCIAL FACTORS ON BIOMARKERS OF CARDIOVASCULAR RISK IN CAREGIVERS

Samara Barrera Caballero,¹

Rosa Romero Moreno Carlos Vara-García,²

María del Sequeros Pedroso Chaparro,³ Javier Olazarán,⁴

Brent Mausbach,⁵ Roland von Känel,⁶ and

Andrés Losada-Baltar,² 1. *Universidad Rey Juan Carlos de Madrid, Madrid, Madrid, Spain*, 2. *Universidad Rey Juan Carlos, Madrid, Madrid, Spain*, 3. *Universidad Autónoma de Madrid, Madrid, Madrid, Spain*, 4. *HGU Gregorio Marañón, Madrid, Madrid, Spain*, 5. *University of California San Diego, La Jolla, California, United States*, 6. *University Hospital Zurich, Zurich, Zurich, Switzerland*

Dysfunctional thoughts about caregiving (DTAC) and familism (i.e. familistic obligation) were associated with worse caregiver emotional and cardiovascular health in cross-sectional studies. The aim of this study was to longitudinally examine the effects of familism and DTAC on cardiovascular health, considering caregiver kinship adjusting for well-established predictors of cardiovascular health. Study participants were 80 family dementia caregivers. Individual interviews and collection of blood samples were conducted in three yearly assessments. Linear mixed (random effects) regression analysis was performed to examine longitudinal associations of familism, DTAC, and circulating levels of cytokine interleukin (IL)-6, a cytokine and biomarker of cardiovascular disease risk (CVD). Caregiver age, gender, alcohol consumption, body mass index (BMI), hours caring, frequency and reaction of behavioral problems and caregivers' transitions were used as covariates. Results showed that increases in DTAC, in familism and higher caregiver age were independently and significantly associated with higher levels of IL-6 over time in the group of spousal caregivers. No significant effects were found for any of the other covariates in spousal caregivers. In contrast, increases in BMI and in frequency of behavioral problems were significantly associated with increases in IL-6 over time in adult child caregivers. No significant effects were found for any of the rest of predictors in adult child caregivers. Findings suggest that high level of obligation familism and DTAC may a profile of increased vulnerability for CVD in spousal caregivers. In contrast, problem behaviors of the care recipient may characterize adult child caregivers in terms of an increased CVD risk.

THE EFFECTS OF REMOTE ACTIVITY MONITORING ON FAMILY CAREGIVERS OF PEOPLE LIVING WITH DEMENTIA OVER AN 18-MONTH PERIOD

Joseph Gaugler,¹ Rachel Zmora,¹ Lauren Mitchell,²

Jessica Finlay,³ Christina Rosebush,² Colleen Peterson,²

Manka Nkimbeng,¹ and Zachary Baker,² 1. *University of Minnesota, Minneapolis, Minnesota, United States*,

2. *Emmanuel College, Boston, Massachusetts, United States*,

3. *University of Michigan, Ann Arbor, Michigan, United States*

Technology interventions for older persons and long-term care are generally utilized as real-time data capture tools to complement clinical or family care for older persons or as interventions themselves designed to improve important dementia care outcomes. Although research on novel technological interventions for people with Alzheimer's disease and related dementias (ADRD) and their family caregivers has grown considerably in the past two decades, much of this work continues to focus on design, feasibility, and acceptability (with a need for conceptual refinement in these areas) and less on controlled outcome studies. The objective of this experimental mixed methods demonstration was to determine the 18-month effectiveness of remote activity monitoring (RAM) technology in improving outcomes among family caregivers of community-dwelling persons with dementia. We used an embedded experimental mixed methods design, collecting qualitative data within the structure of a traditional randomized controlled trial ([QUAN+qual]→QUAN) over an 18-month period for 171 dementia caregivers. Change in caregiver self-efficacy, sense of competence, and caregiver distress served as the main quantitative outcomes of interest. Individual growth curve models indicated that the RAM technology did not have direct effects on caregiving outcomes, and although the qualitative findings indicated several potential moderators of RAM effectiveness on caregiving outcomes, the inclusion of these qualitatively-identified moderators did not result in statistically significant ($p < .05$) effects. Ensuring effective human care management alongside RAM technology may help to overcome the barriers reported by dementia caregivers in this demonstration study.

Session 1010 (Symposium)

ADVANCING DEMENTIA CARE INTERVENTIONS WITH TECHNOLOGY SOLUTIONS

Chair: Jinmyoung Cho

Discussant: Elena Fazio

Over the past two decades, a number of interventions have been developed and tested to help meet the complex care needs of persons living with dementia (PLWD) and the family care support system. Despite the large foundation of empirical evidence, they are often not readily available as part of dementia care support services. Interventions leveraging technology-based solutions have the potential to bolster their desirability, efficacy, and feasibility. While progress has been made, there is still a need to design and test new innovative solutions in real-world settings. This symposium will highlight three such innovative technology solutions for dementia care and explore lessons learned in their development and testing. Smith et al. demonstrate the feasibility of using a novel in-situ sensor system to assess daily functions for PLWD in home or assisted care settings. Results of detecting and classifying diverse forms of functional assessment and environmental conditions will be discussed in the presentation. Czaja et al. describe a randomized controlled trial evaluating the feasibility and efficacy of an innovative dyadic intervention (DT) delivered through an interactive technology. Recruitment challenges and lessons learned from the feasibility of implementing a dyadic intervention will be presented. Stevens et al. introduce an online approach to delivering REACH II, GamePlan4Care (GP4C). Qualitative thematic analyses from GP4C user test

sessions related to both the content and technical features will be discussed. Discussant Dr. Elena Fazio will address the role of technology solutions as a strategy within dementia care interventions and unique challenges and contributions of each project.

TECHNOLOGY INNOVATIONS IN DEMENTIA CARE: IMPROVEMENTS IN FUNCTIONAL ASSESSMENTS THROUGH BACKGROUND SENSING

Matthew Smith,¹ Marcia Ory,² Gang Han,³ Ashley Wilson,⁴ Zane Foster,⁵ and John Fitch,⁵ 1. *Texas A&M School of Public Health, College Station, Texas, United States*, 2. *Texas A&M University, College Station, Texas, United States*, 3. *Texas A&M University School of Public Health, College Station, Texas, United States*, 4. *Texas A&M Center for Population Health and Aging, Texas A&M University School of Public Health, College Station, Texas, United States*, 5. *Birkeland Current LLC, Waco, Texas, United States*

Technological innovations are becoming commonplace in research among persons living with dementia (PLWD) and their caregivers. However, few studies attempt to validate technology's ability to appropriately monitor functional assessment in dementia care research. Bringing together industry, academia, and health care, we demonstrate the feasibility of using a novel in-situ sensor system to continuously and accurately assess daily functions for PWLDs in home or assisted care settings. Phase 1 revealed a high accuracy (~85%) of detecting and classifying ADLs between sensors and human loggers across 26 defined activities. Phase 2, which will target 140 PLWDs, has already demonstrated the value of such sensors in detecting safety concerns (e.g., no heat). Technology-driven research for PLWD and their caregivers have practical applications for assessing diverse forms of functional assessment and environmental conditions which can improve measurement precision over time and space and the ability to better tailor care plans for PLWDs and their caregivers.

A DYADIC TECHNOLOGY-BASED INTERVENTION FOR INFORMAL CAREGIVERS AND PATIENTS WITH DEMENTIA

Sara Czaja,¹ David Loewenstein,² and Sarah Weingast,³ 1. *Weill Cornell Medicine/Center on Aging and Behavioral Research, New York, New York, United States*, 2. *University of Miami Miller School of Medicine, Miami, Florida, United States*, 3. *Weill Cornell Medicine, Weill Cornell Medicine, New York, United States*

Most intervention programs in the dementia domain have exclusively focused on the caregiver (CG) or the patient (CR), despite evidence of a reciprocal interaction between the dyad. This presentation will describe a randomized controlled trial that is evaluating the feasibility and efficacy of an innovative dyadic intervention (DT) that is delivered through an interactive technology that includes an evidenced-based CG component, an evidenced-based cognitive training component for the CR and a dyadic component. The program is designed to: be synergistic and emphasize issues important to CGs in the earlier stages of caregiving. The sample involves 200 informal CGs and CRs with early-stage dementia. Data will be presented regarding factors influencing the feasibility

of implementing a dyadic intervention such as recruitment challenges (e.g., mutual consent and eligibility), and mutual engagement of both the CG and CR. Strategies implemented to maintain the trial during the COVID-19 pandemic will also be discussed.

USER INTERFACE AND USER EXPERIENCE TESTING OF AN ONLINE TRANSLATION OF THE REACH II INTERVENTION: GAMEPLAN4CARE

Alan Stevens, Thomas Birchfield, Kira Swensen, Joseph Banda, and Jinmyoung Cho, *Baylor Scott & White Health Research Institute, Temple, Texas, United States*

GamePlan4Care (GP4C) is a web-based adaptation of the Resources for Enhancing Alzheimer's Caregiver Health II (REACH II) caregiver intervention, redesigned and reformatted for online delivery. The goal of GP4C is to create an online family caregiver support platform that facilitates self-directed exposure to evidence-based skills-training and support for dementia caregivers. This approach of utilizing technology enhanced with live support has the potential for scalability and sustainability. In preparation for an ongoing randomized clinical trial, the GP4C platform underwent industry standard user interface/user experience (UI/UX) testing with dementia caregivers as part of an iterative design process. Testing of caregiver's reaction to technical and content-related aspects of the system was conducted with 31 caregivers. The thematic analysis revealed three themes for technical aspects (logical flow, suggestions on features, innovative resource) and two themes for content aspects (satisfaction and engagement). We will discuss technical and content modifications resulting from UI/UX.

Session 1015 (Symposium)

AGING BIOMARKERS FOR CLINICAL TRIALS AND DRUG DISCOVERY

Chair: Margarita Meer

Co-Chair: Raghav Sehgal

Discussant: Morgan Levine

Developing targeted therapies first requires a working definition of the condition of interest. Unfortunately for aging, this very initial step poses a challenge since chronological age is often not indicative of biological age nor modifiable. This symposium will demonstrate the enormous progress being made towards developing more reliable and valid measures for quantifying biological aging. First, Dr. Albert T. Higgins Chen will show how inaccuracy caused by noise at individual CpG sites can lead to high technical variability in the most widely applied biomarkers of aging—epigenetic clocks. He will further discuss how this can be overcome through novel statistical techniques. Second, Dr. Benoit Lehallier, will discuss plasma proteomic clocks and share insights into their potential roles in Alzheimer's disease and utilization in clinical trials. Third, quantifying the multifactorial aging process can be facilitated by projects incorporating multimodal biomarker data. Pei-Lun Kuo from the Baltimore Longitudinal Study of Aging will present an analysis of longitudinal trajectories of more than 30 phenotypes, which when combined into a single summarized score yield important insights. Fourth, our ability to uncover aging mechanisms and

perform drug screens, requires valid and reliable measures that can be applied in vitro. Christopher Minter who developed in cellulo epigenetic markers will demonstrate how epigenetic aging changes that can be induced in culture shed light on aging in vivo. Finally, a summarizing discussion will be held by Dr. Morgan Levine, an expert in the field.

A COMPUTATIONAL SOLUTION TO BOLSTER EPIGENETIC CLOCK RELIABILITY FOR CLINICAL TRIALS AND LONGITUDINAL TRACKING

Albert Higgins-Chen,¹ Kyra Thrush,¹ Tina Hu-Seliger,² Yunzhang Wang,³ Sara Hagg,³ and Morgan Levine,¹

1. Yale University, New Haven, Connecticut, United States,
2. Elysium Health, New York, New York, United States,
3. Karolinska Institutet, Stockholm, Stockholms Lan, Sweden

Epigenetic clocks are widely used aging biomarkers, but they are calculated from methylation data for individual CpGs that can be surprisingly unreliable. We report that technical noise causes six major epigenetic clocks to deviate by 3 to 9 years between replicates. We present a novel computational solution: we perform principal component analysis followed by biological age prediction using principal components, extracting shared age-related changes across CpGs while ignoring noise from individual CpGs. Our novel principal-component versions of six clocks show agreement between most technical replicates within 1 year, and increased stability in short- and long-term longitudinal studies. This requires only one additional step compared to traditional clocks, does not require prior knowledge of CpG reliabilities, and can improve the reliability of any existing or future epigenetic biomarker. The extremely high reliability of principal component epigenetic clocks makes them particularly useful for personalized medicine and clinical trials evaluating novel aging interventions.

DEEP LONGITUDINAL PROTEOMICS PROFILING REVEALS BIOLOGICAL PATHWAYS RESPONDING TO GRF6019 IN TWO AD CLINICAL TRIALS

Benoit Lehallier,¹ Tibor Nanasi,² Jonas Hannestad,² and Steven Braithwaite,² R&D, Alkermest, California, United States

Blood has been widely investigated to discover biomarkers and gain insights into the biology of aging and age-related diseases. Its protein composition provides insights into complex biological processes, as proteins are often direct regulators of cellular pathways. In clinical trials, selected proteins have been used as primary and secondary endpoints, but recent methodological developments allow the measurement of thousands of proteins with very high sensitivity and specificity. In two phase 2 clinical trials testing the safety, tolerability, and feasibility of infusions of the plasma fraction GRF6019 in Alzheimer's disease (AD), we measured more than 7000 proteins in plasma over the course of the clinical trials. Differential trajectories analysis revealed groups of proteins and pathways that were responding to GRF6019. Several pathways were relevant to the biology of aging and AD and our study suggests that deep proteomics profiling can inform on specific biological processes responding to treatment in clinical trials.

LONGITUDINAL PROFILING IN PHENOTYPIC METRIC OF AGING: INSIGHTS FROM THE BALTIMORE LONGITUDINAL STUDY OF AGING

Pei-Lun Kuo,¹ Morgan Levine,² Jennifer Schrack,³ Michelle Shardell,⁴ and Luigi Ferrucci,⁵ 1. National Institute on Aging, National Institute on Aging, Maryland, United States, 2. Yale University, New Haven, Connecticut, United States, 3. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 4. University of Maryland School of Medicine, Baltimore, Maryland, United States, 5. National Institute on Aging, Baltimore, Maryland, United States

It remains challenging to quantify the pace of aging across lifespan due to lack of comprehensive longitudinal measurements across wide range of age. In Baltimore Longitudinal Study of Aging, we have measured the longitudinal trajectories of more than 30 phenotypes across four pre-identified domain - body composition, energy regulation, homeostatic mechanisms and neurodegeneration/neuroplasticity, among participants with age between 20+ and 90+. We implemented a two-stage approach to summarize the longitudinal trajectories of these phenotypes across four domains into a summarized score. We demonstrated that higher summarized score (denoting for slower longitudinal phenotypic decline) is associated with slower decline in both cognitive and physical functions, across different stages of adulthood. Our results imply that deep longitudinal profiling contains rich information and may potentially replace diseases as an early endpoint in trials targeting at aging. Further, understanding the underpinning of longitudinal phenotypic trajectories may provide clues to the biological mechanisms of aging.

A DNAMCULTURE EPIGENETIC FINGERPRINT RECAPITULATES PHYSIOLOGICAL AGING

Christopher Minter,¹ Marco Morselli,² Margarita Meer,³ Jian Cao,⁴ Sabine Lang,⁵ Matteo Pellegrini,⁶ Qin Yan,⁵ and Morgan Levine,⁵ 1. Yale University, Yale University, Connecticut, United States, 2. UCLA, Los Angeles, California, United States, 3. Yale School of Medicine, New Haven, Connecticut, United States, 4. Rutgers University, Rutgers University, New Jersey, United States, 5. Yale University, New Haven, Connecticut, United States, 6. UCLA, UCLA, California, United States

Aging elicits dramatic changes to DNA methylation (DNAm), however the causes and consequences of such alterations to the epigenome remain unclear. The utility of biomarkers of aging based on DNAm patterns would be greatly enhanced if in vitro models existed that recapitulated physiological phenotypes such that modulation could garnish mechanistic insights. Using DNAm from serially passaged mouse embryonic fibroblasts, we developed a marker of culture aging and asked if culture phenotypes, like exhaustive replication, are epigenetically analogous to physiological aging. Our measure, termed DNAmCULTURE, accurately estimated passage number and was shown to strongly increase with age when examined in multiple tissues. Furthermore, we observed epigenetic alterations indicative of early cultured cells in animals undergoing caloric restriction and in lung and kidney fibroblasts re-programmed to iPSCs. This study identifies culture-derived alterations to the methylome as

physiologically relevant and implicates culture aging as an important feature in known epigenetic aging phenomena.

Session 1020 (Symposium)

AN EXPLORATION ON TRUST

Chair: Elena Portacolone

“Trust is a form of love,” explained a study participant. As a form of love, trust nourishes connections and accelerates progress. As a result, the purpose of this session is to reflect upon the notion of trust and examine how trust moves science and social justice forward. Trust must be seen as sustained or broken over multiple generations. Moreover, trust between older adults and medical and social support institutions has profound implications for this historical moment. In the COVID-19 pandemic, trust can be viewed as a facilitator of emergency responses in the State of Washington as noted in Dr. Berridge’s paper. On the other hand, distrust and a related sense of abandonment contributes to Black Americans’ limited uptake of COVID-19 vaccinations, as noted in Dr. Johnson’s work. On a related note, Dr. Perry’s work shows that lack of trust over time has led those aging with hemophilia to withdraw from care at different points in their own trajectories. Finally, on a positive note, Dr. Kotwal’s work illustrates the role of a peer outreach intervention in facilitating trusting relationships among diverse, low-income older adults which led to sustained reductions, over a 2-year period, in loneliness, barriers to socializing, and depression. This symposium on trust highlights how researchers work, either consciously or unconsciously, within a continuum of trust in their participants’ communities. At a broader level, systemic attention to building trust from academia, government, and national advocacy organizations holds the potential to foster meaningful scientific engagement and empowerment of historically marginalized communities.

THE SIGNIFICANCE OF TRUST IN WASHINGTON STATE’S AGING NETWORK COVID RESPONSE

Clara Berridge,¹ Ian Johnson,² Callie Freitag,¹ Carolyn Parsey,¹ and Maggie Ramirez,³ 1. *University of Washington, Seattle, Washington, United States*, 2. *University of Washington, SEATTLE, Washington, United States*, 3. *University of Washington School of Public Health, Seattle, Washington, United States*

In late summer of 2020, we interviewed 45 senior leaders of social services and health care organizations serving older adults throughout Washington State about service demand, new challenges, and organizational adaptations. These organizations work with people made particularly vulnerable in the pandemic. A significant share reported that half or more of their clients live at or below the poverty line (54%), are people of color (29%), or have limited English language proficiency (20%). The state’s aging network leveraged strong partnerships, expertise, and community knowledge to provide trusted essential services to older Washingtonians and their caregivers. The role of trust as an enabler of emergency response and connection in the context of gentrification, the digital divide, employment loss, and language service gaps will be discussed, as will lack of trust as a barrier to service access, particularly for Latinx immigrant and migrant older adults.

A PEER INTERVENTION FACILITATES TRUST AND IMPROVES PSYCHOSOCIAL WELL-BEING IN DIVERSE, LOW-INCOME OLDER ADULTS

Ashwin Kotwal,¹ Shannon Fuller,¹ Janet Myers,¹ Daniel Hill,² Soe Han Tha,¹ Alexander Smith,¹ and Carla Perissinotto,¹ 1. *University of California San Francisco, University of California San Francisco, California, United States*, 2. *Curry Senior Center, San Francisco, California, United States*

We evaluate a peer outreach intervention to improve the psychosocial well-being of diverse, low-income older adults. Participants (N=74, Age 58-96 years) were recruited from an urban senior center and matched with peers who were >55 years old, received mental health training, and connected participants with health or social activities. We conducted surveys at baseline and 6-month follow-up for 2 years with validated measures of loneliness, social interaction, barriers to socializing, and depression, and thematically analyzed qualitative, semi-structured interviews conducted among a subset of participants (n=15) and peers (n=6). Participants were 58% male, 18% African-American, 19% Latinx, and 8% Asian. Over 2 years, participants experienced sustained reductions in loneliness (p=0.015), depression (p<0.001), and barriers to socializing (p<0.001). Qualitative interviews detailed the role of longitudinal relationships, program flexibility, and the matching process in facilitating trust, motivation, and improved mood. Results can inform larger efficacy studies and implementation of peer-driven community programs.

CHANGING TIME HORIZONS AND TRUST: EXPERIENCES OF AGING WITH HEMOPHILIA

Tam Perry,¹ and Sara Schwartz,² 1. *Wayne State University, Detroit, Michigan, United States*, 2. *University of Southern California, Los Angeles, California, United States*

Trust among those who have experienced a lifetime of medical encounters warrants attention to how trust is both cumulative and complex. This study of a historically isolated cohort incorporates interviews (n=25 older adults/professionals) and focus groups uses a lens of trust to highlight the experiences of those aging with hemophilia, individuals who never expected to age. Understood through the lens of trust, the data show evidence of the absence of safe spaces particularly during the early 80s - blood contamination concerns and homophobia-leading often to social withdrawal. Over time, however, some individuals and families created trusted venues to begin demanding research, treatment and policy change. Advocacy re-engaged the community to organize, educate and advance safety protocols for blood product manufacturing and distribution. This presentation will illuminate how experiences with medical providers, contaminated blood supplies, stigma and uncertain in other spheres of one’s life make trust a co-constructed, fragile concept.

FACTORS RELATED TO COVID-19 VACCINE UPTAKE IN BLACK AMERICAN COMMUNITIES

Julene Johnson,¹ Orlando Harris,² Carl V. Hill,³ Peter Lichtenberg,⁴ Sahru Keiser,² Tam Perry,⁴ and Elena Portacolone,⁵ 1. *University California San Francisco, San Francisco, California, United States*, 2. *University of California, San Francisco, San Francisco, California, United States*

States, 3. Alzheimer's Association, Chicago, Illinois, United States, 4. Wayne State University, Detroit, Michigan, United States, 5. University of California, Berkeley, California, United States

Black/African Americans represent 13% of the population, yet account for about a quarter of COVID-19 deaths. Black Americans receive COVID-19 vaccines at lower rates than whites. To address this gap, we examined effects of the COVID-19 pandemic among Black Americans, emphasizing understanding trust and vaccines. Data were collected (July to September 2020) using 8 virtual focus groups in Detroit and San Francisco with 33 older Black Americans and 11 caregivers. Content analysis was used to identify themes. The first theme pointed to a sense of feeling abandoned by healthcare providers and the government, which exacerbated uncertainty and fear. The second theme emphasized distrust towards healthcare providers and government. The third theme pointed to a reluctance in receiving the vaccine because of distrust of pharmaceutical companies and government, as well as misinformation. These findings suggest that underlying systemic issues need to be addressed to accelerate vaccine uptake among older Black Americans.

Session 1025 (Symposium)

ANALYSIS OF BEST PRACTICE CAREGIVING: A NEW ONLINE DATABASE OF EVIDENCE-BASED DEMENTIA CAREGIVING PROGRAMS

Chair: Sara Powers

Discussant: Sandy Markwood

Best Practice Caregiving (BPC) is a free online database providing comprehensive information on research and implementation characteristics for 44 evidence-based dementia caregiving programs. Programs eligible for BPC have research-tested positive outcomes for family/friend caregivers and demonstrated feasibility in community implementations. This symposium presents results from analyses of the BPC database that includes surveys of 44 program developers and 324 healthcare or community delivery-organizations, and content analysis of 231 published studies. Findings show the most common of 19 types of assistance provided by programs were: Supporting Caregiver/Individual-with-Dementia (IWD) Communication, Encouraging Positive Caregiver-IWD Activities, and Strengthening Coping (93.2%). Least common were: Getting a Dementia Diagnosis (29.5%) and Monitoring Service Benefits (20.5%). Methods of delivering the types of assistance were: information/referral ($M=11.1$), skills training ($M=7.5$), and direct provision of care ($M=3.8$). The most common types of organizations that delivered programs were healthcare organizations (23.8%) and Area Agencies on Aging (23.8%). The greatest delivery-challenges were program marketing (69.8%) and caregiver engagement (66.3%). Most organizations 'strongly agreed' that programs had positive impacts on caregivers (59.5%) but were less certain about IWD benefits (25.1% 'strongly agreed'). Published research studies found the most improved caregiver outcomes were: 1) Strain and/or burden (84.1%), 2) Depressive symptomology (79.5%), and 3) Caregiving efficacy (63.6%). Least common improved outcomes were 1) Access to support information/Community service use (9.1%); 2) Unmet needs (6.8%); and 3) Respite/break from care (2.3%).

Overall, results highlight strengths of evidence-based dementia caregiving programs, along with gaps and challenges to be addressed by existing and new developing programs.

DESCRIPTION AND DEMO OF THE BEST PRACTICE CAREGIVING DATABASE ON 44 RESEARCH PROVEN DEMENTIA CAREGIVING PROGRAMS

David Bass, Alyssa Ciancibello, Rachel Schaffer, and Sara Powers, *Benjamin Rose Institute on Aging, Cleveland, Ohio, United States*

A major advance in family caregiving has been the development, testing, and community delivery of research-proven, evidence-based support programs for family or friend caregivers of persons living with dementia. This presentation showcases and demos Best Practice Caregiving (BPC), a new online resource with comprehensive profiles for 44 of the top evidence-based dementia caregiving programs that are ready for scaling in communities. For these 44 programs, BPC is a database that presents key research findings with links to all its published articles, comprehensive program descriptions including all implementation features, and survey data on program delivery experiences from 324 healthcare and community organizations that offered the program as a regular part of their service portfolio 2019. BPC enables professionals to make side-by-side comparisons of the 44 programs, with the goal of increasing implementations of these evidence-based programs by healthcare and community service organizations.

TYPES OF ASSISTANCES OF EVIDENCE-BASED DEMENTIA CAREGIVING PROGRAMS: DATA RESULTS AND FUTURE DIRECTIONS

Alyssa Ciancibello, David Bass, Rachel Schaffer, and Sara Powers, *Benjamin Rose Institute on Aging, Cleveland, Ohio, United States*

A key feature displayed in Best Practice Caregiving are the types of assistances. Data on 54 areas of care were collected for all 44 programs. These were analyzed through factor analysis and grouped into 19 types of assistance. Types were analyzed by the number of assistances provided, delivery method, and recipient of assistance. On average, programs delivered 11.8 types of assistances, with the most common types being Supporting CG/Individual-with-Dementia (IWD) Communication, Encouraging Positive CG-IWD Activities, and Assisting with Coping (93.2%), with the least common being Getting a Dementia Diagnosis (29.5%) and Monitoring Benefits of Services (20.5%). Assistance was delivered most often through information/referral delivery ($M=11.07$, $SD=5.41$) than direct ($M=3.77$, $SD=4.54$) or skills training ($M=7.50$, $SD=4.54$). Results of the data show the breadth and characteristics of assistances programs provide to support caregivers of persons with dementia, along with gaps in types of assistances and future directions for programs.

EXPERIENCES FROM HEALTHCARE AND COMMUNITY ORGANIZATIONS DELIVERING EVIDENCE-BASED DEMENTIA CAREGIVING PROGRAMS

Rachel Schaffer, Alyssa Ciancibello, David Bass, and Sara Powers, *Benjamin Rose Institute on Aging, Cleveland, Ohio, United States*

Best Practice Caregiving surveyed 324 healthcare and community organizations that replicated one or more of the 44 evidence-based programs about delivery organization characteristics, delivery staff, caregivers and persons with dementia served, funding sources, delivery challenges, perceived impact, and satisfaction. 211 (65.1%) organizations completed surveys about 30 different evidence-based programs. The most common types of organizations that delivered programs were healthcare organizations (23.8%) and Area Agencies on Aging (23.8%). Results showed on average organizations delivered programs for 49 months and served 68 families/year. The most common program delivery challenges were marketing (69.8%) and engaging participants (66.3%). Organizations generally agreed that programs had positive impacts on caregivers (59.5% strongly agree) but were less positive about benefits for persons with dementia (25.1% strongly agree). Discussion provides insights into successes and challenges organizations face when adopting evidence-based dementia caregiving programs in their communities.

OUTCOME PRIORITIES AMONG EVIDENCE-BASED DEMENTIA CAREGIVING PROGRAMS: A CLOSER LOOK

Sara Powers,¹ Alyssa Ciancibello,¹ Rachel Schaffer,¹ David Bass,¹ and Morgan Minyo,² 1. *Benjamin Rose Institute on Aging, Cleveland, Ohio, United States*, 2. *Cleveland State University, Cleveland, Ohio, United States*

Currently, the Best Practice Caregiving website provides information on 231 published studies from 44 dementia caregiving evidence-based programs that have demonstrated beneficial outcomes for dementia caregivers within health care and community-based settings. Across all programs, a total of 34 biopsychosocial outcomes were identified. Supported by the commonly used stress-related frameworks (e.g., Stress-Health Process, Cognitive Behavioral Theory) for which the programs were developed, the most frequently utilized program outcomes included: 1) Caregiver stress, strain, and/or burden (84.1%); 2) Caregiver depressive symptomology (79.5%); and 3) Caregiving efficacy, skills, and/or confidence (63.6%). The least common programmatic outcomes included: 1) Access to support information/Community service use (9.1%); 2) Unmet needs (6.8%); and 3) Respite/break from care (2.3%). The lesser utilized outcomes provide critical insight into current evidence-based programmatic priorities and ways in which professionals can seek to fill gaps in dementia caregiving interventions. Discussion will also focus on future directions of caregiver-related outcome assessments.

Session 1030 (Symposium)

ASPECTS OF GRIT AMONG DEMENTIA FAMILY CAREGIVERS

Chair: Jyoti Savla
Co-Chair: Karen Roberto
Discussant: Jennifer Margrett

Dementia family caregivers often show deep devotion and a strong sense of purpose and duty toward their relatives needing care. The concept of grit, which includes aspects of commitment, purpose, perseverance, and resilience, is a

novel theoretical approach to expanding understanding of dementia family caregiver strengths amidst the challenges they face. Multiple psychosocial and contextual factors are likely to interact with and influence grit among these caregivers. This symposium addresses commitment to the family dementia caregiver role, willingness to embrace the stressful work of caregiving, and perseverance in finding ways to sustain caregiving roles under typical and adverse circumstances. Blieszner focuses on associations between grit and stressors and strains that challenge caregiver well-being and jeopardize continued caregiving. Wilks considers the impact of spiritual support on sustaining resilience among Caucasian and African American dementia caregivers. McCann explores caregivers' responses to changes in informal support and social interactions available to assist with home care tasks over the course of the COVID-19 pandemic. Albers examines the strengths and resources caregivers draw upon to manage the challenges of caring for and supporting a relative in long-term residential care during the pandemic. Collectively, these presentations provide new insights into the range of influences on aspects of grit and circumstances in which grit sustains caregiving. Discussant Margrett considers the value of the concept of grit for furthering understanding of caregivers' abilities to manage typical and unique challenges in their caregiver roles and offers suggestions for future research and interventions to enhance grit among dementia family caregivers.

CARING BEYOND THE CHALLENGES: GRIT IN DEMENTIA FAMILY CAREGIVERS

Rosemary Blieszner, Jyoti Savla, Karen Roberto, Brandy McCann, and Emily Hoyt, *Virginia Tech, Blacksburg, Virginia, United States*

Scholars and practitioners recognize the importance of family caregivers for persons with dementia (PwD) persevering through difficulties and remaining committed to providing care (i.e., possessing grit). Based on Pearlin's stress process model, we examined how grit is associated with stressors and strains that interfere with caregiver well-being and jeopardize continued caregiving. The sample included 158 family caregivers of PwD from rural Appalachia. SEM analysis revealed that grit and family and friend affectual solidarity contributed significantly to mastery. Grit and family solidarity were associated indirectly with role overload through their effect on mastery. Results demonstrate the value of acknowledging the role of grit in enhancing caregivers' confidence about managing difficulties they face and reducing their sense of being overwhelmed by caregiving responsibilities. Thus, strengthening dementia caregivers' commitment to and perseverance in their role is crucial for sustaining their motivation to provide care, despite the challenges they face.

SPIRITUAL SUPPORT AMONG AFRICAN AMERICAN AND CAUCASIAN ADRD CAREGIVERS: A RISK AND RESILIENCE STUDY

Scott Wilks,¹ Wanda Spurlock,² Sandra Brown,² Jennifer Geiger,³ Sarah Choate,⁴ Katherine Kirsch,⁴ Alisha Thompson,⁴ and Cassie Slaton,⁴ 1. *Louisiana State University, Baton Rouge, Louisiana, United States*, 2. *Southern University College of Nursing and Allied health, Baton Rouge, Louisiana, United States*, 3. *East*

Tennessee State University Dept. of Social Work, Johnson City, Tennessee, United States, 4. Louisiana State University School of Social Work, Baton Rouge, Louisiana, United States

Research shows African Americans at greater risk of developing Alzheimer's disease and related dementias (ADRD) compared to Caucasians, suggesting African American ADRD caregivers are rising in numbers at a greater rate than Caucasian counterparts. A recent study indicated spiritual wellbeing differences among these caregiver groups. Using a quasi-follow-up of members of a larger caregiver sample, the purpose of this study was to test spiritual support as a moderator via a risk-and-resilience framework. Secondary data analysis from a sample of 691 ADRD caregivers examined data on demographics and standardized measures of spiritual support, caregiver burden, and psychological resilience. One-third of the sample reported as African American. Resilience negatively regressed, though not significantly, on caregiving burden among both groups. Spiritual support positively, significantly impacted resilience among both groups, slightly stronger among African Americans. Spiritual support did not significantly moderate risk with either group. Implications for professional healthcare practice are discussed.

RESILIENCE AMONG DEMENTIA FAMILY CAREGIVERS IN A CHANGING SOCIAL WORLD

Brandy McCann, Karen Roberto, Tina Savla, Rosemary Blieszner, and Emily Hoyt, *Virginia Tech, Blacksburg, Virginia, United States*

Dementia caregivers must manage the social worlds of their loved ones as well as their own. In a mixed methods study, we interviewed 50 family caregivers prior to the pandemic, twice during early phases of the pandemic, and again during the vaccine roll-out phase. Findings revealed how implementation of stay-at-home orders altered reliance on informal support as well as social ties and interactions. Using content analysis, we identified three ways in which caregivers' managed changes in their social world: rethinking family visits (fewer people, higher quality); reinventing public spaces (church services, exercise venues); and reconsidering self-care (setting boundaries, solace in nature). Caregivers showed varying degrees of resilience in the ways they managed adverse social situations and cared for themselves. Findings reinforce the need for inclusive programs and services to help caregivers learn to maintain supportive social connections that reinforce their care decisions and routines, particularly during times of duress.

NAVIGATING COVID-19 AND LONG-TERM CARE: DEMENTIA CAREGIVERS' CHALLENGES AND STRENGTHS

Lauren Mitchell,¹ Elizabeth Albers,² Robyn Birkeland,³ Henry Stabler,² Jinhee Cha,² and Joseph Gaugler,²
1. *Emmanuel College, Boston, Massachusetts, United States,*
2. *University of Minnesota, Minneapolis, Minnesota, United States,*

Persons with dementia living in long-term care settings have been especially affected by the COVID-19 pandemic, and their family caregivers have had to cope with numerous additional stressors during this time. We conducted 20

semi-structured interviews and gathered open-ended survey data from N=104 caregivers participating in an ongoing intervention trial at the start of the COVID-19 pandemic. Open-ended questions explored the difficulties caregivers have experienced in caring for and supporting a relative in long-term residential care. Caregivers provided their perspectives about services and supports that have facilitated coping with uncertainty, anxiety, and loss during the pandemic, and identified resources and strengths they have found helpful in caring for their relatives. Thematic analysis was used to identify themes reflecting the key challenges and supports that have emerged for caregivers, and to highlight caregivers' recommendations for promoting their and their relatives' well-being during this crisis.

Session 1035 (Symposium)

ASSOCIATIONS AMONG PERSONALITY TRAITS, STRESS EXPERIENCES, AND PHYSICAL AND COGNITIVE OUTCOMES IN OLDER ADULTS

Chair: Eileen Graham

Discussant: David Almeida

Understanding between and within person variability in personality traits, and the processes of general and perceived stress are essential to understanding how to optimize cognitive health in older adults. It is well known that there is large variation in cognitive change: the pace and direction of change differs greatly across individuals. Personality traits and stress experiences are key factors that may account for some of these individual differences. The goal of our symposium is to present novel research in this area and discuss the implications for understanding personality, stress, and cognitive decline. First, Ferguson and colleagues will present a novel approach to assessing daily variability in personality. Their results demonstrate that daily personality assessments are able to capture within-person variability in personality, which could potentially help predict health trajectories in later adulthood. This is an important step in the study of change processes. Second, Luo and colleagues will present the factor structure of general and perceived stress, and show the predictive utility of these factors on physical and cognitive health outcomes. Third, Lawson and colleagues will discuss the extent to which personality is associated with cognitive function in a large sample of Mexican-origin adults. Fourth, Graham and colleagues will present results from a coordinated analysis that addressed associations among personality traits and cognitive decline both pre- and post- dementia diagnosis. Discussant David Almeida will contextualize these new findings and propose next steps.

A COORDINATED ANALYSIS OF THE ASSOCIATIONS AMONG PERSONALITY TRAITS, COGNITIVE DECLINE, AND DEMENTIA

Eileen Graham,¹ Kathryn Jackson,¹ Bryan James,² Emily Willroth,¹ and Daniel Mroczek,¹ 1. *Northwestern University, Chicago, Illinois, United States,* 2. *Rush University, Chicago, Illinois, United States*

There are considerable individual differences in the rates of cognitive decline across later adulthood. Personality traits are among the factors that may account for some of these differences. The current project investigated whether personality

traits were associated with trajectories of cognitive decline, and whether the associations were different before and after dementia diagnosis. The data were analyzed using linear mixed effect regression models. Across study aims was a focus on replicability and generalizability. Each question was address in four independent longitudinal studies (EAS, MAP, ROS, SATSA), and then meta-analyzed using random effects meta-analysis, providing estimates of heterogeneity. As expected, we detected evidence for cognitive decline in all four samples. Results also indicated that neuroticism and openness were associated with total cognitive function. and openness was associated with decline post dementia diagnosis.

ASSESSING PERSONALITY IN DAILY LIFE: VARIABILITY BETWEEN AND WITHIN PERSONS

Giselle Ferguson,¹ Giancarlo Pasquini,² Andreas Neubauer,³ and Stacey Scott,² 1. *Stony Brook University, Stony Brook University, New York, United States*, 2. *Stony Brook University, Stony Brook, New York, United States*, 3. *Leibniz Institute for Research and Information in Education, Frankfurt, Mecklenburg-Vorpommern, Germany*

Trait personality measures may not be able to detect subtle personality changes and fluctuations which may be indicative of cognitive impairment. Measuring personality in daily life may allow sufficient sensitivity to capture this within-person variability. Eighty-six older adults from the Einstein Aging Study completed items assessing daily extraversion and neuroticism for a median of 17 days. Using separate unconditional models, we calculated the proportions of variance in daily extraversion and neuroticism that were due to between-person and within-person variability. Variability in daily extraversion was relatively evenly related to between-person differences and within-person fluctuation (Intra-Class Correlation [ICC] = 0.576), but the majority of variability in daily neuroticism was at the between-person level (ICC = 0.730). Thus, although these daily assessments were sensitive enough to capture within-person variability in personality in daily life, different traits may exhibit more or less of this variability.

THE ROLES OF GENERAL AND DOMAIN-SPECIFIC PERCEIVED STRESS IN HEALTHY AGING

Jing Luo,¹ Bo Zhang,² Emily Willroth,¹ Daniel Mroczek,¹ and Brent Roberts,³ 1. *Northwestern University, Chicago, Illinois, United States*, 2. *Texas A&M University, College Station, Texas, United States*, 3. *University of Illinois-Urbana-Champaign, Champaign, Illinois, United States*

Theoretical and empirical evidence suggests the existence of a general perceived stress factor overarching different life domains. The present study investigated the general perceived stress relative to domain-specific perceived stress as predictors of 26 diverse health outcomes, including mental and physical health, health behaviors, cognitive functioning, and physiological health indicators. A bifactor exploratory structural equation modelling approach was conducted in two samples from the Health and Retirement Study. Across the two samples, perceived stress was well-represented by a bifactor structure where there was a robust general perceived stress factor representing a general propensity towards stress perception. Meanwhile, after controlling for the general factor, specific factors representing perceived stress in different life domains were

still clearly present. The general perceived stress factor was the most robust predictor of the majority of health outcomes. Age, sex, personality traits, and stressor exposure were found as possible diathesis underlying the general perceived stress factor.

PERSONALITY AND SOCIOECONOMIC PREDICTORS OF MIDLIFE COGNITIVE FUNCTIONING IN MEXICAN-ORIGIN ADULTS

Katherine Lawson,¹ Angelina Sutin,² and Richard Robins,¹ 1. *University of California, Davis, California, United States*, 2. *Florida State University College of Medicine, Tallahassee, Florida, United States*,

The present study aims to identify personality and socioeconomic (e.g., education, per capita income, economic stress) factors that contribute to midlife cognitive functioning across middle adulthood. Specifically, we examined how the growth trajectories of personality and socioeconomic factors across 12 years predict subsequent cognitive functioning, using data from a large sample of Mexican-origin adults (N=1,110; median age at Time 1=37 years, age range at Time 1=26-65). Personality was assessed using the Big Five Inventory, which assesses the Big Five domains as well as specific facets of each domain; economic stress was assessed using measures of negative economic events (e.g., job loss) and economic hardship (e.g., difficulty paying bills). Cognitive functioning was assessed using the NIH Cognitive Toolbox with measures of memory, language, and executive function. Findings from this work will help identify intervention targets for promoting healthy cognitive aging in midlife and beyond in Mexican-origin adults.

Session 1040 (Symposium)

BENCHMARKING AGE-FRIENDLY UNIVERSITY PRACTICES: AFU INVENTORY AND CAMPUS CLIMATE SURVEY (ICCS) STUDY INSIGHTS

Chair: Joann Montepare

Co-Chair: Nina Silverstein

The Age-Friendly University (AFU) initiative endorsed by GSA's Academy for Gerontology in Higher Education (AGHE) provides institutions of higher education with guiding principles for addressing the needs of aging populations. Benchmarks are now needed for assessing age-friendly academic, workplace, and physical campus environments, perceptions of campus constituents, and recommendations for advancing age inclusivity. This symposium will discuss what the AFU Inventory and Campus Climate Survey (ICCS) administered to a national sample of colleges and universities is revealing about the study of age-friendliness in higher education. The sample includes data from over 10,000 faculty, staff, students, and older learners surveyed in 2020-21. Whitbourne will introduce the conceptual model that served as the foundation for the ICCS, with special attention to the need to assess and compare "objective" age-friendly practices with "subjective" perceptions of these practices. Bowen will describe the utility of examining age-friendliness across institutional units with different functions: outreach-engagement, personnel, physical environment, research, services-resources, student affairs, and teaching-learning. Beaulieu will present data demonstrating the importance of assessing perceptions

of specific constituent groups including faculty, staff, students, and lifelong learners. Montepare will discuss insights gained about the definition and manifestation of what it means to be ageist, age-friendly, and age-inclusive in higher education. Silverstein will describe strengths and challenges observed across campuses along with recommendations and promising new directions for advancing age inclusivity in higher education.

TOWARD A MODEL OF AGE INCLUSIVITY IN HIGHER EDUCATION

Susan Whitbourne, *University of Massachusetts Boston, Boston, Massachusetts, United States*

The AFU principles clearly state the aspiration of promoting age inclusivity in higher education within the context of the UN Sustainability Development Goals. With these principles as a starting point, the Age-Friendly Campus Climate Inventory and Survey were developed to assess the extent to which AFU principles are put into practice (Inventory) and how campus constituencies perceive these practices. Based on social ecological models, a framework for measuring age inclusivity was developed in which practices ("objective environment") are compared to perceptions ("subjective environment"). Participating campuses (N=29) completed the inventory for each major executive unit, providing scores that were grouped by major campus functions, including research, teaching, community engagement, and support. By comparing these scores with perceptions of each function by samples of constituencies of faculty, staff, and students, it is possible to test the person-environment match as conceptualized by social ecological models providing important clarification for the AFU principles.

TAKING A CAMPUS-WIDE VIEW OF AGE-FRIENDLY PRACTICES IN HIGHER EDUCATION

Lauren Bowen,¹ Nina Silverstein,² Susan Whitbourne,² and Joann Montepare,³ 1. *University of Massachusetts, Boston, University of Massachusetts Boston, Massachusetts, United States*, 2. *University of Massachusetts Boston, Boston, Massachusetts, United States*, 3. *Lasell University, Newton, Massachusetts, United States*

The first AFU principle is to "encourage the participation of older adults in all the core activities of the university, including educational and research programs." As this suggests, a crucial goal of age inclusivity in higher education is to resist the siloing of older adults and age-inclusive efforts in age-specific programs and cohorts. In response, the Age-Friendly Inventory and Campus Climate Survey (ICCS) assessment was designed to assess age-inclusivity across seven areas of institutional activity: outreach & engagement, personnel, physical environment, research, services & resources, student affairs, and teaching & learning. By restructuring and expanding the "pillars" of institutional activity outlined by AFU principles, the ICCS presents two key advantages for benchmarking AFU practices: (1) it traces age-inclusivity across many facets of institutional operations; and (2) it prompts participants and report readers to recognize their role in current and potential age-inclusive efforts, regardless of their role or department on campus.

EXPLORING PERCEPTIONS OF AGE FRIENDLINESS ACROSS DIFFERENT CAMPUS CONSTITUENT GROUPS

Celeste Beaulieu,¹ Nina Silverstein,¹ Lauren Bowen,² Susan Whitbourne,¹ and Joann Montepare,³ 1. *University of Massachusetts Boston, Boston, Massachusetts, United States*, 2. *University of Massachusetts Boston, University of Massachusetts Boston, Massachusetts, United States*, 3. *Lasell University, Newton, Massachusetts, United States*

College campuses are typically considered as environments for adults ages 18-24, even though campuses are comprised of faculty, staff, students, and lifelong learners of all ages. Each group may experience the campus environment differently due to their differing roles. Faculty, staff and students from 21 participating designated Age Friendly Universities across the country answered survey questions on age friendliness, AFU awareness, and on campus practice items. Crosstab analyses show that constituent groups are equally aware of their university as an AFU (6% of each group). Students perceived their university as more age friendly (M=3.47, SD=0.73) compared to faculty and staff, the latter having the lowest perceived friendliness (M=3.27, SD=0.63). Specific age friendly practices show that staff members had markedly different perceptions of the institution's age friendly practices. AFUs need to consider higher education environments as workplaces as well as learning centers to make policies age friendly for all groups.

ON BEING AGEIST, AGE-FRIENDLY, AGE-INCLUSIVE: DIFFERENTIATING CORE CONSTRUCTS AND THEIR IMPLICATIONS

Joann Montepare, *Lasell University, Newton, Massachusetts, United States*

The pioneering Age-Friendly University (AFU) initiative has called for institutions of higher education to respond to the needs of older, more age-diverse populations through new approaches to programs, practices, and partnerships. In exploring in more detail what it means for a campus to be age-friendly, the national AFU Inventory and Campus Climate Survey (ICCS) study has raised questions about how core theoretical concepts are defined and manifested. Using observations from the ICCS study, this presentation will discuss tensions among constructs (e.g., does being age-friendly indicate the absence of ageist attitudes; are age-inclusive practices by design age-friendly?) and how differentiating these constructs better can help higher education focus its efforts in more intentional and productive ways.

OBSERVATIONS AND RECOMMENDATIONS TOWARD INCREASING AGE-INCLUSIVITY

Nina Silverstein, *University of Massachusetts Boston, Boston, Massachusetts, United States*

Some areas of current campus practice better align with AFU principles than others. It may be that age-friendly practices already implemented by campus administrators are either not sufficiently publicized or that the campus constituents are not aware that these accommodations are in place. Specifically, staff members in these institutions appear to have markedly different perceptions of an institutions' overall age-friendliness than did students and faculty. Lower ratings of age-friendliness by staff suggest that the experiences of ageism could contribute to negative outcomes such as stress and burnout. In line with

Sustainable Development Goals (SDGs) in the evaluation of campus sustainability efforts, aging should be addressed along with other elements of diversity, equity, and inclusion. There is also a need to support faculty development for designing courses and materials for age-diverse learners. Finally, campuses might organize age-inclusivity task forces and regularly reassess their age-friendly progress.

Session 1045 (Paper)

Cognitive Function

EFFECT OF AN ELEARNING MEMORY PROGRAM ON REDUCING NEGATIVE IMPACT OF AGE-RELATED MEMORY CHANGES

Lynn Zhu,¹ Danielle D'Amico,² Iris Yusupov,³ Jordan Lass,¹ Brian Levine,¹ Susan Vander Morris,¹ and Angela Troyer,¹
 1. Baycrest, Toronto, Ontario, Canada, 2. Ryerson University, Toronto, Ontario, Canada, 3. York University, Toronto, Ontario, Canada

Age-related memory changes pose considerable concerns for aging adults, and can adversely affect their daily living and cause worry even when changes experienced are not clinically significant. The Memory and Aging Program® is a validated psychoeducation and memory strategy-training program that teaches the public about memory changes during aging and trains them to use evidence-based strategies to support brain health. The program has been offered in-person for over 20 years, and a self-guided eLearning version was recently developed to improve program accessibility. This study evaluated the self-reported impacts of memory changes in older adults who completed this eLearning against a control group. We randomized 202 older adults, without neurological or psychiatric diagnoses (71.6 years; 69 % female; 15.6 years of education), into the eLearning program or a control group that received no intervention. All participants reported their perceived impact of memory changes using the Memory Impact Questionnaire at pre-, post-, and 6-8 weeks follow-up. A significant reduction in negative impact of memory changes on daily living and a significant improvement in positive coping with memory changes relative to controls was observed at post-test (13.4 versus 2.5 points reduction and 7.4 versus 0.1 point improvement, respectively, both $p < 0.05$), but these did not persist at follow-up. The adoption of digital tools has hastened across all ages. Our study showed that self-guided digital tools, such as the eLearning Memory and Aging Program®, may be a promising avenue to help aging individuals reduce the impact of memory changes on daily living.

HYPERTENSIVE RETINOPATHY IS ASSOCIATED WITH WORSE COGNITIVE FUNCTION IN WOMEN: THE SWAN STUDY

Sayoko Moroi,¹ Michelle Hood,² Carrie Karvonen Gutierrez,² Joshua Ehrlich,³ Brenda Gillespie,² Sarah Dougherty Wood,² and David Musch,²
 1. The Ohio State University, Columbus, Ohio, United States, 2. University of Michigan, Ann Arbor, Michigan, United States, 3. University of Michigan, University of Michigan, Michigan, United States

Based on the 2018 American Academy of Neurology guideline, the prevalence of mild cognitive impairment (CI) increases from 6.7% at 60-64 years to 25.2% at 80-84 years. There is interest to identify potential biomarkers in the retina for CI and dementia. The aims of this analysis was to test whether hypertensive retinopathy (HR) was associated with cognitive function using data from the Study of Women's Health Across the Nation (SWAN), Michigan cohort. SWAN, launched in 1996/97, is a longitudinal study of women traversing midlife and into late adulthood. Starting in 2000, cognitive function tests were administered: East Boston Memory Test immediate (EBMTi) and 10-minute delay (EBMTd) for verbal episodic memory; digit span backwards (DSB) for working memory; and symbol digits modalities test (SDMT) for perception speed, motor speed, and visual scanning. Z-scores were calculated for EBMTi, EBMTd, DSB and SDMT and averaged at follow-up visit 15 (2015/16). Eye exams were performed on 255 women (66 + 2.6 years) at follow-up visit 16 (2016/17). HR was based on presence/absence of arteriovenous nicking. Logistic regression showed a statistically significant association of lower average cognitive Z-score with HR (p -value 0.03, $\beta = -0.21$ [95% confidence interval: -0.40 to -0.02]) adjusting for measured hypertension or anti-hypertensive drugs, years of measured hypertension, race, education, and age. Preliminary results indicate that HR is associated with lower cognitive test scores in women in their 60s-70s. This association between a simple ophthalmic exam finding of systemic hypertension, i.e., arteriovenous nicking, and lower cognitive function is consistent with a cerebrovascular mechanism of CI.

LONGITUDINAL MEASUREMENT PROPERTIES OF THE MONTREAL COGNITIVE ASSESSMENT

Björn Andersson,¹ Hao Luo,² Gloria HY Wong,² and Terry YS Lum,²
 1. University of Oslo, Oslo, Oslo, Norway, 2. The University of Hong Kong, Hong Kong, Hong Kong

Background: The Montreal Cognitive Assessment (MoCA) has started to be widely used in longitudinal investigations to measure changes in cognition. However, the longitudinal measurement properties of MoCA have not been investigated. We aimed to examine the measurement invariance of individual MoCA items across four time points. Methods: We used longitudinal data collected between 2014 and 2017 from a cohort study on health and well-being of older adults in Hong Kong. The Cantonese version of the MoCA was used. We applied multiple group confirmatory factor analysis of ordinal variables to examine measurement invariance by educational level and across time points. Invariant items were identified by sequential model comparisons. Results: We included 1029 participants that answered MoCA items across all time points. We found that items Cube, Clock Hand and Clock Number had significantly different item parameters between participants with and without formal education at all time points. The selected model (RMSEA=0.031; SRMR=0.064) indicated that eight items (Trail, Cube, Clock Shape, Clock Number, Clock Hand, Abstraction, Short-term Memory, and Orientation) did not exhibit measurement invariance over time. However, the differences in item parameter estimate over time were marginal. Accounting for the lack

of measurement invariance did not substantially affect classification properties based on cutoff values at the 2nd (major neurocognitive disorder) and 7th (mild cognitive impairment) percentile. Conclusion: Our findings support using MoCA to assess changes in cognition over time in the study population. Future research should examine the longitudinal measurement properties of the test in other populations with different characteristics.

PLASMA LONG CHAIN FATTY ACIDS AND COGNITIVE FUNCTION IN OLDER ADULTS: A COMPARISON OF STATISTICAL ANALYSES

Caroline Duchaine,¹ Pierre-Hugues Carmichael,² Nancy Presse,³ Alexandra Fiocco,⁴ Pierrette Gaudreau,⁵ Guylaine Ferland,⁵ and Danielle Laurin,¹ 1. *Laval University, Quebec, Quebec, Canada*, 2. *Centre intégré universitaire de santé et services sociaux de la Capitale-Nationale, Quebec, Quebec, Canada*, 3. *Université de Sherbrooke, Sherbrooke, Quebec, Canada*, 4. *Ryerson University, Toronto, Ontario, Canada*, 5. *Université de Montréal, Montreal, Quebec, Canada*

Omega-3 fatty acids (FAs) have been suggested as modifiable protective factors for cognitive decline because of their neuroprotective properties. However, the evidence is still inconsistent regarding types of omega-3 FAs, and the probable interrelation with other circulating long chain FAs (LCFAs). This study aimed to evaluate associations between 14 plasma LCFAs and four cognitive domains using a principal component analysis (PCA) and to compare results with those obtained using standard methods. A group of 386 healthy older adults aged 77 ± 4 years (53% women), selected from the NutCog Study, a sub-study from the Québec cohort on Nutrition and Successful Aging (NuAge), underwent a cognitive evaluation and fasting blood sampling. Verbal and non-verbal episodic memory, executive functioning, and processing speed were evaluated using validated tests. LCFAs circulating concentrations were measured by high-performance liquid chromatography using published procedures. Linear regressions adjusted for age, sex, education, and BMI were used to evaluate cross-sectional associations between LCFAs, using PCA or a more standard grouping (omega-3, omega-6, monounsaturated, and saturated LCFAs), and cognitive performance. Higher scoring on the omega-3 PCA factor and higher concentrations of total omega-3 FAs were both associated with better episodic non-verbal memory and processing speed. Higher eicosapentaenoic acid (EPA omega-3) was also associated with these two cognitive domains and with episodic verbal memory. The associations with total omega-3 FAs taken separately were of smaller magnitude than those with PCA. These results suggest that omega-3 FAs should be considered in combination with other LCFAs when evaluating the association with cognitive function.

SOCIAL PARTICIPATION AND THE RISK FOR DEVELOPING MILD COGNITIVE IMPAIRMENT AND DEMENTIA AMONG OLDER ADULTS

Hrafnhildur Eymundsdottir,¹ Sigurveig Sigurdardottir,² Alfons Ramel,² Palmi Jonsson,³ Vilundur Gudnason,⁴ Lenore Launer,⁵ and Milan Chang,⁶ 1. *The Icelandic Gerontological Research Institute, Gardabaer,*

Hofuoborgarsvaio, Iceland, 2. *University of Iceland, Reykjavik, Hofuoborgarsvaio, Iceland*, 3. *University hospital Landspítali, Reykjavik, Hofuoborgarsvaio, Iceland*, 4. *University of Iceland, Kopavogur, Hofuoborgarsvaio, Iceland*, 5. *National Institute on Aging, Bethesda, Maryland, United States*, 6. *The Icelandic Gerontological Research Institute, Reykjavik, Hofuoborgarsvaio, Iceland*

Introduction: We aim to investigate the longitudinal associations between social participation and the risk of developing mild cognitive impairment (MCI) and dementia over 5 years of follow-up among cognitively normal older adults. Methods: A total of 2802 participants had complete follow-up data from Age-Gene/Environment-Susceptibility-Reykjavik-Study. Social participation was assessed by a questionnaire asking the frequency of contact with children, relatives, friends and neighbors. MCI and dementia were diagnosed according to international guidelines and by a team composed of a geriatrician, neurologist, neuropsychologist, and neuroradiologist. Logistic regression analysis was used to assess the associations. Results: At baseline 8% (n=225) reported no social participation. Among cognitively normal participants at baseline, 5.6% (n=243) developed mild cognitive impairment and 2.4% (n= 103) developed dementia during a mean follow-up time of 5.2 years. After full adjustment with covariates including age, gender, education, marital status, vitamin D levels, depression and APOE $\epsilon 4$, those with no social participation at baseline were significantly more likely to develop MCI at follow-up (OR=1.953, P=0.001). However, social participation at baseline was not associated with higher dementia diagnosis at follow-up (OR= 1.490, P=0.194). Conclusions: Community-dwelling old adults who are socially inactive are more likely to develop MCI than those who are socially active. Social participation might independently indicate impending changes in cognitive function among older adults.

Session 1050 (Paper)

COVID-19 and Social Health

CHICAGO OLDER ADULTS' LIKELIHOOD OF BEING HOME BEFORE AND DURING THE COVID-19 PANDEMIC

Ellen Compernelle,¹ Laura Finch,² Louise Hawkey,¹ and Kathleen Cagney,³ 1. *NORC at the University of Chicago, Chicago, Illinois, United States*, 2. *NORC at The University of Chicago, Chicago, Illinois, United States*, 3. *University of Chicago, Chicago, Illinois, United States*

Staying at home has particularly been emphasized for older adults during the COVID-19 pandemic, given their elevated risk of infection and complications. However, little is known about the extent to which this population is indeed spending more time at home during the pandemic, compared to before it began. The present investigation addresses this question, also examining differences by gender and race/ethnicity. We analyzed ecological momentary assessments among 98 older adults (age 65-88 in 2020) who participated in two waves of the Chicago Health and Activity Space in Real Time study. Pre-pandemic data were collected from July-October 2019, and pandemic data were collected from

June–September 2020. Participants responded to smartphone “pings” (five per day for 7 days in each wave; $n=1,910$ and $n=2,437$ before and during the pandemic, respectively) by reporting their momentary location (e.g., home). Findings suggest that respondents were indeed at home more often in mid-2020 than 1 year prior. Multilevel logistic regression models revealed that net of demographics, marital and employment status, and physical health, respondents were more likely to be momentarily at home during versus before the pandemic ($B=0.70$, $SE=0.08$, $p<.001$). This effect was larger among women than men ($B=0.50$, $SE=0.16$, $p=.002$), but did not differ by race/ethnicity. Additional analyses examine whether and how the observed increased reports of being at home may be associated with increased reports of momentary loneliness across the two waves. Findings characterize where Chicago older adults are spending their time amid the pandemic and how this may relate to their well-being.

CREATIVE HOBBIES AS A PROTECTIVE FACTOR AGAINST STRESS DURING THE COVID-19 PANDEMIC IN OLDER ADULTS

Sarah Israel,¹ Darby Mackenstadt,² and Carolyn Adams-Price,¹ *1. Mississippi State University, Mississippi State University, Mississippi, United States, 2. Mississippi State University, Starkville, Mississippi, United States*

The COVID-19 pandemic dramatically impacted our way of life, leading to increased rates of anxiety and depression (Panchal et al., 2021). The implications may be worse for older adults who account for 80% of all COVID deaths (Freed et al., 2020). Meanwhile, prior to the pandemic, Adams-Price and colleagues (2018) found that creative hobby participation provided slightly different benefits for middle-aged and older adults. Specifically, evidence suggested that middle-aged adults may use their creative hobby more for stress relief than older adults. Using a sample of 239 women, aged 40 to 84 years old ($M = 59.7$), we examined whether the degree to which viewing one’s creative hobby as a component of one’s identity related to perceived stress, health anxiety, and depressive symptoms. In addition, we wanted to know whether these relationships were moderated by age. Single moderation models suggest that viewing one’s creative hobby as a part of their identity was related to higher health anxiety and reporting more depressive symptoms. In addition, age was related to reporting lower perceived stress, health anxiety, and depressive symptoms. Lastly, age provided a significant moderation effect to the relationship between degree of identity associated with one’s creative hobby and perceived stress such that middle-aged adults with a high degree of identification with their creative hobby reported the most perceived stress while older adults with a high degree of identification with their creative hobby reported the least perceived stress. Implications for older adult’s well-being and adaptiveness to the COVID-19 pandemic will be discussed.

UNDERSTANDING THE COMPLEXITIES OF COMMUNITY-DWELLING OLDER ADULTS’ LIVED EXPERIENCES DURING COVID-19

Bo Xie,¹ Kristina Shiroma,² Atami De Main,³ Nathan Davis,¹ Karen Fingerma,¹ and Valerie Danesh,¹ *1. The University of Texas at Austin, Austin, Texas, United*

States, 2. The University of Texas at Austin, The University of Texas at Austin, Texas, United States, 3. The University of Texas at Austin, Menard, Texas, United States

Since December 2019, COVID-19 has spurred rapid and extensive research, but this research has focused on some perspectives with others understudied. In particular, studies have not yet explored the complexities of community-dwelling older adults’ lived experiences during the pandemic. This study aimed to address this gap. Community-dwelling older adults living in Central Texas ($N = 200$; age, 65–92 years, $M = 73.6 \pm 6.33$) responded to open- and closed-ended questions over the telephone during June–August 2020. Data were analyzed using inductive thematic analysis. We identified three key themes. (1) Positive experiences, with 4 subthemes: perception that the pandemic has not changed one’s lifestyle; adjusting well—particularly with the aid of technology; being positive in perspective; and a “loner advantage” (being a “loner” pre-pandemic was advantageous during the pandemic). (2) Mixed experiences, with 4 subthemes: doing okay but unhappy about changing lifestyle routines; doing okay but unhappy about loss of in-person interactions with family and friends; doing okay but frustrated by witnessing absence of social distancing or facemask use by others; and maintaining physical health with fluctuating symptoms of depression or anxiety. (3) Negative experiences, with 3 subthemes: bitter about others/society/government not caring for older adults; feeling isolated, bored, and powerless; and worsening as time goes by. A thematic map was subsequently developed. These findings reveal the complexities of community-dwelling older adults’ lived experiences, illustrating effective coping and resilience during the pandemic and dissatisfaction owing to the pandemic’s effects on their lives and to their observations of others’ behaviors.

USING ECOLOGICAL AND TWITTER-BASED ASSESSMENTS TO EXAMINE IMPACTS IN TEMPORAL AND COMMUNITY CONTEXT

Isabella Bouklas,¹ Giselle Ferguson,² Giancarlo Pasquini,² Huy Vu,² Mohammadzaman Zamani,² Ruixue Zhaoyang,³ Stacey Scott,² and H. Andrew Schwartz,² *1. Duke University, Durham, New York, United States, 2. Stony Brook University, Stony Brook, New York, United States, 3. The Pennsylvania State University, University Park, Pennsylvania, United States*

In March 2020, Bronx County (NY) saw one of the first U.S. COVID-19 outbreaks. This outbreak coincided with the ongoing Einstein Aging Study (EAS), which involved older adults living in Bronx County completing annual two-week intensive data collection “bursts.” Thus, it serves as a natural experiment to study pre-COVID to early pandemic-related changes in the daily well-being of participants who were at risk both due to their age and their location. We examined within-person change in self-reported negative thoughts, affect, stress, and loneliness from a subsample of 78 EAS participants. Participants’ data from a two-week “burst” of momentary surveys during 2019 were compared with their data from the corresponding timeframe during the early COVID-19 period (February–June 2020). Personality and mild cognitive impairment were examined as predictors of change. Average momentary loneliness significantly increased from 2019 to 2020. Participants with greater neuroticism

increased more in thought unpleasantness and depressed feelings. To understand the community context, community distress markers were analyzed using Artificial Intelligence (AI)-based assessments of public Twitter posts from Bronx County during the same periods. These Twitter posts also showed a surge of COVID-related topics at the onset of the Bronx outbreak. Language analysis showed a 2019-2020 increase in Bronx community markers of anxiety, depressivity, and negatively-valenced affect extracted from Twitter. We observed 2019-2020 change in both individuals' well-being (via intensive reports) and in their communities (via Twitter). Contextualizing these with the increased COVID-19 discussion online suggests that these may reflect common pandemic effects.

Session 1055 (Paper)

COVID-19 Outcomes for Older Adults

AGE DIFFERENCES IN BECOMING COVID LONG-HAULERS AND IN POST-ACUTE SEQUELAE OF SARS-COV-2

Qiao Wu, and Eileen Crimmins, *University of Southern California, Los Angeles, California, United States*

People who have had COVID-19 can suffer from the continuation of Post-Acute Sequelae of SARS-CoV-2 (PASC), also known as “long COVID”, for months after infection. Understanding PASC is important for treatment, care, and projecting future health of the population. Since older adults are at higher risk of severe illness and consequences from COVID, we hypothesize that they are more likely to become COVID long-haulers and report more symptoms at the time of diagnosis and three months after. We use a nationally representative sample of adults from the Understanding America Study COVID-19 Survey, from March to December 2020, to estimate the prevalence of long COVID and identify the most common long-term symptoms and how they vary by age. We use multilevel models to examine the determinants of symptom count and change over time. Among the 608 people with a COVID diagnosis, 83 (13.7%) aged over 65; almost half (47.9%) reported symptoms three months after diagnosis; the proportion did not differ across age groups. The most common symptoms were fatigue (25.0%), runny/stuffy nose (18.9%), body aches (16.4%), sneezing (15.1%), and headache (13.6%). These symptoms were consistent across age groups, while people aged 65 and older reported significantly less cough ($\chi^2=3.96$; $P=0.05$) and headache ($\chi^2=4.24$; $P=0.04$) compared to their younger counterparts. Neither the mean at the time of the diagnosis nor the rate of change of the symptom count varied across age groups. Our analyses suggest that age is not a significant determinant of PASC symptom count or becoming a COVID long-hauler.

BEYOND CHRONOLOGICAL AGE: FRAILITY AND MULTIMORBIDITY PREDICT IN-HOSPITAL MORTALITY IN PATIENTS WITH COVID-19

Alberto Zucchelli,¹ Alessandra Marengoni,² Davide Vetrano,³ Luigi Ferrucci,⁴ Laura Fratiglioni,⁵ Roberto Bernabei,⁶ Graziano Onder,⁷ and Giuseppe Romanelli,⁸ *1. Università degli Studi di Brescia,*

Karolinska Institutet, Stockholms Lan, Sweden, 2. University of Brescia, Brescia, Lombardia, Italy, 3. Karolinska Institutet, Solna, Stockholms Lan, Sweden, 4. National Institute on Aging, Baltimore, Maryland, United States, 5. Karolinska Institutet 17175, Stockholms Lan, Sweden, 6. Catholic University of Rome, Rome, Lazio, Italy, 7. Italian National Institute of Health, Rome, Lazio, Italy, 8. Università degli Studi di Brescia, Università degli Studi di Brescia, Lombardia, Italy

Background: We evaluated whether frailty and multimorbidity predict in-hospital mortality in patients with COVID-19 beyond chronological age. Methods: 165 patients admitted from March 8th to April 17th, 2020, with COVID-19 in an acute geriatric ward in Italy were included. Pre-disease frailty was assessed with the Clinical Frailty Scale (CFS). Multimorbidity was defined as the co-occurrence of ≥ 2 of these in the same patient. The hazard (HR) of in-hospital mortality as a function of CFS score and number of chronic diseases in the whole population and in those aged 70+ years were calculated. Results Among the 165 patients, 112 were discharged, 11 were transferred to intensive care units and 42 died. Patients who died were older (81.0 vs. 65.2 years, $p<0.001$), more frequently multimorbid (97.6 vs. 52.8%; $p<0.001$) and more likely frail (37.5 vs. 4.1%; $p<0.001$). Less than 2.0% of patients without multimorbidity and frailty, 28% of those with multimorbidity only and 75% of those with both multimorbidity and frailty died. Each unitary increment in the CFS was associated with a higher risk of in-hospital death in the whole sample (HR=1.3; 95%CI=1.05-1.62) and in patients aged 70+ years (HR=1.29; 95%CI=1.04-1.62), whereas the number of chronic diseases was not significantly associated with higher risk of death. The CFS addition to age and sex increased mortality prediction by 9.4% in those aged 70+ years. Conclusions Frailty identifies patients with COVID-19 at risk of in-hospital death independently of age. Multimorbidity contributes to prognosis because of the very low probability of death in its absence.

COVID-19 CASES, HOSPITALIZATIONS, AND DEATHS IN NURSING HOMES: FACTORS IMPACTING THE SECOND SURGE

Sean Fleming,¹ Danya Qato,² Alexandra Wallem,² Paulina Kepczynska,² Linda Wastila,² Tham Le,² and Jeanne Yang,² *1. University of Maryland Baltimore, University of Maryland Baltimore, Maryland, United States, 2. University of Maryland School of Pharmacy, Baltimore, Maryland, United States*

As of March 2021, over 128,000 nursing home (NH) residents have died due to COVID-19 complications, accounting for one-third of all U.S. COVID-19 deaths. Early studies highlighted factors which heightened residents' risk—facility size and profit status, CMS Five-Star quality rating, race, and high Medicaid share. Despite improved nationwide social distancing and access to protective equipment, between October-December 2020 nursing home cases, hospitalizations, and deaths peaked to highest levels since the pandemic's advent. The purpose of this study is to quantify previously unexamined associations between resident, facility, and geographic characteristics and COVID-19 infections, hospitalizations, and fatalities in nursing homes during this second surge. In this cross-sectional study, we constructed a novel

dataset with linked facility- and county-level data from the CMS Nursing Home COVID-19 Public File, Nursing Home Compare, Long-Term Care Focus, and The New York Times. Multivariable logistic regression evaluated the odds of COVID-19 infections, hospitalizations, and deaths in nursing homes. Among 13,156 nursing homes, 80.5% reported ≥ 1 COVID-19 cases; on average, nursing homes reported 4.5 hospitalizations and 3.0 deaths. Facilities with higher acuity patients, chain status, >150 beds, high percentage white residents, low Medicaid share, high surrounding county case rates, and occupancy rates $>75\%$ were significantly ($p < .001$) related to increased odds of all outcomes. N95 mask shortages continued to increase risk of cases and hospitalizations. Five-Star ratings, high influenza vaccination rates, and clinical staff shortages were not significant factors. Findings demonstrate that through 2020, nursing homes continued to face challenges protecting their residents from COVID-19-related morbidity and mortality.

FACTORS ASSOCIATED WITH NURSING HOME RESIDENTS' COVID-19 INFECTIONS: A SYSTEMATIC REVIEW OF LITERATURE

CHENG YIN,¹ Xiaoli Li,² Rongfang Zhan,¹ and Liam O'Neill,³ 1. *University of North Texas, Corinth, Texas, United States*, 2. *University of North Texas, Denton, Texas, United States*, 3. *University of North Texas, University of North Texas, Texas, United States*

Background: Nursing homes were impacted disproportionately by the coronavirus because of their resident's vulnerabilities and settings. Even many previous studies illustrated factors related to nursing home residents' COVID-19 infections, there's no such study epitomizing those factors systematically, while some factors were controversial in different studies. The article aims to summarize major types of factors and provide crucially influential implications for nursing homes to prevent and manage their resident infections. **Methods:** All articles published between 01 January 2020 - 15 January 2021 in English version were searched through three electronic databases (PubMed, Web of Science, and Scopus). Two authors screened and evaluated a total of 121 studies independently based on selection and extraction criteria. **Results:** Seventeen identified studies were included in the research, which involved five major types of factors (nursing home's residence, nursing home, staff, resident, and others). **Conclusion:** nursing home's county infection rate, size, and staff residence were the strongest significant factors in many studies. Per-capital income, symptom-based screening and testing, and asymptomatic individuals have impacted resident's infections variously since the beginning of the pandemic. Nursing home's star rating and a total count of fines became factors when considered its locations. Other factors, including nursing home's type, historical health deficiencies, staffing level, and staff working different facilities, etc., were also significant factors. The value of factors suggests healthcare systems reflect appropriate measures and allocate more resources to nursing homes in high prevalence counties on the basis of universal allocation.

NO INCREASE IN SHORT-TERM MORTALITY FOLLOWING COVID-19 VACCINATION AMONG NURSING HOME RESIDENTS

Barbara Bardenheier,¹ Stefan Gravenstein,² Roe Gutman,³ Neil Sarkar,⁴ Richard Feifer,⁵ Elizabeth White,² and Vincent Mor,² 1. *Brown University School of Public Health, Smithfield, Rhode Island, United States*, 2. *Brown University, Providence, Rhode Island, United States*, 3. *Brown University, Providence, Rhode Island, United States*, 4. *Rhode Island Quality Institute, Providence, Rhode Island, United States*, 5. *Genesis HealthCare, Kennett Square, Pennsylvania, United States*

Reports of fatal adverse events following mRNA-based vaccination for COVID-19 in Norwegian nursing home (NH) residents have raised concern regarding vaccine safety in very old and frail persons. A limitation of these reports, however, is the absence of contemporaneous control groups, particularly given the high baseline mortality in this population. Using electronic health records' data on resident deaths, hospital transfer, vaccination, and daily census from Genesis Healthcare, a large NH provider spanning 24 U.S. states, we compared 7-day mortality and hospitalization rates for vaccinated versus unvaccinated NH residents. Between December 18, 2020 and December 31, 2020, 7006 residents across 118 NHs were vaccinated with the first dose. Mortality and hospital transfer rates within 7 days of vaccination were compared to rates for: (1) unvaccinated residents in the same facility within 7 days of the vaccine clinic ($n=4414$), and (2) residents in 166 yet-to-be-vaccinated facilities between December 25, 2020 and January 1, 2021 ($n=17,076$). We excluded residents with a positive SARS-CoV-2 diagnostic test within 20 days prior to their 7-day observation window. Mortality rates per 100,000 residents were lower among vaccinated (587, 95%CI: 431, 798) versus unvaccinated residents within the same facilities (984, 95%CI: 705, 1382), and compared to residents in not-yet-vaccinated facilities (912, 95%CI: 770-1080), with overlapping 95% CIs. Hospital transfers were lower among vaccinated residents than in either comparison group, but with overlapping CIs. Our findings suggest that short term mortality rates appear unrelated to vaccination for COVID-19 in NH residents, and should dispel concerns raised by previous reports.

Session 1060 (Paper)

Dementia and Cognitive Impairment: Policy and Programs

BUILDING A MODEL OF ADVOCACY: IMPROVING THE DEMENTIA CAPABILITY OF MANAGED CARE HEALTH PLANS IN CALIFORNIA

Brooke Hollister,¹ Jarmin Yeh,² Leslie Ross,² Jennifer Schlesinger,³ and Debra Cherry,³ 1. *University of California, San Francisco, California, United States*, 2. *University of California, San Francisco, San Francisco, California, United States*, 3. *Alzheimer's Los Angeles, Los Angeles, California, United States*

Given the growing prevalence of Alzheimer's Disease and related dementias, and the intensity of this population's care needs, it is imperative that health plans (HPs) increase their dementia-capability. The Dementia Cal MediConnect (Dementia CMC) project proposes an innovative model of health care advocacy that can create dementia-capable

systems change. The Dementia CMC project was a partnership (2013 – 2018) between local Alzheimer's organizations and ten managed care HPs in California. It used the following model of health care advocacy: 1) Identify dementia-capable best practices to set as systems change indicators; 2) Identify and leverage public policies in support of systems change indicators; 3) Identify and engage champions; 4) Develop and advocate for a value and business case to improve dementia care; 5) Identify gaps in dementia-capable practices; 6) Provide technical assistance, tools, and staff training to address the gaps in dementia-capable practices; and 7) Track systems change. Systems change data was collected through participant observation with HPs and interviews with key informants. HPs reported making systems changes toward more dementia-capable practices such as: better pathways for identification and diagnosis; better identification, assessment, support, and engagement of caregivers; and improved systems of referral to Alzheimer's organizations. Some indicators of systems change were inconclusive as a result of variability in HP practices and the lack of common record systems between HPs and providers. The application of this advocacy model has led to systems changes that can be replicated to improve care for people living with dementia and their caregivers.

COGNITIVE IMPAIRMENT TRENDS AMONG OLDER ADULTS IN A MEDICAID HOME AND COMMUNITY-BASED SERVICE PROGRAM

Richard Fortinsky,¹ Julie Robison,² David Steffens,¹ James Grady,¹ and Deborah Migneault,³ 1. *University of Connecticut School of Medicine, Farmington, Connecticut, United States*, 2. *University of Connecticut, University of Connecticut, Connecticut, United States*, 3. *UConn Health, Farmington, Connecticut, United States*

Cognitive impairment (CI) is an important risk factor for nursing home admission, but little is known about CI among older adults in Medicaid HCBS programs. Racial and ethnic group CI disparities are found among community-dwelling older adults, but these CI trends have not been explored in Medicaid HCBS populations. In this study, we determined how CI is associated with older adults' racial and ethnic group identification and educational attainment in Connecticut's Medicaid HCBS program. The study cohort includes program enrollees age >65 during January-March 2019 (N=3,520). CI measures include: Cognitive Performance Scale (CPS), ranging from 0-8 (cognitively intact to very severe impairment); and a dichotomous measure incorporating Alzheimer's disease or other dementia diagnosis (ADRD) and CPS score signifying moderate or severe CI. Study cohort characteristics: 75.7% female; age, mean(sd)=79.1(8.2); Non-Hispanic White=47.8%; Non-Hispanic Black=15.9%; Non-Hispanic Other=2.7%; Hispanic=33.6%; HS education=21.7%; mean(sd) CPS score=2.7(1.9); 36.1% with ADRD/high CPS2 score. In multivariate regression models adjusting for age and sex, CPS scores were not independently associated with race and ethnicity, and the likelihood of having ADRD/high CPS scores did not differ by race and ethnicity (all p-values >0.05). In these same models, persons with more than high school education had significantly lower CPS scores (b=-.12; p<.001), and significantly lower likelihood of having ADRD/high CPS scores (AOR=0.61; p<.001), than persons with less than high school education. We conclude that educational level is independently

associated with CI, but race and ethnicity are not in this cohort. Policy and practice implications will be discussed.

DO INDIVIDUALS SKIMP ON HEALTH CARE AFTER SPOUSE'S DEMENTIA DIAGNOSIS?

Yi Chen, *University of Southern California, Irvine, California, United States*

Dementia is a costly disease that places great burden on individuals and families. The substantial time and financial resources taken away by living with persons with dementia (PWDs) may make their spouses forgo essential health care, thus deteriorating long-term health and increasing downstream healthcare costs. However, such negative externality is understudied. This paper studied the impacts of spouse's incident dementia diagnosis on an individual's use of needed care, defined as annual flu shot and regular doctor visits for those with preexisting conditions. Using HRS linked to Medicare claims, I employed a fixed effects approach to compare the use of flu shot and doctor visit during 1 year before and after the index, for individuals whose spouse had dementia (N=691) and otherwise similar controls (N=5,073). After adjusting for time-varying health, caregiving roles, and other socio-demographic factors, spouse's dementia onset was associated with greater likelihood of getting flu shot and seeing doctors. Among those transitioning into caregiving, spouses of PWDs had a marginally higher risk of skimping on doctor visits, compared to controls (p=0.053). In this broadly representative sample, there lacks evidence for rationed health care ensuing spouse's dementia incidence, at least within a 1-year time frame. However, for new spousal caregivers, the impact of dementia is more profound and complex than deprivation of time. This group may face a trade-off between caring for spouses with dementia and caring for themselves, for whom policy support merits further study and consideration.

PREDICTORS OF DISENROLLMENT AMONG MEDICARE FEE-FOR-SERVICE BENEFICIARIES WITH DEMENTIA

Maricruz Rivera-Hernandez,¹ Aaron Castillo,² and Amal Trivedi,² 1. *Brown University School of Public Health, Providence, Rhode Island, United States*, 2. *Brown University, Providence, Rhode Island, United States*

Medicare enrollment among people with Alzheimer's Disease and Related Dementias (ADRD) has reached an all-time high with about 12% of beneficiaries having an ADRD diagnosis. The federal government has special interest in providing healthcare alternatives for Medicare beneficiaries. However, limited studies have focused on understanding disenrollment from fee-for-service, especially among those with high-needs. In this study we identified predictors of disenrollment among beneficiaries with ADRD. We used the 2017-2018 Medicare Master Beneficiary Summary File to determine enrollment, sociodemographic, clinical characteristics and healthcare utilization. We included all fee-for-service beneficiaries enrolled in 2017 who survived the first quarter of 2018. Our primary outcome was disenrollment from fee-for-service between 2017 and 2018. Regression models included age, sex, race/ethnicity, dually eligibility to Medicare and Medicaid, chronic and disabling conditions (categorized

by quartiles), total health care costs including outpatient, inpatient, post-acute care and other costs (categorized by quartiles) and county fixed-effects. There were 1,797,047 beneficiaries enrolled in fee-for-service with an ADRD diagnosis. Stronger predictors of disenrollment included race/ethnicity and dual eligibility. Disenrollment rates were 7.9% (95% CI, 7.2 – 8.5) among African Americans, 6.6 (95% CI, 6.2 – 7.0) among Hispanics and 4.3 (95% CI, 4.2 – 4.3) among Whites. Duals were 1.9% (95% CI, 1.4 – 2.3) more likely to disenroll from fee-for-service to Medicare Advantage (MA). The inclusion of MA special need plans and additional benefits for those with ADRD and complex chronic conditions may be valuable for those beneficiaries with ADRD, and who may not have Medigap coverage when enrolling in fee-for-service.

RURAL AND URBAN DIFFERENCE IN LONGITUDINAL TRENDS IN PREVALENCE OF DEMENTIA IN MEDICARE CLAIMS AND SURVEY DATA

Nasim B. Ferdows, *University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma, United States*

Shortage of physicians in rural areas can lead to lower diagnosis and underestimation of dementia prevalence in these communities. We used data from the nationally representative Health and Retirement Study and a 20-percent sample of Medicare claims to study rural-urban differences in dementia prevalence. The survey dementia diagnosis is free from medical assessment while the claims diagnosis needs a physician diagnosis. We estimated the trends in dementia prevalence from (2002-2016) based on cognitive tests (using survey data) and diagnosis codes (using claims data) utilizing ordinary least squares regression. Dementia prevalence based on diagnosis codes declined in both urban and rural areas over the course of the study, with a sharper decline in urban areas. Dementia prevalence using diagnosis codes showed significantly higher rates in urban areas during all years (0.024 vs 0.018 in 2002 and 0.017 vs 0.013 in 2014 in rural vs urban areas, respectively). Dementia in the cognitive test sample was higher in rural areas (0.11 vs 0.08 in 2000 and 0.08 vs 0.7 in 2014 in rural vs urban areas), a difference that was significant only in 2004. Our results indicate lower dementia prevalence rates in rural areas in claims based sample compared to survey sample which its dementia prevalence is free medical assessment. Claims data are valuable sources for tracking dementia in the US population, however they are based on medical diagnosis. In rural areas, where there is shortage of physicians and a lack of access to health care services, claims based studies may underestimate dementia rates.

Session 1065 (Symposium)

DIVERSITY OF ACTIVITIES, EMOTIONS, AND PLEASANT EVENTS AND THEIR ASSOCIATIONS WITH MENTAL AND COGNITIVE HEALTH

Chair: Soomi Lee

Co-Chair: Emily Urban-Wojcik

Discussant: David Almeida

The COVID-19 pandemic dramatically changed the structure of our daily lives. One of the most significant changes is a limited opportunity to engage in face-to-face social interactions and enjoy diverse daily activities. This raises a public health concern, because diverse experiences are critical sources of health by increasing social integration, cognitive reserve, and psychological resources. Recently, two lines of research have consistently shown that activity diversity or emodiversity is associated with multiple health outcomes. However, still more integrated efforts are needed to better understand diversity of daily experiences in various aspects and their contributions to health. This symposium brings together different endeavors towards understanding how diversity of daily experiences – activity diversity, emodiversity, and variety in positive experiences – are associated with health and well-being across adulthood. The topic of this symposium is timely to discuss potential prevention approaches to protect population well-being as the pandemic evolves. Paper 1 examines activity diversity (breadth and evenness of daily activity participation) and how it is related to positive and negative emodiversity (rich and balanced emotional experiences) differently by age groups. Paper 2 investigates the longitudinal relationship between activity variety across cognitive, physical, and social domains and cognitive functioning. Paper 3 examines variety in pleasant events and its associations with mental health outcomes. Paper 4 examines whether and how negative emodiversity is associated with mental illness during COVID-19. The discussant, Dr. David Almeida will integrate key findings from these studies, discuss their theoretical and methodological contributions, and consider opportunities for future research.

RICH AND BALANCED EXPERIENCES OF DAILY EMOTIONS ARE ASSOCIATED WITH ACTIVITY DIVERSITY ACROSS ADULTHOOD

Soomi Lee,¹ Emily Urban-Wojcik,² Susan Charles,³ and David Almeida,⁴ 1. *University of South Florida, Tampa, Florida, United States*, 2. *University of Wisconsin--Madison, Madison, Wisconsin, United States*, 3. *University of California, Irvine, Irvine, California, United States*, 4. *Pennsylvania State University, University Park, Pennsylvania, United States*

We examined whether the diversity of daily activities (“activity diversity”) is associated with the diversity of daily emotions (“emodiversity”) and if the association differs by age. Two samples of adults from the Midlife in the United States Study provided activity and emotion data for eight days. Greater activity diversity was associated with greater positive and negative emodiversity in each sample. Age moderated the association between activity diversity and positive emodiversity in an older sample, such that association was stronger for younger adults than for older adults. Results from data combining the two samples revealed that the associations of activity diversity with positive or negative emodiversity were significant when age < 70, 71 years, respectively. Broad and even participation of daily activities may provide more opportunities to experience rich and balanced emotions in adulthood. The weaker associations in older age may suggest the need to promote active lifestyles in later life.

MORE NEGATIVE EMODIVERSITY IS ASSOCIATED WITH WORSE MENTAL ILLNESS DURING (BUT NOT BEFORE) COVID-19

Emily Urban-Wojcik,¹ Alexandra Barnes,² Dan Fitch,³ Andrew Kirvin-Quamme,³ Elizabeth Nord,³ Lauren Gresham,³ Richard Davidson,⁴ and Stacey Schaefer,⁴
 1. *University of Wisconsin--Madison, Madison, Wisconsin, United States*, 2. *Center for Healthy Minds, University of Wisconsin--Madison, Madison, Wisconsin, United States*, 3. *Center For Healthy Minds, University Of Wisconsin--Madison, Madison, Wisconsin, United States*, 4. *University of Wisconsin-Madison, Madison, Wisconsin, United States*

Relations between negative emodiversity (NED; the variety and relative abundance of negative emotions) with depression and anxiety were examined before and during the COVID-19 pandemic. Forty-five individuals (ages 25-65) participated in two ecological momentary assessments (EMA): pre-pandemic and during-pandemic (Fall, 2020). Participants reported how much they felt 6 negative emotions several times each day for 10 days (resulting up to 91 EMA "events"). Each event's NED was computed and then averaged using an adaptation of Shannon's entropy. Participants with higher levels of average NED had higher levels of concurrent depression and anxiety. When adjusting for average levels of negative emotion and other covariates, NED was a significant predictor of depression and anxiety only during the pandemic. These findings, which did not vary by age, suggest that having more diverse negative emotions on a moment-to-moment basis may hold greater significance for mental illness outcomes during times of extreme chronic stress.

THE LONGITUDINAL RELATIONSHIP BETWEEN ENGAGEMENT IN VARIOUS ACTIVITIES AND COGNITIVE FUNCTIONING

Sangha Jeon,¹ Soomi Lee,² and Susan Charles,¹ 1. *University of California, Irvine, Irvine, California, United States*, 2. *University of South Florida, Tampa, Florida, United States*

Recent studies indicate that engaging in more diverse activities is related to higher cognitive functioning. Questions remain, however, regarding whether activity variety within different domains is important. We examined how overall activity variety across domains, as well as variety within cognitive, physical, and social domains are related to cognitive functioning. Data were drawn from Waves 2-3 of Midlife Development in the United States (MIDUS). In cross-sectional analyses (N = 3349), activity variety overall and within each domain were positively related to cognitive functioning regardless of activity frequency. In longitudinal analyses (n = 2054), participants with consistently higher activity variety overall and within the social domain over time (vs. those with consistently low or decreasing activity variety) exhibited better cognitive functioning at W3 after adjusting for cognitive functioning at W2. Findings suggest that engaging in a variety of activities that involve multiple cognitive processes might be beneficial for cognitive health.

VARIETY IN POSITIVE EXPERIENCE AND MENTAL HEALTH: EVIDENCE FROM TWO NATIONAL SURVEYS OF U.S. ADULTS

Anthony Ong,¹ and Soomi Lee,² 1. *Cornell University, Ithaca, New York, United States*, 2. *University of South Florida, Tampa, Florida, United States*

Scheduling of pleasant activities is a core treatment component for various psychiatric disorders, but little is known about whether variety in positive experiences is associated with improved mental health and well-being. Here we demonstrate the benefits of diverse positive experiences. Using data from the Midlife in the United States (MIDUS) II (N = 1,233, Mage = 57yrs) and Refresher (N = 855, Mage = 52yrs) cohorts, we show that greater variety of positive events is associated with lower depression and anxiety, and fewer visits to mental health professionals. These associations remained robust to differences in sociodemographics (age, gender, race, education), personality (openness, conscientiousness, extraversion, agreeableness, neuroticism), and the frequency of positive events, and the results replicated across the two cohorts. The findings highlight the importance of activity diversity in older adults and suggest that efforts to increase engagement in diverse positive experiences could have beneficial effects on mental health outcomes.

Session 1070 (Paper)

End-of-Life Care Practice

CHANGE OF HEALTH AND CHANGE OF PREFERENCES ON LIFE-SUSTAINING TREATMENT: EVIDENCE FROM A LONGITUDINAL STUDY

Yifan Lou,¹ Mercedes Bern-Klug,² and Jinyu Liu,³
 1. *Columbia University, New York, New York, United States*, 2. *University of Iowa, Iowa City, Iowa, United States*, 3. *Columbia University, Columbia University, New York, United States*

Background: Decision-making for end-of-life (EoL) care is not a one-off choice. Older adults may change their preferences for life-sustaining treatments along their health continuum. Guided by prospect theory, we hypothesize that perceived change in health status is a driver behind preference changes. Method: Health and Retirement Study Wave 2012 to 2018 data. Sample is limited to 5,646 older adults who reported whether they requested to limit treatment in living will during two waves of data. Two possible preference changes were tested: from limited to default care and from default to limited care. Change in health status was indicated by changes (1=same, 2=improve, 3=decline) in physical pain, general health, activities of daily living, instrumental activities of daily living (IADL), and number of diagnoses. Multilevel logistic regression models were used to understand how change of health status was related to changes in EoL preferences. Results: 700 older adults changed their preferences some time in 8 years. Those who changed their preferences are more likely to be older and not married, and to have lower socioeconomic background. Older adults who experienced deteriorated pain levels were more likely to change their preferences from default to limited care (OR=3.77, p<.05) and less likely to change from limited to default care (OR=0.63, p<.05). Change in IADL is also a significant predictor of change of preferences. Implication: The findings highlight the importance of periodic reassessment of EoL care preferences with older adults. We discuss policy and practice implications regarding health changes as underlying mechanisms of preference changes.

CLINICAL OUTCOMES OF HOME-BASED PALLIATIVE CARE: AN ADVANCE ILLNESS MANAGEMENT PROGRAM

Cara Wallace,¹ and Yit Mui Khoo,² 1. *Saint Louis University, St. Louis, Missouri, United States*, 2. *Saint Louis University, Saint Louis, Missouri, United States*

Prior studies have reported evidence that patients with chronic medical conditions benefit from home-based palliative care to manage symptoms. The purpose of this study is to evaluate the efficacy of an advanced illness management program provided by a visiting nurse agency. This program aims to reduce the burden of illness and to manage symptoms of patients who have difficulty leaving their home due to severity of their medical conditions. Data for this study were collected from patients who received home-based palliative care from the agency. Although the program has enrolled close to 500 patients from 2016 to 2019, the analytic sample for this study was restricted to patients enrolled between 2018 – 2019 who completed both baseline and follow-up assessments for three measures: Rapid Geriatric Assessment, Integrated Palliative Care Outcome Scale-Patient Version (IPOS), and Brief Illness Perception Questionnaire (BIPQ; N=96, capturing 33.8% of eligible patients). Paired sample t-tests were used to compare the symptoms and health outcomes between baseline and follow-up assessments. Average age of the participants were 79.9 years. Results from the RGA measure showed that patients' scores on frailty and sarcopenia were significantly lower at follow-up, indicating improvement. Comparison of scores between baseline and follow-up on the IPOS measure showed that patients experienced improvement in the following symptoms: pain, weakness, nausea, poor appetite, constipation, sore/dry mouth, drowsiness, and mobility. Findings suggest that palliative care services can effectively managed the symptoms and health outcomes of homebound chronically ill patients. Other implications include reduced emergency room visits and hospital admissions.

CULTURE DIFFERENCES IN ADVANCE CARE PLANNING AND IMPLICATIONS FOR SOCIAL WORK PRACTICE

Jung-Hwa Ha,¹ Changsook Lee,¹ and Jennifer Yoo,² 1. *Seoul National University, Seoul, Seoul-t'ukpyolsi, Republic of Korea*, 2. *University of Georgia, Atlanta, Georgia, United States*

Advance care planning (ACP) is the process of making plans and decisions regarding end-of-life care (EOLC) in advance while one has the physical and cognitive capacity to do so. However, even if health practitioners recognize the importance of ACP, they may be constrained by social and cultural factors in engaging their clients in ACP. This study examined cultural differences in ACP and various strategies that social workers use to initiate conversations on ACP in a range of settings. Using the case study method, we conducted in-depth interviews with 7 social workers who work in South Korea, 2 Korean-American social workers working in the Korean-American communities in the US, and 3 American social workers serving diverse populations in the US. Their practice sites include: university hospitals, day care centers, a community senior center, a nursing home, and a hospice agency. Social workers in both countries emphasized the

need to build rapport with their clients early on and to empower them to take the lead in their ACP while they were still healthy. In Korean and Korean-American communities, social workers recognized their clients' reluctance to speak about EOLC and highlighted the importance of communicating with their family due to their clients' preference for family-centered decision-making. When doing this, a step-by-step approach in giving relevant information was recommended. We identified relationship-building, empowerment, and culturally sensitive approaches as common strategies in initiating discussions on ACP in both countries.

DEVELOPMENT AND FORMATIVE EVALUATION OF A DEATH EDUCATION PROGRAM FOR COMMUNITY-DWELLING CHINESE OLDER ADULTS

Mandong Liu,¹ and Iris Chi,² 1. *University of Southern California, Hangzhou, China (People's Republic)*, 2. *University of Southern California, University of Southern California, California, United States*

Planning for end-of-life (EOL) care in advance can enhance one's quality of life at EOL. Culturally sensitive educational programs are needed in Chinese populations to enlighten the public and encourage advance planning due to a culture of death-denying and avoidance. This study describes the team's efforts to develop and formatively evaluate a death education program designed for community-dwelling Chinese older adults. The program was designed based on the Knowledge-Attitude-Behavior Model, as a 2-session 3-hour program spreading over two days with 1.5 hours for each day. The content paid attention to discussing the importance of making plans for EOL in Chinese culture and discussing how to have death-related conversations with the family and health care professionals. In 2020, semi-structured interviews were conducted by phone with 12 health care professionals and researchers, and four Chinese older adults in China to obtain their feedback on program content and delivery. The directed content analysis method was used to analyze the data. Although they confirmed multiple challenges in conducting death education in China, such as family avoidance even if an older adult initiates the death-related conversation, health care professionals not feeling comfortable with such discussions, etc., they also felt the urgency and importance of delivering death education among older adults and in society as a whole. Detailed suggestions were categorized into relationship building, program preparation (e.g., setting, materials), multiple ways of recruitment, target population, length, various formats of content delivery, content (e.g., pay attention to spiritual care), and general support from the public.

Session 1075 (Paper)

Health and Long-Term Care

A COMPARATIVE ASSESSMENT OF LONG-TERM CARE FINANCING AND SERVICE DELIVERY MODELS

Larry Polivka,¹ and LuMarie Polivka-West,² 1. *Florida State University, Tallahassee, Florida, United States*, 2. *Florida State University, Florida State University, Florida, United States*

The face of public long term care (LTC) funded largely through the Medicaid program is changing rapidly in the U.S. Over the last decade, most states have moved to managed LTC programs in various forms, with a growing number transferring all their programs, home and community based (HCBS) and nursing home services, to a Medicaid (MLTC) model. The amount of rigorously conducted and reported evaluation results on these programs are still very limited. Enough information is available, however, from other sources for at least preliminary comparison of relative cost-effectiveness of MLTC vs. traditional, non-profit models of public LTC services delivery and financing, as discussed in this paper. This comparison will show that, at this point, the MLTC programs are not more cost-effective than the traditional model of LTC administration. In fact, these initial assessments seem to indicate that the traditional model may be superior to the corporate for-profit MLTC model.

ARE NURSING HOME PREFERRED NETWORKS GOOD FOR PATIENTS' OUTCOMES? EVIDENCE FROM THE VETERANS HEALTH ADMINISTRATION

Portia Cornell,¹ Emily Corneau,¹ Kate Magid,² Patience Moyo,³ James Rudolph,³ Cari Levy,² and Vincent Mor,⁴ 1. *Providence VA Medical Center, Providence, Rhode Island, United States*, 2. *Rocky Mountain VA Medical Center, Aurora, Colorado, United States*, 3. *Brown University School of Public Health, Providence, Rhode Island, United States*, 4. *Brown University, Providence, Rhode Island, United States*

In the Veterans' Administration (VA), medical centers contract with community nursing homes to provide care to Veterans. As a purchaser, the VA could pursue a strategy of selecting a high-quality network; alternatively, it could focus resources on oversight by its nursing-home coordinators. The question of whether narrow networks are good for Veterans' outcomes, conditional on quality, therefore, needs empirical investigation. We examined the effect of network concentration on hospital admissions, conditional on Veterans' clinical acuity. We operationalized network concentration as the number of Veterans already in residence at the time of admission, and controlled for publicly reported quality measure (star rating). We identified 93,805 VA-paid admissions to nursing homes between 2013 to 2016. To address selection bias, we estimated effects using a distance-based instrumental variable (IV) for each measure, with the log of distance to the nearest nursing home with a specified number of Veterans at the facility in the previous month (1-4, 5-9, and 10-13, and 14+ Veterans). Going to a facility with 10-13 or 14+ Veterans had a higher hospitalization probability (6.2 and 3.3 percentage points higher, respectively), than going to a facility with 1-4 Veterans. If quality rating improves outcomes, then broader networks are beneficial if consumers (Veterans) choose based on quality, given a broader choice set. Conditional on quality, concentrated networks do not seem to lead to fewer hospital admissions. Our results suggest that the VA could do more in its oversight role to work with these nursing homes to decrease hospital admissions.

EXPLORING THE ROLE OF CONTEXTUAL FACTORS IN MEDICAID NURSING HOMES' PERFORMANCE: A QUALITATIVE PERSPECTIVE

Justin Lord,¹ Midge Ray,² Amy Landry,² Heather Lee,³ Nataliya Ivankova,² Ivan Herbey,³ and Robert Weech-Maldonado,² 1. *Louisiana State University at Shreveport, Bossier City, Louisiana, United States*, 2. *University of Alabama at Birmingham, Birmingham, Alabama, United States*, 3. *UAB, Birmingham, Alabama, United States*

This study explored the role of tested contextual factors (structural, market, and management) in high Medicaid (under resourced) nursing homes performance. Four nursing homes in geographically diverse states were purposefully selected for site visits based on high and low performance (quality/profitability) indicators. Eight nursing home administrators and directors of nursing, and twenty-one nursing staff (RNs, LPNs, and CNAs) and providers of support services were interviewed. Data were analyzed using an inductive thematic approach with NVivo 12 Plus. Within and across case analysis was used to compare participants' perspectives across nursing homes and across administrators and staff. Several themes provide insight into varied influences of contextual factors on these nursing homes' performance: focus on quality care, team-based approach, community support and engagement, and staffing retention. Providing quality care to residents was strategic priority in all facilities, which was enhanced by an adopted team-based leadership approach, open-door policy and home-like atmosphere. Community reputation and availability of local training opportunities for CNAs affected nursing staffing which some facilities addressed using creative retention strategies. These research findings will facilitate interventions, such as leadership training and organizational development activities, aimed at improving the performance of low performing facilities in terms of lower costs and better quality.

HOME HEALTH AGENCY OWNERSHIP AND QUALITY OF CARE OUTCOMES AMONG MEDICARE BENEFICIARIES

Rashmita Basu,¹ Huabin Luo,¹ and Bei Wu,² 1. *East Carolina University, Greenville, North Carolina, United States*, 2. *New York University, New York, New York, United States*

Medicare restructured home healthcare reimbursement from a cost-basis to a 60-day risk-based prospective payment system (PPS) in 2000 to implement the value-based payment model for home healthcare services. Currently home healthcare market in the U.S. is dominated by the presence of for-profit (FP) agencies instead of being primarily served by not-for-profit (NFP) agencies. Using data from the 2016-2018 OASIS for beneficiaries participated in the Medicare Current Beneficiary Survey (MCBS) (N=6,115), the current study examines whether home health agency ownership status is associated with length of stay (LOS) and discharge outcome Medicare home health care patients. Our first outcome variable is discharge status (modeled via ordered probit) with three categories: discharge to the community, inpatient hospital and other long-term care facilities. The second outcome variable is LOS and two dummy variables

LOS \leq 30 days and LOS \geq 99 days were modeled via binary probit. The key independent variable was the ownership status of the agency (FP vs. NFP). Patient level covariates includes demographics (age, gender, race/ethnicity, marital status), comorbidity index, agency characteristics (metropolitan statistical area, hospital-based). Patients in FP agencies were 5.1% ($p < 0.01$) less likely to discharge to community, 15.3% ($p < 0.001$) less likely to have LOS \leq 30 days but 7.5% ($p < 0.001$) more likely to have LOS \geq 99 higher compared to patients from NFP agencies under the PPS. Our results have important implications for clinicians, patients and healthcare professionals to be cognizant about the influence of agency ownership on the delivery of healthcare services in home healthcare sector.

QUALITY IMPROVEMENT EFFORTS IN VA COMMUNITY LIVING CENTERS INCREASED FOLLOWING PUBLIC REPORTING OF PERFORMANCE

Heather Davila,¹ Whitney Mills,² Valerie Clark,³ Christine Hartmann,⁴ David Mohr,⁵ Dan Berlowitz,⁶ Amy Baughman,⁷ and Camilla Pimentel,³ 1. *Iowa City VA Healthcare System; University of Iowa Carver College of Medicine, Iowa City, Iowa, United States*, 2. *Providence VA Medical Center, Providence VAMC/Brown University, Rhode Island, United States*, 3. *VA Bedford Healthcare System, Bedford, Massachusetts, United States*, 4. *VA Bedford Healthcare System, VA Bedford Healthcare System, Massachusetts, United States*, 5. *VA Boston Healthcare System, Boston, Massachusetts, United States*, 6. *UMass-Lowell, UMass-Lowell, Massachusetts, United States*, 7. *Massachusetts General Hospital, Massachusetts General Hospital/Boston, Massachusetts, United States*

In 2018, the US Department of Veterans Affairs (VA) began publicly reporting performance ratings for its 134 Community Living Centers (CLCs; nursing homes) based on health inspections, staffing, and clinical quality measures. CLCs operate within a large, integrated healthcare system with unique financial and market incentives. Although public reporting has led to quality improvements in non-VA nursing homes, we do not know whether CLCs respond to public reporting differently than private sector nursing homes. To address this knowledge gap, we used a comparative case study approach involving 3 purposively selected CLCs with varied (low, medium, high) performance ratings. We conducted semi-structured interviews with personnel ($n=12$) responsible for quality measurement and improvement. Interviews focused on opinions of public reporting, actions taken to improve performance ratings, and motivations for change. Participants indicated public reporting improved transparency and provided an “outside perspective” on their performance. Strategies to improve performance ratings involved 1) data/information, 2) individual roles, and 3) teamwork/communication. All 3 CLCs made changes in these areas, yet respondents in the higher performing CLCs described implementing more strategies immediately after learning their ratings. Respondents in all 3 CLCs described being motivated to deliver good care and achieve public ratings that reflected the care they provided. This meant addressing internal weaknesses that contributed to lower scores for 2 CLCs. Our findings suggest public reporting may improve internal data collection, reporting, and quality improvement

efforts in CLCs. They highlight the potential positive impact of public reporting in prompting quality improvement in nursing homes.

Session 1080 (Paper)

Information Technologies and COVID-19

COVID-19 AND BRAIN HEALTH: GLOBAL COUNCIL ON BRAIN HEALTH RECOMMENDATIONS

Sarah Lock, and Lindsay Chura, *AARP, Washington, District of Columbia, United States*

With growing evidence that the coronavirus directly harms the brain and indirectly harms mental well-being due to social isolation and new, increased stressors, the GCBH recognized the urgent need to inform adults age 50+ about ways to their protect brain health as the pandemic continues. In our latest report, the GCBH describes the known neurological symptoms occurring in the short and long term for adults, providing 10 recommendations to protect brain health and urging research in 11 different areas. Calling for an all-of-society approach to protect the brain health of everyone, the GCBH described the negative effects of COVID-19 on people living with Alzheimer’s disease and other dementias and to the impact of health care inequalities. For example, people with dementia were twice as likely to catch the virus as those without dementia; African Americans with dementia had nearly three times the risk of COVID-19 as Caucasians with dementia. The GCBH also points out that caregivers for those living with dementia have experienced particular stress and provided resources and guidance. The Council spotlights the disproportionate toll of COVID-19 on the vulnerable, including racial and ethnic minorities and those living in low- to middle-income countries. After attending this session, participants will be able to identify the neurological impacts of COVID-19, understand the various ways to mitigate risks to brain health, and learn which areas of research will be critical in the future. These recommendations were developed and put forth by the Global Council on Brain Health Governance Committee and Issue Experts.

EVERYDAY LIFE EXPERIENCES OF SWEDES AGE 70+ DURING THE COVID-19 PANDEMIC

Torbjorn Bildtgaard,¹ and Peter Öberg,² 1. *Stockholms University, Stockholm, Stockholms Lan, Sweden*, 2. *University of Gävle, Gävle, Gavleborgs Lan, Sweden*

As many other countries Sweden has been hit hard by the Corona pandemic, with high numbers of dead in the older population. Since march 16, 2020, the authorities have encouraged people 70+ to voluntarily quarantine and avoid contacts outside the household. How has this affected older people’s everyday lives? This study reports on results from a web-survey on the everyday life experiences of Swedes 70+ carried out between May 28 and July 13, 2020 ($n=1926$). The presentation focuses answers to an open-ended question: “Describe with your own words how your life has been affected by the Corona pandemic”. A qualitative content analysis was used to investigate changes in the everyday lives of the respondents and their appreciations of these

changes. Results show that older Swedes have mostly adhered to public recommendations of self-isolation and withdrawn from social and family contacts, as well as paid and volunteer work. The vast majority (76%) of the respondents describe what they see as negative life changes, such as loss of structure in their everyday life, loss of contact with children/grandchildren and friends, loss of meaningful activities, loss of abilities due to forced unemployment and experiences of ageism. Experiences of loneliness, depression and drop in quality of life are common. Some positive changes were reported. We argue that the experience of the 70+ population during Corona needs to be understood in relation to the promise of the third age, where everyday restrictions are experienced as a forced disengagement into a fourth age life style.

INFORMATION SEEKING DURING THE PANDEMIC: THE ROLE OF AGE, AGENCY, AND FAKE NEWS CONCERNS

Ann Pearman,¹ MacKenzie Hughes,² and Clara Coblenz,²
 1. *MetroHealth Medical Center, Cleveland, Ohio, United States*, 2. *Georgia Institute of Technology, Atlanta, Georgia, United States*

COVID-19 brought rapid changes to the way in which people understand and process news, including both information and misinformation about the pandemic. This cross-sectional study was designed to examine persons' experiences during the earliest months of the pandemic. The sample included 871 adults ages 20-79 (M=38.27 years, SD=11.40). Online surveys were collected between March and May, 2020 using Amazon Mechanical Turk. Participants completed a series of questionnaires, including a measure of agency from the Midlife Development Inventory, a questionnaire that assessed level of skepticism about the COVID-19 pandemic (i.e. fake news beliefs), a depression scale, a question about their level of anxiety about developing COVID-19, and questions about the frequency in which they sought information about the pandemic from different sources (e.g., TV, social media). A multiple regression using information seeking frequency as the outcome variable revealed several significant relationships. Specifically, younger adults, people with higher agency, and people with higher fake news beliefs all reported higher levels of COVID-19-related information seeking. In addition, there was a significant 3-way interaction between age, agency, and fake news beliefs. Disentangling this interaction revealed that older adults with low agency were least likely to engage in information seeking. There were, however, no age differences in information seeking in participants with high agency and fake news beliefs, but large age differences in participants with low agency but high fake news beliefs. Findings suggest agency is an important predictor of information seeking behavior, particularly for older adults with high levels of skepticism about the pandemic.

MOVING ONLINE: EVIDENCE-BASED PROGRAMMING DURING COVID

Susan Hughes,¹ Andrew DeMott,² Gerald Stapleton,¹ and Gail Huber,³
 1. *University of Illinois at Chicago, Chicago, Illinois, United States*, 2. *UIC, Chicago, Illinois, United States*, 3. *Northwestern University, Chicago, Illinois, United States*

The COVID pandemic disrupted the way evidence-based health promotion programs (EBPs) are delivered to older adults who were the most at-risk group in terms of mortality and faced unprecedented threats to their independence and physical and mental health. Many organizations stopped in-person EBPs causing older adults to lose access to key social networks and health resources. It is a top public health priority to find new ways to keep older adults connected to their EBPs. Fit & Strong! (F&S!) is a group exercise/health education EBP for older adults with arthritis offered by CBOs in 32 states. CBOs stopped offering F&S! in-person in March 2020. Since the lockdown, we have worked closely with our provider network to develop and pilot a version that is remote/online and live, titled "F&S! @Home". Instructors deliver F&S! @Home to older adults with minimal technological resources. We created a staging website for both providers/instructors and participants that is used to initiate the classes, enable providers to manage participants, collect data, and share support materials. The pilot began September 2020; since that time 15 classes have been offered to 147 participants. Administration on Community Living falls and arthritis outcomes data are being collected. Preliminary analyses of 45 participants and 8 instructors demonstrate a high rating of the program (mean score of 90.2 out of 100) with no adverse outcomes to date. This presentation will review the process of creating the online adaptation, lessons learned, and will review pre/post outcomes and participant and instructor evaluation feedback.

STRATEGIES OLDER ADULTS USED DURING COVID-19 TO STAY CONNECTED

Brad Doebbeling,¹ Haley Harrelson,² Michelle Houchins,² Hallie Wine,² Claire Pishko,² Cheryl Der Ananian,² Allie Peckham,³ and M. Aaron Guest,²
 1. *College of Health Solutions, Arizona State University, Phoenix, Arizona, United States*, 2. *Arizona State University, Phoenix, Arizona, United States*, 3. *Arizona State University, Phoenix, Arizona, United States*

An unintended consequence of the physical distancing guidelines to prevent the spread of COVID-19 may be increased feelings of social isolation and loneliness in older adults. Purpose: The purpose of this study was to identify successful strategies used in avoiding social isolation and feelings of loneliness in older adults (50+) during the pandemic. Methods: Older adults (n=22) selected from a longitudinal study, *Aging In the Time of COVID-19*, who did not report loneliness, participated in a semi-structured interview via zoom. Individuals were asked a series of questions about how their lives were impacted by the pandemic and what they did to avoid social isolation and loneliness. Each interview was recorded and transcribed verbatim. transcripts were analyzed and categorized to identify common strategies. Results: Participants were primarily female and white (100%) with a mean age of 64.7 years. Preliminary findings (n=5) suggest older adults developed several effective strategies for combating social isolation and feelings of loneliness, including purposely reaching out and "checking in" on others; engaging in exercise, either alone or with others, and engaging in outdoor activities, such as socially distanced in-person encounters. Other effective strategies included virtual events (e.g. community or local events, museums or concerts, etc.), using

technology to communicate with friends and family, and practicing gratitude consistently. Conclusions: Although older adults have been encouraged to stay at home and physically distanced throughout the pandemic, they have found ways to remain socially connected with friends, family, and community, despite not being physically together.

Session 1085 (Symposium)

INJUSTICE SQUARED? AN INTERSECTIONAL LENS TO RESEARCH ON PRODUCTIVE ENGAGEMENT IN LATER LIFE

Chair: Christina Matz

Co-Chair: Cal Halvorsen

Discussant: Christina Matz

Social inequalities over the life course shape later life opportunities and outcomes in important ways. However, research on paid and unpaid work in later life has not always captured (and has sometimes mischaracterized) the variety and complexity of lived experiences in later life—in particular for low-income workers, workers of color, women, and others marginalized due to their social position. Further, statistics often obscure the most important information: how the most marginalized older workers are faring. Intersectionality, a term coined by legal scholar, Dr. Kimberlé Crenshaw, describes the overlapping and intersecting social identities that often influence how we move around in society. Some identities garner privilege and power and others oppression and marginalization; we must look at their intersection to better understand complexity and inform solutions. This symposium will apply an intersectional lens to research on paid and unpaid work in later life. The first paper is a scoping review that assesses the extent to which race and ethnicity are investigated in studies of the longitudinal association between workplace demands and cognitive health. The second paper explores how older Black and Hispanic adults' work engagement is impacted by COVID-19. The third paper considers gender differences in volunteer engagement among Asian-American older adults. The final paper examines the Senior Community Service Employment Program's role in participant financial, physical, and mental well-being. A discussant will reflect on these studies and the need for continued research that considers intersectionality in opportunities and experiences for paid and unpaid work in later life.

WORKPLACE DEMANDS AND COGNITIVE HEALTH INEQUITIES ACROSS RACE AND ETHNICITY: A SCOPING REVIEW

Ernest Gonzales,¹ Rachel Krutchen,¹ Cliff Whetung,² and Jane Lee,³ 1. *New York University, New York, New York, United States*, 2. *NYU, New York, New York, United States*, 3. *University of Hawai'i, Myron B. Thompson School of Social Work, Honolulu, Hawaii, United States*

This PRISMA informed scoping review sought to understand the longitudinal association between workplace demands with cognitive health; and to review how race and ethnicity are investigated in this area of research and evidence of moderating effects. Peer-reviewed articles were drawn from five databases. Inclusion criteria were populations aged 18+, broad conceptualization of workplace demands (e.g., occupational complexity, mental work

demands), and cognitive health outcomes (e.g., cognitive functioning, ADRD). The majority of studies drew from theories that did not interrogate heterogeneity and diverse aging experiences. Consequently, the majority of studies (85%) did not investigate inequities by race and ethnicity although variables and methods are available. Cognitive health inequities are evidenced but findings are mixed and more rigorous causal research is needed. We discuss integrating emerging critical theories (e.g. Critical Race Theory, critical gerontology, minority stress) to sharpen the focus on racial health inequities in an emerging area of prevention research.

THE EFFECTS OF THE COVID-19 PANDEMIC ON THE WORK AND FINANCIAL OUTCOMES OF OLDER BLACK AND HISPANIC ADULTS

Kendra Jason,¹ Dawn Carr,² and Zhao Chen,³ 1. *UNC Charlotte, Charlotte, North Carolina, United States*, 2. *Florida State University, Tallahassee, Florida, United States*, 3. *The University of Arizona, Tucson, Arizona, United States*

This study investigates how older Black and Hispanic adults' work engagement is impacted by the effects of COVID-19. Using intersectionality and cumulative (dis)advantage as complementing theoretical frameworks, data from the Health and Retirement Study, and series of logistic regression models, we measure work engagement changes pre- and post- COVID-19. Preliminary findings suggest that net of other controls, there were no substantial or significant reductions in resilience as the result of COVID-19 itself for any racial/ethnic group. White older adults, and to some degree Hispanics older adults, experienced erosion in resilience related to financial hardships, but the resilience of Black older adults remained stable in the face of increased hardship. Future work in this area will improve our limited understanding of older Black and Hispanic adults' experiences of managing and coping with COVID-19-related work and financial risks—information that will be critical for planning intervention and support services.

EXPLORING GENDER DIFFERENCES IN VOLUNTEER BEHAVIOR AMONG OLDER ASIAN AMERICANS

Patrick Ho Lam Lai,¹ Christina Matz,² and Cal Halvorsen,² 1. *Boston College School of Social Work, Chestnut Hill, Massachusetts, United States*, 2. *Boston College, Chestnut Hill, Massachusetts, United States*

Prior research has documented the health and well-being effects of volunteerism in later life, and that positive outcomes increase in the first 100 volunteer hours/year and slightly increase between 100-200 hours. Given this, it seems that using an intersectional lens to explore disparities in volunteer behaviors and what might explain them is important from a health equity standpoint. Using data from 268,194 individuals aged 65-85 from the most recently available Volunteer Supplement of the Current Population Survey, this study found that White older adults were most likely to spend any time in volunteer activities, while Asian and Hispanic older adults were least, across all racial/ethnic groups. Further, the percentage of older Asian women volunteering in the 100-200 hour range (27%) was significantly higher than that of older Asian men (19%). Social and cultural factors that may explain these racial/gender differences and implications for recruiting older adults as volunteers are discussed.

A COMMUNITY-BASED SYSTEM DYNAMICS STUDY OF THE SENIOR COMMUNITY SERVICE EMPLOYMENT PROGRAM

Cal Halvorsen, Kelsey Werner, and Elizabeth McColloch, *Boston College, Chestnut Hill, Massachusetts, United States*

The Senior Community Service Employment Program (SCSEP), the only federal workforce-training program that targets older adults, engages people aged 55 years and older with incomes at or below 125% of the federal poverty level with multiple barriers to employment. This study examined SCSEP's role in participant financial, physical, and mental well-being. To do so, we held five sessions (four virtual, one telephone) over a combined nine hours in August and September 2020 using a form of participatory research called community-based system dynamics with 15 Massachusetts SCSEP participants and case managers. Through structured activities, respondents identified how program, policy, and organizational factors influence and are influenced by participant well-being (e.g., SCSEP participation results in less social isolation, decreased isolation subsequently increases desire to participate) as well as program and policy recommendations to strengthen the program (e.g., reconsider benchmarks of success). These findings highlight the benefits and potential of this long-running program.

Session 1090 (Symposium)

METHODOLOGICAL APPROACHES TO TRANSFORM, DEVELOP, AND EVALUATE CANCER CARE INTERVENTIONS

Chair: Sean Halpin

Cancer diagnoses in older adults are often abrupt and unexpected, requiring patients to make quick therapy choices. Further, reflecting on traumatic therapy is often difficult. In our symposium, we bring together researchers from varied disciplines to report on patients' cancer therapy choices. Carrion will discuss her mixed-methods approach to older Latino adults' cancer therapy preferences. Next, Blackberry will present how patient-derived photographs (photovoice) can improve supportive care for older Australians in facilitating empowerment, patient-centered care, and shared decision making. Halpin, who will apply conversation analysis to examine how multiple myeloma patients interacted with supplemental material during in-person nurse-led education. Last, Seaman will use his work with head and neck cancer survivors to illustrate the conceptual and methodological challenges of investigating those who discontinue care. Understanding how patients from diverse populaces with various cancer diagnoses navigate their therapy may help inform future cancer-related health services' approaches.

A MIXED-METHODS APPROACH TO THE EXAMINATION OF CANCER TREATMENT PREFERENCES AMONG OLDER LATINO ADULTS

Iraida Carrion,¹ Malinee Neelamegam,² and Tania Estape,³
 1. *University of South Florida, Tampa, Florida, United States*, 2. *Department of Epidemiology of Microbial Diseases Yale School of Public Health, New Haven, Connecticut, United States*, 3. *FEFOC, Fundacion Contra El Cáncer, Barcelona, Catalonia, Spain*

Given the growing population of Latino immigrants 60 years and older and the current lack of relevant data, there is an urgent need to understand this population's cancer treatment preferences to ensure effective interventions and psychosocial care. A study comprising 200 surveys with areas focused on cancer knowledge, attitudes, prevention, early diagnosis, and treatment was developed and administered in Spanish. The survey included a qualitative component consisting of open-ended questions. The mixed-method study gathered quantitative data regarding treatment preferences as well as the voices of older Latino men and women with a history of cancer, including their cancer treatment trajectory. Additionally, the survey data highlighted the lack of knowledge regarding available cancer treatments. The findings suggest that, while older Latino/as have knowledge about the causes of cancer, they lack knowledge regarding cancer diagnoses, which could potentially cause them to avoid treatment.

WHAT HAPPENS NEXT? CONDUCTING RESEARCH WITH CANCER SURVIVORS WHO DISCONTINUE THEIR POST-TREATMENT CARE

Aaron Seaman, and Nitin Pagedar, *University of Iowa, Iowa City, Iowa, United States*

Due to improvements in screening, diagnosis, and treatment, more cancer patients are surviving and living longer. For them, survivorship care provides critical support: surveillance and screening for recurrence and new cancers; physical and psychological symptom management; social and financial management support; management of other chronic conditions; and preventive health and health promotion support. Yet, our pilot data indicates that a substantial number of survivors discontinue their survivorship care with the treating oncology team, a team that often provides critical multidisciplinary support and expertise. While it is important to understand the experiences, outcomes, and needs of these survivors, they can be challenging to engage in research. In this presentation, we will discuss survivors who discontinue, why they might do so, and methods for engaging them in research, drawing upon our work with head and neck cancer survivors.

USING CONVERSATION ANALYSIS TO EXAMINE WHEN EDUCATIONAL VIDEOS ARE INTRODUCED IN PATIENT EDUCATION

Sean Halpin,¹ Michael Konomos,² and Kathryn Roulston,³
 1. *University of Georgia, Decatur, Georgia, United States*,
 2. *Emory University, Atlanta, Georgia, United States*,
 3. *University of Georgia, University of Georgia, Georgia, United States*

As the seas of advanced therapies have swelled in the last few decades, multiple myeloma patients have been empowered, encouraged, and sometimes required, to engage in their care. We applied a conversation analysis approach to 12 nurse-led education visits (1011 minutes of audio) containing reference to educational videos. We indexed extracts based on whether the nurse or patient first mention the video. Patients oriented toward the video to demonstrate knowledge (n=15; 88%) and clarify information (n=2; 12%). Nurses oriented toward the video either through positive (n=14; 39%), negative (n=13= 36%), or

neutral (n=9; 25%) assessments. Videos created opportunities for patients to pursue their topics of interest during in-person visits. Also, nurses often oriented toward the videos pre-emptively to achieve their teaching goals either by acknowledging the patients' exposure to upcoming information or by positively or negatively assessing the videos in ways that enable them to re-orient talk to educational scripts.

GERIATRIC ONCOLOGY IN THE INSTAGRAM ERA: PHOTOVOICE TO ENABLE PATIENT-CENTERED CARE AND SHARED DECISION MAKING

Irene Blackberry,¹ Christopher Steer,² Tshepo Rasekaba,¹ Kim Young,¹ Nicole Webb,² Darren Jayasuriya,³ Kylie Owen,¹ and Mira Kapur,³ 1. *La Trobe University, Wodonga, Victoria, Australia*, 2. *Border Medical Oncology and Haematology, Albury, New South Wales, Australia*, 3. *UNSW, albury, New South Wales, Australia*

Evidence shows that multidimensional assessment of older adults with cancer yields more holistic care and results in better communication about age-related concerns; as well as enables personalised, patient-centered supportive care. Geriatric assessment (GA) captures clinical, physical and psychological factors, with limited opportunity to gather information about the patient's environment, personal contexts and priorities. We trialed the feasibility and acceptability of geriatric assessment (GA)-guided enhanced supportive care (ESC) among 20 adults aged over 70 years in a regional cancer center. We then studied the impact of the integration of four patient-derived photographs (with PhotoVoice analysis) to this ESC on patient satisfaction with communication with the oncologist regarding age-related concerns and on facilitating empowerment, patient-centered care and shared decision making. The use of PhotoVoice analysis of patient-derived photographs is a novel strategy that can facilitate gathering patient-centered information during the assessment process.

Session 1095 (Paper)

Mobility I

FACTORS ASSOCIATED WITH OLDER ADULTS' IN-HOSPITAL MOBILITY: A COMPARISON BETWEEN ISRAEL AND DENMARK

Anna Zisberg,¹ Janne Petersen,² Ove Andersen,³ Efrat Shadmi,⁴ Ksenya Shulyaev,⁵ Efrat Gil,⁶ Maayan Agmon,⁷ and Mette Merete Pedersen,⁸ 1. *University of Haifa, Haifa, HaZafon, Israel*, 2. *Copenhagen University Hospital Frederiksberg, Frederiksberg, Hovedstaden, Denmark*, 3. *Copenhagen University Hospital Hvidovre, Hvidovre, Hovedstaden, Denmark*, 4. *University of Haifa, Mount Carmel, Israel, Haifa, Hefa, Israel*, 5. *Faculty of Social Welfare and Health Science, University of Haifa, Haifa, Hefa, Israel*, 6. *Clalit health services, Haifa and West Galilee, Israel, Haifa, HaZafon, Israel*, 7. *The Cheryl Spencer Department of Nursing, University of Haifa, Israel, Haifa, HaZafon, Israel*, 8. *Copenhagen University Hospital, Amager and Hvidovre, Hvidovre, Hovedstaden, Denmark*

Low levels of in-hospital mobility and excessive bed rest are widely described across the globe as a major risk factor for hospital associated disabilities. Different predictors of in-hospital and post-discharge mobility limitations have been proposed across studies, including age, admission diagnosis, physical performance, cognitive impairment, performance of activities of daily living, and length of stay. However, it is unknown whether similar risk factors across countries are associated with in-hospital mobility given different mobility measurement methods, variations in measurement of predictors and differences in populations studied. In the current study, we investigated the relationship between in-hospital mobility and a set of similar risk factors in functionally independent older adults (65+) hospitalized in acute care settings in Israel (N=206) and Denmark (N=113). In Israel, mobility was measured via ActiGraph and in Denmark by ActivPal for up to seven hospital days. Parallel analysis of covariance (ANCOVA) in each sample showed that community-mobility before hospitalization, mobility performance at admission and length of stay were associated with in-hospital mobility in both countries, whereas age and self-reported health status were associated with mobility only in Denmark. This comparison indicates that despite slightly different measurement approaches, similar risks are attributed to older adults' low in-hospital mobility and emphasizes the contribution of commonly used pre-hospitalization mobility measures as strong and consistent risk factors. This knowledge can support a better understanding of the need of both standard risk assessments and country-based tailored approaches.

MACHINE LEARNING PREDICTION MODELS FOR MOBILITY LIMITATION OVER TIME IN OLDER ADULTS: THE HEALTH ABC STUDY

Jaime Speiser,¹ Kathryn Callahan,¹ Edward Ip,¹ Michael Miller,² Janet Tooze,¹ Stephen Krtichevsky,³ and Denise Houston,¹ 1. *Wake Forest School of Medicine, Winston-Salem, North Carolina, United States*, 2. *Wake Forest School of Medicine, Winston Salem, North Carolina, United States*, 3. *Wake Forest School of Medicine, Wake Forest School of Medicine, North Carolina, United States*

Mobility limitation in older adults is common and associated with poor health outcomes and loss of independence. Identification of at-risk individuals remains challenging because of time-consuming clinical assessments and limitations of statistical models for dynamic outcomes over time. Therefore, we aimed to develop machine learning models for predicting mobility limitation in older adults using repeated measures and variable selection. We used nine years of follow-up data from the Health, Aging, and Body Composition study to model mobility limitation, defined as self-report of any difficulty walking ¼ mile or up a flight of stairs, assessed annually. We considered 46 predictors for modeling, including demographic, lifestyle, chronic condition and physical function variables. We developed three models with Binary Mixed Model Forest, using: 1) all 46 predictors, 2) an automated variable selection algorithm, and 3) the top five most important predictors. Area under the receiver operating curve ranged from 0.78 to 0.84 for the models for two validation datasets (with and without previous annual visit data for participants). Across the three models, the most important predictors of mobility limitation

were ease of getting up from chair, gait speed, self-reported health status, body mass index and depression. Longitudinal, machine learning models predicting mobility limitation had good performance for identifying at-risk older adults based on current and previous annual visit data. Future studies should evaluate the utility and efficiency of the prediction models as a tool in a clinical setting for identifying at-risk older adults who may benefit from interventions aimed to prevent mobility limitation.

PHYSICAL AND COGNITIVE CORRELATES OF GPS-DERIVED LIFE-SPACE CHARACTERISTICS IN OLDER ADULTS

Kyle Moored,¹ Breanna Crane,² Michelle Carlson,³ and Andrea Rosso,¹ 1. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 3. *Johns Hopkins University, Baltimore, Maryland, United States*

Life-space mobility, movement within one's living environment, is important for functional independence in later life. It is unclear which life-space characteristics (i.e., space, duration, shape) are most affected by physical and cognitive limitations. GPS-derived measures mitigate recall bias and offer novel ways to characterize life-space. We examined associations between physical and cognitive performance and GPS-derived life-space characteristics. Participants were 164 community-dwelling adults (Age: $M=77.3\pm 6.5$) from baseline data of a clinical trial to improve walking in older adults. Participants carried a portable GPS for 7 days, which passively collected real-time location. Standard deviational ellipses (SDEs) and minimum convex polygons (MCPs) were derived for each day. Area and compactness of these measures quantified activity space and shape, respectively. For each measure, 7-day medians and median absolute deviations (MAD) were computed to capture both central tendency and variability of weekly activity. Activity duration was quantified as percentage of time outside home. Adjusting for age and sex, percent time outside home was associated with lower mobility performance (i.e., 6-minute walk (6MWT), figure 8 walk, $\rho's=-.17-.18$, $p's<.05$) and executive functioning (i.e., Trail Making Test, Part A: $\rho=.16$, $p=.04$, Part B: $\rho=.19$, $p=.01$). Median MCP and SDE areas, but not compactness, were associated with 6MWT performance ($\rho's=.18-.20$, $p's<.05$). MCP area MAD was associated with greater global cognition (3MSE, $\rho=.15$, $p=.05$). Life-space characteristics were differentially associated with performance measures, suggesting physical and cognitive limitations may constrain life-space mobility via different mechanisms. Variation in these associations by neighborhood walkability and active versus passive travel will also be examined.

Session 1100 (Symposium)

MOBILITY, PHYSICAL ACTIVITY, AND SOCIAL ENGAGEMENT OF COMMUNITY-LIVING OLDER ADULTS

Chair: Wenjun Li

Discussant: Lien Quach

Mobility, physical activity and social engagement are important to healthy aging and independent living among older adults. This symposium includes four related studies

on these issues. Dr. Lien Quach and her team examined racial and ethnic disparities in social engagement among community-living older adults using data from the national Health and Retirement Study. The analysis found that Asians and Hispanics had significantly lower social engagement score compared with non-Hispanic Whites, advocating for further investigations of the causes of racial disparities in social engagement. Dr. Su-I Hou's study examined the impact of physical activity and social relationship on social engagement. The study found positive impacts of more physical activity, better social relationships and volunteers on social engagement. The results have important implications to promotion of social engagement among older adults participating in aging-in-community programs. Dr. Ladda Thiamwong's study demonstrated the benefits of using assistive health technology (AHT) to assess the relationships between fall risks, body compositions and objectively measured physical activity in older adults. Dr. Thiamwong will discuss the research protocol and preliminary results. Dr. Li's Health Aging and Neighborhood Study examined variations of older adults' driving behaviors by sex, age, race, income, health status and housing density of the neighborhoods. The study found substantial differences in mobility and driving patterns by both personal characteristics and neighborhood living environment. The findings have important implications to community programs that support older adults aging in place.

DRIVING HABITS OF OLDER ADULTS IN MASSACHUSETTS: VARIATIONS BY SEX, AGE, RACE, INCOME, HOUSING DENSITY, AND HEALTH

Wenjun Li, Elizabeth Procter Gray, Kevin Kane, Jie Cheng, and Anthony Clarke, *University of Massachusetts Lowell, Lowell, Massachusetts, United States*

Maintaining ability to drive is critical to independent living among older adults residing in suburban and rural communities. We administered structured questionnaire about driving behaviors to 370 persons age 65 and older living in Central Massachusetts between 2018 and 2020. Of them, 307 were active drivers. Driving in the past year was strongly associated with being male, White race, higher income, non-urban resident, and good-to-excellent health. Advancing age was associated with lower frequency of driving, less miles driven, lower percentage of the day spent in transportation. Men and women drove with nearly equal frequency (~26 days/month), but men drove significantly more miles. Non-White drivers were significantly more likely to avoid driving out of town or in difficult conditions, even after controlling for age, sex, income, and density of residential area. In conclusion, driving behaviors differed significantly by age, sex, income, race, and housing density. Further investigation is warranted.

RACE, ETHNICITY, AND SOCIAL ENGAGEMENT AMONG COMMUNITY-DWELLING OLDER ADULTS: THE HEALTH AND RETIREMENT STUDY

Lien Quach, *University of Massachusetts Boston, Newton, Massachusetts, United States*

Social engagement is crucial for older adults. This study examines the relationship between race, ethnicity, and social engagement among community-dwelling older adults using data came from the Health and Retirement Study

(2014) (n=6221). Race and ethnic status were categorized as: non-Hispanic white (NHW), non-Hispanic black (NHB), non-Hispanic "Asians and other race" (NHA) and Hispanic (any race). Social engagement was based on self-report and included keeping in touch with friends, family and participating in social activities. Covariates included age, sex, education, number of comorbidities, physical function, and alcohol consumptions. The mean age was 74.6, 60% were female. Race and ethnicity distribution were 78.6% NHW, 11.9% NHB, 7.89% Hispanics, and 1.7% NHA. The social engagement (SE) score averaged 3.3. Hispanics, Asians and other races had a lower SE score compared with NHW ($b=-0.29$, $p<.0001$; $b=-0.27$, $p=0.04$). Understanding racial and ethnic disparities in SE can help target appropriate social intervention.

PHYSICAL ACTIVITY AND SOCIAL RELATIONSHIPS ON SOCIAL ENGAGEMENT AMONG COMMUNITY-DWELLING OLDER ADULTS

Su-I Hou, *School of Global Health Management & Informatics, University of Central Florida, University of Central Florida, Florida, United States*

This study examined physical activity (FITNESS) and social relationships (FRIENDS) on social engagement among community older adults. Members from two Florida aging-in-village programs participated. Three five-Likert scales were used: A 5-item FITNESS (weight, endurance, strength, flexibility, health), 4-item FRIEND (family, friends, neighbors, communication), and a 3-item social engagement scales (social-leisure activities, stay involved, healthy independent) (Cronbach alphas: .82-.92). Among the 96 participants, 79% were females, 91% were whites, 56% were married, 86% had college education, and 46% living alone. Mean age was 70.7 (SD=10.10). Participants reported at least 30-min. physical activity about 4.2 days per week. Overall social engagement was high (mean=4.38), FITNESS was median (mean=3.46), and FRINED was high (mean=4.19). FITNESS was significant to more 30-min. physical activity. Yet, higher FITNESS, FRIENDS, age, and volunteers were all significant to social engagement. Results has implications on promoting social engagement among older adults participating in aging-in-community programs.

USING ASSISTIVE HEALTH TECHNOLOGY TO ASSESS FALL RISK APPRAISAL, BODY COMPOSITION, AND PHYSICAL ACTIVITY

Ladda Thiamwong,¹ Joon-Hyuk Park,² Renoa Choudhury,² Oscar Garcia,² Maxine Furtado,² Nicole Stallworth,² and Jeffrey Stout,² 1. *College of Nursing, University of Central Florida, Orlando, Florida, United States*, 2. *University of Central Florida, Orlando, Florida, United States*

One-third of older adults have a discrepancy between perceived and physiological fall risks or maladaptive fall risk appraisal (FRA). Older adults who report high fear of falling and overestimate their physiological fall risk are less likely to participate in physical activity (PA). Limited data suggest the interrelation between fall risk appraisal, body composition, and objective measured PA. This cross-sectional study examines the feasibility of recruitment and acceptability of

Assistive Health Technology (AHT), including the BTrackS Balance System (BBS), Bioelectrical Impedance Analysis (InBody s10), and ActiGraph GT9X Link wireless activity monitor. This study demonstrates the benefits of using AHT to study the associations among FRA, body composition, and PA in older adults. We hypothesize that rational FRA is associated with higher levels of PA and skeletal muscle mass and lower levels of percent of body fat and body mass index. Topics presentation included research protocol and preliminary results.

Session 1105 (Symposium)

NEW ISSUES IN LIFE COURSE RESEARCH: WHICH EARLY-LIFE FACTORS MATTER FOR LATE-LIFE OUTCOMES?

Chair: Jacquie Smith

Discussant: Katrina Walsemann

The increased availability of retrospective information about the lives of participants in population panel studies has expanded the range of precursors to include in life course research. However, this also challenges researchers to select among many potential precursors to a late-life outcome and to determine the relative role of factors from different periods in the life course. Each paper in this symposium uses life course information from the Health and Retirement Study (HRS) to examine different late-life outcomes. Speakers will discuss what guided the particular selection of factors and outcome to examine in their study. Sonnega, Helppie-McFall, and Lee focus on indicators of childhood financial and social adversity as potential predictors of early retirement due to poor health. Park, Larkina, and Smith ask if decisions taken in early adulthood about how to balance work-and family-life by individuals and their partners are related to the categories of important life accomplishments older adults report in their life review. Two papers examine precursors of late-life health outcomes. Williams-Farrelly and Smith identified different profiles of physical activity in early- and mid-adulthood. They discuss associations between these profiles and cognitive aging. Whereas social losses, relocation, and multimorbidity are well-documented precursors of Major Depression in old age, Bergmans and Smith asked if poor health in childhood played a distal role. The session concludes with an integrative discussion of issues by Walsemann.

LIFE COURSE ADVERSITY AND EARLY RETIREMENT DUE TO POOR HEALTH

Amanda Sonnega,¹ Brooke Helppie-McFall,¹ and Haena Lee,² 1. *University of Michigan, Ann Arbor, Michigan, United States*, 2. *University of Southern California, Los Angeles, California, United States*

The relationship between life adversity and physical and mental health is well documented. The present research investigates life course adversity and early retirement due to poor health. Data are from the Health and Retirement Study, including the Life History Mail Survey (LHMS), HRS core surveys, and HRS Psychosocial Leave-Behind

surveys. We create measures of childhood financial and social adversity and young-mid adulthood financial and social adversity. Early retirement is defined as self-report of “full” retirement between age 50 and 62. We use a Cox proportional hazards model competing risk framework comparing early retirement when poor health is a major reason for retirement with early retirement for any other reason. Models include covariates for age, gender, marital status, cohort, log household income, and log household wealth. Childhood financial adversity and homelessness in young-mid adulthood increases the instantaneous hazard of early retirement due to poor health.

PERCEIVED ACCOMPLISHMENT IN LATER LIFE: THE INFLUENCE OF PAST DECISIONS BETWEEN FAMILY AND WORK

Jeongsoo Park,¹ Marina Larkina,² and Jacqui Smith,³

1. *Ajou University, Suwon-si, Kyonggi-do, Republic of Korea*, 2. *University of Michigan, Ann Arbor, Michigan, United States*, 3. *University of Michigan, University of Michigan, Michigan, United States*

Whereas previous studies have investigated life regrets, little attention has been paid to the important accomplishments older adults include in their autobiographic life narratives. Phenomenon such as the memory positivity effect suggest that accomplishments should be observed. We used a Health and Retirement Study 2017 Life History Mail Survey (N = 2,165) to examine the characteristics of participants over age 65 who reported accomplishments (max = 3), what was reported, and whether early-life decisions about balancing family and work are associated with the reports. Women, whites, and people with at least high school education and normal cognitive status were more likely to report accomplishments (67%). We categorized reports as family-related (39%), personal (19%), combined family/personal (25%) or other (16%). Multinomial logistic regression models revealed that participants who themselves favored family over work in early life or whose spouse decided for family, were more likely to report family-related accomplishments.

DO LIFE COURSE PHYSICAL ACTIVITY PROFILES REDUCE THE EFFECTS OF CHILDHOOD EXPOSURES ON COGNITION?

Monica Williams-Farrelly, and Jacqui Smith, *University of Michigan, University of Michigan, Michigan, United States*

Although physical activity throughout life is one of the most reliable predictors of healthy aging, can less consistent or favorable trajectories also improve cognition trajectories among older adults? Drawing from accumulation theories, we use longitudinal data from the Health and Retirement Study and Life History Mail Survey (N=9,309) to examine the early antecedents of cognitive decline and the extent to which different life course physical activity profiles can slow such a decline. Results from latent class analysis reveal seven distinct profiles: consistently low, consistently high, consistently average (reference), improvers, decliners, midlife motivators, and previously athletic “couch potatoes.” Growth curve modeling analyses show that membership in the consistently high class and midlife motivators were associated with better cognition initially and over time, with no difference between the two classes. Additionally, though poor health and learning problems in childhood were associated

with worse initial cognition, physical activity does not mediate the relationship.

ASSOCIATIONS OF MENTAL HEALTH AND CHRONIC PHYSICAL ILLNESS DURING CHILDHOOD WITH MAJOR DEPRESSION IN LATER LIFE

Rachel Bergmans, and Jacqui Smith, *University of Michigan, University of Michigan, Michigan, United States*

While poor health in childhood has implications for mental health years later, less is known regarding its long-term impact. We determined whether childhood chronic physical illness burden was associated with major depression (MD) in later life (i.e., >50 years), and tested mediation by childhood mental health status using path analysis. Data came from the 2016 U.S. Health and Retirement Study (n=18,047). One standard deviation increase in childhood chronic physical illness burden was associated with 1.21 (95% CI = 1.12, 1.30) times higher odds of MD in later life. Childhood mental health status explained 57.8% (95% CI: 35.2, 80.4) of this association. Results indicated that the relationship of chronic physical illness burden in childhood with MD in later life was mediated by childhood mental health status. Whether greater screening for psychiatric-related symptoms in childhood or review of health histories in later life can reduce the burden of MD requires further study.

Session 1110 (Symposium)

OPTIMIZING THE GERIATRIC MENTAL HEALTH WORKFORCE THROUGH INNOVATIVE APPROACHES

Chair: Ana Jessica Alfaro

Co-Chair: Rachel Rodriguez

Discussant: Michele Karel

The drastic demand for geriatrics-trained providers in medical and mental healthcare persists years after the Institute of Medicine first highlighted this need (2008; 2012). New innovative approaches must instead optimize the current workforce through leveraging existing geriatric experts' knowledge and skills related to working aging adults. This symposium will highlight four approaches spanning post-licensure education to using technology to deliver specialized services and training. First, Dr. Gregg will discuss the evaluation of an advanced topics workshop in Geropsychology which has significantly enhanced depth of Geropsychology competencies for psychologists working in primarily rural areas. Next, Dr. Asghar-Ali will describe the multi-modal interactive geriatric educational opportunities for interprofessional staff developed by the South East Texas Geriatric Workforce Enhancement Program (SETx GWEP). He will discuss how these training opportunities have been tailored to address the impact of COVID-19 and healthcare disparities among older adults. Third, Dr. Filips will present an evaluation of a consultation model in which a geriatric psychiatrist provides teleconsultation in a 5-state region to rural aging Veterans with complex medical and behavioral comorbidities. Finally, Dr. Beaudreau will describe adaptations to a national VA Problem Solving Training program for mental health clinicians of older Veterans with complex comorbidities. Dr. Karel, VA National Geriatric Mental Health Director, will serve as discussant and comment on the ways in which these novel approaches are meeting the ever-growing need for competent geriatric mental health providers.

VA PROBLEM-SOLVING TRAINING DURING COVID-19 FOR CLINICIANS OF PATIENTS WITH COMPLEX COMORBIDITIES

Sherry Beaudreau,¹ Marcela Otero,² Jessica Walker,³ Christine Gould,⁴ and Julie Wetherell,⁵ 1. VA Palo Alto / Stanford University School of Medicine, VA Palo Alto, California, United States, 2. VA Palo Alto, Palo Alto, California, United States, 3. VA Central Office, Salisbury, North Carolina, United States, 4. VA Palo Alto Health Care System, Palo Alto, California, United States, 5. VA San Diego / UCSD, La Jolla Village, California, United States

To address the shortage of mental health providers in geriatrics, VA has implemented clinician training in a VA Problem Solving Training (PST) protocol adapted to the needs of mostly older patients with complex comorbidities. This presentation will summarize PST implementation adaptations during COVID-19, and compare Veteran treatment outcomes before (2019) and during COVID-19 (2020). Sixty-one clinicians attended a workshop and small-group consultation for two training cases. Consultants provided ongoing feedback to program leadership about pandemic-related implementation challenges. Program adaptations during COVID-19 addressed challenges related to delivering treatment by telephone, video, or in-person and recruitment barriers. Veterans in both cohorts (N = 122) had significant reductions in mental health symptoms from baseline to posttreatment in paired t-test comparisons ($p < .01$). Flexibilities afforded to clinicians in the training during the pandemic did not diminish the effectiveness of the intervention, thus supporting continued implementation of the training program with added flexibility.

EVALUATION OF AN ADVANCED TOPICS WORKSHOP IN GEROPSYCHOLOGY: THE VALUE OF DEPTH IN TRAINING

Jeffrey Gregg,¹ Rachel Rodriguez,¹ Priyanka Mehta,² and Christine Gould,³ 1. Durham VA Health Care System, Durham, North Carolina, United States, 2. VA Palo Alto GRECC, Palo Alto, California, United States, 3. VA Palo Alto Health Care System, Palo Alto, California, United States

The Geriatric Scholars Program- Psychology Track (GSP-P) was implemented to address the dire shortage of mental health providers with geriatrics expertise within the VA, a large integrated healthcare system. One hundred and five psychologists participated in the GSP-P introductory geropsychology competencies course. Though they exhibited significant improvements in confidence, knowledge, and skills across geropsychology domains, increased depth (in addition to breadth) of training is needed. In 2019, GSP-P implemented an advanced workshop for graduates of the introductory course. Twenty-one psychologists participated in the workshop, which included 3.5 days of expert-led seminars followed by completion of an individualized learning plan over six months. Results from our evaluation indicated significant improvements in four of five geropsychology domains on the Pikes Peak Geropsychology Knowledge and Skill Assessment Tool. Our findings demonstrate continued enhancement of geropsychology competencies through advanced coursework is feasible and improves depth of training, particularly when combined with individualized learning plans.

VIRTUAL GERIATRIC MENTAL HEALTH CARE OFFERED WHERE NEEDED MOST: AN EVALUATION OF A TELEHEALTH CONSULTATION MODEL

Julie Filips,¹ Chalise Carlson,² Ana Alfaro,² Ranak Trevedi,³ Anita Savell,⁴ and Christine Gould,² 1. VAMC, Minneapolis, MN, Minnesota, United States, 2. VA Palo Alto Health Care System, Palo Alto, California, United States, 3. VA Palo Alto Center for Innovation to Implementation, Menlo Park, California, United States, 4. CRH Operations for VISN 23, Minneapolis, Minnesota, United States

Many VA facilities serving large rural populations do not have geriatric mental health specialists available to assist with managing the aging Veteran population's complex medical and behavioral comorbidities. We applied mixed-methods to evaluate an innovative model utilizing a geriatric psychiatrist who provides cross-facility consultation in a 5-state region. During a 3-month period, the consultant completed 135 consults and 20 e-consults to settings ranging from outpatient to long-term care. Leadership stakeholder and provider interviews highlight the importance of the availability of the consultant, collaboration with local care teams, staff education, person-centered approach, and work ethic/passion. The core challenges that the consultant helps manage include complex comorbidities, medication questions, and dementia with behavioral disturbance. Initial provider survey responses (n = 11) show high satisfaction with services (100%) and strong agreement (80%) that providers could follow through with recommendations. Next steps include replication of this model in other VA facilities.

THE SOUTH EAST TEXAS GERIATRIC WORKFORCE ENHANCEMENT PROGRAM: REACH, TEACH, INNOVATE

Ali Asghar-Ali, Baylor College of Medicine, Michael E. DeBakey VA Medical Center/Houston, Texas, United States

Through collaboration between academic and community partners, the South East Texas Geriatric Workforce Enhancement Program (SETx GWEP) aims to promulgate the 4Ms framework via a range of educational initiatives. The faculty and audience is interprofessional and diverse, representing the residents of South East Texas. Specific initiatives focus on Alzheimer's disease and related dementias, elder abuse, geriatric mental health, patient priorities, transitions of care, and geriatric dental care. Training modalities include online modules, Project ECHO sessions, webinars, discussion forums, and simulation. During the COVID19 pandemic the SETx GWEP adapted to meet the needs of its stakeholders, including increasing the number of online activities, hosting town hall meetings, and developing training to address the impact of COVID19 on the older adult population. The SETxGWEP trained over 1000 people in 2020. To address healthcare disparities among older adults, SETx GWEP developed training on the practice of cultural humility in older adult care.

Session 1115 (Symposium)

ORAL HEALTH AND DENTAL CARE AMONG OLDER ADULTS IN CHINA: WHAT ARE THE RISK AND PROTECTIVE FACTORS?

Chair: Weiyu Mao
Co-Chair: Yaolin Pei
Discussant: Huabin Luo

Oral health is a global public health concern. The four papers in this symposium capture various understudied risk and protective factors in oral health and dental care among older adults in China. The first paper examined the relationship between social isolation, loneliness, and tooth loss among Chinese older adults, using the Chinese Longitudinal Healthy Longevity Survey. The findings suggest that higher levels of social isolation, rather than loneliness, were associated with fewer remaining teeth and accelerated tooth loss over time. The second paper investigated urban-rural disparities in dental care utilization among Chinese adults aged 18 to 65 years old, using the 2019 New Era and Living Conditions in Megacities Survey. The findings demonstrate urban residents were more likely to visit dentists than rural residents. Besides socioeconomic status, health attitudes/behaviors, and oral health needs, health insurance coverage was considered an important enabling factor to promote dental care use in this population. The third paper examined the relationship between denture use and cognitive decline among Chinese older adults, using data from the Chinese Longitudinal Healthy Longevity Survey. The findings indicate that denture use is protective against cognitive decline over time in later life. The fourth paper examined the prevalence of self-reported orofacial pain symptoms and their correlates at the last year of life among Chinese older adults. Low socioeconomic status, smoking, chronic conditions, oral hygiene practice, and natural teeth condition were associated with such symptoms. This symposium offers valuable insights to improve oral health and dental care in older adults in China.

SOCIAL ISOLATION AND ACCELERATED TOOTH LOSS AMONG CHINESE OLDER ADULTS

Xiang Qi,¹ Yaolin Pei,² Katherine Wang,³ Shuyu Han,⁴ and Bei Wu,² 1. *Rory Meyers College of nursing, New York, New York, United States*, 2. *New York University, New York, New York, United States*, 3. *Duke University, Durham, North Carolina, United States*, 4. *Fudan University, Shanghai, Shanghai, China (People's Republic)*

Social isolation and loneliness in older adults are major global public health concerns. Tooth loss is also a common problem in this population. This study examined the effects of social isolation and loneliness on the number of remaining teeth and the rate of tooth loss among Chinese older adults. We included 4,268 older adults age 65+ from three waves of the Chinese Longitudinal Healthy Longevity Survey (2011/2012, 2014, 2018). Linear mixed-effect models showed higher levels of social isolation were associated with fewer remaining teeth ($\beta = -1.59$, $P < 0.05$) and accelerated tooth loss ($\beta = -0.10$, $P < 0.05$) controlled for socio-demographic, lifestyle, oral hygiene behavior, and health status. Loneliness was neither associated with the number of remaining teeth ($\beta = 0.64$, $P > 0.05$) nor with the rate of tooth loss ($\beta = -0.09$, $P > 0.05$) before and after controlling for covariates. These findings expand our knowledge regarding the correlation between social connection and tooth loss in non-Western populations.

DISPARITIES IN DENTAL SERVICES USE AMONG URBAN AND RURAL ADULTS IN CHINA'S MEGACITIES

Xiaomin Qu,¹ Xiang Qi,² and Bei Wu,³ 1. *East China University of Political Science and Law, East China University of Political Science and Law, Shanghai, China (People's Republic)*, 2. *Rory Meyers College of nursing,*

New York, New York, United States, 3. *New York University, New York, New York, United States*

Using data from the '2019 New Era and Living Conditions in Megacities Survey' that included 4,049 residents aged 18-65, we examined the urban-rural disparities in dental visits among adults living in China's 10 megacities. All of China's megacities are metropolitan regions that include urban, peri-urban and rural land, and all have rural populations within the city boundaries. The results show that 43.3% ($n=595$) rural and 23.8% urban ($n=637$) residents had never visited dentists. Urban residents were more likely to visit dentists than rural residents after controlling for covariates ($OR=1.57$, $95\%CI=1.30$ to 1.91). The rates of visits were similar across age groups. Higher socioeconomic status, having urban insurances, having positive attitudes towards healthy diets and visited physicians regularly, and having poorer oral health was associated with higher odds of visiting dentists ($P < 0.05$). These findings can help develop policies to increase dental care access to underserved populations in Chinese megacities.

DENTURE USE AND COGNITIVE DECLINE IN CHINESE OLDER ADULTS: A PROPENSITY SCORE ANALYSIS

Bei Wu,¹ and Xiang Qi,² 1. *New York University, New York, New York, United States*, 2. *Rory Meyers College of nursing, New York, New York, United States*

Using data from the Chinese Longitudinal Healthy Longevity Survey (2011 to 2018), we examined the effect of denture use on cognitive decline (assessed by the Mini-Mental State Examination [MMSE]) among 1,316 cognitively normal older adults with severe tooth loss (≤ 9 remaining teeth) at baseline. We generated propensity scores for weighted and matched analyses using 18 covariates, classified as socio-demographics, health-related behaviors, health status, and oral health conditions. The results show that non-denture users had worse cognitive decline than denture users. In the kernel-based matched data, the difference in the declined score of cognitive function between denture and non-denture users was 2.25 ($95\%CI=1.37$ to 3.13). In the weighted data, the difference in cognitive function score was 2.14 ($95\%CI=1.35$ to 2.94). Using dentures is beneficial for cognitive health in older adults with severe tooth loss, suggesting that prosthodontic rehabilitation with dentures might have benefits beyond restoring oral functioning.

OROFACIAL PAIN SYMPTOMS AMONG CHINESE OLDER ADULTS IN THE LAST YEAR OF LIFE

Yaolin Pei,¹ Xiang Qi,² Xi Chen,³ and Bei Wu,¹ 1. *New York University, New York, New York, United States*, 2. *Rory Meyers College of nursing, New York, New York, United States*, 3. *University of Iowa, Iowa City, Iowa, United States*

The aims of this study were to examine the prevalence of orofacial pain symptoms and its associated factors in Chinese older adults in the last year of life. We retrospectively followed 1,646 participants (60 years or older) in the last year of life to death from the Chinese Longitudinal Healthy Longevity Survey (CLHLS). The 6-month prevalence of toothache and jaw joint pain or facial pain for older adults in the last year of life to death were 14.1% and 4.5%, respectively. Older adults who had lower socioeconomic status, were smokers, and had any chronic disease tended to have orofacial pain symptoms. This study generated interesting but counterintuitive findings that Chinese older adults who

brushed their teeth at least daily and those who had at least one natural teeth were more likely to have orofacial pain. It is important to include dental care as a part of end-of-life medical treatment.

Session 1120 (Symposium)

PRESIDENTIAL SYMPOSIUM: PHYSIOLOGICAL VS. MOLECULAR CLOCKS, STUDIES FROM MICE TO HUMANS

Chair: Blanka Rogina

Aging is associated with a functional decline in metabolic, physiological, proliferative, and tissue homeostasis leading to deterioration at the organismal level, and an increased risk for disease and death. Genetic, pharmacological and nutritional interventions have been successfully used to preserve metabolic health, which leads to preserved healthspan and extended longevity. However, the rate at which animals in a population become impaired by age-related frailty and disease is highly variable and several aging clocks that measure different age-modulated processes in the organism are being used as potential markers of the rate of aging. These molecular clocks allow to a more accurate quantification of the biological age of animals. Nevertheless, there is still room for further discussion in terms of the strengths and weaknesses of these biomarkers, in order to probe their biological significance, cellular mechanisms, and epidemiological potential to further explore their long-term benefit of increasing healthspan. This symposium will discuss new approaches to delineate physiological versus molecular clocks based on studies in mice and humans. We will also discuss species-specific metabolic mechanisms based on longitudinal studies in mice, monkeys and humans.

INTEGRATIVE ANALYSIS OF MOLECULAR AND PHYSIOLOGICAL DATA TO QUANTIFY BIOLOGICAL AGING

Daniel Belsky, *Columbia University Mailman School of Public Health, New York, New York, United States*

Development of reliable and valid measurements to quantify biological aging is a critical frontier geroscience. Originating in accumulations of molecular changes, biological aging undermines resilience within cellular networks and organ systems, driving disease, disability, and mortality. Measurements of biological aging have been proposed at several molecular and physiological levels of analysis. But agreement between measures implemented at different levels of analysis is low. The timing at which aging processes manifest at different levels of biological organization may vary, with the result that signs of aging manifest in one level of analysis are not yet observable in another. And different aging processes may be most apparent in different molecular levels of analysis. In midlife humans, aging-related changes are manifest at multiple molecular and physiological levels, making this population ideal for development of measurements that integrate information across levels of analysis to more precisely quantify the state and pace of biological aging.

AGING ACROSS THE LIFESPAN: RETHINKING THE DAVID BARKER HYPOTHESIS

Luigi Ferrucci, *National Institute on Aging, Baltimore, Maryland, United States*

For many years, the scope of geriatric medicine has been the care of older persons affected by multiple disease with the aim of improving their functional status and optimize quality of life. As our knowledge of the mechanisms of aging grows rapidly, it is becoming clear that accomplishing this scope requires taking a life-course perspective. Research have failed to establish a clear-cut distinction between normal aging and pathology leading to the hypothesis that aging is at the root of chronic diseases, and difference in health can be ascribed to different aging rates. Research in model organisms, suggest that aging can be modified with consequent changes on healthspan and longevity. Interventions that modulate aging may ultimately prevent most-age-associated diseases and their consequences. From this perspective, geriatric medicine is the leading and most promising branch of biomedical science. Challenges remain: first, demonstrating that certain interventions slow down the aging rate requires the valid measure of aging, and while many tools were developed, “epigenetic clocks” being the most promising, the underline mechanism that drive their changes with aging and validity in clinical applications are unclear. We do not know whether variability in the rate of biological aging assessed in old age are already detectable in younger individuals and person-specific rates remain constant during life. In 1986, David Barker stated the hypothesis that the period of gestation, characterized by a strong epigenetic imprinting, affects health and wellbeing across life, perhaps by setting the aging rate. Perhaps pediatric and geriatric medicine are more connected than previously believed.

EVOLUTION OF NATURAL LIFESPAN VARIATION AND MOLECULAR STRATEGIES OF EXTENDED LIFESPAN

Alaattin Kaya, *Virginia Commonwealth University, Richmond, Virginia, United States*

To understand the genetic basis and the selective forces acting on longevity, it is useful to employ ecologically diverse individuals of the same species, widely different in lifespan. This way, we may capture the experiment of Nature that modifies the genotype arriving at different lifespans. Here, we analyzed 76 ecologically diverse wild yeast isolates and discovered wide diversity of lifespan. We sequenced the genomes of these organisms and analyzed how their replicative lifespan is shaped by nutrients and transcriptional and metabolite patterns. By identifying genes, proteins and metabolites that correlate with longevity across these isolates, we found that long-lived strains elevate intermediary metabolites, differentially regulate genes involved in NAD metabolism and adjust control of epigenetic landscape through conserved, rare histone modifier. Our data further offer insights into the evolution and mechanisms by which caloric restriction regulates lifespan by modulating the availability of nutrients without decreasing fitness.

FRAILITY IN PRECLINICAL MODELS: IMPACT OF HEALTHSPAN ON DISEASE EXPRESSION OVER THE LIFE COURSE

Susan Howlett, *Dalhousie University, Halifax, Nova Scotia, Canada*

People age at different rates. This heterogeneity in aging has led to the concept of “frailty”, a state of heightened

vulnerability to adverse health outcomes at any age. Frailty challenges health care providers, as frail patients are more likely than non-frail patients to experience diseases, hospitalization, and death. We showed that frailty occurs not only in humans, but also in aging rodents. It can be measured with a “frailty index” (FI) based on age-related health deficit accumulation as originally established in humans. We found that maladaptive changes in heart structure and function in late life are correlated more so with frailty than age and are closely graded by FI score, especially in male mice. Adverse effects of frailty originate at cellular/subcellular levels and scale up to organ and system levels, predisposing towards cardiovascular disease. Poor overall health, quantified with an FI, may drive maladaptive cardiac remodeling, especially in older males.

Session 1125 (Symposium)

RECRUITING ELIGIBLE AND INTERESTED STUDY PARTICIPANTS WITH COGNITIVE IMPAIRMENT

Chair: Meghan Mattos

Discussant: Jennifer Lingler

Recruiting and enrolling older adults with cognitive impairment is challenging under the best of circumstances. This symposium will begin with an introduction to best practices for recruitment of older adults living with cognitive impairment, followed by four presentations describing recruitment successes and challenges across multiple settings. The first presentation describes COVID-19 pandemic-related factors that have influenced recruitment and enrollment of older adults with cognitive impairment in an intervention study of a physical activity smartphone app. Strategies and procedural alterations to facilitate achievement of enrollment goals for technology-based interventions are discussed. The second presentation describes researchers' recruiting experiences with older adults with mild cognitive impairment (oaMCI)-care partner dyads for a pilot, platform trial of biopsychosocial interventions. There were differences in study disinterest between oaMCI and study partners that may require specialized communication messaging and strategies for dyad engagement. The third presentation features recruitment adaptations for an Internet-delivered behavioral intervention study with oaMCI and insomnia. Anticipated concerns of oaMCI using technology or accessing the Internet were not significant barriers to recruitment, while fewer oaMCI endorsed sleep concerns than expected. The last presentation demonstrates the potential for telephone-based outreach to increase dementia knowledge and cognitive risk. Working with faith-based health educators to reach rural, ethnically-diverse older adults, researchers will describe how to promote inclusivity and successfully recruit oaMCI within the community. Presenters and participants are encouraged to dialogue on how recruitment and retention barriers may be avoided as well as to share success stories from their own research with oaMCI.

LESSONS LEARNED FROM CLINICAL RECRUITMENT OF OLDER ADULTS WITH MCI FOR AN INTERNET-DELIVERED INTERVENTION STUDY

Meghan Mattos,¹ Mark Quigg,² Carol Manning,³

Eric Davis,³ Ann Sollinger,⁴ Laura Barnes,⁵ and

Lee Ritterband,³ 1. *University of Virginia, School of*

Nursing, Charlottesville, Virginia, United States,

2. *University of Virginia, Charlottesville, Virginia, United*

States, 3. University of Virginia, School of Medicine,

Charlottesville, Virginia, United States, 4. Carilion Clinic,

Roanoke, Virginia, United States, 5. University of Virginia,

School of Engineering & Applied Science, Charlottesville, Virginia, United States

Clinical research involving participants with mild cognitive impairment (MCI) presents challenges to recruitment that may be further compounded by concerns when delivering a behavioral intervention via the Internet. The purpose of this talk is to describe recruitment adaptations for an Internet-delivered behavioral intervention study with older adults living with MCI and insomnia. Over the course of study recruitment, unforeseen barriers to recruitment were discovered, including fewer older adults with MCI endorsing sleep concerns than expected. The most substantive changes made to improve clinical recruitment were related to eligibility criteria, yielding 50% of the overall sample. Anticipated concerns of older adults with MCI using technology or accessing the Internet were not significant barriers to recruitment. Study findings support Internet-delivered intervention use in this population, which in the context of the COVID-19 pandemic, presents a potentially efficient and effective method for recruiting and delivering behavioral interventions in this difficult-to-enroll population.

THE DYAD DILEMMA: STRATEGIES TO RECRUIT STUDY PARTNERS FOR MILD COGNITIVE IMPAIRMENT CLINICAL TRIALS

Allison Gibson,¹ Caitlin Pope,² Elizabeth Rhodus,²

Kelly Parsons,² Julia Johnson,² Dawn Oaks,³ and

Greg Jicha,³ 1. *University of Kentucky, University of*

Kentucky, Kentucky, United States, 2. University of

Kentucky, Lexington, Kentucky, United States, 3. University

Of Kentucky, Sanders-Brown Center On Aging, Lexington,

Kentucky, United States

Mild cognitive impairment (MCI) research faces challenges to successful enrollment, especially with clinical trial studies. This study explores researchers' experiences recruiting from a U.S. Alzheimer's Disease Center for a pilot, platform trial of biopsychosocial interventions for MCI dyads. Individuals with MCI that met the inclusion criteria for the study were invited to participate (n=39). Thematic analysis of recruitment case notes was utilized to track participants' and study partners' interest in participation. In most cases, participants with MCI were interested and willing to enroll and study partners were not. Recruiting persons with MCI and their study partners for clinical trials research may require specialized communication messaging such as education about how interventions address the needs of MCI, along with training on the relationship of MCI to cognitive decline. This presentation highlights effective strategies to engage study partners into recruitment for MCI research such as creating more flexible participation roles and offerings.

RECRUITING OLDER ADULTS WITH COGNITIVE IMPAIRMENTS FOR A SMARTPHONE INTERVENTION DURING COVID-19

Stacey Schepens Niemiec,¹ Lon Schneider,¹

Jeanine Blanchard,¹ Rafael Wagas,² Liberty Teodoro,² and

Karen Dagerman,² 1. *University of Southern California, Los Angeles, California, United States*, 2. *University of Southern California, Los Angeles, California, United States*

The Coronavirus disease 2019 (COVID-19) pandemic has introduced numerous challenges to the global scientific community and has been particularly disruptive to the conduct of ongoing clinical trials. Gerontological studies that focus on older adults with cognitive impairments have endured additional challenges ranging from increased vulnerability of this group to COVID-19, thereby prohibiting study participation, to difficulties in participant engagement as a product of a worsening Digital Divide. The purpose of this talk is to describe the pandemic-related factors that have influenced recruitment and enrollment of older adults with mild cognitive impairment and mild dementia in an ongoing feasibility study of a physical activity smartphone app. We discuss the changes we made to recruitment procedures and the impact those changes have had on the success of enrolling individuals in the study. We conclude with a discussion of feasible strategies and procedural alterations moving forward that may facilitate achievement of enrollment goals.

PROMOTING INCLUSIVITY IN DEMENTIA EDUCATION AND SCREENING IN AN ETHNICALLY DIVERSE, RURAL COMMUNITY DURING A PANDEMIC

Lisa Wiese,¹ Ishan Williams,² Nancy Schoenberg,³ James Galvin,⁴ and Jennifer Linger,⁵ 1. *Florida Atlantic University, C.E. Lynn College of Nursing, Florida, United States*, 2. *University of Virginia, Charlottesville, Virginia, United States*, 3. *University of Kentucky, Lexington, Kentucky, United States*, 4. *University of Miami Miller School of Medicine, Miami, Florida, United States*, 5. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

Rural, ethnically diverse older adults experience disparities in dementia detection/management. The Covid-19 quarantine exacerbated these disparities, and threatened faith-based dementia education and screening activities. We investigated the effectiveness of a telephone-based outreach for increasing dementia knowledge and detecting cognitive risk among a rural, diverse, underserved community of 89% African American, Hispanic, and Haitian Creole residents, Faith-based health educators, trained using virtual Alzheimer's Association resources, contacted church congregants who responded to radio worship service announcements. Participants completed telephone measures of basic dementia knowledge and cognitive risk. Of the estimated 120 persons across five churches who received an invitation, 75% (n = 90) participated in dementia education and memory screening via telephone. Twelve (80%) of the 15 participants assessed as being at risk followed up with their provider. Rural residents are known for preferring face-to-face contact. Their willingness to complete health-promoting research activities by telephone highlighted the community's interest in dementia awareness.

Session 1130 (Symposium)

SLEEP AND HEALTH IN OLDER ADULTS: NEW RESEARCH FROM EARLY-CAREER INVESTIGATORS

Chair: Christopher Kaufmann

Discussant: Amy Berkley

Sleep and circadian patterns change as people age and are linked to a number of health and psychosocial outcomes. As such, there is a need to continue generating new knowledge about sleep in older adults by encouraging early-career scientists to research this topic. In this symposium, sponsored by the Sleep, Circadian Rhythms and Aging Interest Group, we will showcase studies by early-career researchers at the masters through junior faculty level who conduct work in sleep and its impact on health outcomes in older adults. Our symposium will have five presentations. The first will examine how sleep and loneliness may mediate relationships between marital quality and depressive symptoms. The second study will assess links between personality characteristics and objectively measured chronotype. Our third presentation will determine the longitudinal association of sleep duration with body mass index. The fourth will evaluate how an intervention to reduce functional disability in low-income older adults impacts sleep quality. Finally, our fifth presentation will focus on understanding how sleep duration and changes in sleep patterns may impact speech-in-noise performance. Overall, our symposium will highlight multidisciplinary studies of sleep and health outcomes that are of importance to older populations and promote the work of the next generation of sleep, circadian rhythms, and aging scientists.

SLEEP AND LONELINESS AS MECHANISMS THROUGH WHICH MARITAL QUALITY PREDICTS DEPRESSION AMONG OLDER ADULTS

Christina Marini,¹ Lynn Martire,² and Orfeu Buxton,³ 1. *Adelphi University, Garden City, New York, United States*, 2. *The Pennsylvania State University, University Park, Pennsylvania, United States*, 3. *The Pennsylvania State University, The Pennsylvania State University, Pennsylvania, United States*

Pathways through which spousal support and strain influence older adults' well-being are poorly understood. We examined sleep quality and loneliness as mechanisms through which support and strain predict depressive symptoms across ten years utilizing National Social Life, Health, and Aging Project data. Our sample included partnered participants at waves 1 and 2 (N = 1,293; 39% female, M age = 66, SD = 6.93). Support (e.g., rely on spouse) and strain (e.g., spouse criticizes you) were measured at W1, loneliness (UCLA) and sleep quality (restless sleep) were measured at W2, and depression (CES-D) was measured at W3. We estimated latent-variable structural equation models, controlling for age, gender, and W1 depression. Indirect effects of support and strain on depressive symptoms through loneliness were significant. There was an additional trend-level indirect effect of spousal strain on depressive symptoms through restless sleep. Findings highlight multiple pathways through which marital quality predicts later-life well-being.

LINKS BETWEEN PERSONALITY AND SLEEP MIDPOINT IN OLDER ADULTS IN THE NATIONAL SOCIAL LIFE, HEALTH, AND AGING PROJECT

Krishna Patel,¹ Darlynn Rojo-Wissar,² Katherine Duggan,³ Garrett Hisler,⁴ Brant Hasler,⁴ and Adam Spira,⁵ 1. *Penn State College of Medicine, Hummelstown, Pennsylvania, United States*, 2. *Department of Mental Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 3. *Department of Psychology, North Dakota State University, Fargo, North Dakota,*

United States, 4. Department of Psychiatry, University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 5. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States

Chronotype has been linked to poor cognitive outcomes and mortality among older adults. Although previous studies indicate an association between personality and sleep, little is known about associations between personality and chronotype in older adults. We examined the association between personality and objective sleep midpoint (a measure of chronotype) in 463 older adults aged 73.5 ± 7.7 from the National Social Life, Health, and Aging Project who completed the Midlife Developmental Inventory Personality scale and three nights of wrist actigraphy, from which we derived participants' average sleep midpoints. After adjusting for demographics, higher conscientiousness was associated with earlier sleep midpoint ($B = -0.53$, $SE = 0.02$, $p < 0.01$). Associations for other traits were not significant. Findings link conscientiousness to chronotype and raise the possibility that earlier sleep timing may partially account for associations of conscientiousness with health outcomes. Further studies are needed investigating the role of personality in links of sleep and circadian factors with health.

HABITUAL SLEEP, SLEEP DURATION DIFFERENTIAL, AND WEIGHT CHANGE AMONG ADULTS

Yin Liu,¹ Mari Palta,² Jodi Barnet,² Max Roberts,¹ Erika Hagen,² Paul Peppard,² and Eric Reither,¹ 1. Utah State University, Logan, Utah, United States, 2. University of Wisconsin-Madison, Madison, Wisconsin, United States

We assessed longitudinal associations between diary-measured sleep duration and clinically assessed body mass index (BMI) among 784 men and women enrolled in the Wisconsin Sleep Cohort Study (mean [SD] age = 51.1 [8.0] years at baseline). The outcome was BMI (kg/m²). Key predictors were habitual sleep duration (defined as average weekday nighttime sleep duration) and sleep duration differential (defined as the difference between average weekday and average weekend nighttime sleep duration) at each data collection wave. Men with shorter habitual sleep duration on weekdays had higher BMI than men with longer habitual sleep duration on weekdays. Participants with larger differentials between weekday and weekend sleep duration experienced more rapid BMI gain over time for both men and women. Inadequate sleep, characterized as shorter habitual sleep during weekdays and larger weekday-weekend sleep differential, is positively associated with BMI levels and trajectories among men and women in mid-to-late life.

EFFECT OF A BIOBEHAVIORAL ENVIRONMENTAL APPROACH ON SLEEP IN LOW-INCOME OLDER ADULTS

Junxin Li,¹ Safiyyah Okoye,¹ Lena Sciaratta,¹ and Sarah Szanton,² 1. Johns Hopkins University, Baltimore, Maryland, United States, 2. Johns Hopkins School of Nursing, Baltimore, Maryland, United States

Low socioeconomic status and disability are independent risk factors for disturbed sleep. The CAPABLE intervention used a multidisciplinary team approach of occupational therapist, nurse, and handyworker to reduce functional disability in low-income older adults. The 6-month intervention may

benefit sleep as the intervention addressed multiple individual factors associated with sleep quality, including pain, depression, communication, mobility, strength, and balance. This study examined the effect of the CAPABLE intervention on actigraphy-measured sleep in a sub-sample of 73 older adults from the CAPABLE trial (26 intervention vs. 47 control). The sample was aged 75.8 ± 7.45 years, 86.3% female, and 84.9% African American. No significant group differences in sleep parameters were found at 6-month, controlling for baseline values. The intervention resulted in a 5.56% increase in sleep efficiency (95% CI = [1.39, 9.71], Cohen's $d = 0.54$), and 7.39 minutes decrease in sleep onset latency (95% CI = [0.10, 14.5], Cohen's $d = 0.41$) within the intervention group at 6-months.

ASSOCIATIONS OF HABITUAL SLEEP DURATION AND SLEEP STAGES WITH SPEECH-IN-NOISE PERFORMANCE

Kening Jiang,¹ Adam Spira,² Kelsie Full,³ Emmanuel Garcia,¹ Frank Lin,⁴ Nicholas Reed,² Pamela Lutsey,⁵ and Jennifer Deal,⁶ 1. Johns Hopkins Cochlear Center for Hearing and Public Health, Baltimore, Maryland, United States, 2. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 3. Division of Epidemiology and Community Health, University of Minnesota, Minneapolis, Minnesota, United States, 4. Johns Hopkins University, Johns Hopkins University, Maryland, United States, 5. School of Public Health, University of Minnesota, Minneapolis, Minnesota, United States, 6. Johns Hopkins University, Baltimore, Maryland, United States

Speech-in-noise performance involves central auditory and cortical processing and is fundamental to communication. We investigated cross-temporal associations of habitual sleep duration and stages (1996-1998) with speech-in-noise performance (2016-2017) in a subset of the Atherosclerosis Risk in Communities Study participated in the Sleep Heart Health Study ($N = 755$, 61 ± 5 years, 53% female). Speech-in-noise performance was measured by Quick Speech-in-Noise Test; range: 0-30; lower scores = worse performance. Time spent in each stage (stage 1; 2; 3/4; rapid eye movement (REM)) was measured by polysomnography. Habitual sleep duration was calculated by self-reported duration on weekdays and weekends. In models adjusting for demographic and disease covariates, every 10-minute increase in REM sleep was associated with better speech-in-noise performance (0.10 points, 95% CI: 0.00, 0.21); every 1-hour increase in habitual sleep duration was associated with worse speech-in-noise performance (-1.28 points, 95% CI: -2.49, -0.08) among participants sleep >8 hours. Long sleep duration might be a risk marker of speech-in-noise performance, but REM sleep might be a protective factor.

Session 1135 (Symposium)

SOCIAL CONNECTION IN TIMES OF PHYSICAL DISTANCING

Chair: Jeongeun Lee

COVID-19 has been especially devastating to older adults. To prevent the spread of the virus, physical distancing has

become the norm. As a result, there are fewer opportunities available for face-to-face interaction and social activities, which may be particularly harmful to older adults, given their existing loneliness levels. Thus, this symposium brings together a collection of papers that exemplify the interplay of social connection, activities, and mental health outcomes among older adults facing loneliness. The first paper will discuss how activity diversity is linked to higher loneliness and depressive symptoms among heterosexual and LGBTQ older adults. The second paper will present findings on the changes in social connectedness due to physical distancing and their associated impact on the mental health outcomes among older adults. The third paper will present qualitative findings on the effect of physical distancing on older adults' social connectedness using a mixed-method study. The final paper discusses the challenges faced by older adults in their use of digital media for social connection in the present pandemic and highlights some of the population's untapped strengths, which can be leveraged to help them live prosperous online lives. All papers will address practical tips and recommendations for actions, which key stakeholders can take to support older adults during the pandemic. The discussant, Dr. Kahana, will integrate the four papers and highlight the potential and limits of the current effort to address these issues and consider future inquiry routes.

DIVERSITY OF ACTIVITIES AND LONELINESS AMONG HETEROSEXUAL AND LGBTQ OLDER ADULTS

Jeongeun Lee, and Joseph Svec, *Iowa State University, Ames, Iowa, United States*

The extant literature highlights the physiological and psychological benefits of active lifestyles among older adults, though there is a considerable gap in scholarship for sexual minority groups. Utilizing the Social Integration Model, we hypothesize that social activities enhance individual psychological well-being, but those effects differ by one's social identities. Using a national AARP foundation survey of adults (45+), this study examines whether individuals' activities predict loneliness and depressive symptoms of heterosexual ($n=2905$) and LGBTQ adults ($n=318$). We utilize an index of diverse activities, which includes, social technology use, meeting with friends, and volunteer activities. Multiple linear regression is used to study cross-sectional associations of loneliness and depressive symptoms on the diverse activity index. Results show that a wider array of activities correspond with higher psychological well-being and lower loneliness, and this association is higher for LGBTQ older adults. We discuss implications for counseling and wellness programming for LGBT older adults.

CAN WE REPLACE OUR HUMAN CONNECTION WITH TECHNOLOGY?

Nicholas Cone,¹ and Jeongeun Lee,² *1. Iowa State University, Iowa State University, Iowa, United States, 2. Iowa State University, Ames, Iowa, United States*

The COVID-19 pandemic has led to social distancing protocols, subsequently increasing social isolation for older adults. The purpose of this study was to explore the relationship between social connectedness and mental health outcomes. Leveraging NHATS, a nationally representative study ($n = 2,558$, $Mage = 79.20$, $SDage = 6.25$), we examined the

association between the method of social connectedness and mental health outcomes. Descriptive analyses revealed older adults are using various methods (e.g., in-person, phone, and video calls) to remain connected with their social networks during COVID-19. Findings from all of the linear regression analyses indicated phone or video calls are associated with negative affect, whereas in-person visits are associated with lower levels of negative affect. These findings suggest substituting in-person visits with video calls or phones may not be sufficient to relieve their loneliness and negative affect. Future studies should investigate this effect on physical or emotional health outcomes.

SOCIAL CONNECTION PLANNING FOR LONELY OR SOCIALLY ISOLATED OLDER ADULTS

Emily Bower,¹ Aurora Newman,¹ Paige Reohr,¹ and Kimberly Vandorden,² *1. Pacific University, Hillsboro, Oregon, United States, 2. University of Rochester Medical Center, Rochester, New York, United States*

Social connections are important for maintaining health and well-being with age. Behavioral interventions to promote connectedness hold promise, but there is limited evidence to guide effective modifications in the context of physical distancing or quarantine restrictions, such as those required during the COVID-19 pandemic. We present evidence for a brief (1-2 session) social connection intervention, "Connections Planning," to enhance social connectedness for older adults. We first describe a cognitive-behavioral model of loneliness, which served as the framework for developing the intervention. We then present two case examples to demonstrate the application of the intervention with older adults in a community mental health clinic during physical distancing restrictions. Finally, we present initial findings from a pilot study to examine the feasibility and acceptability of the intervention delivered remotely with up to 10 community-dwelling older adults who endorse clinically significant loneliness. Recommendations for adapting the intervention during physical distancing restrictions are provided.

PHYSICAL DISTANCING AND SOCIAL CONNECTEDNESS AMONG OLDER ADULTS

Julie Lutz,¹ Emily Bower,² Ellen Beckwith,³ Julie Choi,³ and Kim Van Orden,⁴ *1. VA Palo Alto Health Care System, Palo Alto, California, United States, 2. Pacific University, Hillsboro, Oregon, United States, 3. University of Rochester Medical Center, Rochester, New York, United States, 4. University of Rochester School of Medicine & Dentistry, Rochester, New York, United States*

The COVID-19 pandemic has significantly impacted older adults; due to elevated risk, many older adults have followed physical distancing guidelines. These efforts, while critical to public health, have also impacted the social interactions and connectedness of older adults. In this mixed-methods study, we conducted qualitative interviews and administered questionnaires to 23 adults age 60 and older to examine how physical distancing has affected their social connectedness; what strategies and supports they have utilized to maintain or improve social connectedness despite physical distancing; and what types of supports, programs, and interventions they feel could promote and foster social connectedness among older adults during physical distancing. The results

may have implications not only for the pandemic, but also for older adults who cannot leave their homes or experience barriers to typical social activities for any reason (e.g., being homebound, having functional impairments).

Session 1140 (Paper)

Social Isolation and Loneliness (SRPP Paper)

COVID-19 AND OLDER ADULTS: COPING WITH LONG-TERM PANDEMIC PRECAUTIONS

Kerstin Emerson, Deborah Kim, George Mois, and Jenay Beer, *University of Georgia, Athens, Georgia, United States*

Studies conducted at the beginning of Covid-19 precautions suggested that older adults were stressed, but hopeful. Less is known how coping has changed for older adults after experiencing months-long pandemic precautions. We explore differences in coping between the initial pandemic declaration in March 2020, and 9 months later, via an internet survey fielded in November 2020 ($n = 781$). We present summary data, using chi-square tests for subgroup analyses. A majority of respondents (aged $M = 66$ yrs, range 60-89) were women (64%) and White (94%). When asked to compare their feelings to the beginning of the pandemic, 44.8% were more frustrated, 38.7% were more stressed, and 32.7% were more anxious. However, 38.3% were more appreciative. Women were significantly more likely than men to report increases in feeling frustrated, angry, scared, stressed, sad, and hopeless. Introverts were significantly more likely than extroverts to report an increase in loneliness and stress. Since the first few weeks of the pandemic, respondents reported more communication through video calls (45.2%), texting (40.2%), and phone calls (28.8%). Additionally, 61.5% spent more time on computers/tablets, 47.2% spent more time watching TV, and 24.5% spent more time praying. Extroverts were significantly more likely than introverts to report an increase in time with TV, phones, and computers/tablets. Women were significantly more likely than men to report increased texting and praying. These data provide further understanding of the impact of long-term pandemic precautions on older adults and suggest particular subgroups of older adults may benefit from public health and mental health interventions.

INTEGRATING ASSESSMENT FOR SOCIAL DISCONNECTEDNESS INTO AGING SERVICES: CHARTING A PATH FORWARD

Alice Prendergast, and Kristi Fuller, *Georgia State University, Atlanta, Georgia, United States*

Social disconnectedness poses a serious threat to the health and well-being of older adults. Although research demonstrates that social disconnectedness was prevalent among older adults long before the COVID-19 pandemic, the crisis has brought significant attention to this issue, as well as resources to address it. The crisis also shed light on the current gap in evidence and guidance on how best to assess for and address social disconnectedness, especially in practice settings. Researchers from the Georgia Health Policy Center conducted a review of existing assessment tools and processes for social disconnectedness and formulated

recommendations for the Georgia Division of Aging Services (DAS) in November 2020. These recommendations involve the use of evidence-based assessments paired with person-centered counseling to address social disconnectedness among at-risk individuals. In this session, researchers from Georgia State University will define social disconnectedness, explain how it differs from related constructs, and discuss the necessity of a holistic approach to assessment; summarize the review and recommendations made to DAS; and present preliminary data from DAS's initial implementation of the assessment process.

THE GREAT MIGRATION AND THE URBAN-RURAL DIVIDE: LONELY LIFE EXPECTANCY IN CHINA

Xueqing Wang, and James Raymo, *Princeton University, Princeton University, New Jersey, United States*

After decades of below replacement fertility, China is now experiencing rapid population aging and the lives of the growing older population are being shaped by massive social and economic change. Of particular importance, is the large-scale migration of working-age adults from rural areas to large cities in search of job opportunities. The departure of migrants from their rural hometowns has resulted in a large population of left-behind older men and women. This distinctively Chinese demographic phenomenon has spurred scholarly interest in the emotional well-being of this older left-behind population, but careful demographic description of aging, migration, grandparenting, and loneliness has yet to be conducted. We bridge this gap by describing the average remaining life spent lonely by older men and women in China. We use Sullivan's method to calculate lonely life expectancy by urban/rural residence and by the migration status of adult children (as proxied by the presence or absence of coresiding children). We use data from the Harmonized version of the Chinese Health and Retirement Longitudinal Study and focus the analysis on adults aged 55-100. Preliminary results show that, at age 55, women on average spend 9% more of remaining life lonely than men and that rural men and women spend more of their remaining life lonely than their urban counterparts. We will extend these life table analyses by conducting multivariate analyses of the correlates of loneliness in urban and rural China to better understand the role of migration and grandparenting responsibilities.

THE LENGTH OF MEMBERSHIP AND LONELINESS OF OLDER ADULTS IN VILLAGE PROGRAMS

Qiuchang (Katy) Cao,¹ Christine Happel,² Katie White,³ and Holly Dabelko-Schoeny,⁴ 1. *The Ohio State University, Columbus, Ohio, United States*, 2. *Clintonville-Beechwood Community Resources Center, Clintonville-Beechwood Community Resources Center, Ohio, United States*, 3. *Ohio State University, Age-Friendly Columbus and Franklin County, Ohio, United States*, 4. *The Ohio State University, The Ohio State University, Ohio, United States*

Villages are consumer-driven programs supporting older adults to age in their own homes while staying socially connected through service referrals, coordination, and the organization of social activities. Although previous studies demonstrated an increase of perceived social support among Village members over time, few studies tested how Village membership influence older adults' loneliness. To address

this gap, a total of 112 members from four Village programs in a Midwest Metropolitan area completed a cross-sectional pilot survey on their social well-being between January and March 2020. The age of participants ranged from 51 to 92 years old ($M=72.30$, $SD=8.38$), over 74% of participants were female and over 88% of participants identified as White/Caucasian. The relationship between the 20-item UCLA loneliness scale and length of Village membership was roughly linear according to the Loess Curve. The scores of the UCLA scale range from 20-80 and higher scores indicate higher loneliness. The Cronbach's alpha of the UCLA loneliness scale was 0.86 in the sample, indicating good internal consistency. The average loneliness score of the sample was 38.45, resembling the average of community-living older adults. Regression results suggested that a one-year increase in village membership was associated with approximately two points reduction in loneliness, holding all else constant. Being female, a racial/ethnic minority, retired, a driver, and having higher frequencies of socializing with friends and neighbors were associated with lower levels of loneliness among Village members. This pilot study provides initial support for the social impact of Villages and informs future larger sample longitudinal studies.

Session 1145 (Symposium)

SOCIAL ISOLATION AND WELL-BEING AMONG MIDDLE-AGE AND OLDER ADULTS: BEFORE AND DURING THE COVID-19 OUTBREAK

Chair: Lydia Li

This symposium brings together five studies that examined the relationship between social isolation and well-being. Two used pre-COVID data from the Health and Retirement Study (HRS). One aimed to identify patterns of social isolation trajectory in a 9-year period, where social isolation was conceptualized as a multidimensional construct. It identified four distinct patterns, and the pattern had a gradient relationship with health outcomes. Another examined the association between self-perceptions of aging (SPA) and social well-being among older adults. It found that positive SPA predicted increased social connectedness and reduced loneliness in four years. Two other studies were based on a longitudinal survey (COVID-19 Coping Survey) that began in April 2020. One reports that adults 55+ with comorbidity at pandemic onset had persistently elevated depressive symptoms in a 6-month period, regardless of their social isolation level. Another paper suggests that physical isolation at pandemic onset was associated with elevated symptoms of depression, anxiety, and loneliness throughout the following six months. The fifth paper was based on two-wave data—2019 survey and 2020 COVID supplement—from the National Aging and Health Trend Study (NAHTS). It found that older adults who were very socially isolated and completely homebound before the pandemic experienced less psychological distress during the outbreak than those who were very socially integrated and not homebound. The five studies highlight the multiple dimensions of social isolation, their antecedents and development over time, and their role in shaping mental health in a pandemic context.

SOCIAL ISOLATION PATTERNS AND HEALTH OUTCOMES IN MIDLIFE AND LATER LIFE

Meng Sha Luo, *Zhejiang University, Hangzhou, Zhejiang, China (People's Republic)*

Conceptualizing social isolation as a multidimensional construct encompassing social networks, social contacts, perceived support and loneliness, this research aims to: (1) identify patterns of social isolation trajectory among middle-aged and older adults in the U.S.; (2) investigate how different patterns of social isolation trajectory are related to adults' physical, mental, cognitive, and overall health. Latent class growth modeling was used to examine social isolation trajectory patterns over nine years in a national sample of 6,457 adults aged 51+. Four patterns of social isolation trajectory were identified: severely isolated, moderately isolated, subjectively integrated, and objectively integrated. The objectively integrated group reported the best physical, mental, cognitive, and overall health, whereas the severely isolated group reported the worst. The moderately isolated and subjectively integrated groups fell in between, with the latter displaying relatively better health outcomes. Findings support a close relationship between poor health and long-term social isolation.

EFFECTS OF SELF-PERCEPTIONS OF AGING ON SOCIAL DISCONNECTEDNESS AND LONELINESS IN OLDER ADULTS

Rita Xiaochen Hu, *Social Work, Ann Arbor, Michigan, United States*

Research shows that self-perceptions of aging (SPA) predict physical, mental, cognitive, and emotional well-being in older adults. Few studies have examined SPA's effects on social well-being. Using data from the 2014–2018 Health and Retirement Study, we examined SPA's effects on older adults' social connectedness and loneliness (age 65+, $N = 3,808$). SPA was measured by eight items. Social connectedness was operationalized by network size, social contact, and social participation. The UCLA Loneliness Scale assessed loneliness. Linear regression results show that more positive SPA is correlated with increased social connectedness ($b = 0.05$ $SE = 0.01$ $p = 0.0003$) and decreased loneliness ($b = -0.09$ $SE = 0.02$ $p < 0.0001$) in four years, controlling for sociodemographic and health characteristics. Further, loneliness is a mediator between SPA and social connectedness. Findings suggest that older adults with negative SPA are at risk of both objective and subjective social isolation.

ASSOCIATIONS BETWEEN COMORBIDITY AND DEPRESSIVE SYMPTOMS DURING COVID-19: VARIATION BY SOCIAL ISOLATION?

Jianjia Cheng,¹ and Lindsay Kobayashi,² *1. School of Public Health, Ann Arbor, Michigan, United States, 2. University of Michigan, Ann Arbor, Michigan, United States*

Adults with comorbidities are at high COVID-19 risk and may experience elevated depressive symptoms during the pandemic. We aimed to investigate the associations between comorbidity at pandemic onset and subsequent depressive symptoms and whether social isolation modified

this association. Data were from monthly online questionnaires in the COVID-19 Coping Study of US adults aged ≥ 55 from April/May-September/October 2020 ($n=4,383$). Depressive symptoms were measured by the 8-item CES-D, and social isolation as “high” vs. “low” based on contact with family, friends, social organizations, and living alone. In multivariable mixed-effects models, comorbidity (≥ 2 vs. < 2 chronic conditions) was associated with greater depressive symptoms at baseline ($\beta=0.50$; 95% CI: 0.36-0.64), this association varied negligibly by social isolation. Differences in depressive symptoms by comorbidity status at pandemic onset were consistent over the six-month follow-up. This study indicates that middle-aged and older US adults with comorbidities experienced persistently elevated depressive symptoms during the COVID-19 pandemic.

PHYSICAL ISOLATION AND MENTAL HEALTH AMONG OLDER U.S. ADULTS IN THE COVID-19 COPING STUDY

Carly Joseph,¹ Brendan O'Shea,² Jessica Finlay,² and Lindsay Kobayashi,² 1. *Central Michigan University, Ann Arbor, Michigan, United States*, 2. *University of Michigan, Ann Arbor, Michigan, United States*

The ongoing COVID-19 pandemic has set an urgent need to understand the impact of physical isolation on mental health. We aimed to investigate the relationships between physical isolation during the period when many US states had shelter-in-place orders (April-May 2020) and subsequent longitudinal trajectories of mental health in middle-aged and older adults (aged 55+, $N=3,978$) over a six-month follow-up (April to October 2020). We used population and attrition-weighted multivariable linear mixed-effects models. At baseline, 7 days/week of physical isolation (vs. 0 days/week) was associated with elevated depressive symptoms ($\beta=0.82$; 95% CI: 0.04-1.60), and all of 1-3, 4-6, and 7 days/week of physical isolation (vs. 0 days/week) were associated with elevated anxiety symptoms and loneliness. Physical isolation was not associated with changes in mental health symptoms over time. These findings highlight the need to prioritize opportunities for in-person connection for middle-aged and older adults when safe to do so.

PRE-PANDEMIC SOCIAL ISOLATION: PROTECTION OR VULNERABILITY IN THE TIME OF COVID?

Lydia Li, *University of Michigan, Ann Arbor, Michigan, United States*

How do older adults at risk of social isolation before the pandemic fare during the COVID-19 outbreak? Using data from two waves (Round 9 [2019] and COVID-19 Supplement) of the National Health and Aging Trend Study (NHATS), we examined the relationship between pre-pandemic social isolation and psychological distress during the outbreak among community-living older adults (age 65+). Results show that the most socially integrated respondents had more PTSD ($\beta=1.47$, $SE=.37$, $p<.001$) and depression/anxiety ($\beta=.34$, $SE=.11$, $p=.002$) symptoms than the most isolated. Older adults who were not homebound had more PTSD ($\beta=2.0$, $SE=.76$, $p=.01$) and depression/anxiety ($\beta=1.05$, $SE=.20$, $p<.001$) than the completely homebound. With shelter-in-place and social distancing requirements, older adults who have been socially active and integrated may experience high-stress

levels and may need extra support to adjust to the changes. Relatively, those who have been very isolated and homebound may experience fewer changes in their lives.

Session 1150 (Paper)

Social Participation

EXPERIENCE DESIGN STUDIO FOR SOCIAL CONNECTION OF OLDER ADULTS

Cheryl Der Ananian,¹ G. Mauricio Mejía,¹ and Brad Doebbeling,² 1. *Arizona State University, Phoenix, Arizona, United States*, 2. *College of Health Solutions, Arizona State University, Phoenix, Arizona, United States*

Social isolation and loneliness are pressing health concerns in older adults, likely exacerbated by social distancing guidelines enacted during COVID-19. Creating effective interventions to address health issues is challenging. Design is an alternative approach to create innovative interventions and to test their preliminary potential. In the present case study, we describe the processes and outcomes of a four-week project in a graduate design studio. Students were asked to develop a prototype for an intervention using digital technologies to increase social connectedness among older adults. This was an interdisciplinary process guided by faculty with expertise in design (Mejía), healthcare redesign (Doebbeling), and gerontology (Der Ananian). In the first week, the faculty helped the students understand the design goals, the implications of social isolation and loneliness, and technology use in older adults. In the second week, students conducted user interviews. In the third week, students set the problem by defining a specific potential audience and context. They also prototyped two preliminary concepts using storyboards and received feedback from the faculty. In the last week, students presented refined prototypes with storyboards, user flows, and interface mockups. Student design ideas included an audio story-sharing app that facilitates conversations and new friendships, an assistance digital service for immigrant older adults that need support with language or cultural challenges, and an art and crafts subscription service with a sharing platform to connect older adults with similar interests. The students' design projects provided innovative technological approaches for improving social connections and could be used in future R&D.

LATE WORKING LIFE PATTERNS IN SWEDEN

Gülin Öylü,¹ Susanne Kelfve,² and Andreas Motel-Klingebiel,³ 1. *Linköping University, Norrköping, Ostergötlands Lan, Sweden*, 2. *Linköping University, Norrköping, Ostergötlands Lan, Sweden*, 3. *Linköping University, Linköping University, Ostergötlands Lan, Sweden*

Late working life patterns differ across different social groups and birth cohorts. The mechanisms of these participation differences and role of working life policies can be understood better by using additional working life indicators and historical perspective. This paper investigates how late working life patterns of different age, gender, education groups and birth cohorts are structured in Sweden using participation, employment type, employment break and exit trajectories of different groups. Using Swedish National

Registry Data, employment trajectories of the age groups of 60–68 of the birth cohorts 1930, 1935, 1940, 1945 and 1950 are followed. Results show that for all birth cohorts, participation is higher for younger age groups, men and higher educated; leaving the working life before 61 is more common among primary educated; changing employment type in late working life is observed more among higher educated men and usage of sickness compensation is higher among primary educated and women. However, the peak age that individuals exit, and experience employment breaks differs over the years. In addition, although higher educated individuals have lower shares in usage of unemployment and sickness compensation for all birth cohorts, the structure of benefits usage of the other education and gender groups change over the years. Overall, results give important insights how changes in working life policies affect working life patterns of different groups over the years.

POLITICAL CONTEXT AND POLITICAL PARTICIPATION ACROSS THE LIFESPAN IN AFRICA

Eugene Dim, and Markus Schafer, *University of Toronto, Toronto, Ontario, Canada*

Gerontologists have long documented how age is associated with political participation. However, few studies have considered how macrocontextual factors shape participation across the life span. Moreover, very few studies have dealt with political engagement and aging in emerging democracies, including those in Africa. This study addresses those gaps, integrating the most recent three waves of Afrobarometer survey data (2011–2018) with country-level data from the freedom house (i.e. freedom index). Findings reveal that, at the individual level, an age gap widens for engagement in protests and shrinks for electoral and non-electoral political participation. When the political context is considered, however, we find that political freedom softens the drop-off of protest behavior at later ages. For electoral and non-electoral political participation, we find that freer countries lessen the expected growth in engagement across the life span. The study implies that political oppression shapes the links between age and political behaviour, but the processes seem different depending on whether they are engaging in risky (where the age gap widens) or non-risky (where the age gap shrinks) political forms of engagement.

PROTECTIVE AND EXACERBATING COGNITION AND ATTRIBUTION FACTORS FROM THE COGNITIVE DISCREPANCY THEORY OF LONELINESS

Jillian Minahan Zucchetto, *Fordham University, New York, New York, United States*

According to the cognitive discrepancy theory, although the discrepancy between actual and desired social resources may result in loneliness, Perlman and Peplau (1998) suggested that cognitive processing and attributional style also impact the interpretation of social information. Previous empirical research investigating predictors of loneliness have not assessed a wide range of cognition and attribution factors, so this study filled this gap by examining how protective (optimism, sense of mastery, and purpose in life) and exacerbating (depression, control constraints, negative self-perceptions of aging (SPA), and experiences of age-based discrimination) factors influence and moderate the experience

of loneliness cross-sectionally and longitudinally using a sample of 3,345 Americans aged 50 years and older from the 2008 and 2012 waves of the Health and Retirement Study. Optimism (β s = -.15, -.13), mastery (β s = -.08, -.07), purpose in life (β s = -.19, -.18), depression (β s = .22, .14), control constraints (β s = .18, .17), negative SPA (β s = .13, .14), and experiences of ageism (β s = .07, .06) were significantly related to loneliness cross-sectionally and longitudinally, respectively. Optimism buffered the negative impact of poor functional social resources (e.g., low social support) on loneliness cross-sectionally while control constraints, negative SPA, and experiencing ageism exacerbated the relationship between low functional social resources and loneliness cross-sectionally. None of the protective or exacerbating factors modulated the relationship between functional social resources and loneliness longitudinally. These findings have important implications for the development of interventions that target loneliness. Targeting maladaptive cognitions may be particularly effective in reducing loneliness.

THE ROLE OF COMMUNITY SUPPORT AND SOCIAL NETWORKS AMONG MARGINALIZED GROUPS IN LATER LIFE

Samuel Van Vleet, *Miami University, Oxford, Ohio, United States*

As the aging population in the United States continues to grow, so does the need for advancement and critical research to better understand later life experiences. The presence of cumulative disadvantages among racial minorities can often lead to later life health disparities. The goal of this study is to assess the role that social networks and community support play in later life health for marginalized communities. Data from the National Health and Aging Trends Study were analyzed using general linear regression techniques. This allowed for better understanding into the relationships between community support, social networks, race/ethnicity and self-reported health. The final sample included 3,857 participants aged 65 and older. After controlling for other variables, community support and social networks had statistically significant positive relationship with later life health. Race/ethnicity was the strongest predictor of worse later life health. The results of this study show the importance of later life social support for predicting health scores. White participants not only maintained higher health scores as compared to Black and Hispanic participants, but they also reported higher levels of social networks and community support. Findings from this study help build upon the literature regarding community support and social networks in later life.

Session 1155 (Paper)

Technology Use and Applications

A LONGITUDINAL STUDY OF OLDER ADULTS' ACCEPTANCE OF ROBOT COMPANIONS AND THEIR EFFECTS ON WELL-BEING

Claudia Rebola,¹ and Bertram Malle,² 1. *University of Cincinnati, Cincinnati, Ohio, United States*, 2. *Brown University, Brown University, Rhode Island, United States*

Robotic animal-like companions for older adults are promising technologies that have shown to have health benefits, especially for individuals with dementia, and good adoption rates in some previous studies. Our project, Affordable Robotic Intelligence for Elderly Support, aims to design new capabilities for companionship and smart care, but at high affordability. In a 6-month longitudinal study of baseline acceptance and well-being, we assessed the impact of an Ageless Innovation Joy for All™ robotic pet on user acceptance and emotional well-being (depression, loneliness, positive emotions). Nineteen participants from independent and assisted living facilities completed three standardized in-person surveys, each 3 months apart, including the CES-D, measures of Loneliness, Emotions, Attitude towards Technology (ATI), and various measures of evaluation of and engagement with robotic technology. The measures showed modest to very good reliability and meaningful construct validity. Participants in this sample showed little depression or loneliness, and these levels did not further decrease over the six months. People welcomed the pet and expressed positive evaluations of it, and these sentiments were stable over time. Attitudes toward technology varied but were unrelated to well-being measures and to robot evaluations. Our current conclusion, on the basis of a small sample, is that the selected robotic pet companion is appreciated and seen as beneficial, and for adults who are already low in depression and loneliness, the robot companion helps maintain the adult's emotional well-being but does not further increase it.

ASSOCIATIONS BETWEEN ACTIGRAPHY-ASSESSED HEALTH BEHAVIORS AND COGNITIVE PERFORMANCE IN OLDER ADULTS

Alex Laffer,¹ Hilary Hicks,¹ Genna Losinski,¹ and Amber Watts,¹ *University of Kansas, Lawrence, Kansas, United States*

Lifestyle behaviors are important determinants of healthy brain aging. Research has not fully explored how sleep quality and physical activity may differentially influence specific domains of cognitive function. The present study aimed to estimate the relative influence of sleep quality and physical activity on cognitive performance in three domains in a sample of older adults. Older adults (ages 60-89, $M = 74.74$) without cognitive impairment ($N = 160$) wore an accelerometer for 7 days in a free-living environment. We used average vector magnitude counts per minute to measure total physical activity (TPA), and average wake after sleep onset (WASO) to measure sleep quality. We created cognitive composite scores (executive function, attention, and verbal memory) from neuropsychological data using confirmatory factor analysis. We regressed cognitive scores onto TPA and WASO with age and education entered as covariates. Higher amounts of physical activity and better sleep quality were associated with better executive function ($R^2 = 20.3\%$, $F(4, 155) = 11.12$, $p < .001$). Neither physical activity nor sleep quality was associated with verbal memory or attention. Results suggest that more physical activity and improved ability to stay asleep may benefit executive function, but not other cognitive domains. Future studies should clarify the interaction and mechanisms of action between health behaviors and cognitive performance in older adults.

INTERNET USE AND COGNITIVE FUNCTIONING IN LATER LIFE: FOCUS ON ASYMMETRIC EFFECTS AND CONTEXTUAL FACTORS

Yijung Kim, and Sae Hwang Han, *1. The University of Texas at Austin, Austin, Texas, United States*

Despite the emerging literature linking information communicative technology (ICT) use and cognitive functioning in later life, whether the association varies as a function of social environment and birth cohort remain an open question. Using nine waves of panel data from the U.S. Health and Retirement Study (2002-2018), we examined within-person asymmetric effects of transitioning into and out of Internet use on cognitive functioning, and whether the associations vary depending on living arrangement and across birth cohorts. Results from the multilevel models indicated that transitioning into Internet use was associated with improved cognitive functioning at a given wave and decelerated cognitive decline over time. Similarly, ceasing to use the Internet was associated with worse cognitive functioning and accelerated cognitive decline. Further, such linkages between Internet use and cognitive functioning were moderated by living arrangement and birth cohort. The detrimental effect of ceasing Internet use was worse for those older adults who live alone. Transitioning into and out of Internet use was unrelated to changes in cognitive functioning among recent HRS cohorts, namely, the War Babies (b:1942-47) and Early Baby Boomers (b:1948-53). These findings highlight the interplay between technology, social environment, and cognitive functioning in later life. The salubrious effects of adopting an ICT technology, such as the Internet, as well as deleterious effects of ceasing to use such technology, underscores the importance of promoting digital literacy and access to ICT technologies among the older adult population.

MOTOR BEHAVIOR CHANGES ARE PREDICTIVE OF ACUTE EVENTS IN SKILLED NURSING

Mary (Libbey) Bowen,¹ Meredith Rowe,² Pamela Cacchione,³ and Ming Ji,² *1. University of Delaware School of Nursing & Cpl. Michael J. Crescenz VA Medical Center, Newark, Delaware, United States, 2. University of South Florida, Tampa, Florida, United States, 3. University of Pennsylvania, University of Pennsylvania School of Nursing, Pennsylvania, United States*

Background: Common acute medical conditions among older adults with dementia in skilled nursing include falls, delirium, and pneumonia. This study utilized a sensor technology to examine how motor behaviors may predict these acute events. Methods: Radio frequency identification (RFID) technology continuously measured time and distance travelled, gait speed, and continuous walking with little/no breaks (paths) across 3 long-term facilities for up to 1 year ($N = 51$). Change point analysis estimates the probability of whether a sudden change occurred and provides the location of the change point (in days prior to the event) in a time series model. Results: Gait speed had very low probability to detect a change point across all events (22 falls, 10 delirium and 8 pneumonia). Sensitivity estimates ranged from 63% (number of paths) to 90% (distance travelled) for a fall; 37.5% (number of paths) to 100% (rest of the motor behaviors) for pneumonia. Except for gait speed, all other motor behaviors had high probability (100%) to detect a delirium change

point. There was intra-individual variability in the location of the change points (mean of 10 days). Linear regression models for time and distance travelled using baseline predictors of age, ethnicity, gait and balance explained 89% and 90% of the variance in change point locations. Conclusions: Prior to an acute event there is a significant change in motor behavior, suggesting these are an early signal that may be used to prevent a fall or provide for the earlier recognition and treatment of delirium and pneumonia.

PRELIMINARY EFFICACY OF AN MHEALTH MINDFULNESS INTERVENTION WITH CAREGIVERS OF OLDER ADULTS WITH MCI OR DEMENTIA

Elissa Kozlov,¹ Danielle Llaneza,² Xinqi Dong,³ and Paul Duberstein,⁴ 1. *Rutgers University, Piscataway, New Jersey, United States*, 2. *Rutgers University, New Brunswick, New Jersey, United States*, 3. *Rutgers University, Rutgers Institute for Health, New Jersey, United States*, 4. *Rutgers University School of Public Health, Piscataway, New Jersey, United States*

Decades of research have documented the negative effects of caregiving on unpaid caregivers. Caregivers are more likely to suffer from high levels of stress and anxiety, and caregivers of older adults with dementia are at especially high risk. Mindfulness Therapy (MT) is a promising, non-pharmacological technique with proven efficacy and effectiveness in managing stress and anxiety in diverse populations. Mindfulness Coach is an m-health delivered mindfulness therapy intervention developed by the Veterans Affairs National Center for PTSD. The objective of this paper is to report the preliminary efficacy of an 8-week pilot trial of mHealth-delivered mindfulness therapy to alleviate anxiety and caregiver stress in caregivers of persons with dementia. Sixty caregivers of patients with mild cognitive impairment or dementia were recruited to participate in this single group pre-post design study. After receiving an orientation to using the app, participants were instructed to use the app daily to learn about and practice mindfulness skills. At the end of the 8 weeks, there was a significant reduction between baseline anxiety on the Hospital Anxiety and Depression Scale Anxiety subscale (mean = 14.45, SD = 3.36) 15.42, SD = 3.12) and 8 weeks (mean = (t(55)=2.6, p=.012) and perceived stress measured by the perceived stress scale at baseline (mean = 23.59, SD = 3.99) and 8 weeks (mean = 21.12, SD = 3.09), (t(56)=5.94, p<.001). This study offers preliminary evidence that mHealth Mindfulness Therapy strategies may help caregivers manage the stress and anxiety associated with caregiving.

Session 1160 (Symposium)

THE LONG AND WINDING ROAD: EARLY YEARS OF THE ACCREDITATION FOR GERONTOLOGY EDUCATION COUNCIL

Chair: Robert Maiden

Co-Chair: Donna Schafer

The long road of establishing an accreditation entity began in August 2010 when the AGHE Accreditation Task Force was convened. After numerous meetings complete with loud and vigorous debates, AGECE, the Accreditation

for Gerontology Education Council emerged in 2016. Over the subsequent years, the Standards hit the hard road of reality leading to various revisions to the Handbook. The symposium's first presentation concerns the history of AGECE and its further development into an independent entity. The key purpose of AGECE is assuring gerontology programs educational quality and enhancement governed by the principle of self-evaluation and peer review that engenders trust. The next presentation discusses the marketing aspect of AGECE built on getting feedback from the public. One of the outcomes of conducting focus groups and surveying the public is the discovery that prospective students really see the value of accreditation. The penultimate presentation focuses on refinements to procedures alluded to in the first presentation in response to the feedback received in meeting with institutions and faculty about what accreditation offers to students, stake-holders, and ultimately the older adults served by the graduates in the work force. The key goal is to clarify the expectations and simplify the application process. On no other issue has more time been spent than on the assessment of students' competency. Our last presentation explains competency-based education consisting of well-articulated student learning outcome measures that are consonant with the program's mission that lead to "closing the loop" of continuous and durable improvements in the learning environment.

REFINING THE LOOP OF CONTINUOUS IMPROVEMENT

Robert Maiden,¹ and Jan Abushakrah,² 1. *Alfred University, Alfred, New York, United States*, 2. *Portland Community College, Portland, Oregon, United States*

Academic assessment of student competency is essential to measure learning within a gerontology program. In its self-evaluation, a program must assess its student learning outcomes. JoAnn Damron-Rodriguez et al. (2019, p. 423) proposed a systematic approach that has several levels. The key is to utilize a competency-based education model. Moreover, to satisfy workforce goals the gerontology program must adopt the AGHE competencies that reflect the knowledge, skills, and attitudes necessary to serve older adults at an acceptable level of care. The next step involves generating well-articulated quantitative or qualitative measures of student learning outcomes (SLOs) consistent with the program's mission statement that include twelve competency domains. SLO measures include test grades, assignments, projects, portfolios, field experiences, essay questions, multiple choice items, and so on. The program's enhancement loop requires the evaluation of SLOs, faculty discussion of them, and a continuous modification cycle "closing the loop" to reach the program's goals.

GOOD TROUBLE ALONG THE WINDING ROAD: DISRUPTION AND ACCOMPLISHMENT

Harvey Sterns,¹ and Joseph Ruby,² 1. *The University of Akron, Akron, Ohio, United States*, 2. *Joe Ruby Consulting, Akron, Ohio, United States*

The establishment of a accreditation body for gerontology degree programs was seen as disruptive. Many key leaders were against creating such a body and wanted this to be delayed or to never happen. In 2012, the AGHE

Accreditation Task Force was established with a Competency Work Group and an Organization Work Group. There have been 5 programs evaluated with a number of schools/university currently in process. The task force filed documents for creating a legal entity and obtaining non-profit status for the new Accreditation for Gerontology Education Council. The Task Force developed the dimensions for program evaluation based on the Competencies and shared information with AGHE members. The Task Force obtained start-up funding for the organization and identified the first programs for accreditation and has been providing outreach and guidance to new programs. There is continual refinement of the process.

IF YOU BUILD IT, WILL THEY COME?: GETTING THE WORD OUT ABOUT GERONTOLOGY ACCREDITATION

M. Aaron Guest,¹ and Phillip Randall,² 1. *Arizona State University, Phoenix, Arizona, United States*, 2. *The Thorndike Group, Minneapolis, Minnesota, United States*

The development of AGECE introduced a new facet to gerontological education: accreditation. The presence of such a new organization requires continuing marketing and education. Throughout its first three years, AGECE has continually worked to provide information and to differentiate between accreditation and credentialing for the broader community. Through informal and formal feedback processes, including focus groups and interviews, AGECE has refined its message and delivery. While schools and departments of Gerontology remain the decision-makers behind seeking accreditation, students have become one of the largest drivers and constituencies AGECE engages as they seek clarification on and the availability of accredited programs of Gerontology. Prospective students, many coming from the health sciences, see the value of accreditation. Furthermore, emerging and international programs see accreditation as an opportunity to engage the field. There is an opportunity to further refine the messages around accreditation and differentiate among the organizations active in gerontological education.

REFINING THE CONTENT OF THE AGECE ACCREDITATION HANDBOOK

Donna Schafer,¹ and Donna Weinreich,² 1. *National Association for Professional Gerontologists, Healdsburg, California, United States*, 2. *Western Michigan University, Plainwell, Michigan, United States*

The AGECE Accreditation Handbook and Self-Evaluation Guide has been revised several times since the first drafts were produced in 2016 and 2017. The Handbook contains information for accreditation applicants, AGECE reviewers, and members of the Board of Governors responsible for administering AGECE policies and procedures. It includes the accreditation standards, eligibility for accreditation, timelines, and self-study and site visit guidelines. It is the central document for the AGECE accreditation process. Handbook revisions, drawn from the experience of accrediting programs, have been for the purposes of clarifying expectations and simplifying the application process. This presentation highlights modifications included in the 2020 Handbook, which simplify the self-study outline and site visit guidelines, and the 2021 modifications, which clarify the "Mapping Course Matrix" (displaying AGHE competencies covered in program courses) and add an "Assessment Matrix"

for measuring acquisition of the competencies and improving the program as needed.

Session 1165 (Symposium)

THE RELATIONSHIPS BETWEEN PHYSICAL ACTIVITY BEHAVIOR, DAILY EXPERIENCES, AND WELL-BEING IN EVERYDAY LIFE

Chair: Erica O'Brien

Co-Chair: David Almeida

Discussant: Christiane Hoppmann

A physically active lifestyle has several health benefits in both the short- and long-term. This includes higher levels of emotional and psychological well-being and, in many cases, maintained well-being despite stressful experiences that can have countervailing, negative impacts on health. This symposium presents innovative research that (a) links physical activity to positive and negative events or experiences in middle-aged and older adults, and that (b) uses different assessment and analytical techniques to unpack these links on multiple timescales – between moments, days, and years. Lee and colleagues investigate the influence of daily positive experiences on the likelihood and extent of physical activity. O'Brien and Almeida examine how daily stressor experiences predict engagement in different intensities of physical activity and highlight moderating factors such as perceived stressor control. Lastly, Benson and colleagues report on whether the potential for daily physical activity to protect against negative stressor responses differs with age and changes across the adult lifespan. Together, these papers consider the nature and mechanisms of the relationship between physical activity and everyday experiences (e.g., stressors and positive events). They also underscore the importance of assessing relationships on different timescales to obtain a clearer understanding of intrapersonal and developmental processes. As discussant, Hoppmann will assess the strengths and limitations of these papers, elaborate on underlying and overarching themes, and identify future directions in this field.

POSITIVE EVENTS AND PHYSICAL ACTIVITY IN DAILY LIFE FOR MIDDLE-AGED AND OLDER ADULTS

Sun Ah Lee,¹ Lizbeth Benson,² Erica O'Brien,³ David Conroy,⁴ and David Almeida,³ 1. *The Pennsylvania State University, University Park, Pennsylvania, United States*, 2. *The University of Oklahoma Health Sciences Center, United States*, 3. *Pennsylvania State University, University Park, Pennsylvania, United States*, 4. *Pennsylvania State University, University Park, Pennsylvania, United States*

Previous studies reveal that positive affective well-being is positively associated with physical activity. The present study extends this work by examining the relationship between positive events and physical activity in daily life. Participants (N=1,016, ages 43-90, 56% women) from the third wave of the National Study of Daily Experiences reported their experiences of positive events and physical activity in eight daily diary interviews. Results from multilevel model analyses showed that on days when participants experienced more positive events than usual, they were more likely to engage in physical activity and reported engaging in greater

physical activity than usual. Further, participants who experienced more positive events on average across the study period also reported engaging in greater daily physical activity. These results were invariant across age. Our findings highlight the importance of naturally-occurring positive experiences in daily life across middle- and later adulthood.

WALKING IT OFF: MORE STRESSORS AND PERCEIVED STRESSOR CONTROL PREDICT MORE PHYSICAL ACTIVITY IN DAILY LIFE

Erica O'Brien, and David Almeida, *Pennsylvania State University, University Park, Pennsylvania, United States*

Research shows that, while the experience of stress relates to lower levels of physical activity (PA), people who perceive a greater sense of control engage in higher levels of PA. This study explores whether a sense of control specifically over stressful situations moderates the negative association between stressor exposure and PA in daily life. We used 8-day diary data from up to 1,236 participants (Age: Range = 43-91, M = 62.47, SD = 10.20) in the National Study of Daily Experiences. Somewhat contrary to hypotheses, people reported spending more time on light PA (but not moderate-to-vigorous PA) on days when they also experienced more stressors than usual. Perceived stressor control appears to magnify this effect, with people reporting even more light PA on days when they feel greater control. Initial findings suggest that a physically active lifestyle may help middle-aged and older adults cope with daily stressors.

ACCELEROMETRY-BASED PHYSICAL ACTIVITY AND AFFECTIVE RESPONSES TO DAILY STRESSORS: AN ANALYSIS OF THE AAPECS STUDY

Eli Puterman,¹ Benjamin Hives,² A. Janet Tomiyama,³ Carissa Low,⁴ Geralyn Ruissen,² Mark Beauchamp,² and Aidan Wright,⁴ 1. *University of British Columbia, University of British Columbia, British Columbia, Canada*, 2. *University of British Columbia, Vancouver, British Columbia, Canada*, 3. *University of California Los Angeles, Los Angeles, California, United States*, 4. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

Evidence suggests that physical activity on a daily basis dampens the extent to which one experiences elevations in negative affect in response to daily stressors. Yet, these studies primarily relied solely on end-of-day recall of stressors and negative affect, and self-reported physical activity. More intensive assessments throughout the day and accelerometry-based physical activity measurements are required to answer whether any type of body movement (e.g. light, moderate, vigorous) reconfigures the end-of-day recall of the intensity of the affective experience of a stressor or, rather, mitigates the actual experience of a stressor in real-time. This presentation will summarize results addressing this question using data from the University of Pittsburgh's Assessment of Personality, Ecological Context, and Stress (AAPECS) study. AAPECS includes 172 participants who wore accelerometers to assess movement-based activities and completed ecological momentary assessment 6 times daily for 14 days, with additional 'bursts' of affective assessments following reported stressors at any time.

AGE-RELATED CHANGE IN THE EXTENT PHYSICAL ACTIVITY ATTENUATES NEGATIVE AFFECT REACTIVITY TO STRESSORS IN DAILY LIFE

Lizabeth Benson,¹ Nilam Ram,² David Conroy,³ Zita Oravec,³ Timothy Brick,³ and David Almeida,³ 1. *The University of Oklahoma Health Sciences Center, United States*, 2. *Stanford University, Stanford, California, United States*, 3. *Pennsylvania State University, University Park, Pennsylvania, United States*

Theories suggest that with increasing age, adults more effectively regulate their emotions and seek to limit high physiological arousal. Prior research indicates physical activity attenuates negative affect reactivity to stress, but also increases physiological arousal. The present study extends prior work by examining age-related differences and changes over time in the extent of attenuation. Participants (n=3,484; MedianAge=53.42 years, SD=13.3; 56% female), from the National Study of Daily Experiences completed 8 end-of-day assessments of their negative emotions, stress, and physical activity across 3 measurement bursts spaced approximately 10 years apart. Results from three-level multilevel models suggest that when full random effects are specified, physical activity does not attenuate negative affect reactivity to stress. Additionally, extent of attenuation did not differ with age or change over time. Discussion pertains to how these findings advance theoretical understanding of socioemotional development and to methodological nuances of random effects and non-normally distributed data.

Session 1170 (Symposium)

A NEW TYPE OF COP: THE ROLE OF CIRCULATING OSTEOPROGENITOR (COP) CELLS IN HEALTH AND DISEASE

Chair: Gustavo Duque

Circulating osteogenic progenitor (COP) cells are a population of cells in the peripheral blood with the capacity for bone formation and broader differentiation into mesoderm-like cells in vitro. While some of their biological characteristics are documented in vitro, their role in the aging process and the pathogenesis of musculoskeletal diseases remains yet to be thoroughly evaluated. This translational session will go from bench to bedside, reviewing the current evidence on COP cells. In this session, we will provide an overview of the role of COP cells in the aging process and a number of physiological and pathological conditions and identify areas for future research. In addition, we will suggest possible areas for clinical utilization in the management of musculoskeletal diseases, which include novel diagnostic and therapeutic uses.

COP CELLS AND TISSUE LOSS SYNDROMES: FRAILITY, SARCOPENIA, AND OSTEOPOROSIS

Gustavo Duque, *The University of Melbourne, St Albans, Victoria, Australia*

COP cells have been identified as having a potential role in the pathogenesis of tissue loss syndromes such as osteoporosis and frailty. This is based on the hypothesis that their dysregulation may cause a decrease in bone and

muscle formation, which also increase the risk of adverse outcomes such as frailty and disability. Whereas high numbers of COP cells have been associated with osteoporosis and fracture healing, a low percentage of COP (%COP) cells have been associated with frailty and disability. In addition, low expression of lamin A (a protein of the inner nuclear envelope) in COP cells has also been associated with frailty and disability in older persons. In this session, the evidence on quantification methods for COP cells in clinical settings and the potential clinical use of COP cells in tissue loss syndromes will be discussed. This discussion will include current evidence supporting the use of COP cells as a biomarker or as a novel therapeutic approach to these age-related conditions.

COP CELLS IN STATES OF BONE ANABOLISM AND ABNORMAL CALCIFICATION/OSSIFICATION

Robert Pignolo, *Mayo Clinic College of Medicine, Rochester, Minnesota, United States*

Circulating osteogenic progenitor (COP) cells are a population of cells in the peripheral blood with the capacity for bone formation, as well as broader differentiation into mesoderm-like cells in vitro. There are several pathologies of accelerated bone formation and physiological responses to injury in which COP cells have been theorized to play a role. These include fracture, vascular calcification, and subtypes of heterotopic ossification (HO). Overall, the available studies suggest COP cells are likely to be mobilized in response to fracture, home to the site of injury, undergo a maturation process, and contribute to the osteogenesis and angiogenesis required for fracture healing. HO is the pathological process of bone formation in nonskeletal tissue and can be acquired or hereditary. COP cells may seed sites of injury and inflammation that precede the formation of endochondral bone identified in both genetic and nongenetic forms of HO. Vascular calcification is a common occurrence in older adults and is strongly associated with poorer cardiovascular health outcomes. It appears that COP cells, particularly those expressing hematopoietic and vascular markers such as CD45 and CD34, contribute to the calcification and ossification of atherosclerotic plaques and aortic valves, and that they correlate to the severity of the calcification. Whether COP cells are attracted to sites of injury and inflammation and so are highly associated with fracture, vascular calcification/ossification and HO, or whether they underlie these processes at a more mechanistic level, remains to be more clearly demonstrated.

THE BIOLOGY OF COP CELLS: MESENCHYMAL OF HEMATOPOIETIC?

Meghan McGee-Lawrence, *Medical College of Georgia, Augusta University, Augusta, Georgia, United States*

Circulating osteogenic precursor (COP) cells constitute a recently discovered population of circulating progenitor cells with the capacity to form not only bone but other mesenchymal tissues. A small but growing body of literature explores these cells, but with a great deal of disagreement and contradiction within it, mainly whether these cells are from mesenchymal or hematopoietic origin. This session will discuss the origins and biological characterization of these cells, including the identification strategies used to isolate these cells from the peripheral blood. It also examines the available

knowledge on the in vitro and in vivo behaviour of these cells in plastic adherence, differentiation capacity, proliferation, and cellular homing. We will also review the profound and exciting implications for future use of COP cells in clinical practice, particularly in comparison with other types of stem cells.

THE KYNURENINE PATHWAY METABOLITES QA AND KYNA INDUCE SENESCENCE IN BONE MARROW STEM CELLS THROUGH THE AHR PATHWAY

Dmitry Kondrikov,¹ Ahmed Elmansi,² Xing-ming Shi,³ Meghan McGee-Lawrence,⁴ Sadanand Fulzele,⁵ Mark Hamrick,⁵ Carlos Isales,⁵ and William Hill,²
 1. *Medical University of South Carolina, Medical University of South Carolina, South Carolina, United States,*
 2. *Medical University of South Carolina, Charleston, South Carolina, United States,* 3. *Augusta University, Augusta, Georgia, United States,* 4. *Medical College of Georgia, Augusta University, Augusta, Georgia, United States,*
 5. *Medical College of Georgia, Augusta, Georgia, United States*

Cell senescence is emerging as a critical factor in the pathophysiology of aging bone loss. We have shown that the essential amino acid tryptophan is metabolized by IDO-1 in the periphery to generate kynurenine (KYN), and that KYN can signal through the aryl hydrocarbon receptor (AhR) transcription factor pathway to inhibit osteogenesis in bone marrow MSCs via epigenetic regulation of osteogenic genes, while also upregulating osteoclastogenic transcription factors and genes driving osteoclast activity. Further, we recently showed that KYN acting via AhR inhibits MSC autophagy while inducing senescence. Here we demonstrate that KYN metabolites downstream from KYN act via the AhR signaling pathway to inhibit autophagy and induce SASP expression and drive senescence in murine and human bone marrow MSCs. We focused on two of these metabolites, quinolinic acid (QA) and kynurenic acid (KYNA) and investigated their effects on BMSC cellular function. We demonstrated that both kynurenine pathway metabolites QA and KYNA increase biomarkers for senescence including beta-galactosidase, p21/Cdkn1 and other SASPs such as PAI-1 and TIMP-2, as well as nuclear DNA damage leading to senescent markers like H2A Ser139 phosphorylation, and the accumulation of senescence-associated hetero chromatin foci (SAHF) with H3K9-me3 labeling. Then upon treatment with the AhR inhibitor 3'4'-DMF the disruption of autophagy and induction of senescent biomarkers was blocked. Like KYN, the effects of QA and KYNA were mediated through the AhR receptor. Therefore, this presents novel therapeutic targets linked to KYN metabolite signaling via AhR to prevent senescence and bone loss.

Session 1175 (Symposium)

A TRANSITIONAL CARE MODEL FOR VETERANS WITH COMPLEX NEEDS DURING COVID: THE BEHAVIORAL RECOVERY OUTREACH (BRO) TEAM

Chair: Kathleen Matthews

Discussant: Latrice Vinson

The Veterans Health Administration's Care for Patients with Complex Problems (CP)² Program developed a national

infrastructure to disseminate promising practice models to improve care for Veterans with complex medical, mental health, and/or neurocognitive conditions, who may also have behaviors disruptive to care. A strategic priority is improving safe and effective transitions to community care for Veterans with complex care needs, many of whom have historically been limited to VA settings as a result of behavioral concerns. The Behavioral Recovery Outreach (BRO) Team was the first model identified for national dissemination and evaluation at partner sites. Developed at VA Central Iowa, BRO is an interdisciplinary team model that identifies Veterans in long-term VA care settings with complex care needs to engage in individualized behavioral programming to manage/stabilize behaviors and safely transition them to more appropriate and less costly community settings. This symposium will describe the BRO team model, highlight the facilitators and barriers to nationally disseminating the BRO model with VA partner facilities, discuss adaptations in continuing community transitions following the COVID-19 pandemic, and describe program outcomes. The first speaker will discuss development of the BRO model and outcomes of a regional dissemination. The second speaker will present results from the program evaluation of the national dissemination. The final speaker will describe BRO Team expansion and lessons learned from the perspective of a VA partner facility. The (CP)2 Program Director will integrate findings and highlight implications for scaling and evaluating promising models for national dissemination for policy, practice, and future research.

EVALUATING IMPLEMENTATION OF THE BEHAVIORAL RECOVERY OUTREACH (BRO) TEAM: ONE YEAR OF IMPLEMENTATION

Jenefer Jedele,¹ Cameron Griffin,² Kathleen Matthews,³ and Latrice Vinson,⁴ 1. *Veterans Health Administration, Ann Arbor, Michigan, United States*, 2. *VA, Ann Arbor, Michigan, United States*, 3. *VISN 23, Des Moines, Iowa, United States*, 4. *Department of Veterans Affairs, Department of Veterans Affairs, District of Columbia, United States*

We present evaluation results after one year of implementation by nine BRO Teams. Monthly checklists documented consistent composition across teams: a psychologist, social worker and nurse. Social workers were recognized as having a critical role in implementation, serving as a referral source and liaison between the CLC, Veteran/family, and community facility. Early implementation focused on team and program development with barriers including unprotected time for Team members. In the first year, the nine teams enrolled 70 Veterans, discharging 86% to community facilities. Characteristics of the Veterans suggest Teams are reaching the complex Veteran targeted by the model. Barriers to successful discharge include community facility inexperience/training and confidence to manage complex residents. COVID emerged as the leading barrier to outreach to internal and external partners and providing transitional support to the Veteran after discharge. We discuss the impact of these preliminary findings on future implementation and dissemination of the model.

THE BEHAVIORAL RECOVERY OUTREACH (BRO) TEAM: A TRANSITIONAL CARE MODEL FOR VETERANS WITH COMPLEX CARE NEEDS

Kathleen Matthews,¹ Grant Bauste,² and Emily Luitjens,³ 1. *VISN 23, Des Moines, Iowa, United States*, 2. *Minneapolis VA Medical Center, Minneapolis, Minnesota, United States*, 3. *St. Cloud VA Health Care System, St. Cloud, Minnesota, United States*

In 2012, VA Central Iowa developed a novel program known as the Behavioral Recovery Outreach (BRO) Team to address unmet needs of our aging Veteran population with complex medical, psychological, neurocognitive and behavioral concerns. BRO Teams provide evidence-informed treatments in inpatient VA settings, and transitional care/support post-discharge to ensure successful placement and stability in the community. We will discuss how implementation science informed the expansion of this model from a local pilot to a nationally disseminated program. We will explore the challenges of ensuring program fidelity while fostering innovation and adaptation. Given the challenges of national dissemination, we will highlight the predicted and unforeseen aspects of program evaluation and policy implications. Finally, we will discuss the impacts of the COVID-19 pandemic on delivery of care methods and community-based interactions, as well as how this program has improved the lives and quality of care for this high-risk Veteran population.

ROLLING OUT BEHAVIORAL RECOVERY OUTREACH (BRO) TEAMS: PERSPECTIVES FROM AN INAUGURAL PARTNER SITE

Trisha Gaudig, *Sioux Falls VA, Sioux Falls, South Dakota, United States*

The Sioux Falls VA Community Living Center (CLC) is a partner site for the Behavioral Recovery Outreach (BRO) Team dissemination. This CLC is home to over 55 Veterans requiring a variety of specialty needs such as dementia care, short-term rehabilitation, respite, hospice, and/or psychosocial needs. Many of the Veterans followed by the BRO Team on the CLC experienced frequent rehospitalizations and difficult placement in the community due to behavioral concerns. Local leadership encouraged participation in the BRO Team dissemination due to the growing need in this VA system to open access to dementia and mental health care, successfully discharge Veterans to appropriate community settings, and reduce unnecessary rehospitalizations. This presentation will discuss BRO Team development, including several factors facilitating successful BRO Team implementation (e.g., leadership support, community outreach approaches, staff partner buy-in), and identify barriers impacting successful implementation with a case example to illustrate strategies to overcome such barriers.

Session 1180 (Symposium)

ADVANCING THE SCIENCE ON UNEXPECTED EPISODES OF CLARITY AND LUCIDITY IN PEOPLE WITH DEMENTIA

Chair: Joan Griffin

Discussant: Basil Eldadah

People with late-stage Alzheimer's disease and related dementias (ADRD) have been reported, largely by way of anecdote, to exhibit unexpected episodes of spontaneous, meaningful, and relevant communication or behavior. These episodes of lucidity (EL) are characterized by spontaneous mental clarity in people living with dementia (PLWD) who are assumed to have lost coherent cognitive capacity. Given the transient nature and limited understanding of underlying mechanisms responsible for this phenomenon, these episodes are frequently overlooked and have received little scientific attention. Few studies have documented EL among PLWD with precision; scientific understanding is limited to anecdotes and case studies, which have not operationalized EL. Thus, there is a critical need for an evidence-based understanding and systematic operationalization of EL. Precise and robust operationalizations of EL will allow future research to assess if EL has different effects on ADRD prognosis or alters how family members manage and adapt to ADRD progression in their care recipient. The National Institute on Aging (NIA) has funded six studies to advance the scientific understanding of EL in dementia. These studies use a variety of methodological approaches to capture EL experiences, and together, they will provide evidence-based operational definitions of EL, novel approaches for measurement of this phenomenon, and estimates of its prevalence. This symposium will provide an overview of the funded studies and three different methodological approaches that are being used to better operationalize and understand EL.

WHAT IS PARADOXICAL LUCIDITY?

Andrew Peterson,¹ and Jason Karlawish,² *1. George Mason University, George Mason University, Virginia, United States, 2. University of Pennsylvania, Philadelphia, Pennsylvania, United States*

In this presentation, I provide a conceptual background from which the other symposium speakers can describe detailed methods for investigating paradoxical lucidity (PL) in dementia. First, I outline the clinical and ethical significance of studying PL. Second, I describe how PL is understudied and so difficult to measure. A working definition of PL has been formulated from case reports, but aspects of this definition remain vague. I argue that this vagueness challenges the measurement of PL and the generalizability of study results. I conclude by proposing ways to address these problems.

EARLY DESCRIPTIONS OF FAMILY CAREGIVERS' EXPERIENCES WITH UNEXPECTED LUCIDITY

Kyungmin Kim,¹ Joan Griffin,² Lauren Bangerter,³ Virginia Biggar,⁴ Dawn Finnie,⁵ Theresa Frangiosa,⁴ Joseph Gaugler,⁶ and Maria Lapid,⁷ *1. Seoul National University, Seoul, Seoul-t'ukpyolsi, Republic of Korea, 2. Mayo Clinic College of Medicine, Rochester, Minnesota, United States, 3. UnitedHealth Group, Minnetonka, Minnesota, United States, 4. UsAgainstAlzheimer's, Washington, District of Columbia, United States, 5. Mayo Clinic, Rocheste, Minnesota, United States, 6. University of Minnesota, Minneapolis, Minnesota, United States, 7. Mayo Clinic, Rochester, Minnesota, United States*

To develop an operational definition of and typologies for episodes of lucidity (EL), we conducted a cross-sectional study of former/current family caregivers

from UsAgainstAlzheimer's A_LIST (N = 538). More than 60% of caregivers (n = 294, 62%) reported witnessing EL with their care recipient over the course of their dementia. Most episodes happened in late stages of dementia (71%). Only 10% happened within 7 days before death. The majority of episodes (71%) lasted <30 minutes. About half the episodes were characterized by uncharacteristic speech and communication. Caregivers perceived these experiences positively (M = 4.10; range = 1–5), but also expressed desire to know why/when EL occurs and how to best respond to it. Data will be used to refine definitions and typologies, and then a prospective, demographically diverse survey will be administered to family caregivers to assess predictors of EL, linking EL to caregiver well-being and bereavement response.

CHARACTERIZING EPISODES OF LUCIDITY IN DEMENTIA: OBSERVATIONAL AND APPLIED COMPUTATIONAL LINGUISTICS APPROACHES

Andrea Gilmore Bykovskyi,¹ Kim Mueller,¹ Nicole Werner,² Erica Smith,¹ Laura Block,¹ and Clark Benson,¹ *1. University of Wisconsin-Madison, Madison, Wisconsin, United States, 2. Industrial and Systems Engineering, Madison, Wisconsin, United States*

Though episodes of lucidity (EL) in Alzheimer's disease and related dementia (ADRD), reportedly more common near end of life, have significant implications for care, they are poorly understood due to underdeveloped methodological approaches for capturing and measuring these events. This prospective observational study addresses these gaps through audiovisual observation among persons with ADRD surrounding end of life to inform data-driven definitions for EL and distinguish EL from routine fluctuations in ADRD. Audiovisual observation is well-suited to addressing gaps in operationalization of EL, providing an objective data source to assess verbal and nonverbal communication, the primary means through which EL are evidenced. Our study is designed to establish optimal procedures for capturing audiovisual data of targeted populations and timeframes to maximize opportunities for detecting EL. Operationalization of EL will be informed by computational linguistic and behavioral-event coding of linguistic and non-linguistic communication features of EL and associated temporal qualities.

DEVELOPMENT OF A STAFF INFORMANT MEASURE OF LUCIDITY

Jeanne Teresi,¹ José Luchsinger,² Mildred Ramirez,³ Stephanie Silver,³ Davangere Devanand,⁴ Julie Ellis,⁵ Gabriel Boratgis,³ and Paloma Gonzalez-Lopez,³ *1. Research Division, HHAR, Riverdale, New York, United States, 2. Columbia University, New York, New York, United States, 3. Research Division, Hebrew Home at Riverdale by RiverSpring Health, Riverdale, New York, United States, 4. Columbia University Irving Medical Center, New York, New York, United States, 5. La Trobe University, Nursing and Midwifery, Bundoora, Victoria, Australia*

Lucidity Measure Development: An existing questionnaire measuring lucidity length, degree, content, coinciding circumstances, and time from lucid episode to death was expanded to include time of day, expressive and receptive

communication and speech the month prior to and during the lucid event. Pilot Study: 33 interviews with staff were conducted; 73% reported ever witnessing paradoxical lucidity. Among 29 events reported, 31% lasted several days, 20.7%, 1 day, and 24.1% less. In 78.6% the patient engaged in unexpected activity. 20% died within 3 days and 17% within 3 months after the event. Qualitative Analyses: To refine the measure, 10 family caregivers and 20 LTSS staff caregivers completed a web-based focus-group type exercise using QualtricsXM. A content-thematic analysis with an inductive approach was applied to make qualitative inferences by analyzing the meaning and semantic relationship of words, phrases, and concepts. Using the reduction method of selection, conceptual content categories will be developed.

Session 1185 (Symposium)

ANNUAL REVIEW OF GERONTOLOGY AND GERIATRICS SYMPOSIUM: BLACK OLDER ADULTS IN THE ERA OF BLACK LIVES MATTER

Chair: Jessica Kelley

Co-Chair: Roland Thorpe, Jr.

Discussant: Linda Chatters

Our renewed urgency and engagement in a national dialogue on issues of systemic racism and racial justice provides a much-needed opportunity to expand the discourses, perspectives, and practices used in the study of aging. This symposium features contributions from the 2021 (Vol 41) Annual Review of Gerontology and Geriatrics focusing on the continued development and maturation of scholarship on the lives of older Black Americans. Building on the scholarship and research contributions of prior generations of eminent African American gerontologists, the volume asks: "What do we know about the lived experience of Black older adults and what is there still to be learned?" The contributing authors continue a tradition of research that examines the life histories and contemporary experiences of older Black adults within their relevant social and personal contexts. Symposium presenters from a range of social science fields (sociology, psychology, social work), explore aspects of physical health, stress, cognition, and social well-being in the context of intersecting social dimensions of marriage, family, gender, and neighborhood.

CANCER AND CAREGIVING AMONG OLDER BLACK AMERICANS AND FAMILIES

Katrina Ellis, *University of Michigan, ANN ARBOR, Michigan, United States*

Cancer disproportionately affects Black Americans and consequently, their families. In addition, cancer is often just one of the significant health concerns facing Black families at any one time. Research on family support after an adult cancer diagnosis overwhelmingly focuses on a single (i.e., primary) caregiver and spousal family caregivers, limiting understanding of the complexity of caregiving within family systems facing multiple health challenges. This presentation presents a framework for a broader focus on the role of family systems in providing cancer care, highlighting both the unique strengths and challenges facing Black families who provide care. A family comorbidity lens is used to

underscore the need to better understand the nature and impact of concurrent health challenges within families. Ultimately, this perspective reflects the lived experiences of older Black adults and their families after a cancer diagnosis and has implications for future research and interventions to address health issues interdependently.

GENDER, STRESS, AND MENTAL HEALTH AMONG OLDER AFRICAN AMERICANS

Christy Erving, *Vanderbilt University, Nashville, Tennessee, United States*

Across studies on social stress exposure on the mental health of older African Americans, most investigate singular stress exposures (discrimination). Furthermore, this research rarely assesses gender differences in the psychological effects of specific stress exposures. I use the National Survey of American of Life to assess: (1) gendered patterns of stress exposure among older African Americans; (2) gendered nuances in the individual, collective, and cumulative effects of stress exposure on mental health. I find gender patterns of stress exposure differed by type of stressor. Women and men shared some stress predictors of mental health (everyday discrimination). Other stress predictors were specific to women (health-related mobility challenges) or to men (perceived neighborhood crime). Study findings challenge gerontologists to consider how race-gender groups are at distinct risks for stressors that elicit poor mental health and provide a call for tailored strategies for improving the psychological health of African American women and men.

MARITAL AND ROMANTIC SATISFACTION AMONG OLDER AFRICAN AMERICANS

Antonius Skipper,¹ and Robert Taylor,² 1. *Georgia State University, Atlanta, Georgia, United States*, 2. *University of Michigan, Ann Arbor, Michigan, United States*

There remains a lack of knowledge on marital satisfaction of African Americans generally, but particularly older African Americans. In addition, only a handful of studies investigate satisfaction among couples who are unmarried. With data from the National Survey of American Life, this study examined the correlates of romantic and marital satisfaction among older African Americans. Findings reveal that married older African Americans were slightly more satisfied with their relationship than individuals who were either remarried or unmarried but in a romantic relationship. Among older African American married adults, older age was associated with higher marital satisfaction, and men had higher levels of marital satisfaction than women. Also, married older African Americans with lower family incomes reported higher marital satisfaction. Given the limited research on older African Americans couples, either married or unmarried, this study offers valuable implications for individuals and professionals engaging these couples in practical settings.

CONTEXTUAL CORRELATES OF COGNITIVE AGING IN BLACK OLDER ADULTS: EXAMINING THE NEIGHBORHOOD

Ketlyne Sol,¹ and Tanisha Hill-Jarrett,² 1. *University of Michigan, Ann Arbor, Michigan, United States*, 2. *University Of South Florida Morsani College Of Medicine, Tampa, Florida, United States*

Black older adults have a unique history that includes enslavement and legalized segregation. This history shapes the present-day experiences of older Blacks, in part, through the neighborhoods in which they live. The neighborhood is a reflection of both the physical and social contexts, and reflects the most natural and intimate context through which a person experiences life. Combined, the unique history and neighborhoods of Black older adults may contribute to their disproportionately experiencing impairments in cognitive function in older age. There is growing interest in how lived experiences across the life course affect cognitive trajectory and, ultimately, cognitive outcomes of older Black adults. In this presentation, we will review recent literature on psychosocial and physical contextual factors and their influence on cognitive aging in older blacks through the lens of the neighborhood.

Session 1190 (Symposium)

APPLYING PRINCIPLES OF IMPLEMENTATION SCIENCE TO AGING PROGRAMS AND POLICIES

Chair: Jaime Hughes Discussant: Nancy Morrow-Howell

Implementation science, defined by NIH as “the scientific study of the use of strategies to adopt and integrate evidence-based health interventions,” continues to grow within research, education, and practice-based settings. Building on principles from organizational psychology, intervention science, health economics, and health services research, implementation science aims to explore how, and under what conditions, evidence-based interventions are successfully implemented and sustained in real-world settings. Applying implementation science to aging programs and settings may help to accelerate the translation of effective programs and policies into practice. This interdisciplinary symposium will provide an introduction to key principles and applications of implementation science. The first three presentations will focus on largescale spread of interventions while the last two presentations will focus on broader applications of implementation science. The first two presentations will focus on adapting interventions from delivery in one setting or population to another. The third presentation will discuss the role of implementation strategies in scaling an intervention from a controlled research setting into a large integrated healthcare system. The third presentation will focus on the intersection of implementation science and policy. The final presentation will discuss the role of implementation science in alleviating health disparities and advancing health equity. Each presentation will utilize examples from ongoing research studies to demonstrate principles. The session will close with an interactive discussion on the role of implementation science within aging, including challenges and considerations for aging programs, policies, and populations as well as opportunities for further training and education.

ADAPTING MONTESSORI PROGRAMMING FOR AGING AND DEMENTIA WITH IMPLEMENTATION STRATEGIES

Natalie Douglas, *Central Michigan University, Mt Pleasant, Michigan, United States*

There is a need to translate research findings to support the wider adoption of person-centered care into typical long-term care environments across the world. Montessori for Aging and Dementia is one mechanism to support person-centeredness, dignity and autonomy of older adults living in long-term care environments. In this presentation, strategies used to support the implementation of Montessori for Aging and Dementia in a long-term care community of 20 people living with severe dementia will be highlighted. Implementation support was provided through capturing and sharing local knowledge, ongoing training and consultation, and tailoring communication supports. Through the use of these iterative strategies, the program was successfully adapted to include people living with severe dementia. While key findings of the project included improvements on a variety of observational and staff administered measures, the focus of this presentation will be on the relationships between the Montessori program’s fidelity, local needs and implementation strategies.

ADAPTING NUTRITION PROGRAMMING FOR INTERGENERATIONAL IMPLEMENTATION

Shannon Jarrott,¹ Rachel Scrivano,¹ Jill Juris Naar,² and Alicia Bunger,¹ *1. The Ohio State University, Columbus, Ohio, United States, 2. Appalachian State University, Boone, North Carolina, United States*

Practitioners frequently tailor programming to meet participant characteristics and logistic constraints, or to incorporate diverse participants, such as intergenerational programming. Adapted programming may be responsive but reduce impact on outcomes. With growing interest in and limited availability of intergenerational protocol, implementation science guides program tailoring to ensure that youth and older adults mutually benefit from adapted programming. We integrated guidelines for tailoring interventions (Framework for Reporting Adaptations and Modifications-Expanded: FRAME) and evidence-based intergenerational practice. We illustrate how program fidelity can be supported in intergenerational settings using examples from an adapted USDA-approved preschool nutrition curriculum delivered intergenerationally. Program acceptability, appropriateness, and feasibility were rated favorably by program stakeholders, and observational implementation data suggest fidelity can be maintained using evidence-based intergenerational strategies. Our findings support the potential for protocol developed for one age group to benefit youth and older adults when it is adapted using implementation and intergenerational guidelines.

IMPLEMENTATION STRATEGIES FOR WIDESPREAD SCALING OF EFFECTIVE PROGRAMS INTO HEALTHCARE SYSTEMS

Jaime Hughes, *Wake Forest School of Medicine, Raleigh, North Carolina, United States*

Translation of effective evidence-based programs into practice is critical to promoting and preserving older adults’ function and independence. This presentation will provide an introduction to implementation strategies, defined as the “methods or techniques used to enhance the adoption, implementation, and sustainability of a clinical program or practice.” Some examples of implementation strategies include education

and training, stakeholder engagement, patient and/or consumer involvement, adaptation, and technical assistance. Application of these implementation strategies will be illustrated using examples from local and national scale out of evidence-based health promotion programs for older adults within the VA Healthcare System. This presentation will close with guidance on how to select, track, and evaluate implementation strategies.

ELIMINATING DISPARITIES AND ACHIEVING HEALTH EQUITY USING IMPLEMENTATION SCIENCE

Beth Prusaczyk,¹ and Ana Baumann,² 1. *Washington University School of Medicine in St. Louis, Saint Louis, Missouri, United States*, 2. *Washington University in St. Louis, Saint Louis, Missouri, United States*

Eliminating health disparities and achieving equity are central to aging services, programs, and research, as we work to ensure older adults are treated equitably compared to their younger counterparts. Additionally, aging services, programs, and research are not immune from the structural racism and other inequities that plague all facets of our lives, and we must work to eliminate disparities within them as well. This presentation will discuss how Implementation science can be used to advance both of these fronts. Implementation science frameworks can be used to ensure multiple levels of context are considered, which is critical when working against something as pervasive and structural as racism. Implementation science can also guide the adaptation of evidence-based interventions for different populations, including for older adults or for different racial or ethnic groups. Furthermore, there are important ways health equity research can improve implementation science that advance the shared goal of eliminating disparities.

USING IMPLEMENTATION SCIENCE TO INFORM AND EVALUATE HEALTH POLICY

Julie Bobitt,¹ and Beth Prusaczyk,² 1. *Center for Dissemination and Implementation Science, University of Illinois at Chicago, Illinois, United States*, 2. *Washington University School of Medicine in St. Louis, Saint Louis, Missouri, United States*

Public health policies can be a tool for the promotion and protection of older adult's well-being but how can we ensure that policies will be effective and applied as intended? This presentation will discuss how implementation science can be used to both inform and evaluate health policies. Scientific evidence developed by applying dissemination and implementation frameworks can be used to inform policy makers as they develop legislation. When used to evaluate policy, D&I frameworks can be applied to examine policy diffusion, how a state, community, or individual organization chooses to carry out the policy, and the impact that policy has on the intended population. D&I frameworks are an effective way to measure the difference between policy intent and what actually happens when a policy is implemented. Examples of how D&I frameworks have been used to inform and evaluate policy will be shared.

Session 1195 (Symposium)

ASIAN OLDER ADULTS, TRAUMA, RESILIENCE, AND HEALTH: RECENT FINDINGS FROM THE RUTGERS ASIAN RCMAR

Chair: Xinqi Dong

Co-Chair: Melissa Simon

Discussant: Bei Wu

U.S. Asians are the fastest growing group of older adults in the nation. However, there remains a dearth of disaggregated research for this population assessing health outcomes such as cognition, suicidality, mortality, and the influence of nutrition on chronic conditions. Drawing on the research of Rutgers Asian RCMAR Scientists, this symposium will examine these areas to provide a better understanding of the health of diverse groups of U.S. Asian older adults. Session 1 will assess the association between living in an ethnic enclave and better cognition among Chinese older immigrants and examine the influence of moderating factors. Session 2 will explore the prevalence of traumatic experience and discuss the association among trauma experience, lifetime mental disorder, and risk of endorsed suicide ideation among aging Asians. Session 3 will assess the relationship between family types and 6-year mortality among U.S. Chinese older adults in Chicago. Session 4 will examine the association between ultra-processed foods and cardiometabolic health (obesity, hypertension, high cholesterol, and diabetes) among U.S. adults 50 or older reporting a single ethnicity. In summation, this symposium describes key research areas such as cognition, suicidal ideation, mortality, and nutrition on the overall health of U.S. older adults. The symposium addresses both risk and protective factors that influence these health outcomes and aims to inform interventions to improve the health of U.S. Asian older adults in the areas of trauma, resilience, and health.

IS LIVING IN AN ETHNIC ENCLAVE ASSOCIATED WITH BETTER COGNITIVE HEALTH OF OLDER IMMIGRANTS? RESULTS FROM PINE

Man Guo,¹ Yi Wang,² HANZHANG XU,³ Mengting Li,⁴ Bei Wu,⁵ and Xinqi Dong,⁶ 1. *The University of Iowa, Iowa City, Iowa, United States*, 2. *University of Iowa, Iowa City, Iowa, United States*, 3. *Duke University School of Medicine, Duke University, North Carolina, United States*, 4. *Rutgers, The State University of New Jersey, New Brunswick, New Jersey, United States*, 5. *New York University, New York, New York, United States*, 6. *Rutgers University, Rutgers Institute for Health, New Jersey, United States*

This study addressed three questions: 1) Is living in Chinatown associated with better cognition among Chinese older immigrants? 2) Is the association moderated by education, acculturation level, and social engagement? 3) Does the association vary by preferred language (Mandarin, Cantonese, Taishanese), an important indicator of heterogeneity among Chinese immigrants? Data were derived from the Population Study of Chinese Elderly in Chicago (N = 3,055). Results showed that Chinese older immigrants who lived in Chinatown had significantly poorer cognition than those who didn't, and such a difference was largely due to educational differences between the two groups. Higher education or acculturation buffered the influence of Chinatown residence on cognitive health, but only among those who speak Mandarin. The findings indicate that living in an ethnic enclave may have a negative impact on cognitive function of Chinese older immigrants. The findings also reveal the sources of heterogeneity within the population.

TRAUMA EXPOSURE, MENTAL DISORDER, AND RISK OF SUICIDE IDEATION AMONG AGING U.S. ASIANS

Ping Ma,¹ Ruike Li,¹ Yuki Shigemoto,² and Lei-Shih Chen,¹ 1. *Texas A&M University, College Station, Texas, United*

States, 2. *Prairie View A&M University, Prairie View, Texas, United States*

This project aims to explore the prevalence of traumatic experience and examine the association among trauma experience, lifetime mental disorder, and risk of endorsed suicide ideation among aging Asians. Data were drawn from the National Latino and Asian American Survey and participants aged 55 and above were included in the study. Descriptive analyses and weighted logistic regressions were employed to analyze the association among outcomes of interest. Approximately 74% of 376 aging Asians experienced trauma exposures. Specifically, 17% of respondents with trauma exposure reported a lifetime mental disorder, and 8% had suicide ideation. After adjusting for demographic, social support, and family factors, aging Asians with traumatic experience had a significantly higher risk of experiencing discrimination and mental disorders (p -values $<.05$). Assaultive or interpersonal violence exposure was positively associated with increased odds of suicide ideation. Culturally tailored mental health intervention and suicide screening are warranted for aging Asians with previous trauma exposure.

TYOLOGY OF FAMILY RELATIONSHIPS AND 6-YEAR MORTALITY RISK

Mengting Li,¹ and XinQi Dong,² 1. *Rutgers, The State University of New Jersey, New Brunswick, New Jersey, United States*, 2. *Rutgers University, Rutgers Institute for Health, New Jersey, United States*

Durkheim's "family protection" thesis indicated that family could protect individuals from death. However, there are heterogeneities in family types. It remains unclear whether all family types play a protective role in older adults' later life. This study aims to test the relationship between family types and 6-year mortality. Data were derived from a prospective cohort study from 2011 to 2017 of 3,018 U.S. Chinese older adults in Chicago. Family typology was clustered by Latent Class Analysis, including tight-knit (high solidarity and low conflict), unobligated ambivalent (high solidarity and high conflict), commanding conflicted (low solidarity and high conflict), and detached (low solidarity and low conflict). Cox model was used. The result showed that older adults in detached type have higher mortality risk than those in tight-knit type after controlling age, gender, education, income, and medical conditions. Future study could explore the mechanisms through which family types affect mortality risk.

ASSOCIATIONS BETWEEN ULTRA-PROCESSED FOOD INTAKE AND CARDIOMETABOLIC HEALTH AMONG DIVERSE U.S. ADULTS 50 OR OLDER

Tali Elfassy,¹ Filippa Juul,² Robert Mesa,¹ Latha Palaniappan,³ Malathi Srinivasan,³ and Stella Yi,² 1. *University of Miami, Miami, Florida, United States*, 2. *New York University, New York, New York, United States*, 3. *Stanford University, Stanford, California, United States*

Asian American (AA) diets are naturally adapted to the NOVA dietary recommendations, favoring minimally processed foods. Yet the relationship between dietary intake and metabolic health, among AAs is largely unknown. We examined the association between ultra-processed foods and

cardiometabolic health (obesity, hypertension, high cholesterol, and diabetes), among US adults 50 or older reporting a single ethnicity, using the National Health and Nutrition Examination Survey (2001-2018). From multivariable adjusted logistic regression models, the highest compared to the lowest quartile of ultra-processed food intake was associated with obesity only, among AAs (OR: 2.15, 95% CI: 1.04, 4.45), followed by non-Hispanic blacks (OR: 1.73, 95% CI: 1.40, 2.14), non-Hispanic whites (OR: 1.41, 95% CI: 1.19, 1.68), and Hispanics (OR: 1.34, 95% CI: 1.08, 1.65). AAs are more likely than other ethnic/racial groups to be obese when consuming ultra-processed foods. Cultural adaptation of current North American-focused dietary recommendations should drive AA preventive dietary recommendations.

Session 1200 (Paper)

Body Weight and Obesity

LONG-TERM VARIABILITY IN BODY WEIGHT IN RELATION TO THE RISK OF DEMENTIA: A PROSPECTIVE COHORT STUDY

Hui Chen,¹ Tianjing Zhou,¹ Yuan Ma,² and Changzheng Yuan,¹ 1. *Zhejiang University, Hangzhou, Zhejiang, China (People's Republic)*, 2. *Harvard T. H. Chan School of Public Health, Boston, Massachusetts, United States*

The prospective association of body weight variability with dementia remains unclear. We aimed to investigate whether long-term variability in body weight is associated with the risk of late-life dementia and to explore their potential temporal relationship using data from a nationwide prospective cohort study of the United States. A total of 5,556 participants free of dementia in 2008 (55.66% women; mean [SD] age, 71.1 [3.1] years) were followed up to 8 years for doctor-diagnosed dementia reported biennially. Body weight variability was assessed as the coefficient of variation utilizing the body weight information collected over 16 years before 2008. Cox proportion hazard model was applied to estimate hazard ratio (HR) of dementia associated with body weight variability. Higher body weight variability was associated with an increased incidence of dementia after controlling for sociodemographic factors, lifestyle, mean body weight, and body weight change. The multi-variable adjusted HR of dementia of the highest quartile of body weight variability was 2.01 (95% CI 1.01-1.87) compared with the lowest. Every 1% increment in variability was associated with a 6.2% higher risk of dementia (HR=1.06, 95%CI 1.04,1.09, p -trend <0.001). Such association was observed for both Alzheimer's disease and other types of dementia, with stronger association observed when body weight variability was assessed closer to dementia assessment.

OCCUPATIONAL DIFFERENCES IN METABOLIC SYNDROME INCIDENCE AMONG OLDER WORKERS

Katharina Runge,¹ Sander K.R. van Zon,² Ute Bültmann,² and Kène Henkens,¹ 1. *Netherlands Interdisciplinary Demographic Institute (NIDI), The Hague, Zuid-Holland, Netherlands*, 2. *University Medical Center Groningen (UMCG), Groningen, Groningen, Netherlands*

This study investigates whether the incidence of metabolic syndrome (MetS), and its components, differs by occupational group among older workers (45-65 years) and whether health behaviors (smoking, leisure-time physical activity, diet quality) can explain these differences. We analyzed data from older workers (N=23 051) from two comprehensive measurement waves of the Lifelines Cohort Study and Biobank. MetS components were determined by physical measurements, blood markers, medication use, and self-reports. Occupational group and health behaviors were assessed by questionnaires. The association between occupational groups and MetS incidence was examined using Cox regression analysis. Health behaviors were subsequently added to the model to examine whether they can explain differences in MetS incidence between occupational groups. Low skilled white-collar (HR: 1.25, 95% CI: 1.13, 1.39) and low skilled blue-collar (HR: 1.45, 95% CI: 1.25, 1.69) workers had a significantly higher MetS incidence risk during 3.65 years follow-up than high skilled white-collar workers. Health behaviors reduced the strength of the association between occupational group and MetS incidence most among low skilled blue-collar workers (i.e. 10.3% reduction) as unhealthy behaviors were more prevalent in this occupational group. Similar occupational differences were observed on MetS component level. To conclude, MetS incidence in older workers differs between occupational groups and health behaviors only explain a small part of these differences. Health promotion tailored to occupational groups may be beneficial specifically among older low skilled blue-collar workers. Research into other factors that contribute to occupational differences is needed, as well as studies spanning the entire working life course.

REMOTE MONITORING ACTIVITY TRAJECTORY-ASSOCIATED WEIGHT LOSS AND FUNCTIONAL ABILITY IN OBESE OLDER ADULTS

John Batsis,¹ Curtis Petersen,² Anna Kahkoska,³ and Karen Fortuna,² 1. *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States*, 2. *Dartmouth College, Lebanon, New Hampshire, United States*, 3. *University of North Carolina at Chapel Hill, University of North Carolina at Chapel Hill/Chapel Hill, North Carolina, United States*

Functional decline in older adults can often be mitigated by physical activity. As older adults increasingly adopt wearable technology, an understanding of how remotely monitored activity is associated with clinical outcomes is needed. Data was analyzed from two cohorts of older adults with obesity (≥ 65 years, BMI (≥ 30 kg/m²)) who completed weekly dietary and exercise-based weight loss interventions (n=93). Follow-up time varied between cohorts (n=37: 12-weeks; n=56: 16 weeks). All participants were provided a Fitbit to monitor physical activity. Baseline and follow up weight, 6-minute walk distance, grip strength, and Late Life Function and Disability Instrument (LLFDI) were collected. We used k-means clustering for longitudinal data to identify physical activity trajectories from Fitbit steps at the daily level. Linear regression models tested for differences in each outcome between trajectories, adjusting for age and sex. Baseline characteristics did not vary across cohorts: mean age 72.7 \pm 4.5 years, 76.5% were female, and mean

BMI was 36.4 \pm 5.1 kg/m². Two physical activity trajectories were identified, termed high and low activity based on differences in mean daily steps (7,476 \pm 4,117 vs. 2,960 \pm 2,453, p <0.001). Participants in the high activity group experienced a 2.4% reduction in weight (p <0.001) and a 4.74% increase in LLFDI score (p=0.007) relative to the low activity cluster. Other outcomes were not significantly different between trajectories. These results demonstrate the potential for remote monitoring data to elucidate longitudinal trends in weight and functional ability. As such, older adults' use of wearable technology may facilitate improvements in weight and functional ability in the community.

THE ASSOCIATION OF MEAL TIMING WITH BODY COMPOSITION AND CARDIOMETABOLIC HEALTH IN OBESE OLDER ADULTS

Samaneh Farsijani,¹ Nancy W. Glynn,² and Anne Newman,¹ 1. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2. *University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania, United States*

Objectives: To determine the association between eating window and time of last calorie intake with body composition and cardiometabolic health in obese older adults. Methods: We performed a cross-sectional analysis on 36 community-dwelling, overweight-to-obese (BMI 28.0-39.9 kg/m²) older adults, recruited to participate in a weight loss and exercise trial. Time of food intake were extracted from three 24-hour food recalls. Eating window was calculated as the time elapsed between the first and last food intake. We recorded the time of last calorie intake either from food or drink. Blood glucose, triglycerides, high-density (HDL) & low-density (LDL) lipoprotein cholesterols were measured as markers of cardiometabolic health. Total fat and lean mass were assessed by DXA. Partial correlation was used to determine the relationships between eating window and last calorie intake with body composition and cardiometabolic markers, while controlling for sex, age, and total calorie intake. Results: On average, participants' eating window was 12.0 \pm 1.1 hours. Time of last calorie intake in 86% of participants was between 6:00-8:00 PM. After controlling for potential confounders, longer eating windows were associated with higher triglyceride levels (P=0.032) and lower HDL (P=0.035), while no association was observed with the other cardiometabolic markers. We observed negative trends, though not statistically significant, between longer eating windows and greater weight, BMI, and fat mass. No association was observed between time of last calorie intake, body composition and cardiometabolic markers. Conclusions: Our results suggest that timing of food intake may influence cardiometabolic risk and obesity in older adults.

TRAJECTORIES OF BODY MASS INDEX AND MULTIMORBIDITY IN OLD AGE: 12-YEAR RESULTS FROM A POPULATION-BASED STUDY

Amaia Calderón-Larrañaga,¹ Xiaonan Hu,¹ Jie Guo,¹ Luigi Ferrucci,² Weili Xu,¹ and Davide Vetrano,¹ 1. *Karolinska Institutet, Solna, Stockholms Lan, Sweden*, 2. *National Institute on Aging, Baltimore, Maryland, United States*

We aimed to study the association of long-terms trajectories of body mass index (BMI) with contemporaneous

changes in multimorbidity development in older adults. Twelve-year BMI trajectories (2001–2013) were identified in subjects aged 60+ years from the Swedish National Study on Aging and Care-Kungsholmen (SNAC-K) using growth mixture models (N=2,189). Information on chronic diseases and multimorbidity was ascertained based on clinical examinations, lab tests, medications, and inpatient and outpatient medical records. Linear mixed models were used to study the association between BMI trajectories and the speed of chronic diseases accumulation, in general and by groups of cardiovascular and neuropsychiatric diseases. Eighty percent of the study population was included in a stable BMI trajectory, 18% in a slow-decline trajectory with an accelerated BMI decline from age 78 onwards, and 2% in a fast-decline trajectory that reached underweight values before age 85. A significantly higher yearly rate of chronic disease accumulation was observed in the fast-decline versus stable trajectories ($\beta=0.221$, 95% CI 0.090-0.352) after adjusting for age, sex, education and time to death. Subjects in the slow-decline trajectory showed a significantly higher rate of cardiovascular diseases accumulation ($\beta=0.016$, 95% CI 0.000-0.031); those in the fast-decline trajectory showed a faster accumulation of both cardiovascular ($\beta=0.020$, 95% CI -0.025, 0.064) and neuropsychiatric diseases ($\beta=0.102$, 95% CI 0.064-0.139), even if the former association did not reach statistical significance. Carefully monitoring older adults with sustained weight loss seems relevant given their likelihood to develop a phenotype of rapidly accumulating chronic -especially neuropsychiatric- diseases.

Session 1205 (Symposium)

BUILDING CAREGIVER RESILIENCE: PITFALLS AND POTENTIAL FOR INTERVENTIONS

Chair: Jeongeun Lee

Co-Chair: Natasha Peterson

Discussant: Steven Zarit

Informal caregivers provide substantial practical and emotional support for individuals with chronic and acute conditions. Consequently, many experience caregiver burden and are at high-risk for psychological morbidity and associated breakdown in the provision of care for care recipients. Many psychosocial interventions have been designed to help caregivers. However, more work is needed to identify which, or what kind of, interventions are optimal for identifying suitable strategies and care management. The main objectives of this symposium are to (1) address psychosocial and demographic factors contributing to caregiver resilience, (2) understand the role of cognitive and behavioral factors that have implications for caregivers' psychological well-being, and (3) specify different caregiving styles and adaptive outcomes. This symposium assembles a panel of experts and brings together empirical research on various challenges that need to be addressed and potential opportunities for creating effective psychosocial intervention targets for caregivers. The first session will discuss several psychosocial and demographic factors associated with resilience among caregivers. The second session will share how caregiving appraisals are closely related to positive and negative affect and whether the level and changes in caregivers'

activity participation moderate this linkage. The third session will identify caregiving styles and strategies utilizing k-modes machine learning analysis and share how caregivers adapt to care situations. The final session will present caregivers' stress experiences related to dementia patients' behavior and psychosocial symptoms in dementia during the day. The session will conclude with Dr. Zarit, who will integrate the four papers and offer insight on implications across studies.

CAREGIVING APPRAISALS AND EMOTIONAL VALENCE: BUFFERING EFFECT OF ACTIVITY PARTICIPATION

Jeongeun Lee,¹ and Nicholas Cone,² 1. *Iowa State University, Ames, Iowa, United States*, 2. *Iowa State University, Iowa State University, Iowa, United States*

Caregiving activities often lead to positive and negative appraisal for caregivers. Caregivers may limit social participation due to caregiving activities. Changes in level of activity participation could have profound consequences for caregiver's valence. However, little is known about how activity participation could moderate the association between these caregiving appraisals and emotional valence. Data came from the National Study of Caregiving (Round 1 and 2), a nationally representative study of caregivers. Referencing Lawton's two-factor model (1990), we examined both the level and changes in activity restriction interacting with positive and negative caregiving appraisals to predict both valence across two waves. Consistent with two factor models, findings revealed level and changes in activity restriction moderated the relationship between caregiving appraisal and outcomes for both valences. These findings highlight the role of activity restriction as a target to reduce negative valence and improve positive valence for caregivers.

TEMPORAL PATTERNS OF DAILY BEHAVIORAL AND PSYCHOLOGICAL SYMPTOMS OF DEMENTIA THROUGHOUT THE DAY

Caitlin Connelly,¹ Kyungmin Kim,² Yin Liu,³ and Steven Zarit,⁴ 1. *University of Massachusetts Boston, Somerville, Massachusetts, United States*, 2. *Seoul National University, Seoul, Seoul-t'ukpyolsi, Republic of Korea*, 3. *Utah State University, Logan, Utah, United States*, 4. *Pennsylvania State University, Pittsburgh, Pennsylvania, United States*

Behavioral and psychological symptoms of dementia (BPSD) are taxing for both the person with dementia (PWD) and their family caregivers. Yet, little is known about how BPSD fluctuates throughout the day (i.e., morning, daytime, evening, and night; e.g., sundowning) and how caregivers perceive BPSD at different times of the day. Using 8-day daily diary data from 173 family caregivers whose relatives were using Adult Day Services (ADS), this study investigated temporal patterns of BPSD and caregivers' stress responses to BPSD throughout the day. Overall, the number of BPSD was highest in the evening, and caregivers' stress reactivity to BPSD increased throughout the phases of the day (i.e., most stressful at night). However, caregivers showed lower reactivity to BPSD in the mornings and at night on days when the PWD used ADS. Our findings about fluctuations of (caregiver reactions to) BPSD throughout the day suggest target windows for just-in-time adaptive intervention.

FACTORS OF CAREGIVING RESILIENCE BY RACE-ETHNICITY IN A NATIONAL SAMPLE OF CAREGIVERS

Jinmyoung Cho,¹ and Natasha Peterson,² 1. *Baylor Scott & White Health Research Institute, Temple, Texas, United States*, 2. *Iowa State University, Iowa State University, Iowa, United States*

Despite heavy burdens and responsibilities, some caregivers are more likely to cope better with their care responsibilities than others, and this could vary by cultural beliefs and norms on caregiving. This study examined contributing factors of resilience with three racial-ethnic groups (White, Blacks, Hispanic). A total of 2,652 caregivers were included from Round 7 of the National Study of Caregiving. Caregiving resilience was defined by higher levels of care demands and higher levels of psychological well-being. Five domains of contributing factors were included: socio-demographic characteristics, context of care, caregivers' psychological attributes, informal and formal support. Multiple logistic regressions showed that caregivers with higher psychological attribute levels were more likely to be resilient in all three groups. However, unique predictors have also been observed by race-ethnic groups (e.g., Blacks using formal support were more resilient). These findings suggest the need for culturally specific programs to facilitate resilience among caregivers.

COGNITIVE-BEHAVIORAL STYLES OF DEMENTIA CARE MANAGEMENT: TARGETING AND TAILORING TO STYLE

Amanda Leggett,¹ Hyunjung Koo,² Cathleen Connell,³ Laura Gitlin,⁴ and Helen Kale,⁵ 1. *University of Michigan, Ypsilanti, Michigan, United States*, 2. *University of Michigan, Ann Arbor, Michigan, United States*, 3. *University of Michigan School of Public Health, Ann Arbor, Michigan, United States*, 4. *Drexel University, College of Nursing and Health Professions, Drexel University, Pennsylvania, United States*, 5. *UC Davis, Sacramento, California, United States*

Despite an extensive literature on the stress process of caregiving, little attention has focused on how caregivers provide care (caregiving styles). To explore caregiving styles among 100 primary caregivers for persons living with dementia, we utilize k-modes machine learning analysis. This technique clusters caregiver's use of behavioral (Dementia Management Strategies Scale; criticism, active management, encouragement) and cognitive (Caregiver Readiness Scale; understanding, adaptability) approaches into style profiles. Three styles were identified: Managers (n=25; high use of criticism, moderate use of active management and encouragement, poor understanding and adaptability), Adapters (n=48; low use of criticism, high use of adaptive management and encouragement, good understanding and adaptability), and Avoiders (n=27; low use of all behavioral strategies, moderate adaptability and understanding). Styles differ by demographic and care characteristics. Findings suggest that caregivers have variable approaches to care that are measurable, thus, targeting/tailoring interventions to caregiver style could be an effective approach.

Session 1210 (Paper)

Cardiovascular Health and Aging

ARTERIAL STIFFNESS AND AGE MODERATE THE ASSOCIATION BETWEEN PHYSICAL ACTIVITY AND COGNITION IN OLDER ADULTS

Adrian Noriega de la Colina,¹ Atef Badji,² Maxime Lamarre-Cliche,² Louis Bherer,² H el ene Girouard,² and Navin Kaushal,³ 1. *McGill University, Montreal, Quebec, Canada*, 2. *Universit e de Montr eal, Montreal, Quebec, Canada*, 3. *University of Indiana, Bloomington, Indiana, United States*

Background: Evidence supports that time spent on physical activity has beneficial effects on cognition in older adults. Nevertheless, this beneficial effect is likely to change in function of individual modifying factors like age and level of arterial stiffness. This study aims to reveal whether arterial stiffness and age modulate the positive impact of physical activity on cognition by developing a double moderation model. Methods: 110 healthy older adults aged 60 to 75 years old were examined for arterial stiffness (carotid-femoral Pulse Wave Velocity [cf-PWV]), global cognition (composite score of Montreal Cognitive Assessment, and Mini-Mental State Examination), and self-reported physical activity (PACED diary). Using PROCESS macro for SPSS, we evaluated if cf-PWV (moderator 1), and age (moderator 2) moderate the relationship between physical activity (X) and global cognition (Y). The threshold for high stiffness was set at 8.5 m/s based on previous studies that reported this cut-off more appropriate for classifying cerebrovascular risk groups. Results: The interaction of arterial stiffness x age moderated the effect of physical activity on global cognition ($\beta = -.89$, $SE = .42$, $p = .037$) (Model: $R^2 = .15$, $p = .018$). Physical activity had a positive effect on cognition in younger-older adults (aged 60 to 68.5 years) with $cf-PWV > 8.5$ m/s ($\beta = .57$, $SE = .222$, $p = .011$, 95% CI .133 to 1.014) and on older-older adults (aged 68.6 to 75 years) with $cf-PWV < 8.5$ m/s ($\beta = .49$, $SE = .190$, $p = .010$, 95% CI .116 to .869). Conclusions: Identifying the right age groups and arterial stiffness levels at which physical activity can have beneficial effects on cognition is a key step in providing tailored behavioral interventions.

CAROTID INTIMA MEDIA THICKNESS AND COMORBID CARDIOMETABOLIC DYSFUNCTION IN WOMEN: THE SWAN STUDY

Aleda Leis,¹ Emma Barinas-Mitchell,² Ana Baylin,¹ Samar El Khoudary,² Elizabeth Jackson,³ and Carrie Karvonen Gutierrez,¹ 1. *University of Michigan, Ann Arbor, Michigan, United States*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 3. *University of Alabama, Birmingham, Alabama, United States*

Metabolic syndrome (MetS) and obesity are risk factors for atherosclerosis but their combined impact is unknown. The aim of this study was to quantify the added risk of obesity on carotid artery intima media thickness (cIMT), an early indicator for atherosclerosis, beyond MetS alone. The Study of Women's Health Across the Nation (SWAN) is a multi-center, multi-ethnic cohort of women traversing

the midlife into early late adulthood. cIMT was assessed between 2005-2007 and MetS, obesity and covariates were measured at the same time. This cross-sectional analysis is restricted to 1,433 women with a body mass index ≥ 18.5 kg/m² and free of cardiovascular disease (CVD) when cIMT was measured. Mean maximum cIMT was related to obesity, MetS and their interaction using multivariable linear regression models. The average age was 60 years (standard deviation 2.7) and the prevalence of obesity and MetS were 44% and 35%, respectively. Both conditions occurred in 24% of women. After adjustment for age, race, smoking, family history of heart disease, and antilipemic medications, obese women had a 0.051mm (95% confidence interval (CI): 0.033,0.070; $p < 0.001$) larger maximum cIMT versus women not obese and women with MetS had a 0.066mm (95%CI: 0.042,0.090; $p < 0.001$) larger maximum cIMT versus women without MetS. There was a statistically significant antagonistic interaction between obesity and MetS; women with both had a mean cIMT of 0.972mm (95%CI: 0.955,0.989) and MetS alone a cIMT of 0.961mm (95%CI:0.938,0.983). This suggests that there is only a small risk of obesity on augmenting cIMT beyond MetS alone.

EPIDEMIOLOGY OF PERIPHERAL VASCULAR DISEASE IN THE LONG LIFE FAMILY STUDY (LLFS)

Allison Kuipers,¹ Ryan Cvejkus,¹ Emma Barinas-Mitchell,¹ Mary Feitosa,² Joanne Murabito,³ and Joseph Zmuda,¹
 1. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2. *Washington University School of Medicine in St. Louis, St. Louis, Missouri, United States*, 3. *Boston University, Framingham, Massachusetts, United States*

Atherosclerotic occlusion of peripheral arteries is a major contributor to morbidity and mortality in older adults. Our aim was to describe the epidemiology of peripheral artery disease (PAD) and other peripheral vascular disease (OPD) in the LLFS. 3248 individuals from 509 families (1182 probands, mean age 89; 2066 offspring, mean age 60) had doppler ankle-brachial index (ABI) assessment. Measures were performed twice for each posterior tibial artery and minimum of the mean ABI was used. PAD was defined as any $ABI < 0.9$. OPD was defined as any $ABI > 1.4$ or ≥ 1 non-compressible artery. Stepwise linear or logistic regression determined significant independent clinical and demographic predictors ($P < 0.05$) after adjustment for age, sex, study center, and familial relatedness. Overall, ABI had a median of 1.2 with 7.4% PAD (18.1% probands, 1.2% offspring; $P < 0.001$). OPD prevalence was 10.6% and was more common than PAD in offspring (8.1%). Age-adjusted OPD was higher in men (13.3%) than women (8.3%, $P < 0.001$), while age-adjusted PAD did not differ by sex ($P = 0.45$). Predictors of PAD included greater age and systolic blood pressure, lower diastolic blood pressure, prevalent kidney disease, antihypertensive use, and current smoking. Predictors of OPD included greater age, male sex, and current smoking. In these exceptionally long-lived families, PAD was low compared to other epidemiologic studies. However, OPD including non-compressible arteries, a marker of arterial stiffness, was more prevalent than PAD. These findings in long-lived families highlight a need for more epidemiologic research in other peripheral vascular disease in adults from the general population.

POSITIVE PSYCHOLOGY, ACTIVATION, AND SELF-CARE ADHERENCE IN A DIVERSE SAMPLE OF ADULTS WITH HEART FAILURE

Rebecca Meraz,¹ Jocelyn McGee,²
 Elizabeth Perry Caldwell,³ and Kathryn Osteen,⁴
 1. *Baylor University, Dallas, Texas, United States*, 2. *Baylor University, Dallas, Texas, United States*, 3. *Baylor University Louise Herrington School of Nursing, Dallas, Texas, United States*, 4. *Baylor University Louise Herrington School of Nursing, Baylor University Louise Herrington School of Nursing, Texas, United States*

Heart failure (HF) self-care is vital to health and wellbeing, yet more than half of all persons with HF do not adhere to the self-care recommendations of taking medications as prescribed, weighing daily, eating low salt foods, or exercising. It has been suggested that disparities in HF among racial/ethnic groups may be reflective of underlying determinants of health, such as poor engagement in self-care activities, rather than genetic or physiological differences. The purpose of this study was to examine direct and indirect effects of perceived social support, positive psychological (PP) characteristics, and patient activation on self-care behaviors in a diverse sample of older adults with HF. A nationwide survey was conducted in cooperation with the recruitment and sampling company Qualtrics. Stratified random sampling was used where 49% of the 174 respondents were persons of color (POC). The mean age was 60. Logistic regression statistical models were used with a lasso procedure. In this study, PP characteristics and activation level were most predictive of HF self-care adherence, particularly medication adherence. Respondents who were resilient, hopeful, and activated also reported higher medication and self-care adherence. Perceived social support and health literacy levels were not associated with self-care adherence. There were no differences in predictive variables by race/ethnicity, gender, or age. Interventions aimed at increasing resilience, hope, and engagement in care or activation may improve HF self-care adherence among persons with HF. Further research is needed to understand the impact of PP characteristics and patient activation level on HF self-care adherence in POC.

Session 1215 (Symposium)

COHORT DIFFERENCES AND SIMILARITIES IN WOMEN'S ATTITUDES ABOUT SELF AND AGING

Chair: Aurora Sherman

Discussant: Jamila Bookwala

This panel focuses on four complementing and international views of women's aging, with a special emphasis on cohort comparisons and using three different studies of women, with contrasting methodological frameworks. In so doing, we present evidence related to trends in social perceptions of aging, attitudes about aging and identity, and ideas about control and objectification. Dr. Newton presents data on older Canadian women showing the connection between physical aging and identity maintenance, using both qualitative and quantitative data and using the lifecourse perspective. Dr. Ryan, using data from the Health and Retirement Study to compare cohorts of women from the 2008 and 2018 HRS waves, reports cohort differences in negative self-perceptions of aging, and that both cohort

and negative self-perfections are associated with life satisfaction, using the life course developmental framework. Ms. Tran compares younger and older cohorts of women on a measure of self-objectification, finding that the older cohort reported lower objectification, consistent with a selection, optimization, and compensation (SOC) model. Finally, Dr. Sherman, using the same data set as Ms. Tran, shows that control beliefs are associated with objectification, regardless of cohort, consistent with objectification theory predictions of consistency over time regarding the impact of objectification experiences. Dr. Jamila Bookwala will provide discussion of this group of papers.

CONTROL BELIEFS, AGE, AND OBJECTIFICATION EXPERIENCES IN YOUNGER AND OLDER WOMEN

Aurora Sherman, *Oregon State University, Corvallis, Oregon, United States*

Control beliefs show age-related patterns; mastery decreases in adulthood, while constraints beliefs often increase. However, there is a great deal of individual variation. This paper addresses antecedents of control beliefs, with attention to experiences and beliefs related to sexual objectification, which have particular impact for women. In this study, younger women ($N = 132$, $M = 20.93$) and older women ($N = 86$, $M = 67.83$) were surveyed regarding their experiences with sexual objectification and constraints beliefs. Multiple regression analyses revealed higher self-objectification was associated with higher constraints ($R^2 = .09^{**}$) and lower mastery ($R^2 = .11^{**}$) but reports of body evaluation and sexual advances were not associated with control beliefs. Further, there were no interactions of either objectification scale with age. These results suggest that objectification may be an important part of the aging experience across the life course, not just in young adulthood.

AGE, ATTITUDES TO AGING, AND IDENTITY IN OLDER CANADIAN WOMEN

Nicky Newton, *Wilfrid Laurier University, Waterloo, Ontario, Canada*

The life course perspective emphasizes social structure, personal agency, and their interdependencies (Settersten et al., 2020), serving as the theoretical framework for this study. Given stereotypical societal views of gender and aging (e.g., Sontag, 1979), physical aging is often the focus when examining women's aging attitudes and concomitant changes in a sense of personal identity. Additionally, studies of midlife women have found relationships between age and identity (e.g., Stewart et al., 2001). Using quantitative and qualitative data, the present study examines associations between age, personal identity, and attitudes to physical, psychological and social aging in older Canadian women ($N = 190$, $M = 70.38$). Results show that while attitudes to physical aging contribute to identity maintenance, attitudes to social and psychological aging are also important for older women's identity maintenance. Interactions between age and attitudes to aging associated with personal identity are discussed with reference to the life course perspective.

COHORT DIFFERENCES IN WELL-BEING AMONG MIDLIFE AND OLDER WOMEN: ROLE OF SELF-PERCEPTIONS OF AGING

Lindsay Ryan, *University of Michigan, Ann Arbor, Michigan, United States*

The current study examines how cohort differences across two age-matched groups of midlife and older women from the Health and Retirement Study are associated with well-being and self-perceptions of aging (SPA). Women aged 51–60 ($n=2318$) and 61–70 ($n=1650$) were selected from the 2008 and 2018 waves. No significant cohort differences were identified for life satisfaction (Diener, Emmons, Larsen & Griffin, 1985) or positive SPA (Lawton, 1975; Liang & Bollen, 1983). The 2008 cohort of midlife women reported significantly higher negative SPA compared to 2018 ($p < .05$). Linear regression analyses find that cohort and SPA are significantly associated with life satisfaction in both age groups, and that the association of negative SPA differs by cohort for the midlife women ($p < .01$). Implications are discussed within the life course developmental framework.

COHORT DIFFERENCES IN SELF-OBJECTIFICATION

Sydney Tran, *Oregon State University, Corvallis, Oregon, United States*

Sexual objectification socializes women to engage in self-objectification—the tendency to view one's body as an object to be used by others and evaluating one's value in terms of attractiveness to others (Noll & Fredrickson, 1998)—and leads to negative psychological consequences. As women age, their bodies move further away from the thin ideal (Guo, Zeller, Chumlea, & Siervogel; 1999) potentially making them more susceptible to body image concerns and dissatisfaction. However, they may also begin using selection, optimization, and compensation (SOC) strategies, countering the impacts of sexual objectification, and promoting successful aging. We compared self-objectification between women in early adulthood ($N = 132$, $M = 20.93$) and women in late middle age or late adulthood ($N = 86$, $M = 67.83$). Results showed that older women had significantly lower levels of self-objectification than younger women. Our findings support the idea the SOC strategies protect against the consequences of sexual objectification.

Session 1220 (Symposium)

COVID-19 IN ASSISTED LIVING: EVIDENCE ON POLICIES, PROVIDER EXPERIENCES, AND RESIDENT MORTALITY

Chair: Kali Thomas

Discussant: Lindsay Schwartz

The devastating effects of Coronavirus disease 2019 (COVID-19) among older adults residing in long-term care settings has been well documented. Assisted living settings in the U.S. have 811,000 residents; most are 80 years or older, and many have one or more chronic illnesses, making them highly susceptible to poor outcomes if exposed to COVID-19. This symposium highlights five studies that focus on various levels of COVID-19 response in assisted living: national organizations, states, assisted living operators and healthcare providers, and residents. The first study compares the sometimes conflicting guidance provided by national long-term care industry-related organizations and recommends assisted living-specific actions for the future. The second study describes the state regulatory response to COVID-19 in assisted living, identifying the themes and implications for the function of the care networks of assisted living residents.

The third study presents findings from interviews with key stakeholders, including policymakers and industry leaders, that reflect on the challenges responding to changing recommendations and policies. The fourth study reports results from a survey with administrators and medical and mental health care providers who treat their residents that illustrates the care practices that were implemented in response to COVID-19 in assisted living. The fifth presentation documents the national excess assisted living resident mortality that was attributable to COVID-19. This symposium culminates with a leading assisted living industry expert reflecting on providers' experiences and posing areas to consider when preparing for and responding to future pandemic events in assisted living settings.

COVID-19 RECOMMENDATIONS FOR ASSISTED LIVING: IMPLICATIONS FOR THE FUTURE

Andrew Vipperman,¹ Sheryl Zimmerman,² and Philip Sloane,³ 1. *University of Virginia, Charlottesville, Virginia, United States*, 2. *Cecil G. Sheps Center for Health Services Research, Chapel Hill, North Carolina, United States*, 3. *UNC Medical School, Sheps Center, Chapel Hill, North Carolina, United States*

Similar to nursing homes, COVID-19 has challenged assisted living (AL), given its congregate nature and vulnerable residents. However, COVID-19 recommendations have not consistently recognized differences between nursing homes and AL, and in so doing present implications for the future of AL. This project examined COVID-19 recommendations from six key organizations and compared them across nursing homes and AL. Differences include recommending more flexible visitation and group activities for AL, while similarities suggest that AL may best integrate health care into offered services (e.g., work with consulting clinicians who know residents and the AL community). Primary points to be discussed are that COVID-19 may accelerate the closer coordination of social work and medical care into AL, because recommendations suggest AL would benefit from the services and expertise of nurses, social workers, and physicians. There seems to be an unmet need to mitigate loneliness in AL, which warrants specific attention moving forward.

STATE REGULATORY RESPONSE TO COVID-19 LIMITED ASSISTED LIVING RESIDENT CAREGIVER NETWORKS

Lindsey Smith,¹ Bethany Linscott Lowe,² Sarah Dys,³ Kali Thomas,⁴ Sheryl Zimmerman,⁵ and Paula Carder,¹ 1. *OHSU-PSU School of Public Health, Portland, Oregon, United States*, 2. *Oregon Health & Science University - Portland State University School of Public Health, Portland, Oregon, United States*, 3. *Portland State University/Vital Research, Portland, Oregon, United States*, 4. *Brown University, Brown University/Providence, Rhode Island, United States*, 5. *Cecil G. Sheps Center for Health Services Research, Chapel Hill, North Carolina, United States*

This paper describes a qualitative content analysis of assisted living emergency rules, revised regulations, and executive orders responding to the COVID-19 pandemic. Using key search terms, we identified 36 states that enacted policies between February and October 2020. The following themes occurred most frequently: testing, infection control, access

restrictions, suspension of requirements, and reporting. The convoys of care model recognizes internal, external, formal, and informal caregivers as essential members of an AL resident's care network. We found that non-staff care providers, including external formal caregivers (e.g. home health and hospice) and informal caregivers (e.g. family), were most often addressed in policies limiting access. Informal caregivers were the least often specifically addressed in these policies. Given the importance of these network members in the AL context, these policies have implications for the wellbeing of the resident and care network.

COVID-19 RESPONSE IN U.S. ASSISTED LIVING SETTINGS: KEY STAKEHOLDER PERSPECTIVES

Sarah Dys,¹ Jaclyn Winfree,² Paula Carder,³ Sheryl Zimmerman,⁴ and Kali Thomas,⁵ 1. *Portland State University/Vital Research, Portland, Oregon, United States*, 2. *Institute on Aging, Portland State University, Portland, Oregon, United States*, 3. *OHSU-PSU School of Public Health, Portland, Oregon, United States*, 4. *Cecil G. Sheps Center for Health Services Research, Chapel Hill, North Carolina, United States*, 5. *Brown University, Brown University/Providence, Rhode Island, United States*

Unique regulatory requirements and scope of services within assisted living (AL) pose distinctive challenges to COVID-19 response. To identify COVID-19 issues specific to AL, we recruited stakeholders with expertise in AL operations, policy, practice, and research (n=42) to participate in remote interviews between July and September 2020. Using thematic analysis, we derived the following overarching themes: 1) Policymakers lack an understanding of the AL context; 2) AL administrators were left to coordinate guidelines with little support; 3) AL organizations faced limited knowledge of and disparate access to resources; 4) State-level regulatory requirements conflicted with COVID-19 guidelines resulting in confusion; and 5) AL operators struggled to balance public health priorities with promoting their residents' wellbeing. To develop evidence-informed policy and avoid unintended consequences, AL operators, direct care workers, residents, and clinicians practicing in these settings should have opportunities to provide feedback through the policy development process, both state and national.

SEVEN-STATE STUDY OF ASSISTED LIVING AND HEALTHCARE PROVIDERS' RESPONSES TO COVID-19

Sheryl Zimmerman,¹ Philip Sloane,² Johanna Hickey,³ Christopher Wretman,³ Paula Carder,⁴ and Kali Thomas,⁵ 1. *Cecil G. Sheps Center for Health Services Research, Chapel Hill, North Carolina, United States*, 2. *UNC Medical School, Sheps Center, Chapel Hill, North Carolina, United States*, 3. *University of North Carolina at Chapel Hill School, Chapel Hill, North Carolina, United States*, 4. *OHSU-PSU School of Public Health, Portland, Oregon, United States*, 5. *Brown University, Brown University/Providence, Rhode Island, United States*

COVID-19 has inordinately affected assisted living (AL), such that the proportion of fatalities to cases has been 21% in AL versus 2.5% for the general population. Understanding how AL administrators and medical and mental health providers have responded to COVID-19 can inform health care going forward. Using a seven-state stratified random sample

of 250 communities, administrators were interviewed and providers completed questionnaires regarding COVID-19 practices. Preliminary data indicate that 79%, 44%, and 62% of administrators reported serving meals in rooms to segregate residents, using telemedicine, and providing extra pay for staff, respectively. Perceived use/effectiveness of practices differed based on dementia case-mix (e.g., face coverings, social distancing). Providers reported less access to patients (82%), more telehealth (63%), and less ability to provide care (43%). However, they uniformly reported high confidence in AL staff ability to prevent (94%) and respond to outbreaks (96%). Discussion will summarize points important for future care.

EXCESS MORTALITY ATTRIBUTABLE TO COVID-19 AMONG ASSISTED LIVING RESIDENTS

Kali Thomas,¹ Wenhan Zhang,² David Dosa,² Paula Carder,³ Philip Sloane,⁴ and Sheryl Zimmerman,⁵
 1. *Brown University, Brown University/Providence, Rhode Island, United States*, 2. *Brown University, Providence, Rhode Island, United States*, 3. *OHSU-PSU School of Public Health, Portland, Oregon, United States*, 4. *UNC Medical School, Sheps Center, Chapel Hill, North Carolina, United States*, 5. *Cecil G. Sheps Center for Health Services Research, Chapel Hill, North Carolina, United States*

This study examines the excess mortality attributable to COVID-19 among a national cohort of assisted living (AL) residents. To do this, we compare the weekly rate of all-cause mortality during 1/1/20-8/11/20 with the same weeks in 2019 and calculated adjusted incidence rate ratios (IRRs) and 95% confidence intervals (CIs). All-cause mortality rates, nationally, were 14% higher in 2020 compared with 2019 (mean, 2.309 vs. 2.020, respectively, per 1000 residents per week; adjusted IRR, 1.169; 95% CI 1.165-1.173). Among the 10 states with the highest community spread, the excess mortality attributable to COVID-19 was 24% higher, with 2.388 deaths per 1000 residents per week in 2020 during January-August vs 1.928 in 2019 (adjusted IRR, 1.241; 95% CI 1.233-1.250). These results suggest that AL residents suffered excess mortality due to COVID-19.

Session 1225 (Symposium)

COVID-19, POLICY, AND NURSING HOMES: A HEALTH AND AGING POLICY FELLOWS SYMPOSIUM

Chair: Nancy Kusmaul

Co-Chair: Toni Miles

Discussant: Lori Frank

COVID-19 significantly impacted older adults, particularly those in long term care. This symposium focuses on policy, and how policies drove many of the outcomes older adults in care experienced during 2020. We begin with a case study of one nursing home describing their operations, how those were impacted by policies at the local, state and federal levels, and operational factors that proved uncontrollable. From there we look more broadly at a national effort as implemented in one state which leveraged clinical and regulatory experts to partner with nursing homes and disseminate emerging and evidence based practice cohorts to address the realities of the COVID-19 pandemic over an extended period. Then we move from the federal to two state level

projects. One looks at the experience of embedding advanced practice nurses (APRNs) into long term care facilities in one state over a five year period including during COVID-19. The final presentation describes hands on support provided by one state government to nursing homes and assisted livings during COVID-19, including the coordination of staff testing and the implementation of the use of the antigen testing machines issued through federal policy. We conclude with a discussion of the interplay of federal, state, and local policy on nursing home experiences in COVID-19 and recommendations for more effective policy interventions.

COLLABORATION WITH THE STATE DEPARTMENT OF HEALTH

Kathleen Unroe, *Indiana University/Probari, Indianapolis, Indiana, United States*

COVID-19 disproportionately affected older adults, creating opportunities for experts in geriatrics and gerontology to support public policy. In Indiana, the Probari team, composed of a geriatrician and a team of nurses with geriatrics and palliative care expertise, supported the state government response to long-term care facilities during the pandemic. The team was involved in helping coordinate all staff testing (534 nursing homes) by the State Department of Health in June and in August, prior to the Federal mandated testing and the distribution of antigen machines. The Probari team also fielded surveys on behalf of the State regarding staff attitudes towards testing and willingness to be vaccinated, to inform state policy and resource efforts. In addition, Probari collaborated with the State Department of Health and the Indiana National Guard by training over 1600 service members to provide non-clinical support in nursing facilities, and monitoring and evaluating that 3 month deployment.

UTILIZING PEER COHORT NETWORKS TO DISSEMINATE INFORMATION AND TO PREVENT AND MITIGATE COVID-19 IN NURSING HOMES

Rajeane Moore, *University of Minnesota, Woodbury, Minnesota, United States*

The COVID-19 pandemic disproportionately impacted residents, families, and staff of nursing homes and senior care communities. Even with federally mandated emergency planning, the pandemic highlighted the lack of preparation to meet the daily challenges faced in senior care. In response, the federal CARES Act including funding for a nationwide network of nursing home cohorts led by academic health centers to disseminate clinical guidance in infection control and pandemic mitigation strategies. We present a case study of a successful diffusion model as implemented in Minnesota with seven cohorts comprised of 242 nursing homes and 544 employees. Experts in geriatric care, long term care regulatory management, and public health led ninety-minute sessions held over the span of sixteen weeks. The session format included foundational evidence-based practices in pandemic management (including infection control, social isolation, leadership, and other topics), individual case studies, peer to peer knowledge diffusion, and expert guidance.

COVID-19 IN LONG-TERM CARE FACILITIES WITH ADVANCED PRACTICE REGISTERED NURSES

Tracie Harrison, *The University of Texas at Austin School of Nursing, Austin, Texas, United States*

The purpose of our report is to give our analytical description of COVID-19 response. The study placed two APRNs in each of five participating nursing facilities (NF), 5-7 days/week for up to two years with the purpose of quantifying if employment of a full-time, salaried APRN, as part of the NF care team, improved the quality of care for the NF residents. Secondly, we studied policies that influenced ability to provide APRN care in the NF. Resident data collected and evaluated to determine if this model of care reduced the rates of adverse events among NF residents. Data included re-hospitalizations, inappropriate prescribing (antipsychotics, antibiotics, opioids and polypharmacy), observational data, and clinical outcomes negatively affecting the quality of life for NF residents (such as falls and pressure injuries). Factors influencing APRN employment in the NF setting were NF mission, environmental aesthetics, resources, NF administrator interactions, state law, and medical director support.

CASE STUDY OF AN OUTBREAK: RESIDENT, STAFF, AND COMMUNITY INDICATORS

Toni Miles, *University of Georgia / College of Public Health, University of Georgia, Georgia, United States*

Outbreak investigation is not infection control. We present a self-study of factors influencing outcomes inside a single nursing home during the early stage of the outbreak - February to May 2020. We examine 3 sources of influence: Practice / Operations; Local, State & Federal Policies; Uncontrollable operational factors. Outcomes of interest include: mortality and resident / staff health. Data consists of clinical records, review of communications, and interviews with staff present during the critical period. Infection control is different from outbreak investigation. There must be a balance between staff empowerment and adherence to guidelines. In an outbreak, staff need the confidence to make decisions based on incomplete knowledge. The presentation concludes with lessons learned – what worked and what actions need improvement. There are areas requiring further analyses of policy and ethics.

Session 1230 (Paper)

Disparities and Alzheimer's Disease

CAUSES OF THE RACIAL DISPARITIES IN THE RISK OF ALZHEIMER'S DISEASE

Stanislav Kolpakov Nikitin,¹ Arseniy Yashkin,² Julia Kravchenko,¹ and Igor Akushevich,¹ *1. Duke University, Durham, North Carolina, United States, 2. Duke University, Morrisville, North Carolina, United States*

The risk of Alzheimer's disease (AD) is not uniform across race-specific subpopulations: Blacks face approximately 50% higher risk of AD onset compared to Whites (Hazard Ratio=1.50; 95% CI: 1.46-1.54). We used Blinder-Oaxaca decomposition, modified for censored data, to explain the disparities in the risk of AD between these races in Medicare beneficiaries aged 65+. This approach measures the contributions to the total difference in AD risks from the differences in the prevalence and the difference in magnitude of the effects of each potential explanatory variable. We used hypertension, diabetes mellitus, depression, cerebrovascular and renal diseases as the potential causes of the racial disparities

in AD risk. We found that the greatest contribution was due to the impact of arterial hypertension, of which 24% of the effect was due to differences in prevalence and 76% due to the differences in effect magnitude. Unexpectedly, the contributions of other studied diseases explained only a small part of the racial disparity in AD risk. The remaining incidence rates, which could not be explained by the contributions of hypertension and other included diseases in the age-specific analysis, were lower for the Black population, although initially, the total age-specific incidence rates of AD were higher for the Blacks when compared to the Whites. Therefore, our results suggest that targeted interventions in the Black subpopulation are urgently needed to mitigate the adverse health effects of hypertension, independent of the possible causes, such as access to hypertension care, or race-related differences in adherence to antihypertensive treatment.

DOCUMENTATION OF DEMENTIA AS A CAUSE OF DEATH AMONG MEXICAN-AMERICAN DECEDENTS WITH DEMENTIA

Brian Downer,¹ Lin-Na Chou,¹ Soham Al Snih,¹ Cheyanne Barba,² Yong-Fang Kuo,¹ Mukaila Raji,¹ Kyriakos Markides,¹ and Kenneth Ottenbacher,¹ *1. University of Texas Medical Branch, Galveston, Texas, United States, 2. University of Alabama, Birmingham, Birmingham, Alabama, United States*

There is lack of data on the frequency and correlates of dementia being documented as a cause of death in Hispanic populations. We investigated characteristics associated with dementia as a cause of death among Mexican-American decedents diagnosed with dementia. Data came from the Hispanic Established Populations for the Epidemiologic Study of the Elderly, Medicare claims files, and the National Death Index. Of the 744 decedents diagnosed with dementia before death, 26.9% had dementia documented as a cause of death. More health comorbidities (OR=0.38, 95% CI=0.25-0.57), older age at death (OR=1.05, 95% CI=1.01-1.08), and longer dementia duration (OR=1.09, 95% CI=1.03-1.16) were associated with dementia as a cause of death. In the last year of life, any ER admission with (OR=0.56, 95% CI=0.32-0.98) or without (OR=0.31, 95% CI=0.14-0.70) a hospitalization, more physician visits (OR=0.95, 95% CI=0.92-0.98) and seeing a medical specialist (OR=0.41, 95% CI=0.24-0.70) were associated with lower odds for dementia as a cause of death. In the last 30-days of life, any hospitalization with an ICU stay (OR=0.57, 95% CI=0.37-0.88) and ER admission with (OR=0.58, 95% CI=0.40-0.84) or without (OR=0.48, 95% CI=0.25-0.94) a hospitalization were associated with lower odds for dementia as a cause of death. Receiving hospice care in the last 30-days of life was associated with 2.09 (95% CI=1.38-3.16) higher odds for dementia as a cause of death. The possible under-documentation of dementia as a cause of death on death certificates may result in underestimation of healthcare resource need of dementia care for Mexican-Americans.

GEOGRAPHIC DISPARITIES OF ALZHEIMER'S DISEASE MORTALITY IN FEMALES WITH BREAST CANCER

Igor Akushevich,¹ Arseniy Yashkin,² and Julia Kravchenko,¹ *1. Duke University, Durham, North Carolina, United States,*

2. Duke University, Morrisville, North Carolina, United States

Our estimates showed significant gaps in mortality rates between the West and East parts of the U.S. when these rates are based on death certificate data. These geographic disparities were persistent over time and could not be fully explained by differences in demographic and socioeconomic characteristics, comorbidities, and/or differences in AD coding between these regions. However, incidence and incidence-based mortality rates based on Medicare data do not reproduce these geographic disparities. Death certificate-based patterns hold for the subset of the population with breast cancer, e.g., for subpopulation for which breast cancer was listed as a secondary cause of death. Therefore, SEER-Medicare data, which contains both death-certificate records and Medicare administrative claims for the same individuals can be used to resolve this inconsistency in findings. Analysis of breast cancer patients from two SEER registries in NJ and WA states in SEER-Medicare data (2000-2013) showed that the fraction of deceased individuals with an underlying cause AD among those who had a Medicare diagnosis of AD is 2.5-3.5 times (depending on the Medicare ascertainment algorithm) higher in WA comparing to NJ ($p < 0.0001$). The odds ratio of not-having AD as an underlying cause is 1.3 for WA vs. NJ and increases with age, for non-white races, and unmarried individuals. Our findings do not support the hypothesis of higher rates of AD in WA state but show that AD is likely underrepresented in death certificate in NJ and possibly other East coast states.

NEIGHBORHOOD DEPRIVATION AND INCIDENT ALZHEIMER'S DISEASE: A REGIONAL COHORT STUDY OF ELECTRONIC MEDICAL RECORDS

Jarrold Dalton,¹ Elizabeth Pfoh,² Kristen Berg,³ Douglas Gunzler,³ Lyla Mourany,² Nikolas Krieger,² Eva Kahana,⁴ and Adam Perzynski,³ 1. *Cleveland Clinic and Case Western Reserve University, Cleveland, Ohio, United States*, 2. *Cleveland Clinic, Cleveland, Ohio, United States*, 3. *Case Western Reserve University at MetroHealth, Cleveland, Ohio, United States*, 4. *Case Western Reserve University, Cleveland, Ohio, United States*

The prevalence of Alzheimer's disease (AD) is anticipated to increase drastically. Neighborhood socioeconomic position (SEP) has been related to multiple processes of health. Understanding whether SEP is related to AD can inform who is at greatest risk of developing this disease. We analyzed electronic medical records of 394892 patients from the two largest health systems in Northeast Ohio to evaluate the relationship between Ohio Area Deprivation Index quintiles (defined at the census tract level) and hazard for a composite outcome of AD diagnosis or primary AD death. We included residents of Cuyahoga and neighboring counties, and used the first outpatient visit beyond age 60 occurring between 2005 and 2015 as study baseline. Outcome data were censored at the earlier of a) the beginning of any 3-year time period without visits or b) non-AD death. We estimated a Cox proportional hazards regression model, adjusting ADI quintile effects for the interaction between age at baseline, sex and race as well as birth year. We used quadratic terms for continuous predictors. After adjusting for these factors, ADI quintile was

significantly related ($\chi^2 = 83.0$ on 4 d.f.; $p < 0.0001$) to the composite time-to-event outcome. Compared to the lowest-deprivation quintile, ADI quintiles 4 (adjusted hazard ratio [95% confidence interval]: 1.18 [1.10, 1.26]) and 5 (1.37 [1.28, 1.47]) had significantly higher hazard for the composite outcome. In conclusion, neighborhood deprivation may be a risk factor for AD independent of demographic factors. Preventive efforts should target individuals living in neighborhoods with high levels of deprivation.

RACIAL DIFFERENCES IN THE EFFECT OF ALZHEIMER'S DISEASE ON ADHERENCE TO MEDICATION THERAPY FOR CHRONIC DISEASES

Arseniy Yashkin,¹ Anatoliy Yashin,² Galina Gorbunova,² and Igor Akushevich,² 1. *Duke University, Morrisville, North Carolina, United States*, 2. *Duke University, Durham, North Carolina, United States*

Multiple dementia (the presence of one or more types of dementia in a single individual) and multi-morbidity (the presence of multiple chronic diseases in an individual) present a major challenge to the U.S. healthcare system. The reduction in cognitive function associated with neurocognitive disorders such as Alzheimer's Disease (AD) and Related Dementias (ADRD) reduce the ability of the affected individual to take care of him/herself. This can manifest as reduced adherence to medication regimens designed to manage other chronic conditions, in reduced ability to engage in healthy behavior such as exercise, or in other ways. The result is an increase in the probability of otherwise avoidable adverse health outcomes and related healthcare costs. In this study, we showcase two high impact chronic conditions common in the elderly: hypertension and type 2 diabetes mellitus (T2D). Using a 5% sample of the total Medicare population we identify groups of individuals with AD/ADRD and i) hypertension, ii) T2D or iii) both. Each group is then propensity-score-matched to similar individuals with hypertension, T2D or both but without a diagnosis of AD/ADRD. The primary explanatory variable of interest is the medication possession ratio (MPR) calculated at 1-year intervals for prescribed diabetes and/or hypertension medications. MPRs were compared between the two groups using t-tests and standardized differences each year after baseline and until death/censoring. A Cox proportional hazard model was then used to estimate differences in survival between these two groups and across race/ethnicity-related strata. Reduced adherence with time and notable race/ethnicity-related differences were identified.

Session 1235 (Symposium)

EMBODYING THE AGING EXPERIENCE: HOW VIRTUAL REALITY IS TRANSFORMING MEDICAL AND NURSING EDUCATION

Chair: Marilyn Gugliucci

Co-Chair: Pamela Saunders

Discussant: Erin Washington

Virtual reality (VR) has long been standard in healthcare education. Recent advances in VR hardware and software applications have coalesced to allow for higher fidelity, more highly realistic simulations that are also deployable at scale -- not just in highly specialized, single location simulation

labs. In tandem, there has been an examination in both the corporate and academic sectors around the efficacy of VR training and learning. While VR has been long proven to be effective in training students and workers in hard skills, its lack of realism has been a barrier to explore efficacy in simulations related to soft skills and emotional intelligence. This symposium will discuss the implementation of virtual reality “labs”, where learners embody in a live 360 film environment the first-person point of view of an older adult -- interacting with gaze, voice, and natural hand motions -- into four university’s medical and nursing curriculum. Lab outcomes include decreased ageism and stereotyping, and increased empathy, sensitivity, cultural competency, and disease knowledge. The first paper reports outcomes of increased understanding, comfort, compassion and empathy of students and informal caregivers after experiencing various labs. The second discusses comparative data on knowledge and attitudes of medical students experiencing the virtual labs individually vs. the group distance mode. The third reports the results of an initial study on how embodying an older adult with sensory impairment affects participant empathy using a standardized scale. The fourth discusses how one university transitioned to delivering immersive labs to nursing students remotely during COVID19.

THE EFFECTS OF A VR TEACHING TOOL ON UNDERSTANDING, COMFORTABILITY, COMPASSION, AND EMPATHY OF STUDENTS AND CAREGIVERS

Carrie Elzie, *Eastern Virginia Medical School, Norfolk, Virginia, United States*

Empathetic care giving is associated with improved patient satisfaction, compliance and outcomes; clinical competence, career satisfaction, and burnout reduction; as well as diminished medical errors and litigation claims. Unfortunately, recent studies have shown erosion in empathy and compassion across the health professions. Virtual reality shows promise as a teaching tool to combat this decline as it has been dubbed the ultimate empathy machine, allowing users to vividly and viscerally experience any situation from any perspective. Embodied Labs allows users to virtually walk in the shoes of different patients, experiencing symptoms, family dynamics, support networks and various components of the health care systems. We have demonstrated that the high level of immersion and presence afforded by these virtual labs are effective pedagogical tools to increase understanding, comfortability, compassion and empathy within various populations including informal caregivers, high school students, health professional students and medical students.

VIRTUALLY TRANSFORMATIVE EXPERIENCES IN GERIATRIC EDUCATION: LESSONS PRE AND POST PANDEMIC

Pamela Saunders, *Georgetown University, WASHINGTON, District of Columbia, United States*

Georgetown University medical students have the option of selecting a two-week rotation in Geriatrics during their third-year. Since Fall 2019, the curriculum has included three immersive virtual reality (VR) labs: hearing & vision loss, Alzheimer’s disease, and end-of-life conversations created by

Embodied Labs. The curricular goals include increasing empathy and sensitivity of learners to the perspective of older adults, decreasing ageism & stereotyping, and increasing clinical knowledge. In each lab, students are immersed in a live film, first-person point of view of an older adult. They interact with the immersive environment via gaze, voice, and natural hand motions. Pre-pandemic, students viewed the labs in-person using a commercial VR headset. Since the pandemic, March 2020, students accessed the VR labs through the virtual modality of Zoom. This abstract summarizes data on knowledge and attitudes examining differences in knowledge and attitudes pre and post-pandemic.

IMPACT OF VIRTUAL REALITY ON HEALTHCARE PROVIDER EMPATHY FOR OLDER ADULTS WITH SENSORY IMPAIRMENT

Suzanne Dutton, *Sibley Memorial Hospital/Johns Hopkins, Washington, District of Columbia, United States*

Virtual reality (VR) is an innovative technology that can simulate dual sensory impairment so that healthcare providers and others can experience this affliction common in older adults. This study investigated whether VR simulation could increase empathy among healthcare workers. Healthcare providers experienced a 7-minute scenario from the viewpoint of “Alfred”, a 74-year-old with macular degeneration and high frequency hearing loss on a commercial VR headset (Oculus Rift). Using a one-group pre/post-test study design, we measured knowledge, changes in empathy, and assessed participants’ self-reported behavior change. Results showed that participants increased their knowledge and that 9 of 14 empathy items had statistically significant increases. Additionally, 97% of participants agreed or strongly agreed that they would utilize the information learned in their work with patients. In conclusion, evidence suggests VR is an effective intervention to increase empathy and positively change behavior to support persons with sensory impairment.

REMOTE DELIVERY OF VIRTUAL REALITY PATIENT SIMULATIONS FOR NURSING EDUCATION

Jaime Hannans, *California State University Channel Islands, Simi Valley, California, United States*

In the midst of rapid transfers to online teaching for experiential learning opportunities in nursing clinical labs this past spring due to the pandemic, nursing simulations with immersive virtual reality (VR) in VR headsets were deemed impossible. In partnership with Embodied Labs, nursing faculty pivoted to facilitating VR using remote learning approaches in groups. In this new VR approach nursing students engaged in active learning, critical discourse, and reflection guided by faculty delivered VR scenarios remotely with in-session debriefing during discussion pause points. Complex scenarios focused on patient or family perspectives (e.g. during end-of-life care or navigating community and healthcare needs as a LGBTQ individual). These were valuable online learning opportunities for undergraduate nursing education. Student feedback was positive, and faculty perceptions indicated using VR remote learning offers rich, engaging discussion through complex topics important to nursing clinical practice.

Session 1240 (Paper)

End-of-Life Care Policy

AN EVALUATION OF THE SERVICE INTENSITY ADD-ON PAYMENT POLICY REFORM IN THE MEDICARE HOSPICE BENEFIT

Thomas Christian,¹ Pedro Gozalo,² Joan Teno,³ and Michael Plotzke,⁴ 1. *Abt Associates, Cambridge, Massachusetts, United States*, 2. *Brown University, Providence, Rhode Island, United States*, 3. *Oregon Health and Science University, Portland, Oregon, United States*, 4. *Abt Associates, Saint Louis, Missouri, United States*

In 2016, the Centers for Medicare & Medicaid Services (CMS) implemented the Service Intensity Add-On (SIA) payment, which incentivized skilled nurse and medical social worker (SN/MSW) visits in the last seven days of life. Little is known about the impact of this initiative. Using 100% Medicare hospice claims, we identified a 10% random sample of Medicare hospice beneficiaries utilizing routine home care service during calendar years 2012-2018. We compared the provision of SN/MSW visits on service dates before and after the SIA's implementation relative to beneficiaries' date of death. We also determined hospice providers' success in providing SN/MSW visits in the last days of life and categorized all providers into quintiles according to the average rate of these visits in the period prior to the SIA's implementation. Cumulative over the last seven days of life, we calculated an increase of 15.7 SN/MSW minutes (95% confidence interval [CI] 14.9-16.5 minutes) per beneficiary after the SIA was implemented. The per-minute increase was greatest on days nearer to death (4.0 minutes day of death, 95% CI 3.6-4.2). There was no detectable visit increase on days which were ineligible for the SIA. Additionally, those providers in the quintile providing the lowest rate of SN/MSW visits pre-SIA exhibited a 14-percentage point increase in rates of these visits, the third, fourth, and fifth quintiles exhibited little change over time. Further monitoring is needed to ensure beneficiaries receive adequate end-of-life care.

CHALLENGES IN IMPLEMENTING AN EXPLICIT PROTOCOL FOR LIVE DISCHARGE FROM HOSPICE

Stephanie Wladkowski,¹ Susan Enguidanos,² Tracy Schroepfer,³ and Keegan Pabst,⁴ 1. *Eastern Michigan University School of Social Work, Eastern Michigan University, Michigan, United States*, 2. *University of Southern California, Los Angeles, California, United States*, 3. *University of Wisconsin-Madison, Madison, Wisconsin, United States*, 4. *Eastern Michigan University, Ypsilanti, Michigan, United States*

A live discharge from hospice can occur when a patient stabilized under hospice care and no longer meets the life expectancy hospice eligibility criteria. In 2018, 220,000 hospice patients across the United States were discharged alive from hospice care, with 1 in 6 discharges due to stabilization, with a life expectancy exceeding hospice's six-month criteria. Hospice practitioners prepare patients and their caregivers upon enrollment for the possibility of a live discharge should their condition stabilize, however, there is no explicit discharge process available within hospice to guide practitioners in transitioning patients (and caregivers) out of hospice care. This transition process largely falls within the

domain of hospice social workers, yet there is no research documenting the challenges and facilitators to conducting a live discharge from hospice. This study aimed to understand social workers' perspectives on the live discharge process. To better understand challenges and facilitators to the live discharge process, we conducted focus group interviews with hospice social workers at four hospice agencies across the U.S. We asked participants to discuss specific tasks associated with the live discharge process for a patient and their caregiver including identifying concrete services needed post-discharge; assessing the psychosocial and grief risk of patient and caregiver; and developing a post-discharge follow-up plan. Using constant comparison analysis we identified several themes including the need for clear professional roles during a live discharge, interprofessional education, and the need for dedicated time for live discharge follow-up. Policy implications and opportunities also will be discussed.

CONSTRUCTION AND PERFORMANCE OF THE HOSPICE CARE INDEX CLAIMS-BASED QUALITY MEASURE

Michael Plotzke,¹ Thomas Christian,² Kim Groover,³ Zinnia Harrison,⁴ Ihsan Abdur-Rahman,⁵ and Cindy Massuda,⁵ 1. *Abt Associates, Saint Louis, Missouri, United States*, 2. *Abt Associates, Cambridge, Massachusetts, United States*, 3. *Abt Associates, Atlanta, Georgia, United States*, 4. *Abt Associates, Rockville, Maryland, United States*, 5. *CMS, Baltimore, Maryland, United States*

As part of the Medicare Hospice Benefit (MHB), hospices submit claims containing information that allows policy makers to assess hospice quality, help policy makers improve the MHB, and increase patients' experiences of care. We examine ten different hospice quality indicators related to the provision of services and patterns of live discharge. We calculated indicators using 100% Medicare fee-for-service (FFS) claims from October 1, 2018 through September 30, 2019. A hospice's total score among all ten indicators is referred to as their Hospice Care Index (HCI), with a possible high score of 10. We examined all hospices with at least 20 discharges. After exclusion, we examined 4,155 hospices representing 1,562,003 beneficiaries. Most hospices earn a high HCI score: over 85% of hospices had scores of eight or more. At the same time, there were some lower scoring hospices: one in ten hospices scored seven on the index, and the remaining 4.9% scored six or lower. We find that on average hospices with higher HCI scores have better Consumer Assessment of Healthcare Providers and Systems (CAHPS®) Hospice ratings. Among hospices with a score of ten, 85.1% of caregivers reported they would definitely recommend the hospice vs. 82.9% of caregivers of patients receiving treatment from hospices with a score of seven or less. Using the HCI, the Centers for Medicare and Medicaid Services and hospice patient caregivers can assess hospices across a broad set of indicators. Policymakers and hospices should monitor these ten indicators to understand their performance relative to peers.

DEATH WITH DIGNITY: A POLICY ANALYSIS

Zainab Suntai, *University of Alabama, Tuscaloosa, Alabama, United States*

Death with dignity is one of many titles attributed to the practice of providing a patient with terminal illness a

means to die in light of extreme suffering as a result of a terminal illness. The purpose of the Oregon Death with Dignity Act is to provide individuals suffering from a terminal illness with the right to make a written request for life-ending medication to end their life in a “humane and dignified manner.” Deborah Stone’s policy goals of equity, efficiency, welfare, security, and liberty provides a framework to analyze whether a policy is doing what it says it wants to do. As such, the goal of this presentation is to apply the policy goals framework to determine if the Death with Dignity Act is accomplishing its stated goals. Applying a theory of the policy process, the Death with Dignity Act was analyzed using the most recently available data from the Oregon Health Authority. Results showed that since the Death with Dignity Act passed in 1997, 2,518 people have received prescriptions for life-ending medications, and of those, 1657 or 66% have used the medication to end their lives. Based on the data aggregated between 1997 and 2019, the Death with Dignity Act has mostly met its purpose of providing individuals with a terminal illness with the right to die on their own terms and with dignity. However, there are still several issues regarding equity, especially for low-income BIPOC populations. Implications for practice, policy and research are discussed.

IMPACTS OF COVID-19 ON THE UTILIZATION OF THE MEDICARE HOSPICE BENEFIT

Michael Plotzke,¹ Betty Fout,² and Thomas Christian,³

1. *Abt Associates, Saint Louis, Missouri, United States,*

2. *Abt Associates, Rockville, Maryland, United States,*

3. *Abt Associates, Cambridge, Massachusetts, United States*

The Coronavirus Disease 2019 (COVID-19) Public Health Emergency (PHE) has had a substantial impact on the provision and utilization of healthcare services. Given the high mortality rate associated with COVID-19 amongst older adults, COVID-19 is likely to have a profound impact on all hospice users due to disruptions in providing services. Our work describes how Medicare beneficiaries have utilized the Medicare Hospice Benefit (MHB) during the PHE and how that compares to utilization of the MHB prior to the PHE. We conducted a retrospective analysis of 100% Part A and Part B Fee-for-Service (FFS) Medicare claims from January 1, 2019 – December 31, 2020. We identified approximately 42.3 million unique Medicare FFS beneficiaries from January 2019 through December 2020. Of these, 1.6 million (3.8%) had at least one hospice claim and 1.7 million (4.0%) had at least one Medicare Part A or Part B claim with a COVID-19 diagnosis during the same time period. The rate of COVID-19 amongst FFS Medicare patients who utilized hospice was 8.3%. Average per-beneficiary per-month hospice visits fell by 28.2% for aides and 15.4% for nurses from December 2019 (7.1 aide visits, 6.5 skilled nursing visits) through December 2020 (5.1 aide visits, 5.5 skilled nursing visits). CMS should continue to monitor the prevalence of COVID-19 amongst hospice users and measures of hospice utilization amongst all hospice users in order to better understand how the PHE impacts the provision of the MHB and ensure beneficiaries continue to have access to needed services.

Session 1245 (Symposium)

POLICY SERIES: FAMILY CAREGIVING POLICIES: WHERE WE ARE NOW

Chair: Pamela Nadash

Co-Chair: Rani Snyder

Discussant: Eileen Tell

This session reviews prospects for advancing family caregiving policy under the Biden Administration, by reporting on the RAISE (Recognize, Assist, Include, Support, and Engage) Family Caregivers Act, enacted in January 2018. The Act directs the Secretary of HHS to develop a national family caregiving strategy, and supports research and consensus-building activities, in collaboration with The John A. Hartford Foundation. It aims to identify actions that communities, providers, government, and others may take to recognize and support family caregivers. To this end, the Administration for Community Living (ACL) has convened an Advisory Council, comprising 15 voting members from various stakeholder groups, to guide the effort; the project also commissioned primary data collection on caregiver priorities and recommendations, using a Request for Information (RFI) in the Federal Register garnering roughly 1600 responses, 12 focus groups with diverse family caregivers, and listening sessions with stakeholder groups. Wendy Fox-Grage, of the National Academy on State Health Policy, which supports RAISE Act activities, will describe the project’s scope of work and activities to date. Pamela Nadash from the LeadingAge LTSS Center @UMass Boston, who leads the data analysis component, will present findings from the commissioned research, while Molly Evans, (MA Executive Office of Elder Affairs) will review the current state of state-level policies aimed at supporting family caregivers. The symposium will conclude with Grace Whiting, CEO of the National Alliance for Caregiving, who will present an advocate’s perspective on the status of family caregiving policy. Eileen Tell, of ET Consultants, will act as discussant.

FINDINGS FROM RAISE ACT RESEARCH: FAMILY CAREGIVER PRIORITIES

Pamela Nadash,¹ Eileen Tell,² Carol Regan,³ Taylor Jansen,⁴

Andrew Alberth,⁵ and Marc Cohen,¹ 1. *University of*

Massachusetts Boston, University of Massachusetts Boston,

Massachusetts, United States, 2. *ET Consulting, Belmont,*

Massachusetts, United States, 3. *Community Catalyst,*

Boston, Massachusetts, United States, 4. *UMass Boston,*

Boston, Massachusetts, United States, 5. *University of*

Massachusetts Boston, Boston, Massachusetts, United States

To understand the needs and policy priorities of family caregivers, the Advisory Council commissioned research: first, through a request for information (RFI) in the Federal Register, which garnered roughly 1600 responses. Qualitative analysis revealed that family caregivers have diverse needs spanning their financial security as well as their needs for caregiver-focused supports; recommendations were similarly diverse, including requests for caregiver pay, improved access to respite, and other major policy changes. These findings fed into 12 focus groups focusing on diverse populations of caregivers, yielding more depth around caregiver priorities. Six stakeholder listening sessions built on these results, aiming to

develop concrete suggestions for a national caregiver strategy – a key outcome of the Advisory Council. Such strategies ranged from a major publicity campaign creating awareness of family caregivers, to suggestions on implementing caregiver assessments, to more ambitious goals such as improved financing for long term services and supports more broadly.

ACTIVITIES UNDER THE RAISE FAMILY CAREGIVING ACT: DEVELOPING A NATIONAL STRATEGY TO SUPPORT FAMILY CAREGIVERS

Wendy Fox-Grage, *NASHP, Washington, DC, District of Columbia, United States*

This presentation describes the unique collaboration between The John A. Hartford Foundation, the Administration on Community Living (ACL), and the National Academy for State Health Policy (NASHP) in supporting the RAISE Act Family Caregiver Resource and Dissemination Center, and the goals and activities of the RAISE Act Family Caregiving Advisory Council. Most importantly, she will present the development of recommendations for a national strategy to support family caregivers involving all levels of government as well as private-sector actors. These recommendations fall into five primary areas, which Fox-Grage will discuss in detail. She will also discuss the Center's development of family caregiving resources for state and federal policymakers and other stakeholders as well as next steps in turning the Council's recommendations into concrete action.

STATE-LEVEL POLICY ACTIONS TO SUPPORT FAMILY CAREGIVERS

Molly Evans, *Commonwealth of Massachusetts, Boston, Massachusetts, United States*

The stresses created by the growing need for family caregivers have failed to prompt federal policy action; in its absence, states are stepping up. This review of state policies that support employment among family caregivers found six main categories of legislative action: paid leave; expanding federally mandated unpaid leave; paid sick time; unemployment insurance for job loss attributable to caregiving duties; establishing family caregivers as a protected classification in employment discrimination; and flexible or alternative work schedules. Despite the demand for policies that support and empower working caregivers, a minority of states have passed such legislation; to date, 9 states have implemented paid family leave; 14 have implemented mandatory sick leave legislation; and 14 have expanded FMLA. This study discusses state-level policy actions, reviews the status and importance of these policies, and finds that despite gaps in caregiver support legislation at the state level, there is significant and promising momentum.

FAMILY CAREGIVERS AS ADVOCATES

C. Grace Whiting, *National Alliance for Caregiving, Washington, District of Columbia, United States*

This presentation discusses the growing influence of family caregiver advocacy and its prospects for impacting policy under the Biden administration, at both the federal and states levels. In particular, it will describe the National Alliance for Caregiving's 50-state unified strategy for establishing the caregiver support infrastructure that is needed to coordinate efforts and to support caregivers across the nation and the

lifespan. Historically, family caregivers have had difficulty acting as effective advocates, given the multiple roles they often play and their widely divergent interests, based on the varying needs of their care recipient and their divergent life circumstances. However, the Biden administration has indicated receptivity to caregiver issues, and the public has become increasingly aware of the caregiver role (in part, due to the pandemic), resulting in improved prospects for policy action at both the state and federal levels. This presentation reviews recent developments and discusses strategies for moving forward.

Session 1250 (Symposium)

IMPACT OF COVID-19 ON OLDER EMPLOYEES OF A LARGE STATE UNIVERSITY: FINDINGS FROM A MIXED-METHODS STUDY

Chair: Zhao Chen

Co-Chair: Amanda Sokan

Burgeoning research on the effects of COVID-19 and university experiences in the U.S. tends to focus on transmission of COVID-19 virus or student-related consequences of COVID-19. However, none to our knowledge examine the effects on older university employees. Universities employ a higher percentage of older adults with diverse job responsibilities and socioeconomic status, presenting a unique closed community for understanding the pandemic's consequences for older adults. Our aims are to: 1) understand older university employees' concerns related to COVID-19, 2) develop intervention strategies to mitigate the adverse impact of the COVID-19 pandemic on the health and wellbeing of older employees, and 3) test the interventions within the target population to help reduce stress and promote wellbeing. Using a community participatory approach, we sought input from employees aged 50 and older at the University of Arizona. Mixed methods were used to collect qualitative (six focus groups; N= 24) and quantitative (online survey; N=1030) data. We conducted and evaluated a set of interventions (i.e., virtual Tai Chi and Qigong, walking exercises, and meditation) using focus group feedback, process evaluation, and outcome assessment with validated questionnaires on sleep quality, mindfulness and psychological wellbeing. Findings show that a significant percentage of older employees worried about getting COVID-19 and had experienced undesirable changes in sleep quality, weight, and physical activity, and concerns about caregiving; however, we also observed psychological resilience in this population. The study highlights the importance of developing immediate and effective programs for promoting health and wellbeing for older employees during the pandemic.

UNDESIRABLE WEIGHT CHANGE AND REDUCED SLEEP QUALITY IN UNIVERSITY OLDER EMPLOYEES DURING THE COVID-19 PANDEMIC

Hamza Butt,¹ Kathleen Insel,¹ Kendra Jason,² Mark Wager,¹ Dagoberto Robles,¹ and Yunjia Yang,¹ 1. *University of Arizona, Tucson, Arizona, United States*, 2. *UNC Charlotte, Charlotte, North Carolina, United States*

This study investigated the occurrence of undesirable weight change (UDWC) and reduced sleep quality (RSQ),

and major factors associated with these changes during COVID-19 pandemic amongst university older employees (age 50+). Participants (n = 846) were recruited throughout campus and completed an online survey. Summary statistics were used to describe characteristics of the study participants and frequency and level of UDWC and RSQ. Proportional odds models were used to assess major factors associated with UDWC and RSQ. The results showed 416 (43.2%) participants reported UDWC and 474 (49.2%) RSQ. Age was inversely, and obesity positively associated with UDWC and RSQ. With each 5-year increase in age, the OR (95% CI) was 0.87 (0.78, 0.97) for reporting UDWC and 0.90 (0.81, 1.00) for reporting RSQ. Obese individuals were significantly more likely to report a worse UDWC and RSQ (OR (95% CI) = 1.58 (1.18, 2.11) and 1.56 (1.16, 2.10) respectively).

IN THEIR OWN WORDS: A STUDY ON COVID-19-RELATED CONCERNS AND PERCEPTIONS OF RISK AMONG OLDER UNIVERSITY EMPLOYEES

Amanda Sokan,¹ Nicole Yuan,² Mariana Felix,² Mark Wager,² Lisa O'Neill,³ and Zhao Chen,⁴ 1. *University of Arizona, Phoenix, Arizona, United States*, 2. *University of Arizona, Tucson, Arizona, United States*, 3. *University of Arizona, Center on Aging, Tucson, Arizona, United States*, 4. *The University of Arizona, Tucson, Arizona, United States*

The purpose of this qualitative study was to examine COVID-19-related concerns and risk perceptions among older employees aged 50+ related to reopening a large state university campus during the COVID-19 pandemic. Recruitment focused on older employees from diverse backgrounds and job classifications. Six focus group interviews, with a total of 24 participants, were conducted using Zoom video conferencing. Interviews were transcribed using Zoom and were double-checked for accuracy. Transcripts were coded and analyzed using ATLAS.ti 9 after establishing inter-rater reliability among two coders. During the campus reopening, older employees reported several concerns and perceptions of risk focused on COVID-19 exposure and transmission to others, individual health and health of other household members, mental health and stress, and job security. Findings were used to inform the development of intervention strategies and resources to promote the health and well-being among older employees during the pandemic.

CAREGIVER CHALLENGES OF OLDER UNIVERSITY EMPLOYEES DURING THE COVID-19 PANDEMIC

Heather Kenning,¹ Yunjia Yang,¹ Lisa O'Neill,² Mindy Fain,³ Mark Wager,¹ and Amanda Sokan,⁴ 1. *University of Arizona, Tucson, Arizona, United States*, 2. *University of Arizona, Center on Aging, Tucson, Arizona, United States*, 3. *University of Arizona Center on Aging, Tucson, Arizona, United States*, 4. *University of Arizona, Phoenix, Arizona, United States*

The COVID-19 pandemic has created numerous challenges for older employees who are also caregivers. Some challenges are associated with disruptions in community-based support services leading to the intensification of caregiver responsibilities. Other challenges are related to caregivers' concerns about their health or the risk of bringing the virus to the care recipient. This study investigated the impacts of those challenges on older (age 55+) working caregivers, from a major

university, with a sample that included 57 male and 80 female caregivers. The investigation explored the association of gender and perception of COVID risk, vulnerability, loneliness, resilience, and interpersonal change. Although literature suggests that female caregivers report more risk-perception, stress, and overburden than male caregivers, our findings showed no significant differences based on gender. These findings suggest the importance of understanding that both male and female older working caregivers have been affected by stress and overburden due to the recent pandemic.

Session 1255 (Symposium)

IMPROVING CARE FOR PERSONS WITH COGNITIVE IMPAIRMENT IN COMMUNITY-BASED LONG-TERM CARE AND ACUTE CARE SETTINGS

Chair: Jing Wang

Co-Chair: Bei Wu

The COVID-19 pandemic has highlighted the importance of providing person-centered care for our vulnerable populations across the globe. This symposium focuses on improving care for persons with cognitive impairment and dementia in various care settings. The first study explored dyadic experiences of living with early-onset dementia pre and during COVID-19 in China through a person-centered care lens. The second concept analysis presented four interrelated dimensions of Asian American caregiver support, including individual, family, community, and professional health system. The third study investigated undergraduate nursing students' attitudes toward pursuing jobs of providing care for older adults with dementia in rapidly-aging urban areas in China and its associated factors. The fourth study examined the impact of social isolation on cognitive function and Quality of Life among acute ischemic stroke (AIS) patients in China. The last study explored an association between perceived control and cognitive function among acute ischemic stroke (AIS) patients in China. The last two studies suggested that perceived control and social isolation may be potential targets in cognitive interventions for AIS patients. This symposium presents the understanding of dementia caregiver support, the empirical evidence of living with dementia, the attitudes towards dementia care among the next generation of nursing workforce, and the impact of social factors on cognitive functions longitudinally. The presenters emphasize the importance of improving care in long-term care and acute care settings. There is a need to design person and family-centered care to improve health and wellbeing of persons with cognitive impairment.

LIVING WITH EARLY-ONSET DEMENTIA IN CHINA: THROUGH A PERSON-CENTERED CARE LENS

Jing Wang,¹ Ding Ding,² and Qianhua Zhao,³ 1. *Fudan University, Shanghai, Shanghai, China (People's Republic)*, 2. *Fudan University Affiliated Huashan Hospital, Shanghai, Shanghai, China (People's Republic)*, 3. *Fudan University Affiliated Huashan Hospital, Shanghai, Shanghai, China (People's Republic)*

We conducted semi-structured interviews with 35 dyads of persons with early-onset dementia (EOD) and their primary informal care partners to explore their dyadic experiences of living EOD in Shanghai, China. Many of them are in their

50s and still need to make familial, financial, and social commitments. They experienced significant disruptions of their "normal" family life and family dynamics, social stigma, and felt marginalized when there was very limited age-appropriate support for them. During COVID-19 pandemic, many persons with EDO and their care partners had decreased social networking opportunities, physical exercises and experienced an increased level of social isolation. The pandemic further complicated their family dynamics, relationships, and communications. Care partners used their strengths to adaptively deal with multiple challenges, cope with the stress, social isolation, and normalize their family life by facilitating collaborative work with persons with EOD.

CAREGIVER SUPPORT FOR ASIAN AMERICAN ALZHEIMER'S DISEASE AND RELATED DEMENTIAS CAREGIVERS: A CONCEPTUAL SYNTHESIS

Mengyao Hu, Allison Squires, and Bei Wu, *New York University, New York, New York, United States*

Informal caregiver support has been defined as different types of interventions. However, it has not been well explained in the social context and not well discussed as an integrative concept for dementia caregivers who are Asian Americans. Therefore, the aim of this study was to conduct a dimensional analysis—a type of evidence synthesis—to explore caregiver support in the context of Asian American dementia caregivers. A synthesis of 40 articles produced four interrelated dimensions of caregiver support: Individual (language, information, psychological issue, and culture); Family (family member support, availability of extended family, and decision making); Community (bilingual and bicultural help, and religion and spiritual source); and Professional healthcare system (expectations from healthcare professionals and caregivers for caregiver interventions, communication concordance, initiative in seeking help, and trust). The findings provide guidance for future studies on this population in promoting caregiver's health and developing caregiver interventions.

PERCEIVED CONTROL AND COGNITIVE FUNCTION AMONG ACUTE ISCHEMIC STROKE PATIENTS IN CHINA

Zhijian Liu,¹ Xiangjing Kong,² Jing Wang,³ Qin Wang,⁴ Bei Wu,⁵ and Juan Li,¹ *1. Department of clinical nursing School of Nursing Second Military Medical University, Shanghai, Shanghai, China (People's Republic), 2. School of Nursing Second Military Medical University, Shanghai, Shanghai, China (People's Republic), 3. Fudan University, Shanghai, Shanghai, China (People's Republic), 4. Linyi People Hospital, Linyi, China, Linyi, Shandong, China*

(People's Republic), 5. New York University, New York, New York, United States

This study explored an association between perceived control and cognitive function among 437 acute ischemic stroke (AIS) patients in China. We collected data from one stroke center in each of the three cities (Shanghai, Nanjing, and Linyi) from June to December, 2020. Cognitive function was assessed by the Montreal Cognitive Assessment (MoCA), and perceived control was assessed by Perceived Control in Health Care Questionnaire at acute stage. Hierarchical linear regression was used. The average of perceived control and MoCA were 81.36 ± 0.877 and 19.66 ± 0.304 , respectively. A number of 374 (85.6%) patients were in cognitive impairment and 63 (14.4%) were cognitively normal. Perceived control was positively associated with cognitive function ($\beta = 0.103$, $p < 0.001$). After controlling for stroke severity, age, gender and education, the association was still significant ($\beta = 0.041$, $p = 0.014$). These findings suggest that perceived control may be a potential target in cognitive interventions for AIS patients.

THE IMPACT OF SOCIAL ISOLATION ON COGNITION AND QUALITY OF LIFE AMONG STROKE PATIENTS IN CHINA

Xiangjing Kong,¹ Juan Li,² Zhijian Liu,² Jing Wang,³ and Bei Wu,⁴ *1. School of Nursing Second Military Medical University, Shanghai, Shanghai, China (People's Republic), 2. Department of clinical nursing School of Nursing Second Military Medical University, Shanghai, Shanghai, China (People's Republic), 3. Fudan University, Shanghai, Shanghai, China (People's Republic), 4. New York University, New York, New York, United States*

This study examined the impact of social isolation on cognitive function and Quality of Life (QoL) among acute ischemic stroke (AIS) patients in China. We conducted in-person interviews among 206 AIS patients during the acute stage and at 3-month after onset in three cities between May 2020 and February 2021. The data was collected during and post-COVID-19 period in China. We conducted bivariate and multiple regression analyses. Results show that over time, average level of social isolation decreased, and cognitive function and QoL increased. After controlling for covariates, social isolation was negatively associated with cognitive function ($\beta = -0.438$, $p < 0.01$) and QoL ($\beta = -2.521$, $p < 0.01$). These findings suggest that addressing the issue of social isolation could potentially impact patients' cognitive function and QoL. Future studies are needed to further examine the linkages between long-term social isolation and changes in cognitive function and QoL among AIS patients.

UNDERGRADUATE NURSING STUDENTS' WILLINGNESS OF PROVIDING CARE FOR OLDER ADULTS WITH DEMENTIA AS THEIR FUTURE WORK

Wenlin Liu, and Jing Wang, *Fudan University, Shanghai, Shanghai, China (People's Republic)*

This study examines how undergraduate nursing students' knowledge of dementia care are associated with their willingness of providing care for older adults with dementia across care settings as nurses in urban China, controlling for factors such as their socio-demographic characteristics, willingness of being a nurse, and years of studying nursing. We surveyed 320 undergraduate students from Shanghai, China and found that students with a better knowledge of dementia care, a longer year of nursing study, have no experience of being cared for by grandparents during childhood, and being the only child at home tended to be less willing to provide care for older adults with dementia in their future work. In order to prepare high-quality future dementia care workforce, nursing educators not only need to disseminate knowledge of dementia care, they should also tailor teaching to students' characteristics and motivate students to take the leadership in dementia care across settings.

Session 1260 (Symposium)

INFUSING REPRESENTATIVENESS AND CULTIVATING HARMONIZATION IN ALZHEIMER'S TRIALS: WORLD WIDE FINGERS

Chair: Rema Raman

Discussant: Neelum Aggarwal

World Wide Fingers is a network involving over 30 countries organized to conduct randomized controlled clinical trials to slow the progression of cognitive decline and reduce dementia risks. Trials are designed to parallel the successful Finnish Geriatric Intervention Study to Prevent Cognitive Impairment and Disability (FINGER) trial of a multidomain lifestyle intervention featuring increased physical activity, improved diet, cognitive training, and metabolic risk factor monitoring. While FINGER found that its intervention significantly benefited cognitive function, it is not clear whether this approach might be successfully tailored to other cultures and environments to yield similar results. This is the goal of World Wide FINGERS. It infuses representativeness by enrolling cohorts that reflect the communities in which it is conducted. For findings across the many trials to be integrated, it is necessary for protocols to be harmonized as much as possible. The COVID-19 pandemic presents special challenges towards harmonization as its disruptions of trial protocols and conduct vary among countries and over time. This symposium is organized to provide the scientific background and framework for the World Wide FINGERS. Novel grassroots efforts towards enrolling representative cohorts in the US will be described. Plans for harmonization and federated data analyses spanning international boundaries and regulations will be outlined. Integrated approaches to challenges of COVID-19 pandemic across trials will be presented. The conclusion of this session will be a discussion of how World Wide FINGERS may serve as a model for collaborative approaches to identify effective, translatable approaches to reduce risks for Alzheimer's disease.

THE SCIENCE BEHIND MULTIDOMAIN INTERVENTIONS TO SLOW COGNITIVE DECLINE

Francesca Mangialasche, *Karolinska Institutet, Stockholm, Sweden*

The spotlight on interventions to protect brain health and prevent Alzheimer's disease (AD) has recently widened to include risk modification. In the last 20 years, evidence continues to build to support cognition-enhancing effects of individual lifestyle components, which include, among others, physical exercise, diet, cognitive training, and cardiovascular risk management. A recent evolution of lifestyle trials is to combine these components as part of intervention delivery. The potential benefit of this approach on cognition in older adults, first showcased in the FINGER trial, is now under investigation by multiple groups across the nation and the globe. The multidomain approach offers important opportunities to boost lifestyle intervention 'dose', to examine inter-component synergistic effects, and for intervention tailoring to meet specific needs and limitations. Harmonization and data-sharing will be essential to meaningfully address the question of whether multidomain lifestyle modification can indeed be 'medicine' to protect brain health and reduce AD risk.

WORLD-WIDE FINGERS: AN INTERNATIONAL NETWORK OF LINKED MULTIDOMAIN TRIALS

Francesca Mangialasche,¹ Alina Solomon,² Tiia Ngandu,³ and Miia Kivipelto,² 1. *Division of Clinical Geriatrics, Stockholm, Stockholms Lan, Sweden*, 2. *Karolinska Institutet, Stockholm, Stockholms Lan, Sweden*, 3. *Finnish Institute for Health and Welfare, Public Health Promotoin Unit, Uusimaa, Finland*

Risk reduction and prevention of dementia in older adults is a growing research area. In the Finnish Geriatric Intervention Study to Prevent Cognitive Impairment and Disability (FINGER randomized controlled trial) a 2-year multidomain intervention -dietary counseling, exercise, cognitive training, vascular and metabolic risk monitoring- improved cognition in older adults from the general population who had increased dementia risk. The intervention was associated also with improvement of other clinical outcomes (e.g., multimorbidity, functional status). The FINGER model is being adapted and tested in different populations and settings through the World-Wide FINGERS, the first global network of multidomain prevention trials, including over thirty countries. The network goal is to identify effective and feasible solution for dementia risk reduction across the spectrum of cognitive decline - from at-risk asymptomatic states to early-symptomatic stages. Through the World-Wide FINGERS-SARS-CoV-2 initiative, the network aims to assess the effects of the COVID-19 pandemic in older adults.

GRASSROOTS APPROACHES TO COMMUNITY-BASED REPRESENTATIVE RECRUITMENT IN MULTIDOMAIN TRIALS

Marcus Hill, *Division of Gerontology and Geriatric Medicine, Winston-Salem, North Carolina, United States*

U.S. POINTER is a randomized, controlled, multi-domain clinical trial to slow the progression of cognitive decline within the American population via tailored and

culturally-appropriate healthy lifestyle interventions. For findings to be broadly relevant across the American population, incorporating an inclusive and robust recruitment effort has been essential to form a diverse and properly representative participant cohort. As such, the trial's inclusive enrollment goal is 30% from traditionally underrepresented communities that include those at elevated risk for Alzheimer's disease and related disorders. To accomplish this goal, U.S. POINTER developed and deployed a grassroots recruitment strategy in partnership with outreach specialists at each site that includes a mix of evidence-based and innovative community engagement approaches. While the COVID-19 pandemic continues to present unique challenges for recruitment, our team has been able to strategize ways to continue working within the community to support trial recruitment. An overview of these methods will be presented.

HARMONIZING DATA COLLECTION AND ANALYSIS IN WORLDWIDE FINGERS TRIALS

Markku Peltonen, *Population Health Unit, Helsinki, Uusimaa, Finland*

One of the goals of the World-Wide FINGERS (WW-FINGERS): A Global Approach to Dementia Prevention network is to prospectively facilitate data sharing and joint analyses across clinical trials on prevention of cognitive impairment and dementia. The aim with prospectively harmonizing studies in different countries and settings regarding interventions, outcomes, measurements, data collection, and establishing best practices for responsible data sharing and access to data for remote joint analyses, is to increase the use of clinical trial data. By utilizing federated database system which connects multiple autonomous, decentralized databases and enables data-analyses to be conducted without individual level data being transferred, could be a feasible and acceptable technical solution for countries around the world, given wide variations in data protection and sharing regulations. Ultimately, prospectively harmonizing clinical studies and establishing a culture of harmonization and sharing, will promote international joint initiatives to identify globally implementable and effective preventive strategies.

MAINTAINING INTEGRITY OF WORLDWIDE FINGER CLINICAL TRIALS DURING THE COVID-19 PANDEMIC

Susanne Roehr, *Institute of Social Medicine, Occupational Health and Public Health (ISAP), Leipzig, Sachsen, Germany*

The COVID-19 pandemic presents challenges to the conduct of randomized clinical trials of lifestyle interventions. World-Wide FINGERS international network convened a forum for researchers to discuss statistical design and analysis issues they faced during the pandemic. We report experiences of three trials that, at various stages of conduct, altered designs and analysis plans to navigate these issues. We provide recommendations for future trials to consider as they develop and launch behavioral intervention trials. The pandemic led researchers to change recruitment plans, interrupt timelines for assessments and intervention delivery, and move to remote intervention and assessments protocols. The necessity of these changes add emphasis to the importance,

in study design and analysis, of intention to treat approaches, flexibility, within site stratification, interim power projections, and sensitivity analyses. Robust approaches to study design and analysis are critical to negotiate issues related to the intervention.

Session 1265 (Symposium)

INTEGRATING HUMANITIES AND ARTS INTO GERONTOLOGY AND GERIATRICS CURRICULA

Chair: Desmond O'Neill

Co-Chair: Dana Bradley

Discussant: James Powers

Humanities, Arts and Cultural Gerontology (HACG) has been an integral element of GSA for over 4 decades, and is included as a notable feature of AGHE guidelines on curricula for gerontology and geriatrics. However, as with many interdisciplinary areas, the degree to which HACG has been successfully inserted into curricula, the extent to which this has involved engagement of faculty in arts and humanities, and the facilitators and barriers of such deeper joint working are unknown. The HACG Advisory Panel and AGHE would like to convene a round-table/symposium at the 2021 Phoenix GSA Meeting to consider the range of experiences of educators of programs in gerontology/geriatrics, from those who can relate success stories in integrating HACG into their curricula, to those who can give insights into challenges and opportunities in attempts to develop such elements in their curricula. Co-convened by Des O'Neill, Chair HACG AP and Dana Burr Bradley AGHE Program Chair, we invite lively discussion which we consider will aid in the development of a road map towards substantive and rewarding initiatives in incorporating scholarship and education in HACG in gerontology and geriatrics educational program

A DECADE OF TEACHING THE COURSE AGING & THE ARTS: REFLECTING ON OPPORTUNITIES AND CHALLENGES

Jacqueline Eaton, *University of Utah, University of Utah, Utah, United States*

In 2010, the University of Utah Gerontology Interdisciplinary Program first offered GERON 5240/6240: Aging and the Arts. This course was developed to enrich program curricula by addressing a gap in content specific to the arts and humanities. The purpose of this presentation is to focus on identifying the opportunities and challenges experienced teaching this course over the past decade. Opportunities will highlight competency mapping, internal and external partnerships, the benefits of bridging disciplines, and innovation in teaching and problem-solving. Challenges experienced include addressing various needs (online learning, undergraduate and graduate levels, multiple disciplines), tuition differentials, and varying levels of enrollment. A stand-alone course is one method of increasing humanities, arts, and cultural gerontology within curricula. It has the potential of enhancing student interest in gerontology while also demonstrating how the arts and humanities can improve work across disciplines.

INTERDISCIPLINARY GERONTOLOGY IN HIGHER EDUCATION: A CASE STUDY FROM SOUP TO NUTS

Justine McGovern, *Lehman College, City University of New York, Bronx, New York, United States*

Through the lens of a multi-year joint project initiated by faculty in Social Work and Digital Arts at Lehman College, the City University of New York's senior college in the Bronx, NY, this paper provides a guide on how to initiate, implement and evaluate interdisciplinary collaborations in gerontology. The paper also suggests ways to ensure that these collaborations can support tenure and promotion processes, funding initiatives, and pedagogical enhancements. The paper focuses on how to make use of campus resources, including departmental Chairs, research offices, and campus-wide committees to identify appropriate collaborators and funding sources; how to nurture productive interdisciplinary relationships, such as clarifying disciplinary expectations and participants' professional needs; and how to maximize return on the effort for tenure and promotion, such as producing publishable content, identifying appropriate opportunities for interdisciplinary publishing and presenting, advocating for interdisciplinary collaborations, and developing interdisciplinary syllabi, an example of evidence-based high-impact pedagogy.

COMING SOON TO A CLASS NEAR YOU: CINEMATIC INSIGHTS ON LATER LIFE

Candace Brown,¹ and Margaret Perkinson,² 1. *University of North Carolina, Charlotte, Charlotte, North Carolina, United States*, 2. *University of Hawaii at Manoa, Honolulu, Hawaii, United States*

Cinema can enhance gerontological education by reinforcing a variety of learning styles, connecting course content to current culture, and providing an alternative, tangible view of what students are learning. The presenters discuss their use of film to teach gerontological concepts in the classroom. In an Introduction to Aging course, the films, "Young at Heart" and "Sunset Story" were used to break through ageist stereotypes, examine examples of resilience at the end of life, and convey the impact of residential context on the experience of aging, i.e., within a retirement home for "retired rebels." In a course on Health and Aging, movies, such as "Red," "Driving Miss Daisy," and "Somethings Gotta Give" are used to compare the social and psychological aspects of aging of the characters to learned concepts in the classroom. Students expressed how watching and writing about the films increased their understanding by bringing abstract gerontological concepts to life.

LESSONS FOR HUMANITIES AND ARTS IN GERONTOLOGY AND GERIATRICS CURRICULA FROM THE MEDICAL AND HEALTH HUMANITIES

Desmond O'Neill, *Trinity College Dublin, Dublin, Dublin, Ireland*

The role of Humanities, Arts and Cultural Gerontology in gerontology and geriatrics curricula finds a metaphor in the rapidly evolving field of medical and health humanities, with which this author has been involved for three decades. Behind the call for increasing humanities and arts

scholarship in the pedagogy of both fields lies the challenge of establishing an interdisciplinary nexus of scholarship that avoids the challenges of dilettantism and gestures such as providing lists of novels and movies. This presentation draws on the presenter's bibliometric research in the medical and health humanities which indicates authorship in the majority to be either solely from the humanities or from healthcare, with little indication of joint working in either authorship or acknowledgements (the scholar's courtesy), and explores the background issues of academic culture with a view to proposing solutions to elevate the inclusion of humanities and arts as a significant element of gerontology education.

Session 1270 (Paper)

Long-Term Care I (BSS Paper)

FACTORS ASSOCIATED WITH THE QUALITY OF STAFF-RESIDENT INTERACTIONS IN ASSISTED LIVING

Anju Paudel,¹ Elizabeth Galik,² Barbara Resnick,² Kelly Doran,² Marie Boltz,³ and Shijun Zhu,⁴ 1. *Penn State Ross and Carol Nese College of Nursing, University Park, Pennsylvania, United States*, 2. *University of Maryland School of Nursing, Baltimore, Maryland, United States*, 3. *Pennsylvania State University, University Park, Pennsylvania, United States*, 4. *University of Maryland, Baltimore, Maryland, United States*

Care interactions are essential to understand and respond to resident needs in assisted living (AL). The factors that influence care interactions in AL have not been directly examined. In this study, we explored the factors associated with the quality of care interactions in AL. It was hypothesized that resident functional status, agitation, depression, and resistiveness to care as well as facility size and ownership would be significantly associated with the quality of care interactions in AL after controlling for resident demographics (age, gender, marital status), comorbidities, and cognition. To test the hypothesis, we utilized baseline data including 379 residents from the second and third cohorts recruited in a randomized trial titled 'Dissemination and Implementation of Function Focused Care for Assisted Living Using the Evidence Integration Triangle'. Regression analysis was performed using a stepwise method. The care interactions were mostly positive (mean=6.3; range = 0-7). Resident agitation and facility ownership were significantly associated with care interactions and accounted for 8.2% of the variance. Increased resident agitation was associated with negative or neutral interaction while for-profit ownership was associated with positive interactions. To promote positive care interactions, staff should be educated about strategies to minimize resident agitation (e.g., calm posture and respectful listening) and encouraged to engage with residents using resident-centered care and communication approach. Findings also suggest the need to work towards optimizing care interactions in nonprofit settings. Future research could further explore the impact of facility-level factors (e.g., staffing ratios, staff longevity, and job satisfaction) on care interactions.

LAUNCHING THE LIVING ALONE WITH COGNITIVE IMPAIRMENT (LACI) PROJECT: BRIDGING RESEARCH AND POLICY

Elena Portacolone,¹ Julene Johnson,² Jacqueline Torres,² M Maria Glymour,² Sahru Keiser,³ and Thi Tran,⁴

1. *UCSF, University California San Francisco, California, United States*, 2. *University California San Francisco, San Francisco, California, United States*, 3. *University of California, San Francisco, San Francisco, California, United States*, 4. *UCSF/ San Francisco, UCSF Institute of Health and Aging/ San Francisco, California, United States*

The Living Alone with Cognitive Impairment (LACI) Project bridges research and policy to develop policy recommendations to address the needs of people living alone with cognitive impairment (PLACI) through new expansions of long-term services and supports. There are an estimated 4.3 million PLACI in the United States. Access to formal LTSS is critical to them because they lack cohabitants to assist with activities of daily living and navigating LTSS, especially during the COVID-19 pandemic. To bridge research with policy, seventeen Policy Advisory Group (PAG) members were recruited, including representatives from state and local government, and LTSS policy experts. Between November 2020-January 2021, a total of 17 individual meetings were conducted with PAG members and one webinar convening of the group. The PAG identified preliminary recommendations in three areas, including: 1) important areas of inquiry for qualitative and quantitative research, 2) best practices for addressing equity across diverse racial/ethnic minority groups, and 3) preliminary policy recommendations that leverage existing innovations. The LACI Project team is actively incorporating the PAG feedback by: a) modifying research questions for the quantitative and qualitative research, b) convening a diverse Community Advisory Group, and c) crafting preliminary policy recommendations based on PAG input. To conclude, engaging the expertise of the PAG to develop policy recommendations to increase LTSS for PLACI is a promising method of bridging research and policy. The engagement of policy experts ensures that fore-coming research is designed to address the most important policy gaps and all policy recommendations are actionable and timely.

LOWER WAGES OF NURSES IN LONG-TERM CARE: DOES RACIAL AND ETHNIC DIVERSITY EXPLAIN THE DIFFERENCE?

Joanne Spetz, Laura Wagner, and Timothy Bates,
University of California, San Francisco, San Francisco, California, United States

Registered nurses (RNs) are a key component of the long-term care (LTC) workforce and prior research demonstrates their importance to ensuring patient safety in LTC settings. RNs who work in LTC settings earn less than those who work in hospitals and also are more likely to be from racial and ethnic minority groups. This study seeks to measure wage differences between Registered Nurses (RNs) working in LTC and other settings (e.g., hospitals) and whether differences are associated with the characteristics of the RN workforce between and within settings. We used the 2018 National Sample Survey of Registered Nurses (NSSRN) public-use file to examine RN employment and earnings. Our study population included a sample of 15,373 employed

RNs who provided patient care. Characteristics such as race/ethnicity, type of RN degree completed, census region, and union status were included in bivariate analyses and multiple regression analyses to examine the effect of these characteristics on wages. Logistic regression was used to predict RN employment in LTC settings. We found that RNs in LTC experienced lower wages compared to those in non-LTC settings, yet this difference was not associated with racial/ethnic or international educational differences. LTC nurses were also significantly less likely to be represented by a labor union, and there was not a statistically significant wage difference for LTC RNs who were unionized. Because RNs in LTC earn lower wages than RNs in other settings, policies to minimize pay inequities are needed to support the RN workforce caring for frail older adults.

WHOLE TEAM, WHOLE PERSON HIGH-INVOLVEMENT QUALITY IMPROVEMENT TRAINING FOR VA COMMUNITY LIVING CENTER LEADERS

A. Lynn Snow,¹ Valerie Clark,² Shibe Zhao,² Ryann Engle,³ Corilyn Ott,⁴ Princess Nash,⁵ Lisa Minor,⁶ and Christine Hartmann,⁷ 1. *University of Alabama, Tuscaloosa, Alabama, United States*, 2. *VA Bedford Healthcare System, Bedford, Massachusetts, United States*, 3. *VA Boston Healthcare Center, CHOIR, VA Boston Healthcare Center, CHOIR, Massachusetts, United States*, 4. *Birmingham VA Medical Center, Birmingham VA Medical Center, Alabama, United States*, 5. *Tuscaloosa VA Medical Center, Tuscaloosa, Alabama, United States*, 6. *Geriatrics and Extended Care, Washington, District of Columbia, United States*, 7. *VA Bedford Healthcare System, VA Bedford Healthcare System, Massachusetts, United States*

Long-term care is a challenging environment for quality improvement due to the high resident acuity, wide variation in resident needs, and wide variation in types and backgrounds of the large staff across three daily shifts. We report results from a learning collaborative undertaken to improve care quality and staff quality improvement skills in the VA CLCs through development of high functioning relationally coordinated teams operating in accord with person-centered care principles. The collaborative included 27 CLCs. Over 9 months leadership teams completed action assignments supported by 5 workshops and regular group coaching calls. Evaluation included fidelity monitoring (attendance, mid- and final progress reports), satisfaction questionnaires, and review of the VA quality measures (CLC Compare). Pre-post participant evaluations revealed a significant increase in positive responses to the question “to what extent do you think applying these new skills/knowledge will improve quality in your CLC?” and positive responses trending toward significance in ratings of abilities to apply new skills. Open-ended survey comments were positive and indicated change in understanding and practice: “utilizing the daily huddle to facilitate real time communication afforded the team a proactive approach to providing care and reducing acute exacerbations. We are able to avert, evaluate as a real time team and make it happen in the now not as a look back.”; “definitely unified front-line staff and CLC leadership.” Some changes were achieved in CLC Compare quality scores (e.g., falls with major injury rate had a 9.6 reduction (average rate = 3.39 pre, 3.07 post)).

Session 1275 (Paper)

Long-Term Care I (SRPP Paper)

NURSING HOME SATISFACTION SURVEYS: DIFFERENCES BY RACE, AGE, AND GENDER

Nicholas Castle,¹ John Harris,² and David Wolf,³ 1. *West Virginia University, Allison Park, Pennsylvania, United States*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 3. *Bellarmine, Louisville, Kentucky, United States*

Nursing home satisfaction information has gained substantial traction as a quality indicator representing the consumers perspective. However, very little research has examined differences in satisfaction related to race, age and gender. As a quality metric, satisfaction measures are variously used for quality improvement, benchmarking, public reporting, and for adjustment to payments. As such, valid comparisons among facilities are important. To our knowledge, no adjustment to satisfaction scores are currently used for nursing homes. However, in many other settings this is a common practice. In this research, nursing home resident, family, and discharge satisfaction scores were examined from >4,000 participants. The data were collected in 2020 and come from 420 facilities. Satisfaction information came from the CoreQ surveys, which include 23 individual questions four of which can be combined to produce an overall satisfaction score. These CoreQ nursing home surveys are endorsed by NQF. Generally lower overall satisfaction scores were found for family members compared to current residents or discharged residents. Minorities (Black, Asian, Hispanic) had lower overall satisfaction scores compared to whites; however, the differences were not significant at conventional levels. Participants of the lowest age (<65 years) were significantly ($p<.05$) less satisfied than older participants (>75 years) and males were significantly ($p<.05$) less satisfied than females. The findings indicate that some case-mix adjustment may be applicable for nursing home satisfaction scores.

QUALITY-OF-LIFE SCORES FOR NURSING HOME RESIDENTS ARE STABLE OVER TIME: EVIDENCE FROM MINNESOTA

Weiwen Ng,¹ Tetyana Shippee,² John Bowblis,³ Odichinma Akosionu,¹ Mark Woodhouse,¹ and Yinfei Duan,¹ 1. *University of Minnesota, Minneapolis, Minnesota, United States*, 2. *University of Minnesota, University of Minnesota, Minnesota, United States*, 3. *Miami University, Oxford, Ohio, United States*

Objective: Quality of life (QoL) is a multidimensional construct that assesses the quality of lived experience in nursing homes (NHs). QoL is directly important to NH residents. However, QoL is only publicly reported in a few states, partly because of concerns regarding measure stability. To address these concerns, we tested the stability of Minnesota's NH QoL measure over one year. Study Design: A pair of two-year cohorts of Minnesota NH residents who responded to the 2012-2013 (N = 4,448) or 2014-2015 (N = 4,644) QoL survey in consecutive years. Stability was measured using the intra-class correlation (ICC) from hierarchical linear models.

Models were fit without any covariates, then individual and facility-level characteristics were added. Principal Findings: Overall QoL had ICCs of 0.602 and 0.614 in the earlier and later cohort respectively. Domain-level ICCs were lower, ranging from 0.374 (positive mood) to 0.571 (lack of negative mood) in the 2012-2013 cohort, with similar trends for the later cohort. Adjusting for important covariates reduces the ICCs slightly, but they remained at 0.565 or higher for the summary score. Conclusions: Person-reported summary QoL has adequate stability over a period of one year. Our results provide impetus to assess and report NH QoL on a national level. Consumers can be confident that if an NH's QoL scores improve from year to year, that represents a real improvement, and not just the scores varying due to which residents were sampled. Some caution, however, is warranted when presenting facility-level domain scores, as these are less stable.

Session 1280 (Paper)

Mobility II

MOBILITY AND MUSCLE STRENGTH TRAJECTORIES: THE EFFECT OF MEDITERRANEAN DIET, PHYSICAL ACTIVITY, AND SOCIAL SUPPORT

Marguerita Saadeh,¹ Federica Prinelli,² Davide Vetranò,³ Weili Xu,³ Anna-Karin Welmer,⁴ Serhiy Dekhtyar,¹ Laura Fratiglioni,⁴ and Amaia Calderón-Larrañaga,³ 1. *Aging Research Center, Karolinska Institutet, Stockholm, Stockholms Lan, Sweden*, 2. *Aging Research Center, Dept NVS, Karolinska Institutet, Neurobiology, Care Sciences and Society, Stockholms Lan, Sweden*, 3. *Karolinska Institutet, Solna, Stockholms Lan, Sweden*, 4. *Karolinska Institutet 17175, Stockholms Lan, Sweden*

Decline in physical function varies substantially across older individuals due to several biological and extrinsic factors. We aimed to determine the effect of modifiable factors -such as dietary patterns, physical activity and social support- and their interaction with mobility and muscle strength decline after age 60. We analyzed data from 1686 individuals aged 60+ from the population-based Swedish National study on Aging and Care in Kungsholmen. The Mediterranean Diet Score was calculated based on a validated food frequency questionnaire. Physical activity was categorized based on current recommendations, and social support was measured according to participants' perceived material and psychological support. Participants' physical function was assessed over 12 years through changes in walking speed (m/s) and chair stand time (s). Linear mixed models adjusted for socio-demographic and clinical factors were used. Subjects with high adherence to Mediterranean diet were <78 years (82.3%), women (56.1%), married (61.1%), with university education (52.8%), high levels of social support (39.3%) and health-enhancing physical activity (51.5%). One-point (over nine) increase in the MDS was associated with a slower annual worsening in walking speed ($\beta^*_{\text{time}}=0.001$; $p=0.024$) and chair stand time ($\beta^*_{\text{time}}=-0.014$; $p=0.008$). The protective effect of Mediterranean diet was highest among subjects reporting high social support ($\beta^*_{\text{time}}=-0.065$, $p=0.026$ for chair stands) and high physical activity ($\beta^*_{\text{time}}=0.010$,

$p=0.001$ for walking speed), beyond the effect of each exposure individually. A higher adherence to Mediterranean diet, especially in combination with recommended levels of physical activity and high social support, contribute to delay the decline in physical function observed with aging.

REGIONAL MICROSTRUCTURAL INTEGRITY IN RELATION TO GAIT SPEED: THE ATHEROSCLEROSIS RISK IN COMMUNITIES STUDY

Kevin Sullivan,¹ Chad Blackshear,² Timothy Hughes,³ Rebecca Gottesman,⁴ Prashanthi Vemuri,⁵ Thomas Mosley,¹ Michael Griswold,¹ and B. Gwen Windham,² 1. *The University of Mississippi Medical Center, Jackson, Mississippi, United States*, 2. *University of Mississippi Medical Center, Jackson, Mississippi, United States*, 3. *Wake Forest School of Medicine, Winston-Salem, North Carolina, United States*, 4. *Johns Hopkins University, Baltimore, Maryland, United States*, 5. *The Mayo Clinic, Mayo Clinic, Minnesota, United States*

Brain imaging-based biomarkers of neuropathology are associated with mobility in older adults, but the relation of regional microstructural integrity to gait speed in the context of a broader neuropathological profile is less understood. We examined cross-sectional associations of microstructural integrity with 4-meter usual-pace gait speed (cm/s) in a subsample of ARIC study participants who completed 3T MRI brain scans with diffusion tensor imaging (2011-13; $n=1785$; mean age= 76.2 ± 5.3 , 60% Female, 28% Black). We considered total brain and six regional averages of fractional anisotropy (FA; lower=worse microstructural integrity) and mean diffusivity (MD; higher=worse microstructural integrity): frontal, temporal, parietal, occipital, anterior and posterior corpus callosum. Associations were tested in multivariable linear regression models adjusted for demographics, cardiovascular risk factors, and with and without additional neuropathological indices: total brain volume, white matter hyperintensities, infarcts, and microhemorrhages. When modeled separately, all neuropathology indices were associated with slower gait speed. Every standard deviation (SD) higher total brain FA was associated with $+2.56$ cm/s gait speed (95% CI: 1.64, 3.48) and every SD higher MD was associated with -4.27 cm/s gait speed ($-5.34, -3.20$). All regional estimates were comparable. When adjusted for all other neuropathology indices, only posterior corpus callosum FA ($\beta=1.72$; 0.67, 2.77), total MD ($\beta=-1.63$; -3.02, -0.25), frontal lobe MD ($\beta=-1.76$; -3.03, -0.48), and temporal lobe MD ($\beta=-1.40$; -2.78, -0.02) remained significantly associated with gait speed. Microstructural integrity is an informative measure of brain pathology in relation to mobility, with regional measures tied to executive, memory, and somatosensory function being more informative when a broader neuropathological profile is considered.

THE CORTICAL DYNAMICS OF DUAL-TASK STANDING IN OLDER ADULTS

Melike Kahya,¹ On-Yee Lo,² Junhong Zhou,³ Alvaro Pascual-Leone,⁴ Lewis Lipsitz,⁵ Jeffrey Hausdorff,⁶ Christoph Michel,⁷ and Brad Manor,⁸ 1. *Marcus Institute for Aging Research, Harvard Medical School, Boston, Massachusetts, United States*, 2. *Hebrew SeniorLife/Harvard Medical School, Boston, Massachusetts, United*

States, 3. *Harvard Medical School/Hebrew SeniorLife, Roslindale, Massachusetts, United States*, 4. *Harvard Medical School, Boston, Massachusetts, United States*, 5. *Hebrew SeniorLife, Boston, Massachusetts, United States*, 6. *Tel Aviv University, Tel Aviv University, Tel Aviv, Israel*, 7. *University of Geneva, University of Geneva, Geneva, Switzerland*, 8. *Hinda and Arthur Marcus Institute for Aging Research, Harvard Medical School, Boston, Massachusetts, United States*

In older adults, the extent to which performing a cognitive task when standing diminishes postural control is predictive of future falls and cognitive decline. The cortical control of such “dual-tasking,” however, remains poorly understood. Electroencephalogram (EEG) studies have demonstrated that the level of attention and cognitive inhibitory activity during cognitive task performance can be quantified by changes in brain activity in specific frequency bands; namely, an increase in theta/beta ratio and a decrease in alpha-band power, respectively. We hypothesized that in older adults, dual-tasking would increase theta/beta ratio and decrease alpha-band power, and, that greater alpha-band power during quiet standing would predict worse dual-task performance. To test this hypothesis, we recorded postural sway and EEG (32-channels) in 30 older adults without overt disease as they completed trials of standing, with and without verbalized serial subtractions, on four separate visits. Postural sway speed, as well as absolute theta/beta power ratio and alpha-band power, were calculated. The theta/beta power ratio and alpha-band power demonstrated high test-retest reliability during quiet and dual-task standing across visits (intra-class correlation coefficients >0.70). Compared with quiet standing, dual-tasking increased theta/beta power ratio ($p<0.0001$) and decreased alpha-band power ($p=0.002$). Participants who exhibited greater alpha-band power during quiet standing demonstrated a greater dual-task cost (i.e., percent increase, indicative of worse performance) to postural sway speed ($r=0.3$, $p=0.01$). These results suggest that in older adults, dual-tasking while standing increases EEG-derived metrics related to attention, and, that greater cognitive inhibitory activity during quiet standing is associated with worse dual-task standing performance.

VALIDATION OF THE INTEGRATED CARE FOR OLDER PEOPLE SCREENING TOOL: FOCUS ON THE CHAIR RISE TEST TO ASSESS LOCOMOTION

Emmanuel Gonzalez-Bautista,¹ Philippe de Souto Barreto,² Aaron Salinas-Rodriguez,³ Sandrine Sourdet,¹ Yves Rolland,¹ Leocadio Rodriguez-Mañas,⁴ Sandrine Andrieu,⁵ and Bruno Vellas,² 1. *Toulouse University Hospital (CHU Toulouse), Toulouse, Midi-Pyrenees, France*, 2. *CHU Toulouse: Centre Hospitalier Universitaire de Toulouse, Gérontopôle de Toulouse, Institut du Vieillissement, Midi-Pyrenees, France*, 3. *National Institute of Public Health of Mexico, Cuernavaca, Morelos, Mexico*, 4. *Getafe University Hospital, Getafe, Madrid, Spain*, 5. *University of Toulouse III, INSERM, UPS, Toulouse, Midi-Pyrenees, France*

The Integrated Care for Older People (ICOPE) is a function- and person-centered healthcare pathway developed by the World Health Organization (WHO). ICOPE's first step (Step 1) consists of screening for impairments in the

intrinsic capacity (IC) domains (namely sensorial, cognition, nutrition, psychological, and locomotion). For instance, the ICOPE Step1 tool suggests a cut-point of 14 seconds for five-repetition chair rise time as a marker of impaired locomotion. Given the lack of validation of this tool in the literature, we aimed to validate the ICOPE screening tool concerning incident health outcomes, focusing on the locomotion assessment. First, we analyzed the five-domain screening tool's ability to identify older adults (OA) at higher risk of incident outcomes (frailty, disability, dementia) using longitudinal data from the Multidomain Alzheimer Preventive Trial (MAPT). For the locomotion assessment (chair rise test), we derived and cross-validated age-specific cut points from two population-based cohorts using ROC (receiver operating characteristic) analysis. We further verified those cut points among OA real-life users of the health system and clinical trial participants. In conclusion, the ICOPE Step 1 screening tool was able to identify OA at higher risk of incident frailty, disability, and dementia. New chair-rise-time cut points for age groups 70-79 years old and 80 years and older were valid in populations from different settings. The ICOPE Step 1 tool provides a practical and integrative way of screening older adults for impairments in IC and detecting those at higher risk of functional decline.

Session 1285 (Symposium)

RECOGNIZING AND INTERVENING ON ELDER ABUSE, NEGLECT, AND EXPLOITATION IN THE AGE OF COVID-19

Chair: Pi-Ju Liu

Discussant: Pamela Teaster

The rapid outbreak of coronavirus disease 2019 (COVID-19) caused by the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) has led to a global pandemic. Public health measures to prevent the spread of COVID-19, such as social distancing and self-quarantine, have drastically altered people's lives and led to social isolation, financial instability, and disrupted access to healthcare and social services. Older adults have not only borne the brunt of the highest COVID-19 mortality rates, but recent studies also describe growing reports of elder mistreatment. It is necessary to attend to these age-related disparities during the remainder of the COVID-19 pandemic and future health crises. This symposium includes four presentations on researchers' findings in elder mistreatment during the COVID-19 pandemic. Dr. E-Shien Chang will compare prevalence of elder mistreatment before and since the pandemic, and highlight associated risk and protective factors during the pandemic. Dr. Lena Makaroun will examine changes in elder mistreatment risk factors among caregivers during the pandemic. Dr. Pamela Teaster will present Adult Protective Services' (APS) policy and practice changes in response to the pandemic to demonstrate the pandemic's impact on service providers. Lastly, Dr. Pi-Ju (Marian) Liu will appraise elder mistreatment victims' awareness of COVID-19 and their unmet needs during the pandemic. Following the four presentations, Dr. Pamela Teaster will moderate a discussion on how elder mistreatment is a growing concern,

especially during the pandemic, and what service providers are doing to protect older adults.

ELDER ABUSE DURING THE COVID-19 PANDEMIC: PREVALENCE, RISK, AND PROTECTIVE FACTORS

E-Shien Chang,¹ and Becca Levy,² 1. *Weill Cornell Medicine, New York City, New York, United States*, 2. *Yale University, Woodbridge, Connecticut, United States*

It has been assumed that the pandemic has brought with it a surge in elder abuse due to heightened health and interpersonal stressors. However, empirical evidence is lacking. This study aimed to estimate the prevalence of, and risk and resilience factors of elder abuse during the pandemic. In a web-based survey of a socio-demographically diverse sample of 897 older persons, one in five older persons (n = 191; 21%) reported elder abuse, an increase of 84% from prevalence estimates before the pandemic. In the multivariate logistic regression models, sense of community was a persistent protective factor for elder abuse (OR= 0.89, 95% CI 0.85–0.93). At the relational level, physical distancing was associated with reduced risk of elder abuse (OR= 0.94, 95% CI 0.90–0.98). At the individual level, financial strain was associated with increased risk of abuse (OR= 1.08, 95% CI: 1.02–1.14). Implications for prevention strategies will be discussed.

CHANGES IN ELDER MISTREATMENT RISK FACTORS REPORTED BY CAREGIVERS OF OLDER ADULTS DURING THE COVID-19 PANDEMIC

Lena Makaroun,¹ Scott Beach,² Tony Rosen,³ and Ann-Marie Rosland,¹ 1. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2. *University of Pittsburgh, University of Pittsburgh, Pennsylvania, United States*, 3. *Weill Cornell Medical College / New York-Presbyterian Hospital, PELHAM, New York, United States*

This study aimed to assess how the COVID-19 pandemic has impacted caregiver (CG)-related risk factors for elder mistreatment (EM) in a community sample of CGs. A non-probability sample of 433 CGs caring for care recipients (CRs) age ≥60 years completed a survey on COVID-19 impacts in April-May 2020. Compared to before COVID-19, over 40% of caregivers reported doing worse financially, 16% were experiencing new financial hardship, 19.4% were a lot more worried about their financial situation, 15% reported drinking more alcohol, and 64% had somewhat or greatly increased feelings of social isolation and loneliness. CGs reported that COVID-19 had made caregiving more physically (18.7%), emotionally (48.5%) and financially (14.5%) difficult and interfered with their own healthcare (19%). Differences found between younger and older caregivers will be presented and implications of these increased CG-related EM risk factors for healthcare and social service providers discussed.

A NATIONWIDE STUDY ON HOW COVID-19 CHANGED APS POLICIES AND PRACTICES

Pamela Teaster, *Virginia Tech, BLACKSBURG, West Virginia, United States*

The purpose of this inquiry by the Virginia Tech Center for Gerontology and WRMA, Inc., was to explore changes being implemented by APS programs across the country in response to the COVID-19 pandemic. With input from the

Administration for Community Living, the research team used a three-step process (e.g., telephone interviews with state-level APS administrators, a national online survey, and in-depth interviews with local and APS) to capture information on changes caused by efforts to mitigate the spread of COVID-19. This presentation concerns changes in APS policy and practice that the pandemic caused, including modifications in-person visits and adjustments to timeline requirements. Discussion of alterations in policy and practices during the first five months of the pandemic can elucidate APS and other services and planning for older adults in future emergency situations.

ELDER ABUSE VICTIMS DURING THE COVID-19 PANDEMIC: ADMINISTRATIVE DATA FROM SAN FRANCISCO ADULT PROTECTIVE SERVICES

Pi-Ju Liu,¹ Aining Wang,¹ Laura Schwab-Reese,¹ and Sara Stratton,² 1. *Purdue University, West Lafayette, Indiana, United States*, 2. *San Francisco Adult Protective Services, Department of Aging and Adult Services, City and County of San Francisco, San Francisco, California, United States*

This study examined elder mistreatment victims' experiences at the beginning of the COVID-19 pandemic. San Francisco Adult Protective Services (APS) caseworkers conducted phone interviews to inquire about clients' awareness of COVID-19 and unmet needs. Nine-hundred-and-thirty-four (71%) of 1,313 APS' past clients or their collaterals were interviewed, with 741 (79%) responding positively to COVID-19-awareness questions, and 697 (75%) having no unmet needs. Binary logistic regression with Firth adjusted maximum likelihood estimation method revealed that older persons ($p < .05$), self-neglectors ($p < .05$), and victims of neglect ($p < .05$) were less aware of COVID-19. Unmet needs varied by mistreatment type. Victims of isolation were more likely to have medical needs ($p < .05$), while victims of emotional abuse were more likely to report loneliness ($p < .001$). Collaboration between service providers is key in assisting victims experiencing unmet needs to live safely in a public health crisis.

Session 1290 (Paper)

Research Methods

AGING IN THE AFTERMATH OF ADVERSITY: LATER-LIFE IMPACT OF INSTITUTIONAL CHILD ABUSE AND DISCLOSURE

Shauna Rohner,¹ Andreas Maercker,² Alan Carr,³ and Myriam Thoma,⁴ 1. *University of Zurich, Zürich, Zurich, Switzerland*, 2. *University of Zurich, University of Zürich, Zurich, Switzerland*, 3. *University College Dublin, Dublin, Dublin, Ireland*, 4. *University of Zurich, Zurich, Zurich, Switzerland*

Until the 1990's in Ireland, many children in institutional care experienced abuse and neglect, with lasting negative effects, including trauma symptoms and psychopathology. While trauma disclosure can be important for recovery, findings are inconsistent and often lack consideration of wider social and interpersonal contexts. As survivors of

this historical adversity enter later-life stages, research is needed on the long-term impact and to clarify the role of disclosure. Therefore, this study aimed to examine the later-life impact of institutional child abuse on health and well-being, and the role of trauma disclosure and socio-interpersonal contexts in an older adult sample. Qualitative semi-structured interviews (60-120 minutes) were conducted with 17 Irish older adults, aged 50-77 years (mean age=60.7 years), who experienced childhood institutional abuse. Audio-recorded interviews were transcribed and analysed using Framework Analysis. Themes for 'childhood and related later-life adversity' included detrimental perceptions and interactions, re-exposure and reminders, failure of system and society, and cycle of abuse. Disclosure themes included successful, unsuccessful, and non-disclosure, as well as evidence of socio-interpersonal interactions (e.g., non-disclosure influenced by shame or fear, compounded by socio-cultural values, (lack of) social acknowledgment, or the power of the church in society). Results suggest that childhood institutional abuse can have long-term negative impacts into later life, including social, psychological, physical health, and socio-economic aspects. Disclosure results emphasize the need to consider the complex social, cultural, and interpersonal contexts within which an individual is embedded. This may enhance understanding and facilitate targeted health and social care services for this older adult population.

CHILDHOOD EXPOSURE TO FAMILY VIOLENCE AND LATER-LIFE SIBLING RELATIONSHIPS

Jooyoung Kong, and Jaime Goldberg, *University of Wisconsin-Madison, Madison, Wisconsin, United States*

There has been a growth in research examining the long-term effects of childhood adversity on later life outcomes; however, only a few studies have examined the impact that childhood adversity has on sibling relationships in late adulthood. To address this gap in the literature, the current study examines the latent class structure of childhood exposure to family violence and investigates whether a latent class membership is associated with aspects of later-life sibling relationships, including geographical proximity, frequency of contact, perceived closeness, similarity in outlook, and exchange of support. Using data from 3,921 adult participants in the Wisconsin Longitudinal Study and the Bolck, Croon, and Hagenars (BCH) approach of latent class analysis (LCA), we identified five latent classes (prevalence rate noted): "Never experienced violence (75%)," "experienced sibling violence (7%)," "experienced parental abuse & witnessed domestic violence (4%)," "experienced father's abuse & witnessed domestic violence (10%)," "experienced mother's abuse & witnessed domestic violence (5%)". Childhood exposure to family violence was a significant predictor of later-life sibling relationships. Specifically, adults who experienced sibling violence and their mother's and/or father's abuse in childhood showed significantly lower perceived closeness and similarity in outlook with their siblings in adulthood than those who did not experience violence. Our findings suggest that childhood exposure to family violence may have a long-term negative impact on the emotional aspect of sibling relationships. Future research may explore

how the impact of childhood adversity on sibling relationships affects other aspects of adult lives, such as individual well-being or caregiving for aging parents.

INVESTIGATING SEQUENTIAL AND SIMULTANEOUS CHANGES IN TRAJECTORIES OF COGNITIVE DECLINE AND DEPRESSIVE SYMPTOMS

Matthias Klee,¹ and Anja Leist,² 1. *University of Luxembourg, Esch-sur-Alzette, Luxembourg*, 2. *University of Luxembourg, Esch-sur-Alzette, Diekirch, Luxembourg*

Background. The role of depression as risk factor or early symptom of cognitive decline and dementia is still debated. Exploiting longitudinal trajectories of memory recall in a large European sample, we sought to better understand the nature of simultaneous versus sequential changes in depressive symptoms alongside memory recall at older ages. **Method.** A total of 4,865 respondents to the SHARE survey, mean age at t1 61.5 years (SD = 7.53), completed the EURO-D depression scale and a delayed recall task across six waves spanning ~13 years. We applied k-means clustering to distinguish trajectories of depressive symptoms and delayed recall. Clusters indicating depressive and recall trajectories were included in logistic regressions to assess likelihood of parallel versus sequential change, controlling for age, gender, employment status and education. **Results.** Analyses revealed six distinct trajectories each for depressive symptoms and delayed recall. Visual inspections indicated that only declining recall trajectories showed increases in depressive symptoms, occurring simultaneously rather than sequentially. Using grouped declining recall trajectories as outcome, the low-increasing depressive symptoms trajectory was associated with cognitive decline (OR = 1.52 [1.11, 2.06]), whereas the stable-high depressive symptoms trajectory was associated with cognitive decline in respondents aged 60-69 years (OR = 1.78 [1.01, 3.16]). **Discussion.** Distinguishing trajectories in depression and recall incorporates longitudinal information able to further elucidate relationships between depression and cognition. While the findings suggest depression as a co-morbidity, attention needs to be given to a comparatively small high-stable depressive symptoms trajectory group with elevated risk of cognitive decline in their 60s.

PRE-STATISTICAL HARMONIZATION OF BEHAVIORAL INSTRUMENTS ACROSS EIGHT SURVEYS AND TRIALS

Diefei Chen,¹ Eric Jutkowitz,² Skylar Iosepovici,³ John Lin,⁴ and Alden Gross,¹ 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 2. *Brown University, Brown University, Rhode Island, United States*, 3. *Brown University School of Public Health, Providence, Rhode Island, United States*, 4. *Brown University, Sugar Land, Texas, United States*

Data harmonization methods facilitate further use of existing studies and research resources. Most statistical harmonization methods require pooling data across studies, which is complex and requires careful scrutiny of source data. Most methods (e.g., item response theory) require datasets to have common items for linking a common construct across studies: this necessitates the qualitative process of pre-statistical harmonization. Here, we document pre-statistical

harmonization of items measuring behavioral and psychological symptoms (e.g., agitation, wandering, etc.) which represent problematic behaviors among people with dementia administered in a national survey (ADAMS), evaluations conducted at Alzheimer's Disease Research Centers (NACC), and in six randomized trials (COPE, TAP, ALZQOL, ACT, REACH, ADSPPlus). We describe our approach to review question content and scoring procedures to establish comparability across items prior to data pooling. We identified 327 items from 15 instruments across these eight studies. We found considerable cross-study heterogeneity in administration and coding procedures for items that measure the same domain. For example, eight items were coded as count variables in some studies but as categorical variables in others. Moreover, of the 359 items, 191 are conditionally dependent on values of another item. These issues around item response heterogeneity and conditional dependency needed to be resolved prior to estimation of item response theory models for statistical co-calibration. We leveraged several rigorous data transformation procedures to address these issues, including re-coding and winsorization. This study provides guidelines for how future research may acknowledge and address similar issues in pooling behavioral and related instruments.

TRENDS IN DEMENTIA PREVALENCE IN THE UNITED STATES, 1995-2019: AN AGE-PERIOD-COHORT-INTERACTION ANALYSIS

Mark Lee,¹ and Liying Luo,² 1. *University of Minnesota, Minneapolis, Minnesota, United States*, 2. *Pennsylvania State University, University Park, Pennsylvania, United States*

Previous studies have indicated that age-specific dementia prevalence has declined in the United States and other high-income countries. However, these studies have been limited by estimating temporal change in dementia rates on a strictly period basis, with little attention to possible cohort effects. Distinguishing age, period, and cohort effects is both methodologically and theoretically important for identifying the etiological factors driving dementia decline in the population. In this study, we apply the novel Age-Period-Cohort-Interaction (APC-I) model, which defines cohort effects as the interaction between age and period main effects. The APC-I model improves on earlier APC models (e.g., the accounting method) by solving the linear dependence between predictors through theoretical clarification instead of statistical manipulation. We use the APC-I model to estimate period and cohort trends in dementia prevalence using data from the Health and Retirement Study (HRS). Our analysis points to significant period and cohort effects. Dementia prevalence declined significantly between the periods 1995-1999 and 2015-2019. At the same time, cohorts born in the 1940s had significantly lower odds of dementia than would be expected given age and period main effects. This cohort's unique protection from dementia has been relatively stable as they have aged. Our study identifies the periods during which and cohorts for whom dementia risk has declined in the United States. Further research is needed to specify the period factors (e.g., broad based improvements in nutrition) and cohort factors (e.g., increases in educational attainment) that are responsible for these trends.

Session 1295 (Symposium)

STRESS, COGNITION, AND MINORITY HEALTH

Chair: Toni Antonucci

Co-Chair: Laura Zahodne

Discussant: Melissa Gerald

This symposium examines the many factors influencing cognition and health among ethnically and racially diverse groups. Kindratt et al. use representative, national data to examine cognitive limitations and diabetes among foreign born Non-Hispanic Whites, Blacks, Hispanics, Asians and Arab Americans. Results indicate that prevalence of cognitive limitations was highest among non-Hispanic Whites and Arab-Americans, lowest among Blacks and Asians. Diminich et al. investigate the association of stressors and metabolic risk factors with cognitive/emotional functioning in a population of Hispanic/Latina(o) immigrants. They find a link between components of metabolic syndrome that are associated with domain specific deficits in cognition. These impairments are linked to posttraumatic stress, immigration related trauma and emotional health and wellbeing. Arevalo et al. examine cross-sectional and prospective associations of sleep duration and insomnia symptoms with measures of cognitive functioning among older Latinos from Puerto Rican ancestry with a longitudinal sample of older adults from the Boston Puerto Rican Health Study. Findings indicate that hours of sleep and insomnia symptoms are significantly associated with a number of global and specific cognitive factors. Finally, Munoz and colleagues, using a regional racially and ethnically diverse sample of people living in a large northeastern city, identified four stress profiles. These profiles (which focus on different types of stress) were differentially associated with working memory performance. In sum, these four papers document the experiences of stress and their association with cognitive functioning in diverse minority groups each of whom are disproportionately at risk for ADRD/RD. Gerald, from NIA, will serve as discussant.

DISPARITIES IN COGNITION AMONG U.S. AND FOREIGN-BORN MINORITY POPULATIONS WITH AND WITHOUT DIABETES

Tiffany Kindratt,¹ Florence Dallo,² Laura Zahodne,³ and Kristine Ajrouch,⁴ 1. *University of Texas at Arlington, Arlington, Texas, United States*, 2. *Department of Public and Environmental Wellness, Rochester, Michigan, United States*, 3. *University of Michigan, Ann Arbor, Michigan, United States*, 4. *University of Michigan, Ypsilanti, Michigan, United States*

Adults with cognitive limitations and diabetes may be less able to adhere to treatment recommendations. Our aims were to: 1) estimate and compare the prevalence of cognitive limitations and diabetes among foreign-born non-Hispanic whites, blacks, Hispanics, Asians, and Arab Americans to US-born non-Hispanic whites; and 2) examine associations after controlling for covariates. We linked 2002-2016 National Health Interview Survey and 2003-2017 Medical Expenditure Panel Survey data (ages ≥ 45 years, $n=122,898$). The prevalence of cognitive limitations was highest among foreign-born non-Hispanic whites (9.71%) and Arab Americans (9.40%) and lowest among foreign-born blacks

(5.19%). Foreign-born non-Hispanic whites had higher odds (OR=1.36; 95% CI=1.05-1.49) of cognitive limitations than their US-born counterparts. Foreign-born Hispanics with diabetes had greater odds of cognitive limitations (OR=1.91; 95% CI=1.63, 2.24) compared to US-born non-Hispanic whites. Additional findings will be discussed focused on stressors that may contribute to cognition disparities using the immigrant health paradox framework.

SLEEP AND COGNITION: RESULTS FROM A LONGITUDINAL COHORT OF OLDER PUERTO RICAN ADULTS

Sandra Arevalo, *California State University, Torrance California, United States*

We examined cross-sectional and prospective associations of sleep duration and insomnia symptoms with measures of cognitive function among older adults aged 45-75 y from the Boston Puerto Rican Health Study, a longitudinal cohort of 1500 participants of Puerto Rican ancestry. We found, statistically significant cross-sectional associations of sleep duration (hours) and an executive function domain before ($F=6.20$; $\text{Prob}>F=0.0001$) and after ($F=2.33$; $\text{Prob}>F=0.05$) controlling for covariates (age, sex, education, smoking, drinking, mental and health conditions and medication use); between sleep duration and global cognition before ($F=5.38$; $\text{Prob}>F=0.0003$) and a trend after controlling for covariates ($F=2.20$; $\text{Prob}>F=0.0669$). In longitudinal associations, sleep duration (time2) was significantly associated with global condition at time3 ($F=2.42$; $\text{Prob}>F=0.0475$) after controlling for time2 global cognition. In conclusion, we found hours of sleep and insomnia symptoms significantly associated with various cognitive factors. A public health focus on sleep hygiene may improve cognitive health outcomes in older Puerto Rican adults.

IMMIGRATION-RELATED TRAUMA ASSOCIATED WITH METABOLIC RISK AND COGNITION IN HISPANIC AND LATINO IMMIGRANT POPULATIONS

Erica Diminich,¹ Kristine Ajrouch,² Toni Antonucci,³ Sean Clouston,⁴ Irving Vega,⁵ Laura Zahodne,³ Noah Webster,³ and Richard Gonzalez,³ 1. *Stony Brook University, Stony Brook, New York, United States*, 2. *University of Michigan, Ypsilanti, Michigan, United States*, 3. *University of Michigan, Ann Arbor, Michigan, United States*, 4. *Renaissance School of Medicine, Stony Brook University, Renaissance School of Medicine, Stony Brook University, New York, United States*, 5. *Michigan State University, Grand Rapids, Michigan, United States*

Recent immigrant and undocumented Hispanic/Latino adults in the United States (U.S.) are an underserved segment of the aging population. In this cross-sectional pilot study, we examined associations between self-reported stressors metabolic syndrome, emotional reactivity, and cognitive functioning in a heterogeneous sample ($N=80$) of Hispanic/Latino adults (43.8% Central America; 43.8% South America; 7.5% Caribbean; mean years in the U.S.=18.1, $SD=12.8$). Participants (Meducation=10.2 years, $SD=5.34$; Mage=48.6 years, $SD=12.3$) underwent blood draw, anthropometrics and NIH-toolbox cognitive and behavioral measures. Linear regressions indicated that, elevated glucose was inversely associated with working memory ($r=-.30$), whereas higher HDL and controlled

glucose were associated with better episodic memory ($r=.27$) and executive functioning ($r=.32$). Results further revealed associations between immigration-related trauma and elevated posttraumatic stress symptomatology. Implications for mental health and early detection of modifiable risk factors to promote healthy aging in vulnerable Hispanic/Latino immigrant populations are discussed.

PSYCHOSOCIAL STRESS PROFILES AND COGNITIVE FUNCTION IN A RACIALLY AND ETHNICALLY DIVERSE SAMPLE OF ADULTS

Elizabeth Munoz,¹ Laura Zahodne,² Richard Gonzalez,² Noah Webster,² Martin Sliwinski,³ and Stacey Scott,⁴ 1. *The University of Texas at Austin, The University of Texas at Austin, Texas, United States*, 2. *University of Michigan, Ann Arbor, Michigan, United States*, 3. *The Pennsylvania State University, University Park, Pennsylvania, United States*, 4. *Stony Brook University, Stony Brook, New York, United States*

We developed comprehensive multi-domain profiles of psychosocial stress in urban-dwelling, racially and ethnically diverse adults (age range: 25-65; N=256; 63% Non-Hispanic Black; 25% Hispanic; 9% Non-Hispanic White) and evaluated associations with cognitive function. Participants completed psychosocial stress measures tapping into ten domains and tasks of processing speed, working memory, and episodic memory. Latent profile analyses controlling for age yielded four-profiles: high neighborhood stress, moderate versus high work stress and daily discrimination, and high health and relationship stress. Profiles significantly differed in income, age, and employment status. The profile with moderate work stress and daily discrimination and the profile with high neighborhood stress each had significantly lower working memory than the other profiles. The finding of lower working memory among individuals in the moderate work stress and daily discrimination profile was not due to sociodemographic variables. Results highlight the potentially cumulative influence of different contextual stressors on cognition.

Session 1300 (Paper)

Teaching and Learning During the COVID-19 Pandemic

GENERATING COMMUNITY ENGAGED LEARNING IN GERONTOLOGY COURSES DURING THE COVID-19 PANDEMIC

Katarina Felsted, and Samantha Whitehead, *University of Utah, Salt Lake City, Utah, United States*

This presentation describes the core traits of a community-engaged learning (CEL course), how one gerontology program incorporated a theoretical framework to continue to provide students opportunities during the COVID-19 pandemic, and how generalizable this is across gerontology programs. Caregiving and Aging Families, a gerontology course enrolling both undergraduate and graduate students, champions community-engaged learning in two critical ways: students attend caregiver support groups in the community, and students form a partnership with a caregiver mentor in the community. This partnership allows students an intimate

look at the caregiver's role and burden while enlisting the student to prepare a service care plan and compendium of resources for the caregiver. Ensuring the safety of older adults during the COVID-19 pandemic placed restrictive parameters on these experiences. While students typically attend support groups and identify and partner with a caregiver mentor in person, this needed modification during the pandemic. This was created through the application of Baltes' Theory of Selection, Optimization, and Compensation (SOC model), aided by a CEL teaching assistant, funded through the campus Community Service Center. This allowed for identifying, coordinating, and communicating with community partners throughout the semester and provided ongoing communication, technical assistance, and problem-solving for both partners and students. Caregiver groups with a robust online, synchronous presence were identified and approached. The gerontology program communities of interest disseminated a call for community caregivers with basic technological familiarity. The caregiver mentor-student partnerships were founded and maintained, with additional benefits stemming from a shared pandemic experience.

GENERATION TO GENERATION PROJECT: PAIRING STUDENTS WITH OLDER ADULT MENTORS DURING THE COVID-19 PANDEMIC

Pamela Elfenbein, *University of North Georgia, Gainesville, Georgia, United States*

To meet the needs of older adults isolated in the midst of the COVID-19 pandemic, we began pairing Human Services and Gerontology students with community dwelling adults 55 years of age and older, recruited through senior centers and other organizations serving older adults.

Students paired with isolated older adults were tasked with building supportive relationships, assuring that basic needs were being met and that all available community resources were in place, and then documenting their mentor's life stories with an emphasis on the resilience, strength and wisdom of their older adult mentors (to focus and build on their strengths, the older adults we engage with are referred to as our "mentors"). Oral histories and supporting artifacts are archived in the university's library permanent repository.

The oral histories portray unique perspectives into life, strength, and resilience during the COVID-19 pandemic and quarantine. The older adult mentors participating in the Generation to Generation project reported feeling strengthened and connected through their participation in the Generation to Generation project.

To determine if social Isolation and loneliness can be ameliorated through participation in the Generation to Generation oral history project, researchers utilized the UCLA Loneliness Scale in pre- and post- participation interviews; findings will be shared.

HIGH DEATH ANXIETY AND AMBIGUOUS LOSS: LESSONS LEARNED FROM TEACHING THROUGH THE COVID-19 PANDEMIC

Raven Weaver,¹ Cory Bolkan,² and Autumn Decker,¹ 1. *Washington State University, Pullman, Washington, United States*, 2. *Washington State University, Vancouver, Washington, United States*

For gerontological educators, topics such as mortality, loss, and end-of-life issues often emerge or are central in their courses. However, the COVID-19 pandemic has raised our awareness of loss and death on a global scale and teaching during the pandemic has raised questions about how educators, communities, or systems of higher education can support students' learning while simultaneously experiencing losses during intense times of uncertainty. In this mixed-method study of 246 students enrolled in undergraduate thanatology courses, we explored their levels of death anxiety and their experiences with pandemic-related losses. We found that students' death anxiety increased significantly during the pandemic, in comparison to the years prior ($p < .001$). We also conducted a content analysis in a subset of students' written narratives ($n = 44$) regarding their pandemic experiences. We identified three themes. Participants desired: (a) more flexibility from instructors, no questions asked; (b) more compassion and understanding; and (c) specific, targeted support resources. The voices of students were filtered through the authors' interpretation as educators to provide several teaching recommendations that support student learning during challenging times. The recommendations align with a trauma-informed approach, given the high rates of death anxiety and ambiguous loss among students, and have immediate implications for educators teaching during the pandemic, and for years to come. Finally, we also advocate for more university and community-based thanatology, and gerontology education offerings in general, to help normalize conversations about death, loss, and bereavement.

INTERGENERATIONAL COMMUNICATION AS INTERVENTION: SOCIAL ISOLATION IN OLDER ADULTS DURING COVID-19

Laura Kirk,¹ Penny Kessler,² Stephanie Gingerich,³ Sharon McGill,³ and Hanna Pryor,⁴ 1. *University of Minnesota, Minneapolis, Minnesota, United States*, 2. *University of Minnesota, University of Minnesota School of Nursing, Minneapolis, Minnesota, United States*, 3. *University of Minnesota School of Nursing, Minneapolis, Minnesota, United States*, 4. *Presbyterian Homes and Services, Roseville, Minnesota, United States*

Social isolation and loneliness are prevalent and impactful in the lives of older adult across care settings, and the emergence of a deadly global pandemic requiring social distancing and quarantining exacerbated these experiences significantly in 2020. A semester-long communication-focused clinical project was developed and piloted for sophomore bachelor of nursing science (BSN) students during fall 2020. Affording preclinical nursing students the opportunity to develop communication skills early in their program of study holds potential, and learning the story of older adults appears to be mutually beneficial; older adults serve as mentors and share their story, and preclinical nursing students have an opportunity to learn about their mentor's life, challenging some prevalent stereotypes about aging. A pre- post-clinical survey of student attitudes toward older adults suggests a dramatic positive shift in perspective, and unsolicited, anecdotal comments in student reflections support this finding: "...it helped me feel much more open to working with older adults in the future"; "This conversation taught me that my assumptions about the older generation are not always correct". Of older adult participants, 96% reported the experience enriched and enhanced their social connectedness, with

88% requesting to participate in the program again. Narrative comments from residents indicated that their involvement enabled them to feel engaged and purposeful: "I was a mentor"; "Conversations were so alive. Connections with curious young people fill my heart and soul." Intergenerational sharing of life stories has the potential for both healing and growth and may provide an antidote to ageism.

SOCIAL RETRIBUTION OF STUDENTS OF MASTER IN GERONTOLOGY DURING THE COVID-19 PANDEMIC: ENHANCING COMPETENCIES

Elva Dolores Arias-Merino,¹ Ma. Guadalupe Díaz-González,² Neyda Ma. Mendoza-Ruvalcaba,³ Martha Elena Vazquez-Arias,⁴ and José Rosario Gonzalez-Ulloa,⁵ 1. *Universidad de Guadalajara, Zapopan, Jalisco, Jalisco, Mexico*, 2. *Desarrollo Integral de la Familia, DIF Zapopan, Zapopan, Jalisco, Mexico*, 3. *Universidad de Guadalajara CUTONALA, Guadalajara, Jalisco, Mexico*, 4. *Universidad de Guadalajara, El Palomar, Jalisco, Mexico*, 5. *Universidad de Guadalajara, Tlaquepaque, Jalisco, Mexico*

Introduction: In response to the COVID-19 pandemic older adults were called to lockdown and social isolation. Master in Gerontology (MAGE) in a social retribution action delivered a companion program called "I'm with you, You're with me". MAGE competencies encompass those proposed by AGHE. The aim is to analyze competencies acquired by students in gerontology in the companion program during the COVID-19 Pandemic. Method: Participated 16 students of MAGE and 16 older adults selected by their high vulnerability conditions reported by social workers from the Metropolitan Center of Older Adults from DIF-Zapopan city. The program was designed to provide emotional support, was delivered by telephone for 3 months (Ago-Nov 2020). Experiences were obtained through an online-questionnaire, data were analyzed qualitative and quantitatively. Results: Students reported higher development in the competencies: 1) Interactional, that capture the process of knowing and doing across the fields of gerontology, related to stereotypes and discrimination, autonomy and self-determination, and the use of the technology to enhance the communication; 2) Fundamental, that represent the essential orientation to the field of gerontology, related to identify the impact of public policy and the application of intervention strategies and the use of technologies with older adults, families and caregivers; 3) Contextual, related to promote solid social networks for the wellbeing. The meaning of participating in this program was mainly centered in a gratifying professional experience, "small actions that make big gestures". Conclusion: Gerontologist promote social solidarity through the transference and applying of the knowledge to enhance social development.

Session 1305 (Symposium)

THE WAKE FOREST IASDR: A RESOURCE FOR STUDYING THE EFFECTS OF CALORIC RESTRICTION ON HEALTH OUTCOMES IN OLDER ADULTS

Chair: Denise Houston

Co-Chair: Jamie Justice

Discussant: Anne Newman

Over the past 25+ years, a focus of the Wake Forest Claude D. Pepper Older Americans Independence Center (OAIC) has been to study the consequences of and treatments for geriatric obesity. The Wake Forest OAIC has provided support for 18 clinical trials of caloric restriction (CR), with and without various exercise regimens, in 2,545 adults (71% women, 21% African American) with a mean±SD age of 67.5±5.9 years and BMI ≥27 kg/m². A priority of the Wake Forest OAIC is to collate and store common data (e.g., demographics, physical performance, cognitive function), biospecimens (blood, muscle, adipose), and images (DXA, CT) from these trials in the Integrated Aging Studies Databank and Repository (IASDR; <https://www.peppercenter.org/public/dspIASDR.cfm>). This IASDR serves as a resource for the scientific community to foster new scientific questions and analyses. This symposium will provide an overview of CR trials and participants included in the IASDR and how the IASDR supports secondary analyses of CR by highlighting several secondary analyses using data and/or samples from the IASDR. Justice and colleagues examined the effect of CR on a geroscience-guided biomarker index using blood samples from the biorepository. Weaver and colleagues examined the effect of different exercise regimens on CT-derived muscle and bone measures during CR. Miller and colleagues pooled data from 11 trials to determine if CR-induced appendicular lean mass loss is associated with changes in physical performance. Finally, Hsieh and colleagues pooled data from eight trials to examine whether the effect of CR on gait speed differed by baseline BMI and inflammation.

THE FIRST EVALUATION OF A GEROSCIENCE BIOMARKER INDEX (TAME-BI) IN A TRIAL OF CALORIC RESTRICTION AND EXERCISE

Jamie Justice,¹ Mark Espeland,² Denise Houston,² Stephen Kritchevsky,³ Barbara Nicklas,² Nicholas Pajewski,² and Dalane Kitzman,² 1. *Wake Forest School of Medicine, Wake Forest School of Medicine, North Carolina, United States*, 2. *Wake Forest School of Medicine, Winston-Salem, North Carolina, United States*, 3. *Wake Forest School of Medicine, Winston Salem, North Carolina, United States*

We leveraged the WF OAIC biorepository to measure a consensus-derived panel of blood-based biomarkers of aging and constructed a geroscience-guided biomarker index (TAME-BI), testing it for the first time in a clinical trial. We measured IL-6, TNF- α -receptor-I, growth differentiating factor-15, cystatin C, and N-terminal pro-B-type natriuretic peptide in a 20-week randomized trial of caloric restriction (CR), aerobic exercise (EX), CR+EX, or attention-control in 88 patients (67±5years) with heart failure with preserved ejection fraction (HFpEF). We calculated TAME-BI (analyte levels ranked, binned by quintile, and summed) and found a time×treatment interaction for improved TAME-BI with intervention ($p \leq 0.05$) and detected associations between change in TAME-BI and change in six-minute walk distance ($r = -0.24$), usual walk speed ($r = -0.23$), and left ventricular relative wall thickness ($r = 0.31$). In sum, CR+EX intervention improved TAME-BI and changes in TAME-BI were associated with changes in key functional measures in older HFpEF patients.

EXERCISE MODALITY AFFECTS OLDER ADULT CT-DERIVED MUSCLE AND BONE LOSS DURING CALORIC RESTRICTION

Ashley Weaver,¹ Diana Madrid,¹ Katelyn Greene,¹ Michael Walkup,¹ Walter Ambrosius,¹ Anthony Marsh,² W. Jack Rejeski,³ and Kristen Beavers,⁴ 1. *Wake Forest School of Medicine, Winston Salem, North Carolina, United States*, 2. *Wake Forest University, Winston-Salem, North Carolina, United States*, 3. *Department of Health and Exercise Science, Wake Forest University, North Carolina, United States*, 4. *Wake Forest University, Winston Salem, North Carolina, United States*

Caloric restriction (CR) can exacerbate muscle and bone loss. We examined 18-month changes in computed tomography (CT)-derived trunk muscle, and volumetric bone mineral density (vBMD) and finite element-estimated bone strength of the spine and hip in 55 older adults randomized to CR alone or CR plus aerobic (CR+AT) or resistance (CR+RT) training. Trunk muscle area loss trended higher with CR+AT [-16.8 cm² (95% CI: -26.4, -7.1) vs CR: -6.7 (-12.8, -0.5), CR+RT: -9.0 (-14.5, -3.4)]. Spine vBMD loss trended higher with CR+AT [-0.014 g/cm³ (-0.027,-0.001) vs. CR: -0.005 (-0.022,0.012), CR+RT: -0.004 (-0.019,0.011)], and similarly for vertebral bone strength. Hip vBMD losses trended lower with CR+RT [-0.015 g/cm³ (-0.024,-0.006) vs. CR: -0.027 (-0.036,-0.019), CR+AT: -0.029 (-0.037,-0.020)]. Hip vBMD and trunk muscle losses were positively correlated ($r=0.53$), and spine vBMD loss tended to increase with trunk muscle loss ($r=0.21$) and fat infiltration ($r=0.17$). Collectively, aerobic training was less effective at preserving muscle-bone health during CR.

APPENDICULAR LEAN MASS LOSS DOES NOT IMPACT PHYSICAL PERFORMANCE CHANGE DURING CALORIC RESTRICTION IN OLDER ADULTS

Daniel Beavers,¹ Ryan Miller,² Kristen Beavers,³ and Barbara Nicklas,¹ 1. *Wake Forest School of Medicine, Winston-Salem, North Carolina, United States*, 2. *Wake Forest School of Medicine, Winston Salem, North Carolina, United States*, 3. *Wake Forest University, Winston Salem, North Carolina, United States*

Data from 11 six-month randomized controlled trials were pooled, with 902 participants randomized to caloric restriction (CR; n=762) or Non-CR (n=140) to determine if CR-induced appendicular lean mass (ALM) loss was associated with change in physical performance among older adults. After adjusting for age, sex, race, body mass index, exercise assignment and baseline value of the outcome, CR had significant ALM loss [-0.77 kg (95% CI: -0.89, -0.65)], while Non-CR had ALM gain [+0.28 kg (0.08, 0.49)]; $p < 0.001$. Both groups experienced similar improvements in the Short Physical Performance Battery (SPPB) score [CR: +0.45 (0.35, 0.55) vs Non-CR: +0.50 (0.30, 0.69); $p = 0.63$] and sit-to-stand time [CR: -1.42 s (-1.81, -1.03) vs Non-CR: -1.85 s (-2.49, -1.21)]; $p = 0.19$. Change in SPPB score and sit-to-stand time was not associated with change in ALM (both $p > 0.15$). In spite of significant ALM loss, CR resulted in overall improvements in physical performance in older adults.

EFFECT OF BASELINE BMI AND IL-6 ON GAIT SPEED RESPONSE TO CALORIC RESTRICTION IN OLDER ADULTS

Katherine Hsieh,¹ Rebecca Neiberg,¹ Kristen Beavers,² and Daniel Beavers,³ 1. *Wake Forest School of Medicine, Winston Salem, North Carolina, United States*, 2. *Wake Forest University, Winston Salem, North Carolina, United States*, 3. *Wake Forest School of Medicine, Winston-Salem, North Carolina, United States*

We examined whether the effect of caloric restriction (CR) on gait speed change in older adults (67.3 ± 5.27 years) varied by BMI and interleukin 6 (IL-6). Data from eight six-month randomized controlled trials were pooled, with 1268 participants randomized to CR ($n=710$) and non-CR ($n=558$) conditions. Baseline BMI/IL-6 subgroups were constructed using $BMI \geq 35$ kg/m² and $IL-6 > 2.5$ pg/dL, and participants were jointly classified as high/high ($n=395$), high/low ($n=208$), low/high ($n=271$), or low/low ($n=344$). Overall treatment effects showed significant improvements in gait speed in CR versus non-CR [mean difference: 0.02 m/s (95% CI: 0.01, 0.04)]; however, CR assignment significantly interacted with BMI/IL-6 subgroup ($p=0.03$). Greatest gait speed improvement was observed in the high/high CR subgroup [$+0.06$ m/s (0.03, 0.09)] and appeared to be driven by no gait speed change among the high/high non-CR subgroup. Gait speed response to CR was greatest in older adults with elevated baseline BMI and IL-6.

Session 1310 (Symposium)

TOWARD A MODEL FOR MEASURING SOCIAL AND STRUCTURAL DETERMINANTS OF ALZHEIMER'S DISEASE AND RELATED DEMENTIAS

Chair: Shana Stites

Co-Chair: Joyce Balls-Berry

Discussant: Lisa Barnes

Social and structural determinants of health (SSDoH) are conditions in the environments in which individuals are born, live, learn, work, play, worship, and age that affect health, functioning, and quality-of-life outcomes across the life course. Growing evidence suggests that SSDoH can help to explain heterogeneity in cognitive, functional, and interventional outcomes in Alzheimer's disease and related disorders research and clinical practice. The National Institute on Aging (NIA) has prioritized collecting SSDoH data in order to elucidate disease mechanisms and aid discovery of a disease modifying treatments. However, a major nexus of ADRD research, the national network of Alzheimer's Disease Research Centers (ADRCs), does not routinely collect SSDoH data. We describe a model for feasibly gathering and analyzing SSDoH data across Alzheimer's Disease Research Centers (ADRCs). We lay out theoretical underpinnings of key constructs and their measure, empirical evidence for their importance, and their potential for elucidating disease and prevention mechanisms. Toward a goal of translation, we describe a general approach to measuring SSDoH along with core set of measures. We also describe empirical support and rationales for assessing SSDoH in standing geographically and culturally diverse research cohorts, and guiding considerations in selecting modules to serve unique communities.

We specifically address SSDoH in Black, Hispanic/Latin, and refugee populations with an eye toward conveying how geographic proximity, socioeconomic status, ethnoracial factors, and sex/gender/sexual orientation affect populations in ways directly relevant to Alzheimer's disease (AD) and Alzheimer's disease related dementias (ADRD).

ASSESSING SSDOH IN ALZHEIMER'S RESEARCH: CORE MEASURES AND THOSE IN SEXUAL AND GENDER MINORITY POPULATIONS

Shana Stites,¹ and Sharnita Midgett,² 1. *University of Pennsylvania, Philadelphia, Pennsylvania, United States*, 2. *University Pennsylvania, Philadelphia, Pennsylvania, United States*

Social and structural determinants of health (SSDoH) are conditions that can impact on Alzheimer's disease and Alzheimer's disease related dementias (AD/ADRD) outcomes. We will describe theoretical underpinnings of core SSDoH constructs and their measure, empirical evidence for their importance, and their potential for elucidating disease and prevention mechanisms. We focus on a core set of SSDoH measures that are important across a broad range of socially and culturally heterogeneous populations. We outline a rationale for universal implementation of a set of SSDoH measures and juxtapose the approach with alternatives, such as investigator-initiated grants, aimed at collecting SSDoH data. We also speak very briefly about the evidence supporting assessing SSDoH with respect to sex, gender, and sexual orientation and considerations in doing this.

SSDOH IN LATINXS: FACTORS OF INFLUENCE

David Marquez, *University of Illinois at Chicago & Rush University, University of Illinois at Chicago, Illinois, United States*

Research with Latinxs/os/as regarding Alzheimer's disease and related dementias (ADRD) is lacking. This is staggering because among Latinxs in the United States, the number diagnosed with ADRD is expected to grow by more than 800% from 2012 to 2060 (Wu et al., 2016). Older Latinxs have a high risk and prevalence of ADRD - partially attributed to their longer life spans and the presence of adverse risk factors such as metabolic syndrome, type 2 diabetes mellitus, and other cardiovascular conditions (Chin et al., 2011). What is often missing in the discussion is the role of social and structural determinants of health (SSDOH) in this population. Overall Latinxs have low levels of formal education, work in physically demanding jobs, and experience immigration stress. How these and other SSDoH influence Latinxs will be discussed; as well as potential resilience factors like familial relationships, and religiosity or spirituality.

AGING, SOCIAL DETERMINANTS OF HEALTH IN THE CASE OF PERSONS WITH DISABILITIES AND REFUGEES

Jean-Francois Trani, *Brown school, Washington University in St Louis, Missouri, United States*

Structural and social determinants of health differentially impact on social groups. Among those particularly disadvantaged during the life course are both persons with disabilities and refugees. Because of the way society treats

these two populations, both persons with disabilities and refugees may face physical, social, economic and environmental barriers that impede them from benefiting from the same opportunities accessible to other social groups. As a result, these populations have less access to education, higher unemployment, are more likely to be deprived and excluded from social benefits. In other words, public stigma—prejudice and discrimination voiced and practiced by the general population—translates to a life course characterized by daily stressors that result in a higher likelihood of cognitive disorders and dementia. Measuring and analyzing SSDoH inclusive of disability and refugee experiences are essential to efforts aimed at recruitment and retention and knowledge generation in ADRD research.

SSDOH AND AGING IN PERSONS OF AFRICAN ANCESTRY

Joyce Balls-Berry, *Washington University School of Medicine Knight Alzheimer's Disease Research Center, Washington University in St. Louis, Missouri, United States*

Persons of African Ancestry (Black) encompasses a broad spectrum of individuals across the African diaspora. The diversity of the Black community must be considered in the context of SSDoH especially as it relates to diseases of aging. Blacks report higher levels of discrimination as a barrier to Alzheimer's Disease or related dementia (ADRD) care, are less likely to receive timely diagnoses of ADRD, and many do not trust that a future cure for ADRD will be shared equally and equitably with their community compared to their white counterparts. Once diagnosed, older Blacks, are twice as likely as their white counterparts to have ADRD. A key to addressing the Black community's ADRD needs is speaking openly about the historical underpinnings related to social injustice and racism as a link to appropriate ADRD diagnoses. Ultimately, SSDoH impact treatment, healthcare policy, and the future of biomedical research for the Black community.

Session 1315 (Symposium)

UNDERSTANDING THE ABNORMAL TODAY FOR LIFE TOMORROW: A STUDY OF THE GENERATIONS DURING THE COVID-19 PANDEMIC

Chair: Lisa D'Ambrosio

Discussant: Lisa D'Ambrosio

The spread of COVID-19 in the United States in early 2020 abruptly transformed American life, with widespread closures of public spaces and businesses, limitations on social activities, and the need for individuals to physically distance from each other. Some changes wrought by the virus may persist post-pandemic—such as Americans' adoption of new technologies or disease prevention behaviors. Since the onset of COVID-related safer-at-home orders, the MIT AgeLab has sought to understand how the pandemic affects people's attitudes and behaviors. This symposium will present findings drawn from three waves of national, online surveys conducted in 2020: March (N=1202), May-June (N=1,387), and November-December 2020 (N=1444). The surveys explored participants' COVID-19-related attitudes and behaviors across a range of domains. Each presentation in this symposium will highlight a different focus of cross-generational

research conducted over time, with a particular focus on experiences of adults ages 55 and over. The first will focus on participants' overall health, wellbeing, and perceptions of the COVID-19 vaccine. The second will present experiences of family caregivers of older adults and children. The third will center on the impact of the pandemic on the generations' retirement and longevity planning experiences. The fourth and final presentation will focus on participants' attitudes and experiences using and adopting technology. This symposium will deepen attendees' understandings of multigenerational attitudes and experiences during the COVID-19 pandemic, with a particular focus on the experiences of adults ages 55 and over.

SELF-REPORTED HEALTH, WELL-BEING, AND COVID-19 VACCINATION WILLINGNESS ACROSS THE GENERATIONS

Taylor Patskanick, *MIT, Somerville, Massachusetts, United States*

The COVID-19 pandemic has impacted the generations' health and wellbeing across a range of dimensions. In the first survey, the 50+ adopted the smallest number of health behaviors (e.g., handwashing, mask-wearing, etc.) in response to the pandemic compared to younger age groups. In the first and second surveys, the Baby Boomer generation reported less intense worry than other generations, especially regarding their socioemotional health and family members' health. For younger generations, worries tended to increase from March to June—especially those related to socioemotional health and COVID-19 in general. In the third survey wave, older generations self-reported better psychological wellbeing, less personal burnout, and better cognitive health compared to younger generations. Willingness to get the COVID-19 vaccine did not vary by generation in this sample; however, implications of this (including additional factors that may be influential such as psychological wellbeing) will be discussed.

PERCEPTIONS AND IMPACTS OF COVID-19 ON FAMILY CAREGIVERS

Alexa Balmuth, *MIT AgeLab, Cambridge, Massachusetts, United States*

For many family caregivers, COVID-19 has presented new obstacles to providing elder-care while balancing additional responsibilities such as work or childcare. Three survey waves explored impacts over the course of the pandemic. Family caregivers demonstrated resilience, taking a variety of measures to care for and protect family; caregivers were also more confident in their ability to protect loved ones age 60+ from contracting COVID-19 than non-caregivers. However, COVID-19's toll on caregivers was evident. Caregivers reported higher personal burnout than non-caregivers, and across all three survey waves, consistently reported greater degrees of worry in regards to COVID-19 in general, as well as its impacts on domains including the health and wellbeing of themselves and family members, and near and far term finances. This presentation will highlight how caregivers' perceptions and impacts of COVID-19 have evolved over the course of the pandemic, and implications of these findings for life tomorrow.

THE IMPACTS OF COVID-19 ON TECHNOLOGY USE AND EXPERIENCE ACROSS GENERATIONS

Chaiwoo Lee,¹ Shabnam FakhrHosseini,² and John Rudnik,³ 1. *Massachusetts Institute of Technology, Cambridge, Massachusetts, United States*, 2. *MIT AgeLab, Cambridge, Massachusetts, United States*, 3. *University of Michigan School of Information*

Among its many downstream effects, the COVID-19 pandemic has influenced how people think about and interact with technology. With limitations and restrictions around in-person interactions and use of public spaces, people are increasingly relying on technology to support everyday activities including work, communication and care. Results from the survey series showed an increased adoption of and interest in home, health and communication technologies. The changes may be long-lived, with the majority of the new adopters saying that they will continue to use the technologies that they started using in response to the pandemic. A generational comparison showed that while baby boomers and the silent generation were less likely than younger adults to have made recent adoptions, the older generations did not significantly differ in terms of interest in using new technologies. This presentation will also report on how COVID-19-related changes in technology experience varied by other demographic and socio-economic characteristics.

THE INFLUENCE OF COVID-19 ON RETIREMENT AND LONGEVITY PLANNING: A MULTIGENERATIONAL PERSPECTIVE

Julie Miller,¹ Martina Raue,² and Lisa D'Ambrosio,³ 1. *MIT, Cambridge, Massachusetts, United States*, 2. *MIT AgeLab, Cambridge, Massachusetts, United States*, 3. *Massachusetts Institute of Technology, Cambridge, Massachusetts, United States*

For many, the COVID-19 pandemic has painted a new economic picture of longevity. Results from the series demonstrated that younger generations surveyed—Gen Xers, Millennials, and Zoomers—generally reported elevated levels of worry about how the pandemic would affect their long-term finances. Baby Boomers, by comparison, evinced significantly less worry. And, although the pandemic has had a disproportionate economic impact on lower-income individuals, a higher income did not appear to confer freedom from worry. When it comes to planning for longevity, worry can be paralyzing. Zoomers were the generation most likely to agree that the future is too uncertain for them to even think about planning financially for retirement, and this sentiment applied for other generations as well. This presentation will also describe other ways in which the COVID-19 pandemic had influenced respondents' perceived longevity preparedness and attitudes across a variety of demographic and socio-economic characteristics.

Session 1320 (Symposium)

UNIQUE OPPORTUNITIES AND CHALLENGES FROM TWO ONLINE PSYCHOSOCIAL RANDOMIZED CLINICAL TRIALS

Chair: Carol Musil

Co-Chair: Britney Webster

Discussant: Rachel Pruchno

Research aimed at testing readily delivered online psychosocial interventions for addressing the needs of custodial grandfamilies (CGF) has been scarce. This symposium reports on two NIH-funded randomized clinical trials (RCT) involving fully online interventions: Study 1 (S1)-dyadic social Intelligence training for custodial grandmothers and their adolescent grandchildren, and Study 2 (S2)-4 week resourcefulness training with daily journaling intervention for grandmothers only. We presented here on the unique advantages and challenges of online RCTs as they apply to CGFs and similar hard-to-reach populations. First, in a cross-study collaboration, Jeanblanc et al. report data from both studies on how COVID-19 influenced coping habits, grandchild's remote learning, household conflict, uncertainty, and finances. Second, Castro et al. investigate how baseline positive and negative affect were reported in daily diaries completed by both grandmothers and grandchildren across 14 days at pretest in S1. Third, Musil et al. describe the challenges and benefits of using an entirely online design for the distribution and collection of longitudinal data, as exemplified by 4 weeks of qualitative daily journals from S2. Lastly, Webster et al. report on the benefits and challenges of recruitment and retention strategies encountered across S1 and S2. As discussant, Rachel Pruchno considers how the specific methodological advantages and disadvantages of online RCTs covered in the above papers apply to family caregiving research in general.

COMPARISONS BETWEEN RECRUITMENT AND RETENTION STRATEGIES FOR TWO ONLINE RCTS

Britney Webster,¹ Alexandra Jeanblanc,² Gregory Smith,¹ and Frank Infurna,³ 1. *Kent State University, Kent, Ohio, United States*, 2. *Case Western Reserve University, Cleveland, Ohio, United States*, 3. *Arizona State University, Tempe, Arizona, United States*

Custodial grandfamilies (CGF) comprise a small, diverse group of the US population which can make samples difficult to recruit and retain. Two online RCT studies (S1 & S2) for CGF used a variety of recruitment strategies with varying success. S1, for grandmothers (GM) only, successfully recruited from Facebook (47.95%) and community flyers (17.73%). S2, dyadic study for GM and adolescent grandchildren (AGC), recruited through emails to high school counselors (43.29%) and community (30.94%) and professional (17.13%) kinship support organizations. The advantages of online RCTs for hard-to-reach populations include expedited administration, buffering against social distancing, nationwide enrollment (S1-42 states; S2-43 states), and generalizability of findings. Challenges of online RCTs are establishing rapport and building trust with participants who are not comfortable with technology and designing screenings to identify false participants. Overall, these studies highlight the advantages of an online RCT, especially for hard-to-reach populations like custodial grandfamilies.

MANAGEMENT AND ANALYSIS OF LARGE QUALITATIVE DATA SETS: LESSONS LEARNED FROM DAILY JOURNALS FOR A BEHAVIORAL RCT

Carol Musil,¹ and Alexandra Jeanblanc,² 1. *CWRU School of Nursing, Cleveland, Ohio, United States*, 2. *Case Western Reserve University, Cleveland, Ohio, United States*

As part of a national RCT of a resourcefulness skills training intervention, 342 grandmother caregivers, completed

daily online journals for 4 weeks, reporting “challenges or difficulties you faced today with your grandchildren or other family members and how you handled them.” In this paper, we describe the challenges and benefits of using an entirely online design for the distribution and collection of daily journals. We used NVIVO-12 Plus to perform directed content analysis to assess intervention enactment fidelity and compare content between intervention (trained in and prompted to discuss skills) and control groups. Over 92% (n=317) of participants completed daily journals. There was variation in reporting of skill use between groups: 36% of controls spontaneously used the skill “seek professional help” whereas only 4% of the control group reported the skill “change from usual reaction”. With careful management, qualitative data from large samples can be obtained and effectively analyzed for fidelity.

DAILY EMOTIONAL DYNAMICS OF CUSTODIAL GRANDFAMILIES: CROSS-DYAD CORRELATIONS OF AFFECT MEANS AND VARIABILITY

Saul Castro,¹ Frank Infurna,² Britney Webster,³ Gregory Smith,³ Max Crowley,⁴ Megan Dolbin-MacNab,⁵ and Carol Musil,⁶ 1. *Arizona State University, Arizona State University, Arizona, United States*, 2. *Arizona State University, Tempe, Arizona, United States*, 3. *Kent State University, Kent, Ohio, United States*, 4. *Pennsylvania State University, University Park, Pennsylvania, United States*, 5. *Virginia Polytechnic University, Blacksburg, Virginia, United States*, 6. *CWRU School of Nursing, Cleveland, Ohio, United States*

Evidence indicates that daily emotional dynamics are associated with mental and physical health. However, these processes have not been examined among custodial grandmothers taking care of adolescent grandchildren. This daily diary study examined correlations between grandmothers and adolescents' mean levels and variability in negative (NA) and positive affect (PA). Custodial dyads (M = 214) across the nation completed two weeks of daily surveys. For both grandmothers and adolescents, their own PA means were negatively correlated with NA means, PA variability, and NA variability; NA means were positively correlated with variability in PA and NA (ps <.01). Across dyads, grandmothers' PA means were positively correlated with adolescents' PA means and negatively correlated with adolescents' NA means, PA variability and NA variability. Grandmothers' NA means were positively correlated with adolescents' variability in PA and NA (ps <.01). Our findings demonstrate how daily emotional dynamics are correlated within and between family members.

PREDICTORS OF COVID-19 RELATED STRESS AMONG CUSTODIAL GRANDMOTHERS

Alexandra Jeanblanc,¹ Megan Dolbin-MacNab,² Carol Musil,³ and Gregory Smith,⁴ 1. *Case Western Reserve University, Cleveland, Ohio, United States*, 2. *Virginia Polytechnic University, Blacksburg, Virginia, United States*, 3. *CWRU School of Nursing, Cleveland, Ohio, United States*, 4. *Kent State University, Kent, Ohio, United States*

This paper examined predictors of COVID-19 stressors among 316 custodial grandmothers raising school-aged grandchildren using regression. Grandmothers, who were participants in two nationwide behavioral RCTs, completed an online

questionnaire in Spring 2020. Predictors included grandmother demographics, depressive symptoms, perceived caregiving stress and reward, stress management strategies, and grandchild factors. Outcomes included grandmothers' stress related to using bad coping habits (r2=.24), grandchildren's remote learning(r2=.39), household conflict (r2=.29), COVID-19 fear and uncertainty (r2=.28), and finances(r2=.24). Regression results indicated that grandmothers' pre-existing depressive symptoms predicted all outcomes except remote learning stress. Higher caregiving stress was associated with all outcomes, except concerns about using bad coping habits. Grandmothers with less perceived access to care reported greater concern about bad coping habits and remote learning stress, while minority grandmothers reported more financial stress and COVID-19 fear and uncertainty. Findings suggest that the COVID-19 pandemic has compounded the stress experienced by already burdened custodial grandmothers.

Session 1325 (Symposium)

UNPACKING DATA FROM ADULT DAY CENTERS IN ORDER TO REALIZE THEIR UNTAPPED POTENTIAL IN DEMENTIA CARE

Chair: Tina Sadarangani

Discussant: Lauren Parker

Adult day centers (ADCs) in the United States represent a vital, but commonly overlooked, resource for dementia care among community-dwelling older adults. However, the severity of dementia in ADC users, their medical complexity, the supports offered to them, and health outcomes associated with adult day services among persons living with dementia is poorly understood. This is in part due to a lack of standardized data collection in this industry. In this symposium, we present the most current research on these issues, as well as strategies to improve data collection across ADCs to strengthen care. The symposium begins with analysis of data from the state of California that identifies patterns of chronic conditions in ADC users with dementia that are associated with emergency department visits and hospitalizations. We then examine data from the Centers for Disease Control, comparing dementia specialized ADCs and their participants to non-specializing ADCs. We compare the extent to which states with ADC programs require collection of patient centered reported outcomes on persons with dementia. Finally, we explore an innovative collaboration between researchers and community partners to simplify data collection in these centers. Our findings suggest that persons with dementia in ADCs are an extremely complex population and that some ADCs are better suited than others to meet their extensive needs. Additional patient-centered data collection can be supported with widely available software, and has the potential to demonstrate the effectiveness of ADCs, aid in program development, and help leverage funding opportunities.

EXPLORING THE INTERSECTION OF CHRONIC DISEASE, FUNCTION, AND SOCIAL CARE IN ADULT DAY CARE CLIENTS WITH DEMENTIA

Tina Sadarangani,¹ Jonelle Boafu,² Bei Wu,³ Abraham Brody,⁴ and Gary Yu,⁵ 1. *New York University Rory Meyers College of Nursing, New York University Rory Meyers College of Nursing, New York, United States*,

2. *Rory Meyers College of Nursing, New York, New York, United States*, 3. *New York University, New York, New York, United States*, 4. *NYU Hartford Institute for Geriatric Nursing, New York, New York, United States*, 5. *NYU Rory Meyers College of nursing, New York, New York, United States*

The interrelationships among dementia, concomitant disease, and social determinants of health are poorly understood and have critical implications for disease course, treatments, and caregiving needs. The aim of this study was to identify patterns of co-occurring chronic conditions among persons with dementia and the relationship of these patterns with clinical characteristics, demographic predictors and functional status. A latent class analysis (LCA) was conducted using data from 53 California adult day centers (n=3,053). Four distinct groups emerged: “dementia only”; “dementia +: > 2; + > 3; + >5 chronic conditions. Having dementia + >5 was associated (p <.001) with greater risk of falls, isolation, medication mismanagement, and reduced likelihood of using an adaptive device. Dementia in day center clients is complicated by clinical conditions, functional decline, and a need for supports that may be lacking. Center staff must be trained and resourced to manage the complex needs of persons with dementia.

DEMENTIA SPECIALIZATION AMONG ADULT DAY SERVICES CENTERS: NATIONAL STUDY OF LONG-TERM CARE PROVIDERS

Jessica Lendon,¹ Manisha Sengupta,² and Amanuel Melekin,¹ 1. *National Center for Health Statistics, Hyattsville, Maryland, United States*, 2. *CDC/NCHS, Hyattsville, Maryland, United States*

Adult day services centers (ADSC) are a source of community-based care for persons with Alzheimer’s disease/ other dementias. This study compares dementia specialized ADSCs (DSADSC) and their participants to other ADSCs that do not specialize in dementia care using the 2016-2018 National Study of Long-term Care Providers. DSADSCs account for 10% of all ADSCs and serve 15% of all ADSC participants with dementia. About half of DSADSC participants have dementia, compared to 30% in other ADSCs. A higher percentage of DSADSCs, compared to other ADSCs, were in the Midwest, were nonprofit, had a social model, and employed nursing aides. Fewer DSADSCs, compared to other ADSCs, provided nursing, mental health, and transportation services. More DSADSC participants were 75 years of age or older and needed assistance with eating and toileting. Findings may help identify how ADSCs, particularly, DSADSCs, meet the unique care needs of older adults with dementia.

USING EXISTING SOFTWARE SYSTEMS TO COLLECT OUTCOME DATA IN ADULT DAY SERVICES

Keith Anderson,¹ Lisa Peters-Beumer,² and Laurie Duff,³ 1. *University of Texas at Arlington, Arlington, Texas, United States*, 2. *Concordia University Chicago, River Forest, Illinois, United States*, 3. *Easterseals New Hampshire, Manchester, New Hampshire, United States*

Recently, there has been a resounding call for standardized outcome data collection in adult day services (ADS). Outcome data have the potential to demonstrate the effectiveness of ADS, aid in program development, and help

leverage funding opportunities. Unfortunately, many ADS centers do not collect outcome data for several reasons, including the cost of data collection software and systems. In this presentation, we present one effort to utilize an existing multiuse ‘off the shelf’ software solution to collect ADS outcome data for a network of ADS providers. The researchers collaborated with software developers and ADS providers to adapt the software to incorporate outcome measures and reporting functionality on both the individual and program levels. Adaptation and adoption required attention to HIPAA compliance, workflow integration, measurement fidelity, and data management processes. Despite these challenges, adapting existing software systems may be a cost-effective way to enable expanded outcome data collection in ADS.

DOCUMENTING THE NEED FOR PATIENT-CENTERED RELEVANT OUTCOMES IN ADULT DAY SERVICES

Jonelle Boafu,¹ Keith Anderson,² Abraham Brody,³ and Tina Sadarangani,⁴ 1. *Rory Meyers College of Nursing, New York, New York, United States*, 2. *University of Texas at Arlington, Arlington, Texas, United States*, 3. *NYU Hartford Institute for Geriatric Nursing, New York, New York, United States*, 4. *New York University Rory Meyers College of Nursing, New York University Rory Meyers College of Nursing, New York, United States*

ADCs are not uniformly regulated at the federal or state level, resulting in the absence of uniform data collection. The lack of large-scale data has resulted in a dearth of evidence on the role ADC services play in the health and well-being of their clients, particularly persons living with dementia (PLWD). The purpose of this study was to compare data being collected across states and evaluate the degree to which patient centered relevant outcomes (PCROs) are being collected. A review of ADC regulations in 50 states found that <10 states, required standardized reporting on ADC participants. Regulatory forms relied on clinical judgment as opposed to validated tools, and focused on eligibility for services as opposed to independence, engagement, or clinical interventions in the ADC. Emphasizing collection of PCROs in ADCs, beginning at the state level, is an essential step in documenting the value and effectiveness of ADCs, particularly for PLWD.

Session 1327 (Symposium)

SENSORY HEALTH AND DEMENTIA CARE: UNDERSTANDING AND ADDRESSING UNMET NEEDS IN ADRD

Chair: Carrie Nieman

Co-Chair: Heather Whitson

Discussant: Laura Gitlin

Sensory health in dementia stands at the intersection of two major public health challenges. Hearing and vision impairments are among the most common and disabling comorbidities in dementia and may worsen the trajectory of decline yet frequently go unrecognized and unaddressed. Improving sensory function may be an accessible and cost-effective nonpharmacological intervention to aid in the management of neuropsychiatric symptoms, improve quality of life for persons with dementia, and reduce burden for care

partners. This symposium presents the latest evidence on the impact of sensory impairment in dementia and efforts to integrate sensory health into the care of persons with dementia. This symposium will cover emerging evidence of the impact of hearing loss and vision impairment on persons living with dementia, specifically around neuropsychiatric symptoms, disability, and cost. In moving toward solutions, we will discuss new approaches to provide vision and hearing care for persons with dementia in diverse settings, from audiology to specialized memory clinics to home-based care. This discussion will include findings from a systematic review of telehealth in dementia care, which highlights the limitations of existing literature on accounting for the sensory needs of persons with dementia and their care partners. Finally, we will share new international practice recommendations on vision and hearing impairment among persons living with dementia. The symposium highlights the large, yet often unrecognized, sensory health needs of persons with dementia and the multi-prong approach required to identify and support sensory health and, ultimately, healthy aging among persons with dementia.

NEUROPSYCHIATRIC SYMPTOMS AND HEARING LOSS IN DEMENTIA: UNMET NEED AND OPPORTUNITY FOR INTERVENTION

Carrie Nieman,¹ Alexander Kim,¹

Emmanuel Garcia Morales,² Constantine Lyketsos,³ Nicholas Reed,² Valerie Cotter,⁴ Sara Mamo,⁵ and Esther Oh,¹ 1. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*, 2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 3. *Johns Hopkins Bayview, School of Medicine, Baltimore, Maryland, United States*, 4. *Johns Hopkins School of Nursing and School of Medicine, Baltimore, Maryland, United States*, 5. *University of Massachusetts Amherst, Amherst, Massachusetts, United States*

Hearing loss is one of the most common comorbidities among persons with dementia, with prevalence of 60->90%. Most go untreated and disparities exist. However, sensory impairment may influence the health of individuals and care partners. We will share findings from a clinic-based cohort of persons with dementia (n=101). Controlling for demographic and clinical factors, we found that every 10 decibel increase in hearing loss was associated with nearly an additional neuropsychiatric symptom (b = 0.7 per 10 dB; p = 0.01) and 1.3-point increase in severity (b = 1.3 per 10 dB; p = 0.04). These findings provide the first estimates that utilize objective audiometry. Furthermore, hearing aid use appeared to be protective. Hearing care may represent an additional, but underutilized, non-pharmacological intervention. We will discuss these findings in the context of the epidemiology of hearing loss in dementia and highlight new opportunities for managing hearing loss through community-based approaches.

VISION IMPAIRMENT IN DEMENTIA CARE

Heather Whitson, *Duke University School of Medicine, Durham, North Carolina, United States*

Epidemiological evidence indicates that 3-4% of community-dwelling adults over age 65 years old have

functionally limiting deficits in both vision and cognition. The comorbidity prevalence is higher in older age strata and in long-term care. Seniors with co-occurrence of vision impairment and dementia have six times higher odds of disability and higher average annual Medicare fee for service costs (\$13,655 [95% confidence interval: \$9,931-\$18,798], compared to peers with dementia alone (\$8,867 [95% confidence interval: \$7,360-10,683]) or neither condition (\$4,518 [95% confidence interval: \$4,360-\$4,682])). This talk will review evidence that people with early dementia and vision problems can experience improved function through appropriately tailored vision rehabilitation interventions. The talk will provide recommendations for unbiased cognitive assessment in visually impaired people. The session will outline research opportunities regarding the question of whether preventing or treating vision impairment may improve cognitive trajectories and neuropsychiatric symptoms in people with dementia.

CONSIDERING THE TECHNOLOGICAL AND SENSORY NEEDS OF PATIENTS WITH COGNITIVE IMPAIRMENT IN THE ERA OF TELEHEALTH

Esther Oh,¹ Julie Yi,² Corrine Pittman,³ Carrie Price,⁴ and Carrie Nieman,¹ 1. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*, 2. *Johns Hopkins University, Baltimore, Maryland, United States*, 3. *Howard University College of Medicine, Washington, District of Columbia, United States*, 4. *Towson University, Towson, Maryland, United States*

During the COVID-19 pandemic, telehealth has become an important means of delivering memory care. Telehealth that is responsive to the technological abilities and preferences as well as the sensory needs of persons living with dementia is critical to advancing access to care. We conducted a systematic review to investigate the use of telehealth among older adults with cognitive impairment. The search yielded 3,551 titles and abstracts that led to 17 full-text articles. Studies showed that telehealth can be used for routine care, cognitive assessment and telerehabilitation with good efficacy and satisfaction. Three studies investigated telemedicine delivery in the home and 16/17 studies relied on support staff and care partners to navigate technology. No studies reported adaptations to account for sensory impairments and 5/17 studies excluded individuals with sensory impairments. This talk will review barriers and facilitators to telehealth for older adults with cognitive impairment and adaptations to address sensory needs.

CARING FOR PERSONS WITH DEMENTIA IN AUDIOLOGY

Marilyn Reed, *Baycrest Health Sciences, Toronto, Ontario, Canada*

While hearing loss is highly prevalent among patients with dementia, it frequently goes unidentified and unmanaged. It has been a commonly-held belief that older adults with dementia are unable to benefit from hearing rehabilitation, but recent evidence shows that many individuals with dementia can successfully use amplification, helping to improve communication, social interaction and quality of life for these individuals and their caregivers. This presentation will describe how modifications to practice led to successful outcomes for

the majority of patients of a geriatric audiology clinic with co-morbid hearing loss and cognitive impairment. In a study of hearing aid use in 67 patients with these comorbidities, over 90% used hearing aids successfully with measurable benefit for both patients and caregivers. Furthermore, we will discuss approaches to improving communication for LTC residents with dementia and hearing loss through the support of audiologists during remote visits with physicians and families during the pandemic.

DEVELOPMENT OF INTERNATIONAL PRACTICE RECOMMENDATIONS FOR PERSONS WITH HEARING, VISION, AND COGNITIVE IMPAIRMENT

Barbara Weinstein,¹ Jenna Littlejohn,² and Iracema Leroi,³

1. *City University of New York, New York, New York, United States*, 2. *University of Manchester, Manchester, England, United Kingdom*, 3. *Global Brain Health Institute, Dublin, Dublin, Ireland*

Many older adults being evaluated for dementia have unrecognized hearing and/or vision problems which can confound results of neuropsychological assessment(s) and can impact care recommendations. International care standards for detection, assessment, and management of people living with dementia (PwD) are rarely addressed yet are critical. We propose a set of recommendations crafted to foster the highest quality health care to enable PwD to live well with these combined impairments. The focus is detection, diagnosis, treatment, and support of PwD who have age-related hearing and/or vision impairments. The guiding principles underlying the recommendations was a focus on promotion of a person-centered approach, but to be pragmatic in considering all contextual levels including professional care pathways and socio-economic/policy factors internationally. The recommendations are inclusive of all stakeholders who work together to promote equity and mutual respect across the domains. The guidelines are designed to be pragmatic, implementable, resource sparing, and sustainable.

Session 1330 (Symposium)

ABUSE OF AND INTERVENTION FOR OLDER ADULTS DURING THE COVID-19 PANDEMIC

Chair: Pamela Teaster

Discussant: Cory Bolkan

Beginning in the United States in 2020, SARS-CoV-2 lead to unprecedented changes in the lives of both younger and older people. Efforts to mitigate the spread of the novel coronavirus, which included physical distancing and self-quarantine not only upended the lives of many people but also created natural laboratory conditions for the mistreatment of older adults. Exploring the mistreatment of older adults during the pandemic presented an unprecedented opportunity to examine perspectives of service providers and affected older adults. This symposium offers four perspectives on this subject. Dr. Karen Roberto and colleagues will present changes and challenges that COVID-19 brought for Adult Protective Service staff and the vulnerable adults whom they serve. Ms. Lori Smetanka and colleagues will present changes and challenges that COVID-19 created for state and local Long-Term Care

Ombudsman. Dr. Holly Ramsey-Klawnsnik and Ms. Tammy Seaver will report on how the pandemic affected Nevada Adult Protective Services clients, casework, and staff. Finally, Dr. Pamela Teaster and colleagues will discuss how older adults experienced exploitation attempts during the early months of the pandemic. Dr. Cory Bolkan will begin the discussion, highlighting how conditions brought about by COVID-19 both enabled and thwarted efforts to address elder abuse.

ADULT PROTECTIVE SERVICES STUDY ON THE IMPACT OF COVID-19

Karen Roberto,¹ Pamela Teaster,² Jyoti Savla,¹ Imogen Fua,³ Karl Urban,⁴ and Emily Hoyt,¹ 1. *Virginia Tech, Blacksburg, Virginia, United States*, 2. *Virginia Tech, BLACKSBURG, West Virginia, United States*, 3. *WRMA, Inc., Rockville, Maryland, United States*, 4. *WRMA, Inc., Arlington, Virginia, United States*

The purpose of study was to explore changes in implemented of APS programs in response to the COVID-19 pandemic. This three-phase study began with telephone interviews with eight state-level APS administrators of early phase "hot-spots" that were used to inform questions for the Phase II national survey of state APS programs. Forty-seven states completed an on-line survey on the effects of the pandemic on work and workload, policy and practice, staff, partnerships, and preparedness. Phase III interviews with 7 local APS programs provided an "on-the-ground" view of challenges of meeting clients' needs. Although most APS programs reported fewer reports of adult maltreatment than before the pandemic, the stress and disruption of COVID-19 required new work arrangements, to which programs adapted technological and managerial support to care for the needs of both APS staff and the clients they served. Finding provide insight for policy and planning requirements for future catastrophic events.

COVID-19 AND THE LONG-TERM CARE OMBUDSMAN PROGRAM: FINDINGS FROM A NATIONAL STUDY

Lori Smetanka,¹ Chenguang Du,² Pamela Teaster,³ and Kathryn Ratliff,² 1. *The National Consumer Voice for Quality Long-Term Care, Washington, District of Columbia, United States*, 2. *Center for Gerontology, Virginia Tech, BLACKSBURG, Virginia, United States*, 3. *Virginia Tech, BLACKSBURG, West Virginia, United States*

The purpose of our study was to explore changes for long-term care ombudsman programs across the country in response to the COVID-19 pandemic. The study team explored the effect of COVID-19 on programs: cases, resident engagement, complaint investigation and resolution, services, complaints, changes in visitation, and preparedness plans. The research team developed survey items and beta-tested them with state and local LTCOs prior to distributing the survey nationally to State Long-Term Care Ombudsman and Local Long-Term Care Ombudsman in order to characterize experiences of the participants. From 62 state LLTC respondents we learned there were 81.0% fewer cases received, 97.36% were less able to engage with residents, 78.95% were less involved

in the engagement of residents in complaint investigation and resolution and there were 71.05% fewer activities involved in investigations. Not surprisingly, there was an 80.0% increase in information that the LTCO provided to the media.

COVID PANDEMIC IMPACT ON NEVADA ADULT PROTECTIVE SERVICES

Holly Ramsey-Klawnsnik, *Klawnsnik & Klawnsnik Assoc & Consultant, Nevada Adult Protective Services Program, Canton, Massachusetts, United States*

Empirical data regarding Covid pandemic impact on the Nevada Adult Protective Services (APS) Program clients, casework, and staff was gathered and analyzed as part of a multi-faceted program evaluation. Key findings include: 66% of the staff agreed or strongly agreed that the pandemic made their jobs more challenging. Respondents reported Covid-related challenges faced by clients, the program, and themselves as social workers serving older and vulnerable adults. Adverse client impacts observed included increased social and emotional isolation, loss of housing, exacerbation of symptoms of mental illness, necessary services being cut from clients subsequent to testing Covid positive, and fear and reluctance to allow needed visiting service providers, such as home health aides, into their homes. We will discuss the implications of the findings on APS services and clients, and on related health and human services designed to promote the wellness and independence of older and vulnerable adults.

FINANCIAL EXPLOITATION OF OLDER ADULTS DURING THE EARLY MONTHS OF THE COVID-19 PANDEMIC

Pamela Teaster,¹ Karen Roberto,² Jyoti Savla,² Chenguang Du,³ Emily Hoyt,² Scott Beach,⁴ Neil Charness,⁵ and Peter Lichtenberg,⁶ *1. Virginia Tech, BLACKSBURG, West Virginia, United States, 2. Virginia Tech, Blacksburg, Virginia, United States, 3. Center for Gerontology, Virginia Tech, BLACKSBURG, Virginia, United States, 4. University of Pittsburgh, University of Pittsburgh, Pennsylvania, United States, 5. Florida State University, Tallahassee, Florida, United States, 6. Wayne State University, Detroit, Michigan, United States*

COVID-19 created a “perfect storm” for financial exploitation directed at older adults. We invited adults aged 60 and older enrolled in gerontology research registries at Virginia Tech, Florida State University, Wayne State University, and University of Pittsburgh to complete an on-line survey about experiences with financial exploitation by strangers. The 997 respondents ranged in age from 60 to 98 (M = 71.3; SD = 6.8); most identified as White (93.4%), female (64.2%) and living with a spouse/partner (58%). Approximately one-half of respondents (56.87%) reported experiencing a scam attempt about COVID-19 issues. Most contact by scammers was electronic (49%) and frequently occurred two or more times (40%). Most respondents ignored the request (i.e., hung up phone, deleted text/email, threw away mail). However, 9% sent the requested payment, and 4% gave the scammer their personal information. Confidence in financial matters and having attended financial educational programs protected older adults from being scammed.

Session 1335 (Paper)

Adult Protection and Elder Abuse

CHANGING FAMILY RELATIONSHIPS DURING THE COVID-19 PANDEMIC: THE CASE OF ELDER ABUSE

Elsie Yan,¹ Daniel Lai,² and Vincent Lee,³ *1. The Hong Kong Polytechnic University, Hong Kong, Hong Kong, 2. Hong Kong Baptist University, Hong Kong Baptist University, Hong Kong, 3. The Hong Kong Polytechnic University, The Hong Kong Polytechnic University, Hong Kong*

Since the first confirmed case being identified in January 2020, authorities in Hong Kong have implemented various measures in an attempt to control the spread of the disease. These measures include compulsory quarantining of infected persons and those suspected of exposure, temporary closure of high-risk premises, and suspension of public activities and services, encouraging work-from-home arrangement etc. These measures, however, may exacerbate the impact of known risk factors and create new avenues for elder mistreatment. Life stress, financial strains and work-from-home arrangements increase chances of family conflicts, cessation of public services increases burden in the already stressed caregivers. This study examines the changing intergenerational family relations in the midst of the pandemic. A total of 1200 community dwelling senior citizens participated through responding to a telephone survey. Information was collected on participants' demographic characteristics, perceived disruptions brought about by COVID-19, family relations, physical and mental health, etc. Family conflicts and abuse were commonly reported: 27.8% reported family conflicts, 14.5% psychological abuse, 3.1% physical abuse, 3.9% financial abuse. A large proportion of participants (41.8%), however, also reported improved family relations during the pandemic. Results of logistic regression indicate that advanced age, female gender, poor financial situation were significant predictors for family conflicts and abuse. Contrary to our expectations, pandemic related disruptions in daily lives and perceived safety in the community were not associated in family conflicts and abuse in the present sample.

INCIDENCE AND RISK FACTORS OF ELDER MISTREATMENT IN THE COMMUNITY: A LONGITUDINAL POPULATION-BASED STUDY

David Burnes,¹ David Hancock,² John Eckenrode,³ Mark Lachs,² and Karl Pillemer,³ *1. University of Toronto, Toronto, Ontario, Canada, 2. Weill Cornell Medicine, New York City, New York, United States, 3. Cornell University, Ithaca, New York, United States*

Prior population-based elder mistreatment (EM) risk factor research has focused on problem prevalence using cross-sectional designs, which cannot make causal inferences between proposed risk factors and EM or discern existing cases from new cases entering the population. This study sought to estimate the incidence of EM and identify risk factors for new cases. It is a ten-year prospective, population-based cohort study with data collected between 2009 (Wave 1) and 2019 (Wave 2). Based on Wave 1 random, stratified

sampling to recruit English/Spanish-speaking, cognitively intact, community-dwelling older adults (age ≥ 60) across New York State, this study conducted computer assisted telephone interviews (CATI) with 628 respondents participating in both Wave 1 and Wave 2 interviews (response rate=60.7%). Ten-year EM incidence was regressed on factors related to physical vulnerability, living arrangement, and socio-cultural characteristics using logistic regression. Ten-year incidence rates included overall EM (11.4%), financial abuse (8.5%), emotional abuse (4.1%), physical abuse (2.3%), and neglect (1.0%). Poor self-rated health at Wave 1 significantly predicted increased risk of new Wave 2 overall EM (odds ratio [OR]=2.8), emotional abuse (OR=3.67), physical abuse (OR=4.21), and financial abuse (OR=2.8). Black older adults were at significantly heightened risk of overall EM (OR=2.61), specifically financial abuse (OR=2.8). Change from co-residence (Wave 1) toward living alone (Wave 2) significantly predicted financial abuse (OR=2.74). Healthcare visits represent important opportunities to detect at-risk older adults. Race is highlighted as an important social determinant for EM requiring urgent attention. This study represents the first longitudinal, population-based EM incidence study.

PERCEIVED FINANCIAL VULNERABILITY IS RELATED TO PERCEIVED COGNITIVE IMPAIRMENT AND LIVING ALONE

Peter Lichtenberg,¹ Maggie Tocco,² and Juno Moray,²

1. *Wayne State University, Detroit, Michigan, United States,*

2. *Wayne State University, Wayne State University/Detroit, Michigan, United States*

Objective: Perceived financial vulnerability is linked to physical and mental health and also to risk for financial exploitation (Lichtenberg et al., 2020a,b). This study examined the relationship of risk scores for financial exploitation to demographic variables, perceived memory loss and living alone. Methods: The 17-item self-report Financial Exploitation Vulnerability Scale (FEVS) posted on our website <https://olderadultnestegg.com> was completed by a convenience sample of 258 older adults. Correlational, multiple regression and Chi Square analyses were used. Results: Thirty percent of the sample scored at an elevated risk for financial exploitation due to perceived financial vulnerability. Although this was a convenience sample the results were similar to what was found in a sub-study of the HRS. Thirty eight percent of participants were living alone and 38% reported that their memory was less reliable than a year ago. Financial vulnerability risk score was significantly related to decreased education ($r=-.12$), living alone ($r=.21$) and perceived memory loss ($r=.35$). Eighteen percent of the variance was accounted for in a multiple regression ($F(5,250)=10.73$, $p<0.001$, $r^2=0.18$) with all three measures predicting FEVS risk score independently. The combination of perceived memory loss and living alone was significantly associated with the highest percentage of elevated risk scores. Discussion: Perceived financial vulnerability and its relationship to health (e.g. memory loss) and financial exploitation, continues to be under-appreciated in gerontology and geriatrics research. Our findings, consistent with GSA's

Longevity Fitness report further highlights this important dimension.

RISK FACTORS OF FINANCIAL EXPLOITATION VERSUS SCAM

Pi-Ju Liu,¹ Stacey Wood,² Aining Wang,¹ Yaniv Hanoch,³ David Hengerer,⁴ and Mary Muskat,⁵ 1. *Purdue University, West Lafayette, Indiana, United States,* 2. *Scripps College, Claremont, California, United States,* 3. *University of Southampton, Southampton, England, United Kingdom,* 4. *Claremont Graduate University, Claremont, California, United States,* 5. *Purdue University, West Lafayette, California, United States*

Financial exploitation (FE) perpetrators are usually seen in a position of trust, such as family members or friends, whereas perpetrators of scam tend to be unknown individuals. Few empirical studies have examined victim risk factors, and this study aimed to systematically compare risk factors of FE versus scam. One-hundred-and-ninety-five adults (ages 18-89) were recruited to complete a 60-minute survey and interview at Purdue University in Indiana ($n1=97$) and Scripps College in California ($n2=98$). Risk factors assessed included cognitive tasks (overall cognition, memory, and executive decision), socio-emotional questionnaires (depression, resilience, ostracism, and social integration), financial measures (numeracy, objective financial knowledge, retirement worries, and financial well-being), physical health and demographics (age, gender, education level, marital status, ethnicity). Additionally, participants reported experiences of FE and scam, including (1) the 11-item short-form Older Adult Financial Exploitation Measure, (2) seven questions on scam from the Health and Retirement Study, and (3) likelihood to contact a scammer after reviewing lottery scam materials. The three dependent variables were log-transformed before OLS regression models were built. Each dependent variable was associated with different risk factors. Lower standard of living ($p=.02$) and ostracism ($p<.05$) independently predicted FE. Lower physical health ($b=-.02$, $p=.003$) was the strongest predictor of scam, with lower level of financial well-being ($p=.02$) serving as an independent predictor. For lottery scams contact likelihood, ostracism ($b=.04$, $p=.005$) and being male ($b=-.23$, $p=.04$) were the strongest predictors. Since risk factors differed between FE and scam, prevention and intervention programs should target the unique profiles of risk factors for each.

STRUCTURAL AND INDIVIDUAL AGEISM PREDICTS ELDER ABUSE PROCLIVITY AND PERPETRATION

E-Shien Chang,¹ Joan Monin,² Daniel Zelterman,² and Becca Levy,³ 1. *Weill Cornell Medicine, New York City, New York, United States,* 2. *Yale School of Public Health, New Haven, Connecticut, United States,* 3. *Yale University, Woodbridge, Connecticut, United States*

Considering that elder abuse affects one in six older persons worldwide, a need exists to identify factors that predict this abuse. Previous studies have found that ageism operates at both structural (i.e., societal-level stigmatizing views toward older persons) and individual levels (i.e., negative age beliefs) to affect health. However, it was not known whether and if so, how these two levels

work together to impact perpetrators committing elder abuse. Thus, examining the mechanism between ageism and elder abuse was the aim of the current study. We hypothesized that structural and individual ageism would simultaneously predict elder abuse. In addition, following Stereotype Embodiment Theory, the impact of structural ageism on elder abuse would be mediated by individual ageism. In Sample 1, participants described their proclivity to abuse older people if they could do so without punishment ($n=1,580$). In Sample 2, family caregivers described actual abuse of their older care recipients ($n=400$). Overall, elder abuse proclivity (33% in Sample 1) and perpetration (56% in Sample 2) were prevalent. As hypothesized, structural ageism and individual ageism simultaneously predicted elder abuse proclivity and perpetration. Also as predicted, individual ageism significantly mediated the association between structural ageism and elder abuse in both samples. This the first study that examined the mechanistic pathways between structural and individual levels of ageism in the context of elder abuse. Effective solutions to prevent elder abuse should incorporate upstream interventions to mitigate the adverse effects of ageism.

Session 1340 (Symposium)

POLICY SERIES: BUILDING MOMENTUM FOR DIVERSITY, EQUITY, AND INCLUSION IN GERIATRICS AND GERONTOLOGY EDUCATION

Chair: Jennifer Severance

Co-Chair: Barbara Gordon

Discussant: Brian Lindberg

With an increasingly multicultural and diverse older adult population, health care professionals must be prepared to serve older adults from varied backgrounds and marginalized communities; address health determinants and disparities; and promote diversity, equity, inclusion, and empathy within systems of care. The National Association for Geriatrics Education (NAGE) is a non-profit organization representing geriatric and gerontology education and training programs, including Health Services and Resource Administration (HRSA) funded Geriatric Workforce Enhancement Programs (GWEPs), and Geriatric Academic Career Awardees (GACAs). The 44 GWEPs focus on improving health outcomes for older adults by enhancing geriatrics and primary care training of the healthcare workforce. The 26 GACA awards support leaders in Age-Friendly health care transformation and interprofessional clinical geriatrics training. This symposium examines the role both programs have in reducing racial health disparities in older adults by promoting increased diversity of the geriatrics/gerontology workforce and advancing public policies for racial equity and inclusion. First, presenters will introduce the NAGE Diversity and Racial Equity Workgroup that supports a broader and unified effort across GWEPs and GACAs for equity and inclusion in geriatrics and gerontology education. Presenters will then share strategies to mobilize system-level changes within their institutions. Finally, examples of progress showcase individual GWEP and GACA projects and partnerships aimed at reducing racial health disparities within a multidimensional and local

context. Presenters discuss strategies and opportunities to disrupt and transform health professions education at multiple levels and implications for policies supporting optimal aging for all older adults.

ANSWERING THE CALL FOR DIVERSITY AND RACIAL EQUITY: THE NATIONAL ASSOCIATION FOR GERIATRIC EDUCATION

Katherine Bennett,¹ Rosellen Rosich,² Linda Edelman,³ Barbara Gordon,⁴ Anna Goroncy,⁵ and Jennifer Severance,⁶
 1. *University of Washington, Seattle, Washington, United States*, 2. *University of Alaska Anchorage, Anchorage, Alaska, United States*, 3. *University of Utah College of Nursing, Salt Lake City, Utah, United States*, 4. *University of Louisville, Louisville, Kentucky, United States*, 5. *University of Cincinnati Department of Family and Community Medicine, Cincinnati, Ohio, United States*, 6. *University of North Texas Health Science Center - Ft. Worth, TX, Fort Worth, Texas, United States*

The National Association for Geriatric Education (NAGE) is a non-profit organization representing geriatric and gerontology programs, including Health Services and Resource Administration funded Geriatric Workforce Enhancement Programs (GWEPs), and Geriatric Academic Career Awardees (GACAs). NAGE responded to the renewed call to address systemic racism and racial inequities by forming a Diversity and Racial Equity Workgroup. The Workgroup explored ways to disseminate educational resources, support members to address racial inequities among older adults, promote increased diversity of the geriatrics/gerontology workforce, and support public policy initiatives that address racism and health disparities. Initial outputs include creating a Diversity and Racial Equity resource page, identifying liaisons to the Workgroup from each NAGE Committee to ensure impact across the organization, and organizing collaborations across GWEPs and GACAs to share successful initiatives. Future plans include education and advocacy with members and collaborating organizations to address systemic racism and racial health inequities impacting older adults.

REFLECTION LEADING TO ACTION ON DIVERSITY, EQUITY, AND INCLUSION AT THE VIRGINIA GWEP

Chuck Alexander,¹ Patricia Slattum,² Ishan Williams,³ and Leland Waters,¹
 1. *Virginia Commonwealth University, Richmond, Virginia, United States*, 2. *Department of Pharmaceuticals, Richmond, Virginia, United States*, 3. *University of Virginia, Charlottesville, Virginia, United States*

Last year's Black Lives Matter protests inspired the Virginia Geriatric Education Center (VGEC) GWEP's plenary to engage in reflection and discussion on diversity, equity, and inclusion (DEI) in our work together. During each bi-monthly meeting, we dedicate time to generate ideas to improve our programming, how we work together, and how we partner and recruit for our programs. Champions for DEI on our plenary led an effort to develop a DEI newsletter clarifying DEI concepts and introducing resources thematically related to the monthly VGEC faculty development program curriculum. By incorporating these resources into our monthly curriculum, facilitators have a new access point to incorporate content on health equity and policy into our curriculum. The intentional focus on DEI is opening the door to

deeper reflection and conversation with a goal of improving all our programming, cultivating a new social awareness, and bringing new voices and perspectives to the table.

PARTNERING WITH AFRICAN AMERICAN FAITH-BASED COMMUNITIES TO SUPPORT DEMENTIA CAREGIVERS

Monica Long,¹ Shellie Williams,² Katherine Thompson,¹ Jason Molony,³ and Jeff Graupner,² 1. *University of Chicago, Chicago, Illinois, United States*, 2. *University of Chicago Medicine, Chicago, Illinois, United States*, 3. *The University of Chicago Medicine, Chicago, Illinois, United States*

African Americans (AA) are twice as likely to develop Alzheimer's Disease as Caucasians. Historically, houses of faith have been a center of the AA community and a trusted source of information and support. Based on these facts, as well as community needs, the SHARE Network (a Geriatrics Workforce Enhancement Program on the South Side of Chicago) in partnership with faith-based community leaders, created an opportunity for community members to train to become resource experts on Alzheimer's Disease & Related Dementias (ADRD) and create sustainable caregiver support groups (CSGs). The resulting initiative, Dementia Resource Champions, is a train-the-trainer style health education initiative piloted in 2018, and subsequently expanded and modified due to COVID. Participants receive instruction on stress reduction, ADRD, and community resources. They discuss how to structure CSGs to meet community needs. Results of this initiative include development of five brand-new CSGs with faith communities on Chicago's South Side.

GWEP TAG-TEAM RESPONSE: COVID-19 HEALTH DISPARITIES IN ORANGE COUNTY, CALIFORNIA

Jung-Ah Lee,¹ Julie Rousseau,² Neika Saville,³ Sonia Sehgal,² and Lisa Gibbs,⁴ 1. *University of California, Irvine, Irvine, California, United States*, 2. *University of California, Irvine, Orange, California, United States*, 3. *Division of Geriatric Medicine and Gerontology, Orange, California, United States*, 4. *UC Irvine Health, UC Irvine Health, California, United States*

Health disparities follow zip codes, and in Orange County, CA, both COVID-19 cases and deaths are highly concentrated in our diverse geriatric populations in Santa Ana (44,075) and Anaheim (40,984) where our two UCI Federally Qualified Health Centers (FQHCs) are located, and Garden Grove (16,174) and Buena Park (7,581), where University of California Irvine (UCI) TAG-TEAM GWEP community partner FQHCs are located. Collectively, our FQHCs serve diverse populations, with 83-88% of patients identifying as Hispanic/Latino or Asian. As we support these clinics in becoming Age-Friendly Health Systems, UCI's GWEP pivoted to provide COVID-19 education in the form of multi-lingual materials and videos available in Spanish, Vietnamese, Korean, Mandarin, and Farsi. Additionally, through our Age-Friendly Geriatrics Tele-ECHO Series we are working to build Mental Health care competencies among these FQHC providers since the pandemic morbidity and mortality disparities have resulted in a profound mental health crisis in our communities.

MITIGATING IMPLICIT RACIAL BIAS IN THE CLINICAL SETTING: A QUALITATIVE STUDY OF FAMILY MEDICINE RESIDENTS

Anna Goroncy, *University of Cincinnati Department of Family and Community Medicine, Cincinnati, Ohio, United States*

Implicit racial bias (IB) in physicians contributes to racial health inequities. Health profession trainees are not consistently trained to address IB. This phenomenological study explored Family Medicine (FM) residents' experience of applying strategies to mitigate IB during home visits (HVs) to homebound older adults. FM residents completed pre-work related to IB, applied strategies to mitigate IB during HVs, then completed written reflections and commitments-to-change (CTC). A two-month survey assessed completion of targeted changes and barriers faced. Researchers completed a thematic analysis identifying five themes: Response to IAT, barriers, strategies, value of HVs and mindfulness. All residents' stated level of CTC remained the same (9/9, 100%) and 8/9 residents (89%) had partially or fully implemented their intended change at 2 months. Residents continued applying newly-learned strategies two months after training with transference to other clinical settings and bias types. These findings can facilitate development of clinically-based IB curricula with lasting impacts.

Session 1345 (Paper)

Care Transitions

ANTIPSYCHOTIC AND PSYCHOPHARMACOLOGICAL MEDICATIONS: CARE TRANSITIONS AMONG NURSING HOME RESIDENTS

Sarah Holmes,¹ Aida Kuzucan,² Abisola Olopoenia,² Nicole Brandt,³ Becky Briesacher,⁴ Danya Qato,² Barbara Zarowitz,² and Linda Wastila,² 1. *University of Maryland School of Nursing, Baltimore, Maryland, United States*, 2. *University of Maryland School of Pharmacy, Baltimore, Maryland, United States*, 3. *University of Maryland School of Pharmacy, University of Maryland School of Pharmacy, Maryland, United States*, 4. *Northeastern University, Boston, Massachusetts, United States*

Nursing home residents are frequently prescribed anti-psychotic and other psychopharmacologic medications (AP/PPM) to manage behavioral and psychological symptoms. Residents also experience care transitions between nursing homes and other healthcare institutions. Limited research exists on the relationship between AP/PPM use and care transitions in this population. The purpose of this study is to compare odds of care transitions among those with and without AP/PPM use, controlling for resident characteristics. This cross-sectional study used data from a 5% random sample of Medicare beneficiaries between 2011-2015 who resided in a nursing home and were continuously enrolled in Medicare Parts A, B, and D. Chi-square tests compared resident characteristics and AP/PPM use between those with <2 and ≥2 transitions. Multivariate logistic regression evaluated the odds of transitions in those with and without AP/PPM use during a one-year follow-up, including

interaction effects among AP and PPM use. Among 132,263 eligible residents, the majority were female (68%), white (85%), and >75 years old (63%). Of residents who experienced ≥ 2 transitions, 17% received AP and 82% received PPM, compared to those with <2 transitions for which 9% and 66% received AP/PPM, respectively ($p < .001$). Logistic results showed that for residents with PPM use, those who take AP have 1.33 the odds of experiencing ≥ 2 transitions than PPM users who do not take AP ($p < .001$). Findings demonstrate a significant association between AP/PPM use and care transitions in nursing home residents. Prudent use of AP/PPM should thus be optimized with a goal of reducing care transitions and improving quality of care.

HOW CAN PROVIDERS BETTER ADDRESS RECOVERY NEEDS FOR GERIATRIC TBI SURVIVORS?

Mia Vogel,¹ Wonkyung Jung,² and Hilaire Thompson,²

1. *Washington University in St. Louis, St. Louis, Missouri, United States*, 2. *University of Washington, Seattle, Washington, United States*

Older adults are at increased risk for poorer recovery from traumatic brain injury (TBI), incidence of pre-injury frailty, and comorbidity compared to younger adults. In this study, a longitudinal multiple case study approach was taken to describe gaps in health service delivery identified by older adults following mild-moderate TBI. Participants were interviewed at 1 week, and 1, 3, 6, and 12 months post injury (5 times). In total, 57 interviews were conducted with 13 participants and transcribed verbatim. Codes were identified inductively to develop a codebook for guiding thematic analysis in NVIVO. Two independent investigators double coded 16 transcripts (28%) and reached consensus; remaining transcripts were allocated to the two investigators for independent coding and verified and reconciled with the other coder until consensus was reached. Many participants were happy with the care they received. However, ongoing health issues and TBI symptoms sometimes remained unaddressed. Follow-up and care planning would have been helpful for most patients as well as ways to address common balance and dizziness issues. Among some, the unwillingness to go to a provider for follow-up or adhere to medication and physical therapy exercises were issues. In some cases, providers were unable to help or understand the reason for patients' symptoms (e.g., smell/taste changes, ear issues, etc.). Sometimes, providers did not address the issues that were of most concern to patients, or they would prescribe treatments that were not acceptable to patients. Empathetic, tailored, and patient-centered approaches are needed to improve care delivery and outcomes.

I'M THE ONLY SON SHE GOT LEFT: MALE CAREGIVERS' EXPERIENCES MANAGING OLDER ADULTS' POST-ACUTE CARE

Michael Bueno,¹ David Russell,² and Jo-Ana Chase,³

1. *University of Missouri - Columbia / University of California, Irvine, Placentia, California, United States*, 2. *Appalachian State University, Boone, North Carolina, United States*, 3. *University of Missouri, Columbia, Missouri, United States*

Family caregivers (FCGs) play an integral role supporting older adults transitioning to post-acute care following a hospitalization. FCGs function as advocates, information agents, and most importantly, care managers and providers.

Although, caregiving has been traditionally seen as a female role, men are increasingly undertaking these roles and responsibilities. This research addresses a gap in the existing literature by exploring the subjective experiences of male FCGs of older adults in the post-acute setting. Using data from two parent qualitative studies on caregiving in the post-acute setting (N=40), we conducted a qualitative secondary analysis using conventional content analysis of male caregiver participants' interview data (n=11). Interviews explored the subjective experiences of male caregivers' interactions with home health care supportive personnel and conducting medical/nursing tasks for older adults. Five themes emerged: areas of abandonment, financial needs, masculinity, organization of care, and preparation. These themes highlighted areas of both confidence and struggle for male FCGs and captured their unique experiences managing the care of an older adult in the post-acute setting. Furthermore, the themes illustrate male FCGs' feelings of guilt, financial impact, work disruptions, and the perceived effect of masculinity on their caregiving role. Findings can inform clinicians' provision of focused and tailored resources to meet the specific needs of male FCGs. Future research should explore the evolving experiences of male FCGs over time, particularly those FCGs of older adults with chronic illnesses.

RECEIPT OF TRAINING AMONG FAMILY CAREGIVERS ASSISTING WITH A POST-HOSPITAL CARE TRANSITION

Julia Burgdorf,¹ Chaneé Fabius,² Catherine Riffin,³ and Jennifer Wolff,² 1. *Center for Home Care Policy & Research, New York, New York, United States*, 2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 3. *Weill Cornell Medicine, New York, New York, United States*

Medicare Conditions of Participation require hospitals to provide training to family and unpaid caregivers when their support is necessary to enact the post-discharge care plan. However, caregivers often report feeling unprepared for this role. We perform a cross-sectional analysis of the 2017 National Health and Aging Trends Study and its linked National Study of Caregiving (nationally representative surveys of older adults and their family and unpaid caregivers, respectively) to assess the prevalence of, and factors associated with, caregiver receipt of adequate transitional care training. Our analytic sample includes 795 (weighted n=7,083,222) family caregivers who assisted an older adult during a post-hospital care transition in the past year. The outcome of interest caregiver-reported receipt of the training needed to manage this transition ("adequate transitional care training") from hospital staff. Six in ten (59.1%) caregivers who assisted during a post-hospital care transition reported receiving adequate transitional care training. In weighted, multivariable logistic regression models, caregivers were half as likely to report receiving adequate transitional care training if they were black compared to white (Adjusted Odds Ratio (aOR): 0.52; 95% CI: 0.31-0.89) or experienced financial difficulty (aOR: 0.50; 95% CI: 0.31-0.81). Findings suggest that socially vulnerable family caregivers of older adults are less likely to report receiving adequate transitional care training. Changes to the discharge process, such as using standardized caregiver assessments, may be necessary to ensure equitable support of family caregivers.

TOLERABILITY OF LITHIUM: A NATURALISTIC DISCONTINUATION STUDY IN OLDER ADULTS (≥60 YEARS)

Marinke Flapper,¹ Els van Melick,² Jos van Campen,³ Natasja Schutter,⁴ and Rob Kok,⁵ 1. *Onze Lieve Vrouwe Gasthuis Amsterdam, Amsterdam, Drenthe, Netherlands*, 2. *Hospital Reinier de Graeff, Delft, Zuid-Holland, Netherlands*, 3. *Hospital OLVG, Hospital OLVG, Noord-Holland, Netherlands*, 4. *Arkin Ouderen, Amsterdam, Noord-Holland, Netherlands*, 5. *Parnassia, Den Haag, Zuid-Holland, Netherlands*

Lithium is one of the most effective treatment options in both bipolar disorder and treatment-resistant depression. The use of lithium in older adults declined during the last decades, probably resulting in undertreatment of older adults. To investigate how well lithium is tolerated in old age, we aimed to determine the frequency, reasons and possible predictors of discontinuation due to adverse effects in a cohort of hospitalized adults aged 60 years or older who had started with lithium.

We performed a retrospective cohort study based on chart reviews. Participants were in treatment at Parnassia Group at The Hague, the Netherlands. After inclusion (between January 2010 and December 2016), participants were followed until April 2017, when we performed data extraction and analysis.

In our sample of 135 patients (median age 69 years, median follow-up duration 18 months), 49 (36.3%) participants discontinued lithium. Only a minority (11 (8.1%)) of the participants discontinued solely due to adverse effects. The majority discontinued lithium due to psychiatric (18,5%) reasons, (most commonly mentioned within this subgroup: lack of effectiveness and non-compliance) or a combination of reasons (7.4%). None of the factors we studied (age, gender, Charlson Comorbidity Index (CCI), polypharmacy, renal function and neurological history) were significantly associated with discontinuation due to adverse effects.

The frequency of lithium discontinuation in our cohort was in range with frequencies reported in younger patients. Older age itself should not be a reason to withhold lithium treatment.

Session 1350 (Paper)

Caregiving and Well-Being

A CASE FOR TRAUMA-INFORMED DEMENTIA CARE: THE EMANCIPATORY POWER OF PSYCHOLOGICAL RESILIENCE AND TRAUMA FROM COVID-19

Adrienne Ione, *Silver Linings Integrative Health, LLC, Tacoma, WA, Washington, United States*

The dominant nonpharmacological therapeutic approach in dementia care is “person-centered.” The racial disparities in disease and diagnosis affliction, represents an urge to incorporate trauma sensitivity. Antipsychotic use rates among this population being substantially higher than two years ago, as well as increasing evidence of ACE scores being a significant risk factor in dementia development, we need to consider the emancipatory power of

trauma-informed dementia care. Data were collected from 103 peer-reviewed journal articles. Person-centered care practices were analyzed for adherence to SAMHSA’s principles that guide a trauma-informed approach. Studies were rated on a Likert-scale in six areas: safety; trustworthiness and transparency; peer support; collaboration and mutuality; empowerment and choice; and cultural, historical & gender issues. It was observed that of the 103 search returns, 38 met study criteria. Within these data, it was observed that the majority of studies scored low on incorporation and adherence to SAMSHA’s trauma-informed approach. While a few studies mentioned the magnifying effects of a current traumatic event on preexisting vulnerabilities, no study highlighted the growth or flourishing potential in triggering past trauma and the current traumatic event offering an opportunity of mind-somatic integration. This paper proposes trauma-informed dementia practices consider: 1) intake and assessment to include a screening of ACE score; 2) evaluation of (re)integrating current losses into current developmental and lifespan phase; and 3) offering therapeutic support of current traumatic event (COVID-19) to metabolize past traumatic events in the context of current developmental and lifespan phase.

ADULT SIBLING TENSION AND OLDER MOTHERS’ PSYCHOLOGICAL WELL-BEING: THE MODERATING ROLE OF CAREGIVING

Megan Gilligan,¹ J. Jill Suitor,² Yifei Hou,³ Barbra Brottman,⁴ Jeenkyoung Lee,⁴ and Eunbea Kim,⁴ 1. *Iowa State University, Iowa State University, Iowa, United States*, 2. *Purdue University, Purdue University, Indiana, United States*, 3. *Purdue University, West Lafayette, Indiana, United States*, 4. *Iowa State University, Ames, Iowa, United States*

The life course perspective concept of “linked lives” suggests that the lives of adult children and older parents are interconnected and consequential for the well-being of members of both generations. In this work, we consider the association between tension among adult siblings and older mothers’ psychological well-being. We focus specifically on tension in the adult sibling relationship because research has shown that negative relationship quality is especially consequential for well-being. We consider this association in the context of caregiving because this is a time when offspring are often required to coordinate with each other to provide assistance. We utilized data from 304 older mothers (average age = 78) and 736 of their adult children (average age = 49) from the Within-Family Difference Study (WFDS) II. First, we examined the direct association between adult sibling tension and mothers’ reports of depressive symptoms. Second, we examined whether the association between sibling tension and mothers’ depressive symptoms was moderated by mothers’ need for care. Preliminary results indicated no direct effect of sibling tension on mothers’ depressive symptoms. However, moderation analysis revealed that sibling tension was associated with an increase in mothers’ depressive symptoms among mothers who reported needing assistance. These findings highlight the importance of understanding the interconnected nature of adult family relationships especially in the context of later-life family caregiving.

In particular, the findings reveal that older mothers in need of care are especially vulnerable to tension in the relationships among their adult children.

HOW GENDER SHAPES THE EFFECTS OF IMMEDIATE FAMILY MEMBERS' DEATHS ON ADULTS' PSYCHOLOGICAL WELL-BEING

J. Jill Suito,¹ Megan Gilligan,² Catherine Stepniak,³ Yifei Hou,³ and Robert Frase,³ 1. *Purdue University, Purdue University, Indiana, United States*, 2. *Iowa State University, Iowa State University, Iowa, United States*, 3. *Purdue University, West Lafayette, Indiana, United States*

The deaths of family members constitute one of the most serious negative life events experienced in adulthood. The impact of these losses on psychological well-being may differ considerably by the structural relationship between the deceased and the survivors, and by the genders of both family members; however, few studies have been able to explore these variations by generation, gender, and time since death. In this paper, we use mixed-methods data to explore how depressive symptoms are affected differentially in adulthood by the deaths of mothers, fathers, and siblings, as well as by the gender of survivors. We address these questions using data collected from approximately 600 adult children nested within 250 later-life families, in which approximately 55% experienced the death of at least one parent and 15% experienced the death of a sibling in the previous decade. Preliminary multilevel regression analyses showed that deaths of siblings predicted sisters' but not brothers' depressive symptoms. In the case of parents, only mothers' deaths were found to predict daughters' depressive symptoms, whereas neither parents' deaths predicted sons' well-being. Further, these patterns differed little by time since death. Qualitative data revealed that women were more likely to report that both their mothers' and siblings' deaths had led to higher conflict within the sibling network, which previous research has shown predicts psychological well-being. Taken together, these findings demonstrate the salient role of gender in shaping well-being in the face of events of deaths of parents and siblings in adulthood.

SANDWICH GENERATION CAREGIVING AMONG BABY BOOMER AND GENERATION X CAREGIVERS IN THE UNITED STATES

Christina Miyawaki,¹ Erin Bouldin,² Eva Jeffers,³ and Lisa McGuire,⁴ 1. *University of Houston, Houston, Texas, United States*, 2. *Appalachian State University, Boone, North Carolina, United States*, 3. *Centers for Disease Control and Prevention (CDC), Atlanta, Georgia, United States*, 4. *CDC, Atlanta, Georgia, United States*

Sandwich generation caregivers are generally those who care for both a child and an older adult. Baby Boomer and Generation X belong to this age cohort. Using data from the 2015-2018 Behavioral Risk Factor Surveillance System Caregiver Module, we compared the prevalence and characteristics of sandwich caregivers across these two generations. Data represent adults from 44 jurisdictions. We categorized caregivers into generations using their age at the time of the

survey (N=34,777). Sandwich caregivers were classified as those who lived with a child (≤ 18 years) and provided care/assistance to a parent/grandparent with a long-term illness/disability during the past 30 days. Prevalence ratios (PR) from log-binomial regression models that included generation, sandwich caregiver status, sex, and race/ethnicity were used to compare weighted estimates. Six percent of Baby Boomers and 31% of Generation X were sandwich caregivers ($p < 0.001$). In adjusted models, sandwich caregivers had a lower prevalence of any chronic health condition (PR=0.77, $p=0.01$) and fair/poor health (PR=0.87, $p=0.003$) than other caregivers, but similar frequent mental and physical distress prevalence. Baby Boomer caregivers were more likely to report a chronic health condition, fair/poor health, and frequent physical distress than their Generation X counterparts, but less likely to report frequent mental distress. Sandwich caregivers in these generations appear to be in better health than other caregivers. Nonetheless, it is critical to support the needs of sandwich caregivers as they age, given their important role in meeting the needs of both children and older adults and the additional challenges created by the pandemic.

THE EFFECT OF NURSE AIDE RETENTION ON OHIO'S NURSING HOME RESIDENT CARE EXPERIENCE SCORES: A FACILITY-LEVEL ANALYSIS

Katherine Kennedy, *LTSS COIN Providence VA Medical Center*

The objective of the study was to analyze whether higher nurse aide retention was related to better resident care experiences using an overall score and seven domain scores among a sample of Ohio nursing homes. The 2017 Ohio Biennial Survey of Long-Term Care Facilities was used in combination with the 2017 Ohio Nursing Home Resident Satisfaction Survey. These data were merged with the Ohio Medicaid Cost Report, Certification and Survey Provider Enhanced Reports, LTC Focus, Area Health Resource File, Rural Urban Commuting Area data, and Payroll-based Journal Public Use Files. The analytic sample (N=690) represents freestanding facilities with a full-year cost report. The analysis included means and frequencies, ANOVAs with Tukey adjustments, and linear regressions that controlled for heteroskedasticity. Quartiles of the CNA retention rate were used to define four groups: low, medium, high, and extremely high. After controlling for facility and county characteristics, facilities with high CNA retention (61-72%) had significantly higher overall resident care experience scores by 1.27 percentage points and better environment scores by 1.35 percentage points compared to those with low CNA retention (0-48%). Medium retention (49-60%) also had significantly better environment scores than low retention. Compared to the high retention group, facilities with extremely high retention (73%+) had significantly lower scores for the overall resident care experience, facility culture, caregivers, and spending time. Maintaining a high retention rate of CNAs is important, but there were surprising negative effects from having extremely high retention potentially due to high burnout or poor person-job fit.

Session 1355 (Paper)

COVID-19 and Well-Being

GROWTH MINDSET AND OLDER ADULTS' WELL-BEING DURING THE COVID-19 PANDEMIC

Yena Kyeong,¹ Pamela Sheffler,¹ Esra Kürüm,¹

Leah Ferguson,¹ Elizabeth Davis,¹

Carla Strickland-Hughes,² and Rachel Wu,³ 1. *University of California, Riverside, Riverside, California, United States*, 2. *University of the Pacific, University of the Pacific, California, United States*, 3. *University Of California - Riverside, Riverside, California, United States*

Growth mindset, the belief that abilities and attributes are improvable, may help buffer against older adults' feelings of social isolation during the COVID-19 pandemic, as it may foster effective self-regulation and resilience. This study examined the effects of growth mindset on older adults' well-being and adjustment, compared to younger and middle-aged adults. Participants self-reported on their growth mindset, depression, well-being, and daily habits amid the pandemic. For older adults ($N = 178$, 82% female, M age = 70.42, SD age = 6.50, range 60-90), regression analyses (controlling for gender, education, income, and age) revealed that growth mindset was associated with decreased depression ($\beta = -.29$, $p = .001$) and increased well-being ($\beta = .38$, $p < .001$). In addition, a logistic regression showed that older adults with a higher growth mindset were more likely to adjust their daily tasks during the pandemic (e.g., using technology to remotely socialize; $OR = 1.77$, $p = .012$). The same set of analyses in samples of younger ($N = 235$, 72% female, M age = 29.84, SD age = 5.89, range 18-39) and middle-aged adults ($N = 188$, 74% female, M age = 50.02, SD age = 6.10, range 40-59) revealed that growth mindset was associated with decreased depression and increased well-being. However, in these groups, growth mindset did not predict the likelihood of adjusting daily tasks. Findings suggest that while growth mindset is linked to enhanced well-being during the pandemic, its effect on adjusting to new circumstances might be salient in older adulthood.

IT WAS HEARTBREAKING . . . IT WAS HORRIBLE: THE EXPERIENCES OF NURSING HOME RESIDENTS' CHILDREN DURING COVID-19

Vivian Miller,¹ Nancy Kusmaul,² Jacquelyn Burns,¹ and Ji Hyang Cheon,³ 1. *Bowling Green State University, Bowling Green, Ohio, United States*, 2. *University of Maryland, Baltimore County, Baltimore, Maryland, United States*, 3. *University of Maryland, Baltimore County, University of Maryland Baltimore County, Maryland, United States*

As a result of COVID-19, the Centers for Medicare and Medicaid Services (CMS) suspended all outside visitors from entering nursing homes on March 13, 2020. For more than six months, care partners were only permitted in compassionate care situations, so adult children of residents were only able to contact their parents via phone calls, video chats, window visits, and in some cases, limited outdoor visits. Experts have written on the adverse, detrimental impact of this lack of connection and isolation has had on residents. However, the lived

experiences from the perspectives of residents' adult children remain largely absent from the literature. To uncover the experiences of these care partners, semi-structured interviews were conducted ($N=12$) from December 2020 to February 2021. Adult children shared witnessing their parent' physical and cognitive decline which they attributed to the lack of visitors. Care partners expressed feeling frustrated that they were unable to observe their parent's health condition, and could not provide support. Also, many rightfully worried they would never see their loved one again. Findings from this study reveal implications for nursing home leaders and policymakers, such as building infrastructure and systems that both ensure safety and allow care partners to regularly see their residents in long-term care to avoid the unintended adverse consequences of these policies. Further, findings from this research indicate the need for future programs to mitigate and lessen the long-term consequences this isolation has had on both residents and their adult children.

MENTAL HEALTH EFFECTS OF COVID-19 IN OLDER ADULTS ARE MODERATED BY EXISTING MENTAL HEALTH NEEDS AND EMOTIONAL SUPPORT

Tianyin Liu, Shiyu Lu, Terry YS Lum, Walker Siu Hong Au, Man-Man Peng, Dara KY Leung, and Gloria HY Wong, *The University of Hong Kong, Hong Kong, Not Applicable, Hong Kong*

Mitigating mental health consequences is one of the priorities for the society to advance, and the aim of this study is to investigate the mental health effects of COVID-19 in older adults and to explore risk and protective factors. Social workers recruited 722 older adults living in the community (mean age 73.6 ± 8.4) from January 2020 to February 2021 in Hong Kong, and interviewed them for basic demographics (age, gender, education, and living status), mental health service use in recent three months (proxy for existing needs), number of people to talk to when feeling down (proxy for emotional support network), and assessed their depression using Patient Health Questionnaire-9 (PHQ-9). Impacts of COVID-19 were indicated by local daily effective reproductive number (R_t) and N th wave since the start of the pandemic. Generalized linear models (GLM) were applied. Basic demographics were not associated with depression, existing mental health needs ($\beta=2.99$, $p<.001$), R_t ($\beta=1.08$, $p<.05$) and N th wave ($\beta=0.49$, $p<.05$) were positively associated with depression, while emotional support network was negatively associated with depression ($\beta=-2.47$, $p<.001$). There was also a significant interaction between R_t and N th wave on depression ($\beta=0.69$, $p<.05$), suggesting ongoing COVID-19 took a toll on older adults' mental health. Three-way interactions between COVID-19 R_t , N th wave and existing mental health needs ($\beta=0.25$, $p<.05$) and emotional support network ($\beta=-0.12$, $p=.07$) on depression further indicated that older adults with existing mental health needs warrant more attention, and wider emotional support network may buffer the impact of the pandemic on mental health.

RACIAL DIFFERENCES IN THE EROSION OF PSYCHOLOGICAL RESILIENCE FOLLOWING COVID-19 RELATED FINANCIAL HARDSHIP

Miles Taylor,¹ Dawn Carr,¹ and Kendra Jason,² 1. *Florida State University, Tallahassee, Florida, United States*, 2. *UNC Charlotte, Charlotte, North Carolina, United States*

Objectives: Research on the impact of COVID-19 among older adults has primarily focused on virus outcomes, but it is also possible the pandemic's hardships have eroded the adaptive capacity of older adults. It is also likely these impacts vary by race and ethnicity. We examine changes in psychological resilience (PR) among older adults pre and post-pandemic to determine whether financial and social hardships have altered this resource for White, Black, and Hispanic older adults. **Method:** Using the COVID module recently released by the HRS (n=735), we examined changes in PR between 2016 and 2020 related to specific COVID experiences. We tested interactions to determine whether the effects of these experiences were conditioned by race and ethnicity. **Results:** Consistent with previous literature, resilience was relatively stable during this time on average. Financial hardship due to COVID-19 diminished resilience, but this effect was concentrated primarily among White Americans. PR was unchanged related to financial hardship among Black Americans. **Discussion:** The results suggest that PR is a relatively stable resource in later life, even during a pandemic. However, this resource may be impacted in the face of specific and especially new challenges in later life. Policies and interventions related to job loss and financial hardship during the pandemic should be seen as supporting the capacity for older adults to adapt to current as well as future challenges.

Session 1360 (Paper)

COVID-19 Pandemic I

CHANGES IN HEALTH AND WELL-BEING IN COVID-19 CLINICALLY VULNERABLE OLDER ENGLISH PEOPLE DURING THE PANDEMIC

Giorgio Di Gessa,¹ and Debora Price,² 1. *University College London, London, England, United Kingdom*, 2. *University of Manchester, Manchester, England, United Kingdom*

People with specific health profiles and diseases (such as diabetes, lung and heart conditions) have been classified as 'clinically vulnerable' (CV) to Covid-19, i.e. at higher risk of severe illness and mortality from Covid-19, and were targeted for shielding. However, there is as yet little evidence on how the pandemic and shielding impacted the health and social well-being of CV older people. Using data from Wave 9 (2018/19) and the first Covid-19 sub-study (June/July 2020) of the English Longitudinal Study of Ageing, we investigated changes in health and well-being during the pandemic by clinical vulnerability. We also explored the interactions between CV and age-group (50s, 60s, 70s, 80+), and between CV and shielding. Results suggest that CV older people (~39% of the sample) were more likely to report worse health and social well-being outcomes during the pandemic compared to non-CV participants, even considering pre-pandemic levels of health and well-being. However, changes in health were not uniform across age groups, with those in their 50s and 60s more likely to report greater deterioration in mental health than those in their 70s and over 80. Moreover, older adults who were shielding and were CV reported the most substantial rises in anxiety, depression, receipt of formal care as well as decreases in well-being and physical activity. While policies focussing on shielding CV older people reduce rates

of hospitalisation and death from Covid-19, policymakers should address the wider needs of this group if their long-term health and social well-being are not to be compromised.

COMPARISON OF EMBEDDED SENSOR DATA FOR LONG-TERM CARE RESIDENTS BEFORE AND AFTER ONSET OF THE COVID-19 PANDEMIC

Erin Robinson, Wenlong Wu, Geunhye Park, Gashaye M. Tefera, Kari Lane, Marjorie Skubic, James Keller, and Mihail Popescu, *University of Missouri, Columbia, Missouri, United States*

Older adults have experienced greater isolation and mental health concerns during the COVID-19 pandemic. In long-term care (LTC) settings, residents have been particularly impacted due to strict lockdown policies. Little is known about how these policies have impacted older adults. This study leveraged existing research with embedded sensors installed in LTC settings, and analyzed sensor data of residents (N=30) two months pre/post the onset of the U.S. COVID-19 pandemic (1/13/20 to 3/13/20, 03/14/20 to 5/13/20). Data from three sensors (bed sensors, depth sensors, and motion sensors) were analyzed for each resident using paired t-tests, which generated information on the resident's pulse, respiration, sleep, gait, and motion in entering/exiting their front door, living rooms, bedrooms, and bathrooms. A 14.4% decrease was observed in front door motion in the two months post-onset of the pandemic, as well as a 2.4% increase in average nighttime respiration, and a 7.6% increase in nighttime bed restlessness. Over half of our sample (68%) had significant differences ($p < 0.05$) in restlessness. These results highlight the potential impact of the COVID-19 pandemic and social distancing policies on older adults living in LTC. While it is not surprising that significant differences were found in the front door motion sensor, the bed sensor data can potentially shed light on how sleep was impacted during this time. As older adults experienced additional mental health concerns during this time, their normal sleep patterns could have been affected. Implications could help inform LTC staff, healthcare providers, and self-management of health approaches among older adults.

CROSS-NATIONAL ANALYSIS OF BEREAVEMENT FROM COVID-19 AND DEPRESSIVE SYMPTOMS AMONG OLDER ADULTS IN EUROPE

Haowei Wang,¹ Ashton Verdery,¹ Rachel Margolis,² and Emily Smith-Greenaway,³ 1. *The Pennsylvania State University, University Park, Pennsylvania, United States*, 2. *University of Western Ontario, London, Ontario, Canada*, 3. *University of Southern California, Los Angeles, California, United States*

The COVID-19 pandemic has left older adults around the globe grieving the sudden death of relatives and friends. We examine if COVID-19 bereavement corresponds with older adults' depressive symptoms in 27 countries, and test for variation by gender and country context. We analyzed the Survey of Health, Ageing and Retirement in Europe (SHARE) COVID-19 data collected from N=51,383 older adults (age 50–104) living in 27 countries between June-August 2020, of whom 1,363 reported the death of a relative or friend from COVID-19. We estimated pooled-multilevel logistic regression models to examine if COVID-19 bereavement

was associated with depressive symptoms and worsening depressive symptoms for older men and women, and we tested whether the national COVID-19 mortality rate in their country had an additive, or multiplicative, influence. COVID-19 bereavement from the death of a relative or friend is associated with significantly higher odds of reporting depressive symptoms, and reporting that these symptoms have recently worsened since the outbreak of COVID-19. Net of personal loss, living in a country with the highest COVID-19 mortality rate corresponds further with women's depressive symptoms; however, living in the midst of more COVID-19 deaths does not alter the implications of personal loss for depressive symptoms. COVID-19 deaths have lingering mental health implications for surviving older adults. Even as the collective toll of the crisis is apparent, bereaved older adults are in particular need of mental health support.

FINANCIAL HARDSHIP AND THE PAIN OF SOCIAL DISCONNECTION DURING THE COVID-19 PANDEMIC IN THE UNITED STATES

Tirth Bhatta,¹ Nirmala Lekhak,² Timothy Goler,³ Eva Kahana,⁴ and Sfurti Maheshwari,⁵ 1. *University of Nevada, Las Vegas, Nevada, United States*, 2. *University of Nevada Las Vegas, Las Vegas, Nevada, United States*, 3. *Norfolk State University, Newport News, Virginia, United States*, 4. *Case Western Reserve University, Cleveland, Ohio, United States*, 5. *University of Nevada, Las Vegas, Las Vegas, Nevada, United States*

Considerable scholarly attention has been directed at increasing social isolation and loneliness during the COVID-19 pandemic, and their adverse impact on later life psychological well-being. Notably absent is the focus on financial hardship in the context of overlapping unprecedented economic and public health crisis. It is unclear whether loneliness continues to differ across different levels of financial hardship even amidst immense uncertainty, social isolation, and anxiety induced by the pandemic. Based on our nationwide web-based survey of adults aged 50 years and older (n=1861), we used ordinal logistic regression to examine the influence of financial hardship on loneliness and assessed the role of socioeconomic status (SES), emotional support, and health status in contributing to such influence. We found significantly higher odds of greater loneliness ($\beta = .28$, $p < .001$) among individuals who reported experiencing greater financial hardship. Among two measures of SES, only household income contributed substantially to the influence of financial hardship on loneliness. We documented significantly lower emotional support and greater health disadvantage among individuals experiencing greater financial hardship. Consideration of emotional support and health status explained the remaining influence of financial hardship, due to their association with both financial hardship and loneliness. Despite a sense of shared vulnerability and social isolation across the general population, our findings suggest that SES inequalities in later life loneliness are maintained even in the midst of the pandemic.

REPRESENTING DUTCH OLDER ADULTS DURING COVID-19: WHAT CAN WE LEARN?

Jolanda Lindenberg,¹ and Miriam Verhage,² 1. *Leyden Academy on Vitality and Ageing, Leiden, Zuid-Holland, Netherlands*, 2. *Leyden Academy on Vitality and Ageing,*

Leyden Academy on Vitality and Ageing, Zuid-Holland, Netherlands

From the very beginning of the COVID-19 pandemic older adults have been at the heart of public debate. Early articles argued that public representation of older persons displayed a resurgence of ageist stereotypes and beliefs in (inter)national media (e.g. Ayalon et al. 2020, Fraser et al 2020, Lichtenstein 2020, Sotomayer et al. 2020). Yet studies confirming this are absent up to now. In this paper, we present findings on the representation of Dutch older adults during the first six months of the COVID-19 crisis in The Netherlands. We analysed 1141 articles about older adults of the five largest newspapers using quantitative content analyses and discourse analysis to systematically explore patterns, sentiments and meaning in the articles. We show that the majority of these articles were published in general news and that older adults were rarely (2%) cited in these articles. Most prominent adjectives were vulnerable and weak. Most prominent substantives were attention, long-term care facility and loneliness. The sentiment was largely negative. Additionally, we find three discursive frames predominate: 'an older people's disease', 'vulnerability' and 'solidarity'. This evidences that the Dutch reporting on older adults during COVID-19 reproduced a discourse of dependency highlighting and further emphasizing the sociopolitical context before COVID-19 while drawing out earlier ageist tendencies. On the basis of our findings and drawing on advisory experiences, we discuss implications for policy, education and practice and how we can reframe and differently address older adults specifically in terms of language and their more (un)conscious positioning in (public) debate.

Session 1365 (Symposium)

CREATING VIRTUAL COMMUNITY FOR OLDER ADULTS: DURING THE COVID-19 PANDEMIC AND BEYOND

Chair: Lawrence Kosick

Co-Chair: Jennifer Hunt

Discussant: Erica Solway

Combining data on health and well-being from the University of Michigan National Poll on Healthy Aging (NPHA) with case studies and data from GetSetUp, a virtual online learning community, and the Michigan Department of Health and Human Services (MDHHS), this symposium will highlight how virtual community can be created and supported during the COVID-19 pandemic and beyond. Polling data on loneliness and physical environments demonstrate the need for opportunities for connection before and during the pandemic. Other polling data from the NPHA shows telehealth visits increased significantly as did the use of video chat technology. These findings suggest that comfort with technology may help support aging in place. GetSetUp helps to make this possible with customized learning to help older adults overcome hurdles to tech adoption and use. GetSetUp classes focus on supporting social connection and providing information on resources and services. Beyond the pandemic, these services will remain critical for many older adults, including those facing mobility limitations, those with limited community, and those looking to diversify their networks. The Senior Deputy Director of Aging and Adult

Services Agency will highlight how Michigan combines data and technology to support Michigan's aging network. The GetSetUp and MDHHS virtual community allowed for a statewide connection to health and aging services, including programs such as vaccine information sessions. The data and case studies described will highlight the need for connection during the COVID-19 pandemic and how a startup and State worked together to address this need.

LESSONS IN CUSTOMIZING VIRTUAL COMMUNITIES TO MEET THE NEEDS OF OLDER ADULTS

Lawrence Kosick, *GetSetUp, Midvale, Utah, United States*

GetSetUp started as a technology learning platform for older adults. During Covid-19 we realized that many adults not only wanted to learn technology but were eager for life-long learning opportunities. Our specially designed technology platform offered a safe, welcoming space that fosters growth, learning, and community for older adults over 60,000 Michiganders over 60 joined in just 4 months. Case studies show how older adults can benefit from technology to feel empowered, reduce social isolation, and improve wellbeing through a job or volunteer opportunities and new friendships. Reports highlight this ongoing need for those with limited community, mobility issues, or those looking to diversify their communities. A trusted virtual community helps connect the physical world digitally to assure older adults understand processes like vaccine enrollment procedures. Virtual communities will not replace physical communities but offer research opportunities, reach more remote communities, and allow for collaboration with state and aging networks.

LESSONS ON USING HEALTH RESEARCH & TECHNOLOGY TO BROADEN RESOURCES FOR OLDER ADULTS ACROSS THE STATE

Jennifer Hunt,¹ and Alexis Travis,² *1. Michigan Department of Health and Human Services, Michigan, United States, 2. Michigan Department of Health and Human Services, Lansing, Michigan, United States*

The vision of the Michigan state unit on aging is for residents to live well and thrive as they age. The COVID-19 pandemic exacerbated the existing problem of older adult social isolation. Social engagement and community involvement are keys to healthy aging. Combining state resources with the GetSetUp virtual community allowed for statewide connections and extended resources, creating an almost around-the-clock virtual senior center. Through customized courses the state was able to offer vaccine navigation sign-up classes, among other classes, to help older adults interact with essential health and aging services. As Michigan continues to work to address health equity and social determinants of health beyond the pandemic, technology designed specifically for older adults is an important component of programmatic offerings. It also allows for a public-private partnership opportunity to support older adults as they age.

POLL FINDINGS ON SOCIAL CONNECTION AND TECHNOLOGY USE DURING THE COVID-19 PANDEMIC

Erica Solway, *University of Michigan, Ann Arbor, Michigan, United States*

The National Poll on Healthy Aging conducted an online survey of a nationally representative sample of adults

age 50-80 (n=2,074) in June 2020 about experiences related to loneliness, their physical environments, and telehealth and technology use. 41% felt a lack of companionship, and 46% reported infrequent social contact. Feelings of loneliness were more likely among those who lived alone or who did not have access to features in their neighborhood and community which may offer opportunities for safe interactions. The poll also found that 26% of adults age 50-80 had a telehealth visit March through June 2020 and 64% overall reported being comfortable with video conferencing technology, with notable differences by demographic subgroup. These results highlight the need for new opportunities for older adults, especially those with the greatest social and economic need, to feel connected and to be confident using technology, both during and after the pandemic.

Session 1370 (Symposium)

CURRENT AND FUTURE DIRECTIONS IN MINORITY AGING: EMBRACING INTERDISCIPLINARY MODELS

Chair: Heather Farmer

Co-Chair: Amy Thierry

Discussant: Keith Whitfield

Racial/ethnic disparities in health among older adults are well-documented. More research is needed to clarify the complex and multifactorial mechanisms underlying these associations. This symposium will feature research that employs innovative theoretical and methodological approaches to understand the biopsychosocial mechanisms that underlie racial/ethnic disparities in older adults' health and determine sources of within-group heterogeneity in minority aging. Dr. Forrester will integrate stress biology and intersectionality to demonstrate the importance of stress and resilience (e.g., John Henryism) with biological aging within Black adults participating in the Coronary Artery Risk Development in Young Adults (CARDIA) Study. Dr. Brown Hughes will present innovative research using data from the African American United Memory and Aging Project (AA-UMAP) on the importance of Alzheimer's disease-specific knowledge and perceptions among Black older adults. Dr. Gamaldo will employ a within-race approach to understand how knowledge and perceptions of Alzheimer's disease and related dementias (ADRD) shape cognitive performance among Black older adults in the AA-UMAP study. Dr. Mitchell will use Health and Retirement Study data to explore the role of midlife stress exposure in accounting for racial disparities in trajectories of cognitive functioning. Drs. Thierry and Farmer will use HRS data to examine how psychosocial resilience (e.g., mastery) affects the relationship between perceived neighborhood conditions (e.g., disorder) and cognition among Black older adults. This work highlights the importance of applying an interdisciplinary lens to move the study of minority aging forward and ultimately, to reduce the unnecessary burden of morbidity and mortality among minoritized groups.

EXPLORING HOW NEIGHBORHOOD CHARACTERISTICS AND PSYCHOSOCIAL RESILIENCE AFFECT COGNITION AMONG OLDER BLACK ADULTS

Heather Farmer,¹ Amy Thierry,² Marina Armendariz,³ Sydney Kirven,⁴ and Kyler Sherman-Wilkins,⁵ *1. University*

of Delaware, Newark, Delaware, United States, 2. Xavier University of Louisiana, Xavier University of Louisiana, Louisiana, United States, 3. The Pennsylvania State University, University Park, Pennsylvania, United States, 4. Xavier University of Louisiana, New Orleans, Louisiana, United States, 5. Missouri State University, Springfield, Missouri, United States

Black older adults are at greater risk for poor cognitive health than Whites, and adverse neighborhood conditions may contribute to this disparity. Moreover, limited research examines how resilience is implicated in the relationship between neighborhoods and cognition among Blacks. Using 2006-2016 waves of the Health and Retirement Study, we examine how perceived neighborhood characteristics (physical disorder and social cohesion) and psychosocial resilience (social support, mastery, and sense of purpose) contribute to cognitive functioning among 1,655 Black adults ages 65+. Results from multilevel linear regression models show that greater physical disorder was associated with worse cognitive functioning, and this was attenuated after adjustment for socioeconomic status. We found a positive association between purpose and mastery with cognitive functioning, even after accounting for socioeconomic, psychosocial, and health-related characteristics. Thus, high levels of purpose and mastery may be protective for cognitive functioning among Black older adults in spite of experiencing negative neighborhood contexts.

NAVIGATING BLACK AGING: THE IMPACT OF STRESS AND THE POWER OF RESILIENCE IN PROMOTING HEALTH

Sarah Forrester,¹ Keith Whitfield,² Catarina Kiefe,³ and Roland Thorpe, Jr.,⁴ 1. *University of Massachusetts Chan Medical School, Worcester, Massachusetts, United States*, 2. *University of Nevada Las Vegas, Las Vegas, Nevada, United States*, 3. *University of Massachusetts Medical School, Worcester, Massachusetts, United States*, 4. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

The health profile of African Americans clearly shows that stress works to worsen chronic conditions. To improve the health of aging African Americans, interventions need to address how effects of stress are reduced by individual resilience factors and exacerbated by anxiety or other traits. We will characterize the effects of stress by measuring rate of biological aging (RBA) over thirty years in a Black cohort (aged 18-30 at baseline) of approximately 2,000 individuals from the longitudinal CARDIA study. Biological aging (BA) captures premature physiological aging beyond that predicted by an individual's chronological age. RBA will be characterized by within person change in BA over 30 years. We will measure the association between RBA and anxiety and will further measure the extent to which various forms of individual resilience factors mitigate the effects of anxiety on BA. We will also explore how intersectionality is evinced in sex differences in RBA.

THE AFRICAN AMERICAN UNITED MEMORY AND AGING PROJECT: AD KNOWLEDGE AND FAMILY HISTORY AS IT RELATES TO COGNITION

Alyssa Gamaldo,¹ Allison Caban-Holt,² and Travonia Brown-Hughes,³ 1. *The Pennsylvania State University, University Park, Pennsylvania, United States*, 2. *Maya Angelou Center for Health Equity, Winston-Salem,*

North Carolina, United States, 3. *School of Pharmacy, Hampton, Virginia, United States*

This study explores the influence of Black adults' Alzheimer's disease (AD) knowledge and family history of AD on cognition. A sample of Black adults (n=66, age range=45-84) completed a computerized cognitive (CogState Brief) battery and surveys of AD knowledge, family history of AD diagnosis, and health. On the 14-item AD knowledge survey, participants correctly answered a mean of 10.80 (SD=1.50) items. Approximately, 56% reported a biological family member diagnosed with AD, of these 30% reported this being a mother or father. Linear regression models suggested no significant association between AD knowledge and cognitive performance. However, adults with a family member diagnosed with AD had worse visual learning accuracy even after adjusting for age, education, and income. Increased age was associated with worse processing speed, particularly in adults with a mother diagnosed with AD. These findings demonstrate the importance of examining the influence of family history on Black adults' cognitive health.

THE EFFECTS OF MID-LIFE STRESS EXPOSURE ON BLACK-WHITE DIFFERENCES IN COGNITIVE DECLINE

Uchechi Mitchell, *University of Illinois Chicago, School of Public Health, Chicago, Illinois, United States*

Cognitive decline is a precursor to cognitive impairment and dementia. Recent research suggests that cognitive decline may begin earlier in the life course for Blacks and that Black-white disparities in cognitive function emerge in midlife. Disproportionate exposure to chronic and acute stressors during mid-life may explain Black-white differences in trajectories of cognitive function over time. In this study we use data from approximately 3,700 Black and white respondents age 51-64 from the Health and Retirement Study to examine race differences in cognitive decline and the role mid-life stress exposure play in these differences. Initial findings suggest that mid-life Blacks have lower levels of cognitive function, but their rates of cognitive decline do not differ significantly from mid-life whites. Financial strain and everyday experiences of discrimination are inversely associated with cognitive decline and only partially explain differences in cognitive decline between mid-life Blacks and whites.

REDEFINING THE USE OF DIGITAL COMMUNITIES: AD KNOWLEDGE IN AN ONLINE EDUCATED COHORT OF MIDLIFE AND OLDER BLACKS

Travonia Brown-Hughes,¹ Alyssa Gamaldo,² Corinne Pettigrew,³ Allison Caban-Holt,⁴ Nihal Mohamed,⁵ and Roland Thorp, Jr.,⁶ 1. *School of Pharmacy, Hampton, Virginia, United States*, 2. *Penn State University, University Park, Pennsylvania, United States*, 3. *Johns Hopkins University, Baltimore, Maryland, United States*, 4. *Maya Angelou Center for Health Equity, Winston-Salem, North Carolina, United States*, 5. *Icahn School of Medicine at Mount Sinai Department of Oncological Sciences, New York, New York, United States*, 6. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

The normalization of memory loss continues to contribute to diagnostic delays among older adult African Americans with dementia. We utilized an innovative recruitment method

to establish a solely online study to examine perceptions and knowledge levels of Alzheimer's Disease in a highly educated geographically diverse cohort of 223 African Americans aged 50-84. Participants were recruited through largely electronic communications. Sample participants were primarily female (n=196), with 51.1% having completed a master's degree, and 58.2% of participants with household incomes of \$90,000 or higher. Study findings revealed that although highly educated, 42% of sample participants believed significant memory loss was a normal part of aging and 59.6% felt that God's Will was a possible cause of AD. A sizable majority of participants, 86.5%, felt most family physicians were not trained to diagnose AD. Findings underscore the need for physician and community education within diverse populations, regardless of education and SES status.

Session 1375 (Symposium)

DEVELOPING SYNERGISTIC RELATIONSHIPS BETWEEN AGE-FRIENDLY UNIVERSITIES AND AGE-FRIENDLY COMMUNITIES

Chair: Joann Montepare

Co-Chair: Wendy Rogers

The Age-Friendly University (AFU) initiative was designed to support the Global Network for Age-Friendly Cities and Communities (WHO, 2018) and offers a range of opportunities for institutions of higher education to help communities adapt to their new age-diverse social structures as a result of shifting age demographics. In turn, age-friendly community partnerships are helping to fuel campus efforts to advance age-inclusivity through education, research, and community engagement. At present over 70 institutions have joined the AFU global network, as more campuses prepare to become age-friendly partners. In this collaborative symposium (Directors of Aging Centers and AFU Interest Groups), campus leaders will describe synergistic relationships between their age-friendly campus efforts and the age-friendly efforts of their neighboring communities. Montepare (Lasell University) will provide an overview of the AFU initiative and its set of 10 principles, and make the case that campuses and communities are necessary partners for creating and developing age-friendly efforts. Demonstrating this assertion, Pastor and Rogers (University of Illinois Urbana-Champaign) will describe linkages between their community and campus initiatives, including developing a Panel of Elders, television programming for older adults, and hosting joint events. Black and Andel (University of South Florida) will discuss the intersection between the AFU principles and the processes undertaken by age-friendly communities. Revell and Viveiros (University of Massachusetts Dartmouth) will show how campus collaborations with nearby communities are instrumental in sustaining age-friendly efforts, especially during a pandemic.

AGE-FRIENDLY UNIVERSITIES (AFU): NECESSARY PARTNERS FOR AGE-FRIENDLY COMMUNITIES

Joann Montepare, *Lasell University, Newton, Massachusetts, United States*

The pioneering Age-Friendly University (AFU) initiative, endorsed in 2016 by GSA's Academy for Gerontology in Higher Education (AGHE), calls for institutions of higher

education to respond to shifting demographics and the needs of aging populations through more age-friendly campus programs, practices, and partnerships. The case will be made that AFU institutions can also play vital roles in helping neighboring communities develop, launch, assess, and sustain their age-friendly efforts through research and related endeavors that engage students and faculty. In addition, AFU campus-community partnerships can play a critical role in breaking down age-segregation that fuels ageism, building intergenerational connections, and increasing aging literacy among rising community members - all of which are necessary steps for building age-friendly communities.

ENHANCING COLLABORATIONS BETWEEN OUR AGE-FRIENDLY COMMUNITY AND UNIVERSITY INITIATIVES

Wendy Rogers, and Brian Pastor, *University of Illinois Urbana-Champaign, Champaign, Illinois, United States*

Community involvement and synergistic partnerships are key to fostering a holistic approach to programming and outreach that assess and meet the needs of the older adults in our communities. The University of Illinois Urbana-Champaign has created an Age-Friendly network to facilitate these partnerships featuring our designation of Age-Friendly City and Age-Friendly University as well as partnerships with our state and local governments, community aging services providers, and continuing care retirement communities. Through these partnerships, we have identified the landscape of the community, assessed the unique needs older adults, and identified novel solutions. We will discuss our plans for activities that will empower older adults in our community and at our university by promotion connection, collaboration, and inclusion.

LEVERAGING THE INTERSECTION BETWEEN AGE-FRIENDLY UNIVERSITIES AND AGE-FRIENDLY COMMUNITIES

Kathy Black, *University of South Florida, Sarasota-Manatee, Florida, United States*

Age-friendly Universities represent a growing contribution to the worldwide age-friendly movement. For universities, the international effort aims to highlight the role higher education plays in responding to the opportunities associated with an aging population. The initiative outlines ten principles to engage older adults via collegiate mission pertaining to research, education and service. Shared practices suggest diverse and unique application of the guiding tenets across participating colleges and universities. However Age-friendly Universities are also part of a broader ecosystem, situated in geographic locales reflecting actual or prospective age-friendly community status. The global Age-friendly Community movement is a decade-old effort to improve the environments in which we age via a cyclical process. This paper identifies the intersection between Age-friendly University principles and Age-Friendly Community processes and discusses reciprocal considerations for mutual advancement of the broader movement.

CREATING AN AGE-FRIENDLY MODEL SYSTEM THROUGH A COMMUNITY AND UNIVERSITY PARTNERSHIP

Andrew Revell,¹ and Jennifer Viveiros,² *1. University of Massachusetts Dartmouth, University of Massachusetts*

Dartmouth, Massachusetts, United States, 2. University of Massachusetts Dartmouth, North Dartmouth, Massachusetts, United States

The University of Massachusetts 5-campus system was the first university system to receive the Age-Friendly University designation in the AFU Global Network (Business West, 2019). Simultaneously, the town of Dartmouth and city of New Bedford became Age-Friendly Communities. This allowed for dynamic collaboration between our university and communities. This presentation highlights several examples. The Ora M. DeJesus Gerontology Center faculty and student researchers developed the original age-friendly survey items for New Bedford's initial community assessment; and the College of Nursing and Health Sciences faculty and student researchers compiled data for Dartmouth's survey. Community service during the pandemic has flourished. The Community Companions program, which matches students with community members in social need, went virtual. Nursing students and faculty have been on the frontline in the vaccination efforts in the town of Dartmouth. These partnerships will be presented as examples of potential opportunities for other age-friendly communities. Community-university partnerships are encouraged.

Session 1380 (Symposium)

DISPARITIES RESEARCH AT THE DEEP SOUTH ALZHEIMER'S DISEASE CENTER OF THE UNIVERSITY OF ALABAMA AT BIRMINGHAM

Chair: Maria Pisu

Discussant: David Geldmacher

Residents of the US Deep South (Alabama, Georgia, Louisiana, Mississippi, and South Carolina) have a 20–30% higher risk of developing Alzheimer's disease or related dementia (ADRD). Moreover, >20% of African Americans, who are at higher ADRD risk than whites, live in this region. Therefore, one important goal of the Deep South Alzheimer's Disease Center (DS-ADC) of the University of Alabama at Birmingham is to spearhead research to address these disparities. This panel presents current DS-ADC research, with two presentations focusing on the local patient population and the last two on the Deep South population compared to the rest of the nation. Addressing the challenge of recruiting representative samples in clinical research, the first paper is part of a research program to understand difference that may exist between African American and white research participants. The second paper examines patients with multiple conditions, in particular dementia and cancer, showing a marked disadvantage in cognition outcomes for African Americans. The next two papers take a broader perspective to better understand the population of older adults with ADRD in the Deep South and in the rest of the US. The third paper examines socioeconomic and medical contexts of African American and white older Medicare beneficiaries with ADRD, and the fourth paper examines differences in utilization of specialists, ADRD drugs, and hospitalizations in the two regions taking these contexts into account. The discussant will close the session by placing these studies in the larger context of the disparities research at the DS-ADC.

HEALTH CARE UTILIZATION IN DIVERSE OLDER ADULTS IN THE DEEP SOUTH AND THE REST OF THE UNITED STATES

Maria Pisu,¹ Roy Martin,¹ Liang Shan,² Giovanna Pilonieta,³ Richard Kennedy,¹ Gabriela Oates,¹ and David Geldmacher,⁴ 1. *University of Alabama at Birmingham, Birmingham, Alabama, United States*, 2. *University of Alabama at Birmingham, Birmingham, Alabama, United States*, 3. *University of Alabama at Birmingham, Birmingham, Alabama, United States*, 4. *University of Alabama at Birmingham, Birmingham, Alabama, United States*

We examined racial/ethnic (R/E) differences in health care utilization among older adults with Alzheimer's disease and related dementia (ADRD) from US Deep South [DS] and non-DS, and individual or context-level factors that affect this utilization. Data were 2013–2015 claims for Medicare beneficiaries with ADRD; county-level data were used to define context-level covariates; adjusted analyses were conducted separately for DS and non-DS. Across R/E groups, 33%–43% in DS, 43%–50% in non-DS used ADRD specialists; 47%–55% in DS, 41%–48% in non-DS used ADRD drugs; 42.9%–53.4% in DS, 42%–51.8% in non-DS had hospitalizations in a one-year follow-up. R/E differences were not significant, with few exceptions. Comorbidities, poverty, and medical resources availability were associated with specialist use and hospitalizations; comorbidities and specialist use were associated with drug use. In non-DS only, other individual, context-level covariates were associated with health care outcomes. Research should further examine determinants of health care utilization in these populations.

THE CHALLENGE OF IDENTIFYING REPRESENTATIVE SAMPLES IN RESEARCH INVOLVING MINORITY PARTICIPANTS

Giovanna Pilonieta,¹ and David Geldmacher,² 1. *University of Alabama at Birmingham, Birmingham, Alabama, United States*, 2. *University of Alabama at Birmingham, Birmingham, Alabama, United States*

Determining participants' demographics, cognition, and functional performance by race is crucial to understanding disparities in clinical research on Alzheimer's disease. We compared demographic and performance variables between Black/African American (B/AA; N=30; 41%) and White participants (N=43, 59%) in the UAB Alzheimer's Disease Center. Among 73 participants, 38 (52%) were women, mean age was 65.7 (SD 9.47), and mean education was 16 (2.31) years. Significant differences in gender proportions across race groups were observed. B/AA women represented 70 % of their race group, white women represented 39.5 %. There were no statistically significant differences in age, education, cognitive or functional severity, reasons to participate in research, referral source, objective measures of cognition, or informant-rated daily function by race group. In conclusion, despite 50% oversampling of B/AA participants compared to the State population, no differences in cognitive and functional performance at the time of enrollment were associated with race.

SOCIAL DETERMINANTS OF ALZHEIMER'S DISEASE AND RELATED DEMENTIAS: RACIAL AND REGIONAL VARIATIONS

Roy Martin,¹ Liang Shan,² David Geldmacher,³ Giovanna Pilonieta,⁴ Richard Kennedy,¹ Gabriela Oates,¹ and Maria Pisu,¹ 1. *University of Alabama at Birmingham, Birmingham, Alabama, United States*, 2. *University of Alabama at Birmingham, Birmingham, Alabama, United States*, 3. *University of Alabama at Birmingham, University of Alabama at Birmingham, Alabama, United States*, 4. *University of Alabama At Birmingham, Birmingham, Alabama, United States*

To examine whether racial and regional social determinants of health disparities exist for older adults with Alzheimer's disease and related dementias (ADRD). We identified 115,879 African American (AA) and White older adults with ADRD (10% from the Deep South) from administrative claims data for a 5% random sample of Medicare beneficiaries (2013-2015). We examined racial and regional differences across sociodemographic characteristics, county-level linked poverty indicators, medical resource availability categories, insurances quality indicators. Social context differences were found between regions including Deep South older adults with ADRD having higher economic impoverishment and lower access rates to specialty medical care services. Older Deep South AA had higher Medicare/Medicaid eligibility rates and less medical access. Significant socioeconomic disparities exist between Deep South and other US regions across several social determinant factors in older adults with ADRD. Social context differences were especially prominent for older Deep South AA with ADRD.

THE RELATIONSHIP BETWEEN PRIOR CANCER DIAGNOSIS AND ALL-CAUSE DEMENTIA PROGRESSION AMONG U.S. ADULTS

Mackenzie Fowler, Nicole Wright, Kristen Triebel, Gabrielle Rocque, Ryan Irvin, and Richard Kennedy, *University of Alabama at Birmingham, Birmingham, Alabama, United States*

Cancer-related cognitive impairment is a common effect of cancer that shares symptoms with dementia. Only one study examined cancer's longitudinal association with dementia. This analysis expands to a larger clinical sample. Electronic health record data were extracted from July 2003-February 2020. Baseline cognition/progression on the Alabama Brief Cognitive Screener (ABCs) by cancer history were assessed using linear mixed effects models, with interaction by race. After adjustment for demographics/socioeconomics, those with cancer history had higher baseline cognition (β : 1.49 [0.91-2.07]), and declined slower (β : 0.40 [0.08-0.71]) than those without. Health behaviors/comorbidities attenuated this association. Non-Hispanic Blacks with cancer history demonstrated lower cognition throughout follow-up compared to non-Hispanic Whites / other race/ethnicities with cancer history and participants without cancer history. Health behaviors/comorbidities confound and race modifies the relationship between cancer and dementia. Exploring the role of health behaviors/comorbidities on this association and causes of racial disparities is needed.

Session 1385 (Symposium)

EMERGING SCHOLARS AND JUNIOR FACULTY PRESENT NEW STRATEGIES FOR STUDENT ENGAGEMENT IN GERONTOLOGY

Chair: Sarah Hahn

Discussant: Jennifer Kinney

With the rapid aging of the population, the need for gerontological educators to identify pedagogical strategies to increase interest and prepare students continues to grow. Innovative approaches and educational practices contribute greatly to student success in the gerontological classroom. Literature on gerontological pedagogy has shed light on the success of high-impact practices, creative assignments, pedagogical interventions, and even different course modalities when it comes to effectively delivering gerontological content and engaging students. Additionally, the Academy for Gerontology in Higher Education (AGHE) provides a wealth of suggestions for creating and implementing effective gerontology courses and assignments. However, while we are familiar with these practices, we are not familiar with how specific groups of academics, such as emerging scholars and junior faculty, are utilizing them. Emerging scholars and junior faculty experience several major transitions as they prepare for life in academia. To ensure that emerging scholars and junior faculty are well prepared, we need to continue to empower these individuals to foster growth. This can be done by highlighting how emerging scholars and junior faculty have met the goals of maximizing and optimizing student learning. As such, the purpose of this symposium is to examine innovative approaches used by emerging scholars and junior academics in the gerontological classroom that have optimized student learning. This includes presentations on strategies for team-based learning, using intersectionality as a theoretical lens, and two creative written assignments, The Gerontological Movie Database Review and Interview an Elder.

INTERVIEWING AN ELDER: STUDENTS' PERCEPTIONS OF CHANGE IN AN INTRODUCTION TO GERONTOLOGY CLASSROOM

Sarah Hahn, *Mercy College, Dobbs Ferry, New York, United States*

Within the gerontological classroom, high-impact practices and creative assignments have consistently shown to help engage students, optimize learning, and increase positive attitudes toward older adults and aging (e.g., Chonody, 2015; Yamashita, et al., 2018). One such creative assignment, interviewing an older adult, has been cited as both an influential and valuable experience to gerontology students (e.g., O'Hanlon & Brookover, 2002). Although this assignment has been popular in and out of gerontology courses, more data regarding this and student's understanding is needed. As such, this presentation aims to 1) introduce and establish the value of using the written assignment, "Interview an Elder" in the gerontology classroom and 2) present preliminary qualitative data on how students' perceptions of older adults changed after the assignment. Using thematic analysis, results suggest that students are not only surprised by what they learned, but have increased positive perceptions of older adults overall.

FLIPPING THE SCRIPT ABOUT AGING THROUGH FILMS: THE GERONTOLOGICAL MOVIE DATABASE REVIEW

Sara Hackett, *University of South Florida, Wesley Chapel, Florida, United States*

Education about the heterogeneity of the older adult population is an important step for reducing ageist attitudes. As many undergraduate students view gerontology as an unrelatable discipline, educators are tasked with identifying innovative strategies to make course content engaging. The purpose of this presentation is to share an emerging educator's experience with creating a novel essay assignment. Based off the International Movie Database (IMDb), the Gerontological Movie Database (GMDb) Review encourages students to use their knowledge to evaluate how older adults are portrayed in films. Explicitly, students must 1) choose a film that focuses on older adult characters and 2) apply key gerontological concepts (e.g., the life course perspective) to critique the film's representation of aging. Though movie reviews are not a typical genre of writing, this assignment increases students' understanding of how their perception of aging, coupled with master narratives embedded within today's culture, influences the construction of age.

USING TEAM-BASED LEARNING IN AN ONLINE SYNCHRONOUS GERONTOLOGY COURSE

Leah Janssen, *Scripps Gerontology Center, Oxford, Ohio, United States*

Team-based learning (TBL) was chosen for its learner-centered approach to intentional engagement and purposeful application of course material in a cross-listed, upper-level gerontology class (i.e., Social Forces in Aging). Intedashboard, an online TBL platform, was utilized to support the online synchronous course, which is especially useful for its integration of class material, module assessments, peer/course evaluations, and dashboard display of live team activity. From the perspective of an emerging scholar, this symposia session will explore the application of TBL as a tool for developing teams, helping students personally connect with course material, and support inclusive teaching initiatives. More specifically, this presentation examines how a scaffolded TBL exercise on cumulative advantage/disadvantage, intersectionality, and social identities led to increased identification and awareness of students' social location, and the perceived impacts on their later lives.

USING INTERSECTIONALITY THEORY AS A LENS IN A PERSPECTIVES ON AGING CLASS

Kelly Munly, *Penn State Altoona, Altoona, Pennsylvania, United States*

The presenter will discuss strategies for using intersectionality as a theoretical lens in her Perspectives on Aging class in order to support students to understand the relevance of aging studies—including health and social disparities in aging—for their contemporary lived lives, as well as for prior generations. With this relevance established, the class also examines the significance and justification for the development of policy, such as Social Security legislation, as well as the need for aging-related career areas. The presenter will discuss the application of key course resources, including research that looks at aging in historic contexts, as well as content highlighting the importance

of Age Friendliness and the diversity of career areas to support Age Friendliness and more optimal aging experiences overall. Examining historic roots of aging-related experiences in social contexts creates an informative platform for understanding experiences of aging in society today.

Session 1390 (Symposium)

ESPO AND HEALTH SCIENCES SECTION SYMPOSIUM: CONDUCTING CLINICAL TRIAL RESEARCH DURING THE COVID-19 PANDEMIC: TRANSFORMING RESEARCH PRACTICE FOR THE FUTURE

Chair: Brianna Morgan

Co-Chair: An Nguyen

Discussant: An Nguyen

The COVID-19 pandemic caused significant disruptions for people and institutions across healthcare settings. Clinical trials are an important research tool to test interventions in real-world healthcare settings and provide high quality evidence that supports older adults' longevity and wellness. Clinical trialists must consider how to account for unpredictable and ever-changing environmental contexts. The COVID-19 pandemic is a specific example of a changing context that impacted all stages of the clinical trials process from planning, to administration, and outcomes. Reflecting on ways clinical trialists navigated their studies during the COVID-19 pandemic may unlock opportunities to design flexible clinical trials that meet the needs of older adults in real-world environments. This symposium highlights five clinical trials for older adults that occurred during the COVID-19 pandemic. Dr. Carpenter will discuss lessons learned in implementing a palliative care intervention in nursing homes. Brianna Morgan will describe the pivots needed to complete a clinical trial testing an advance care planning website for nursing home residents with dementia. Dr. Nuckols will describe obstacles and opportunities to implementing a randomized controlled trial on hospital nursing units, including implications for medication safety. Dr. Pevnick will highlight barriers and facilitators to implementing a pharmacist-led intervention to reduce hospital readmissions. Dr. Stark will share novel procedures for conducting clinical trials in the community that reduce burden for older adult participants while maintaining fidelity. Presenters will address practice transformations that researchers can bring forward to design flexible clinical trials that meet the needs of older adults in different healthcare contexts.

ADAPTING AN ADVANCE CARE PLANNING WEBSITE FOR PERSONS WITH DEMENTIA IN NURSING HOMES DURING THE COVID-19 PANDEMIC

Brianna Morgan,¹ Liza Behrens,² Sonia Talwar,³ Emily Summerhayes,⁴ Mary Ersek,⁴ and Nancy Hodgson,⁵
1. *University of Pennsylvania, Philadelphia, Pennsylvania, United States*, 2. *Ross and Carol Nese College of Nursing, Pennsylvania State University, University Park, Pennsylvania, United States*, 3. *University of Pennsylvania, School of Nursing, Philadelphia, Pennsylvania, United States*, 4. *University of Pennsylvania school of nursing, Philadelphia, Pennsylvania, United States*, 5. *University*

of Pennsylvania, School of Nursing, Philadelphia, Pennsylvania, United States

We partnered with a national for-profit nursing home (NH) organization to test the acceptability and use of an advance care planning (ACP) website for people living with dementia using a randomized controlled trial (RCT) design. Concurrently, the COVID-19 pandemic disproportionately impacted NHs and halted in-person research. We will present challenges, opportunities, and adaptations in site engagement, recruitment, and data collection. Initially, NHs were overwhelmed by pandemic efforts and research staff were unable to enter sites. We capitalized on time and available resources by beta-testing the website in a comparable population and designing surveys to elicit COVID-19's impact on ACP. Once able, NH staff took on recruitment and data collection efforts intended for research staff. We supported NHs by pivoting to remote data collection, providing technology on site, and offering flexible communication. Flexibility is key in supporting site engagement, recruitment, and data collection and has implications for designing pragmatic RCTs.

INNOVATION IN TIMES OF UNCERTAINTY: CLINICAL TRIALS IN NURSING HOMES DURING SARS-COV-2

Joan Carpenter, *University of Maryland School of Nursing, Baltimore, Maryland, United States*

In March 2020 the Centers for Medicare & Medicaid Services (CMS) announced restrictions on visitors and nonessential personnel in nursing homes to protect residents and facilities from SARS-CoV-2 (severe acute respiratory syndrome coronavirus 2) outbreaks. At the time, these measures were “temporary” but they continued well into 2021 resulting in a prolonged pause on in-person study activities in a palliative care clinical trial in 12 nursing homes. This session will address the impact of this pause and decisions made to overcome the potential failure of the trial. Of utmost importance was respecting nursing homes rapidly changing context, continued communication with the site leadership, transitioning to phone and video-conference study activities, and designing a retrospective study using existing data to answer a different but similar research question. As clinical researchers move forward implementing trials and complex interventions in nursing homes, we must use the lessons learned to design flexible trial protocols.

CONDUCTING A CLUSTER RCT ON MEDICATION SAFETY IN NURSING UNITS OVERTAXED BY THE COVID-19 PANDEMIC

Teryl Nuckols,¹ Ed Seferian,¹ Bernice Coleman,¹ Carl Berdahl,¹ Tara Cohen,¹ and Andrew Henreid,²
1. *Cedars-Sinai Medical Center, Los Angeles, California, United States*, 2. *Cedars-sinai Medical Center, Los Angeles, California, United States*

Medication errors continue to harm many hospitalized patients. In other high-risk industries, voluntary incident reporting is widely used to improve safety. Reporting is widely used in hospitals, but not as effectively. This AHRQ-funded cluster RCT will assess the effects of the SAFE Loop, which includes five enhancements in incident reporting implemented on hospital nursing units. Analyses will compare changes in nurses' attitudes toward reporting, event reporting rates,

report quality, and medication event rates between intervention and control arms. The COVID-19 pandemic has created both obstacles and opportunities. The intervention requires study staff to engage nursing unit directors, attend daily nursing “huddles”, and train overtaxed front-line nurses in a geographic area greatly impacted by COVID-19 surges. This created uncertainty around the best time to start the trial. Conversely, we have collected unique data on the implications of COVID-19 for medication safety while testing our instruments during the trial preparation phase.

ADDRESSING COVID-19 BARRIERS TO CLINICAL TRIAL ENROLLMENT AND IMPLEMENTATION IN THE PHARM-DC STUDY

Joshua Pevnick,¹ Michelle Keller,² Korey Kennelty,³ Michelle Ko,⁴ Logan Murry,³ An Nguyen,¹ Andrew Henreid,⁵ and Jeffrey Schnipper,⁴
1. *Cedars-Sinai Medical Center, Los Angeles, California, United States*, 2. *Cedars Sinai, Cedars Sinai, California, United States*, 3. *University of Iowa, Iowa City, Iowa, United States*, 4. *Brigham and Women's Hospital, Boston, Massachusetts, United States*, 5. *Cedars-sinai Medical Center, Los Angeles, California, United States*

Recent hospitalization puts older adults at higher risk of experiencing adverse drug events (ADEs) that are a common cause of hospital readmission. Yet, most ADEs are preventable. The PHARMacist Discharge Care (PHARM-DC) study is a multi-site randomized controlled trial that seeks to evaluate the effect of pharmacist-led peri- and post-discharge interventions on 30-day hospital readmissions among older adults taking ≥ 10 medications or ≥ 3 high-risk medications. The PHARM-DC intervention includes pharmacist-led patient counseling, medication reconciliation at discharge, and a follow-up phone call post-discharge. We will highlight study protocol adaptations undertaken during the COVID-19 pandemic to address challenges to enrollment and to minimize risk of COVID-19 exposure for study participants and research personnel. Additionally, we will share insights from focus groups and semi-structured interviews with pharmacist interventionists and pharmacy leaders on barriers and facilitators to implementation due to the pandemic and strategies for future clinical trials to overcome barriers.

CAN WE DO BETTER FOR OLDER ADULT RESEARCH PARTICIPANTS? CLINICAL TRIAL IMPROVEMENTS PROMPTED BY A GLOBAL PANDEMIC

Susy Stark, *Washington University, St Louis, Missouri, United States*

Retaining older adults in clinical trials has often been a challenge for researchers. Clinical trial procedures, aimed at improving fidelity, often offer barriers to frail older adults who have challenges traveling to medical centers and enduring long clinical assessment visits. During the COVID-19 pandemic, we modified the procedures of two randomized controlled trials. COMPASS: A novel transition program to reduce disability after stroke is a clinical trial examining the efficacy of a transition home program that provides home modifications and self-management strategies compared to stroke education. HARP: Removing home hazards for older adults living in affordable housing is a pragmatic trial examining the effectiveness of a home hazard removal program

for residents of low-income housing. Modifications to the trials were designed to reduce human contact but in some cases reduced the burden on trial participants. Modified procedures addressed retention, assessment of endpoints and intervention methods.

Session 1395 (Paper)

Family Caregivers

DAUGHTERS-IN-LAW IN NEGOTIATING THE INTERGENERATIONAL CONTRACT IN RURAL CHINA: A QUALITATIVE CASE STUDY

Yong-Zhen Li,¹ and Crystal Kwan,² 1. *The Hong Kong Polytechnic University, Kowloon, Hong Kong*, 2. *The Hong Kong Polytechnic University, Kowloon, Hong Kong*

Daughters-in-law play a key role in intergenerational relationships, especially in Rural China. Albeit, their voices are less heard and examined. This study explores how daughters-in-law in Rural China view and negotiate intergenerational contracts with their older adult parents-in-law. A qualitative case study design was used, and multiple data collection methods (including semi-structured interviews, observation and document review) with thematic analysis were employed. Findings highlight that daughters-in-law play a key role in shaping the intergenerational contracts between their spouse and their spouse's parents. In particular, the daughters-in-law provided instrumental support to their parents-in-law who were without self-care abilities or at risk when their adult child (the daughter-in-law's spouse) went to the city/county for work. There were also unique findings highlighting diverse negotiations of the intergenerational contract between daughters-in-law and their older adult parents-in-law. In the context of growing austerity and the current pandemic, whereby informal social supports and networks become key to older adults' wellbeing, identifying strengths and barriers of intergenerational support from daughters-in-law, is significant to support both the individual members and family wellbeing.

DIVERSE CAREGIVERS IN THE UNITED STATES: IMPLICATIONS FOR CAREGIVING ACROSS THE LIFESPAN

C. Grace Whiting,¹ Rita Choula,² Yanira Cruz,³ Lauren Pongan,⁴ and Feylyn Lewis,⁵ 1. *National Alliance for Caregiving, Washington, District of Columbia, United States*, 2. *AARP Public Policy Institute, Washington D.C., District of Columbia, United States*, 3. *National Hispanic Council on Aging, Washington, D.C., District of Columbia, United States*, 4. *Diverse Elders Coalition, Diverse Elders Coalition, New York, United States*, 5. *Independent, Washington, District of Columbia, United States*

Caregivers with diverse backgrounds make up an important part of the landscape of caregiving in the US. Their unique experiences have been traditionally under-researched in the field of social sciences and underrecognized by society. To further understand the impact of race, ethnicity, class, gender and sexuality onto caregiving, the National Alliance for Caregiving (NAC) and the AARP Public Policy Institute commissioned an in-depth analysis of the dataset collected from the Caregiving

in the US 2020 study, which segments populations based on ethnic and sexual identity, geographic location, and income level. Utilizing survey interviews with 1,392 caregivers in the US, this study found differences amongst the African-American, Latinx, and Asian American-Pacific Islander populations in relation to age, time spent caregiving, ADL/IADLs, caregiving strain and intensity, receipt of formal and informal support, and financial impact. In consideration of the distinct challenges presented by diverse caregiving throughout the lifespan, this presentation will also feature results from a 2020-2021 Diverse Elders Coalition and NAC commissioned study on the unmet caregiving needs in diverse communities. 11 virtual listening sessions were held with 400 caregivers of color, including American Indian/Alaska Native caregivers, and LGBTQ caregivers across the nation. Presentation attendees can expect to learn new insights into the experiences of diverse caregivers, while also gaining a fresh understanding of informal and formal support preferences with a multicultural lens. Finally, this presentation will provide recommendations to further prioritize the needs of historically marginalized caregivers in policy and practice.

HEALTH OF AGING FAMILIES: COMPARING COMPOUND AND NONCOMPOUND CAREGIVERS

Fei Wang,¹ Christina Marsack-Topolewski,² Rosanne DiZazzo-Miller,³ and Preethy Samuel,³ 1. *Case Western Reserve University, Cleveland Heights, Ohio, United States*, 2. *Eastern Michigan University, Ypsilanti, Michigan, United States*, 3. *Wayne State University, Detroit, Michigan, United States*

Providing care to a family member with disabilities takes a toll on the caregiver and the whole family's health. Among aging caregivers, compound caregiving (i.e., caring for additional family members) has become an increasingly common scenario. However, few research studies have focused on compound caregivers. Extant literature describes individual-level outcomes, with sparse knowledge on family-level outcomes. The present study examines the differences in the individual and family health of aging compound and noncompound caregivers, using the family quality of life framework. Web-based cross-sectional data collected from 112 aging caregivers (i.e., over 50 years) was analyzed using chi-square and independent sample t-tests to examine differences between caregivers. Compound caregivers had worse perceptions of personal health ($t = -2.96$, $p = .004$, $d = -.61$) than noncompound caregivers. In terms of family health, although all caregivers shared similar perceptions on the importance, opportunities, initiative, and stability, compound caregivers had lower attainment ($t = -2.64$, $p = .009$, $d = -.44$) and satisfaction ($t = -3.90$, $p < .001$, $d = -.73$) than noncompound caregivers. Findings have practice implications for identifying caregivers' multiple responsibilities. It is necessary to develop individual and family level programs focused on health promotion and caregiving training.

STATE MEDICAID POLICY AND LTC: A MULTI-STATE QUALITATIVE STUDY OF POLICY INFLUENCE ON CAREGIVER EXPERIENCES

Tonie Sadler,¹ Kevin Yan,¹ Daniel Brauner,² Harold Pollack,³ and R. Tamara Konetzka,³ 1. *The University of Chicago, Chicago, Illinois, United States*, 2. *Western Michigan*

University, Kalamazoo, Michigan, United States,
3. University of Chicago, Chicago, Illinois, United States

This study focuses on long-term care (LTC) state Medicaid policy and its impact on caregiver decisions and experiences. It examines respondents' general knowledge of LTC state policies and services, challenges with navigating LTC policies and services, and decision-making pathways based on these factors. Using purposive sampling, 63 family caregivers across eight states participated in open-ended qualitative interviews (2019-2020) until thematic saturation was reached. Questions broadly examined caregivers' experiences and decisions, focusing on decisions made around type of care setting and experiences with LTC state policy. States were selected to represent variation in Home and Community Based Service (HCBS) expenditures as a percentage of total Medicaid long-term services and support expenditures. While LTC policies and services vary significantly by state, we identified many parallels in caregiver experiences and perceptions across states, as respondents often lacked specific knowledge about LTC policies and services and how to access them. Overarching themes include LTC policy navigation challenges, distrust in state-funded LTC services and supports, and moral expectations of caregiving. To manage these challenges, caregivers employed coping strategies such as utilizing informal support networks, hiring care coordination assistance, and "stretching things thin" to fill the policy and service gaps. Study findings highlight potential strategies to improve LTC services across states. There is a need to improve community trust with state services by employing transparent regulatory and evaluation procedures for LTC. Wider access to case management may improve communication and knowledge of available services to maximize benefit from HCBS expansions.

TIMING AND SUPPORT MATTER: CAREGIVING DEMANDS AT THE INTERSECTION OF STRESS PROCESS AND LIFE COURSE PERSPECTIVES

Yeonjung Lee,¹ Alex Bierman,² and Margaret Penning,³

1. University of Calgary, Calgary, Alberta, Canada,
2. University of Calgary, University of Calgary, Alberta, Canada, 3. University of Victoria, Victoria, British Columbia, Canada

Extensive research documents the outcomes of family caregiving. However, perspectives differ, with some suggesting that caregiving provides psychological rewards and others suggesting that the stress of caregiving carries psychological costs. We argue that both of these perspectives are correct, but their applicability will differ based on the timing of caregiving and the availability of social support. A life course perspective suggests that the timing of a stressor in the life course will create variations in its mental health impacts, whereas a stress process perspective suggests that the consequences of a given stressor for mental health will vary based on the availability of social support. A synthesis of these two perspectives then suggests that social support will act as stress buffer differently depending on the age of caregiver. To examine these questions, we use a subsample of respondents who reported caregiving (N=20,441) in the 1st wave of the Canadian Longitudinal Study on Aging. Analyses provide evidence of different outcomes of caregiving, according to both the timing of caregiving and the availability of support.

In particular, a high level of caregiving demands are associated with greater depression and lower life satisfaction. Social support inhibits both associations, and the association between high demands and life satisfaction is stronger in older caregivers. Social support does not buffer high caregiving demands more strongly at older ages, though, showing two distinct process. Demanding caregiving appears particularly detrimental for psychological well-being as people age, and the efficacy of social support resources do not increase to compensate.

Session 1400 (Symposium)

FOUR APPROACHES FOR IMPLEMENTING INTERPROFESSIONAL EDUCATION

Chair: Jennifer Mendez

Discussant: Jennifer Mendez

Using Microsoft Teams, the students from Psychology and marketing at Upper Iowa University, create a marketing plan focused on proposing a product or service targeting older adults. The Michigan LEND program, engages a minimum of 4 disciplines in practice online simulation approaches to respond to a case study. At Wayne State University and University of Detroit Mercy, during a zoom visit with community dwelling 50+ old adults, students from 9 disciplines collaborate on recommendations, referrals, and resources to improve health and/or quality of life. Marquette University students from 10 health professions participate in a series of four half-day workshops, designed in alignment with the Interprofessional Education Collaborative (IPEC) core competencies.

MARKETING AND PSYCHOLOGY: AN INTERDISCIPLINARY PARTNERSHIP

Melinda Heinz, and Summer Zwanziger Elsinger, *Upper Iowa University, Fayette, Iowa, United States*

Students enrolled in Psychology of Aging and Consumer Behavior combined efforts during an 8-week course to create marketing plans focused on proposing a product or service targeting older adults. The goal of the project was to 1) infuse aging content into the curriculum 2) increase awareness of older adult consumers and 3) decrease aging stereotypes. Student teams were engaged in this project one day each week over 8 weeks. Instructors created weekly tasks to break down components of the project and each student group was required to turn in evidence of their completed task. During the 2020-2021 academic year, participants used Microsoft Teams and recorded their tasks for instructors to grade. A rubric was used to facilitate grading of weekly team tasks and similar weights/points were used in both classes to create similar levels of student "buy in." Suggested implementation tips for both face-to-face and online modalities will be discussed.

SIMULATION APPROACH TO INTERPROFESSIONAL EDUCATION

Margaret Greenwald,¹ and Jennifer Mendez,² 1. *Wayne State University, Wayne State University -, Michigan, United States*, 2. *Wayne State University, Detroit, Michigan, United States*

A team practice simulation approach to interprofessional education is presented. Participants (79 trainees over 4 years)

were assigned to one of six teams representing clinical services for a client with complex clinical needs (medical care, outpatient therapy, dental, nutrition, speech and hearing, leadership). Each student within the team was assigned a specific role (e.g., primary care, policy maker, family member). A critical component of this activity is that each participant adopted the role and perspective of an individual in a different clinical area than their own. In preparation for a live discussion by all participants, each team met to study their assigned clinical roles and to prepare a one-page slide addressing specific questions given only to their team. At the live session, the overall goal was to develop a coherent clinical plan for the client. This is an effective approach for IPE in care of clients across the lifespan.

USING CANVAS FOR AN INTERPROFESSIONAL VIRTUAL TEAM VISIT

Ashley Reed, and Jennifer Mendez, *Wayne State University, Detroit, Michigan, United States*

This session will demonstrate how to use the Canvas learning management system (LMS) to organize and facilitate interprofessional education experiences (IPE) amongst students and faculty. Emphasis will be placed on the use of modules as a way to organize content and facilitate requirements associated with IPE. In addition, the session will include demonstration on how to assign disciplines to sections to aid in faculty abilities to review of student submissions.

CURRICULAR APPROACH TO IPE: PREPARING HEALTH PROFESSIONS STUDENTS TO DELIVER TEAM-BASED CARE

Stacy Barnes, and Kelly Horton, *Marquette University, Milwaukee, Wisconsin, United States*

Interprofessional education (IPE) is essential to prepare students for future healthcare careers and to meet accreditation requirements for health profession schools. After surveying successful IPE programs across the country, Marquette University developed a curricular approach. Over 1,500 students from 10 health professions (Athletic Training, Medical Laboratory Science, Counseling Psychology, Dentistry, Medicine, Nursing, Occupational Therapy, Physical Therapy, Physician Assistant Studies, Speech-Language Pathology) currently participate in a series of four interactive, half-day courses which are aligned with the Interprofessional Education Collaborative (IPEC) core competencies. Courses were moved online in response to the pandemic and are currently delivered using Microsoft Teams. Feedback from learners and faculty is gathered using post-event surveys and has been overwhelmingly positive. Learner outcomes are measured using the Interprofessional Collaborative Competencies Attainment Survey. Overall, this approach has proven to be an effective and efficient model for delivering IPE to large numbers of students.

Session 1405 (Symposium)

GOING VIRTUAL WHEN THE DOORS CLOSE: ADDRESSING GERIATRIC WORKFORCE TRAINING NEEDS DURING A PANDEMIC

Chair: Linda Edelman

Co-Chair: Gail Towsley

Discussant: Timothy Farrell

The focus of our Geriatric Workforce Enhancement Program (GWEP) is to enhance long-term services and support (LTSS) and primary care healthcare workforce capacity through interprofessional education (IPE) and to increase patient, family, and caregiver engagement. When it became evident that LTSS settings, schools, and communities were going to be adversely impacted by the COVID-19 pandemic for the unforeseeable future, our GWEP quickly pivoted to address new challenges and initiate technology to continue our programs. In this symposium, we describe four programs implemented or revised during the COVID-19 pandemic. We utilized CARES (Coronavirus Aid, Relief and Economic Security) funding to develop a 3-part Project ECHO on utilizing telehealth in LTSS settings. We pivoted quarterly Fireside Chats – community-based educational programs held at partnering LTSS settings for older adults and caregivers – to bi-weekly and now monthly webinars addressing topics relevant to COVID-19 and combatting social isolation. Because students could no longer attend an in-person IPE course introducing them to long-term care, we revised the course to be online with a partnering nursing home participating in an interactive mock care conference. Finally, a 2-semester undergraduate Honors College project-based course introducing students to successful aging utilized virtual activities to expose students to the challenges of hospice care during a pandemic. With these adaptations, as well as activities that advocated for, and supported, LTSS settings and older adults, our GWEP program was able to continue to provide education and support to the setting and individuals most impacted by COVID-19.

VIRTUAL TRANSITIONS AND OPPORTUNITIES IN LTSS EDUCATION POST-PANDEMIC

Gail Towsley,¹ Jacqueline Telonidis,² Cherie Brunner,³ and Linda Edelman,¹ 1. *University of Utah College of Nursing, Salt Lake City, Utah, United States*, 2. *University of Utah College of Nursing, Salt Lake City, Utah, United States*, 3. *University of Utah School of medicine, Salt Lake City, Utah, United States*

The Utah Geriatric Education Consortium Learning Community transitioned to the Age-Friendly Long-Term Services and Support (LTSS) ECHO with support from Comagine Health, our local QIN-QIO. ECHO sessions utilize case-based learning and mentorship to help community providers gain the expertise required to provide needed care and/or services to older adults. Since March 2020, and in response to the needs of our partners, four ECHO sessions (average of 47 attendees per session) have focused on COVID-19 training including COVID-19 briefings, infection prevention, positive thinking and coping with stress. With our partners, we also co-created a 3-part LTSS telehealth ECHO series to illustrate how telehealth can address the unique challenges of COVID-19. We will discuss 1) how we met the educational needs of our partners during a health crisis 2) the process we took to develop the LTSS telehealth ECHO series, and 3) opportunities for continued virtual education application.

PIVOTING COMMUNITY-BASED EDUCATIONAL PROGRAMMING FOR FORMAL AND INFORMAL CAREGIVERS DURING COVID-19

Kara Dassel,¹ Jacqueline Telonidis,² Catherine Witt,¹ and Linda Edelman,³ 1. *University of Utah, Salt Lake City, Utah, United States*, 2. *University of Utah College of Nursing, Salt Lake City, Utah, United States*, 3. *University of Utah College of Nursing, Salt Lake City, Utah, United States*

The Utah Geriatric Education Consortium provides community-based education about Age-Friendly Health Care and Dementia-Friendly Communities targeted towards informal and professional caregivers. As such, we have collaborated with our community partners to host a series of “Fireside Chats”. Since March of 2020, we have hosted 17 Fireside Chats. Our attendance has exceeded our expectations, with over 500 attendees (average of 32 attendees per session). The professional attendees come from a variety of interdisciplinary backgrounds including nursing, medicine, public health, allied health, aging services, and health and long-term care administration. Our non-professional attendees include family caregivers, students, and older adults in the community. This session will address: a) the logistical steps we took (and lessons learned) as we “pivoted” our Fireside Chats into a virtual video-conference format, b) how we redesigned the curriculum to address topics related to COVID-19, and c) will review our evaluation feedback.

ADAPTING A PROJECT-BASED AGING LABORATORY DURING A PANDEMIC

Troy Andersen,¹ and Linda Edelman,² 1. *University of Utah, University of Utah College of Social Work, Utah, United States*, 2. *University of Utah College of Nursing, Salt Lake City, Utah, United States*

Aging Well in Utah is a competitive 2-semester project-based Honor’s College Praxis Laboratory for 9 students from different degree programs dedicated to deepening understanding of the aging process through a broad gerontological lens. This session will address how the course was adapted during the COVID-19 pandemic, including: 1) scheduling virtual class times with guest lecturers; 2) conducting older adult interviews via Zoom to provide students experience in communicating “what matters most”, one of the 4Ms of Age Friendly HealthCare; 3) adapting a student-designed medical narrative project highlighting stories of transition and healing through the dying process for previously unsheltered residents of a hospice program to focus on the lived experience of hospice patients during COVID-19; and 4) utilizing virtual technology to interview hospice patients, family members and hospice staff. In spite of challenges, student evaluations were above average and reported increased interest in incorporating age-friendly concepts into future careers.

IPE IN LTC IMMERSION EXPERIENCE: CREATING A BRIDGE TO CAREERS IN LONG-TERM CARE

Megan Thomas Hebdon,¹ Christina Wilson,² Catherine Bernier-Carney,³ Jacqueline Telonidis,⁴ and Susan Chase-Cantarini,⁵ 1. *University of Texas at Austin, University of Texas at Austin, Texas, United States*, 2. *University of Utah College of Nursing, Salt Lake City, Utah, United States*, 3. *University of Utah College of*

Nursing, Salt Lake City, Utah, United States, 4. *University of Utah College of Nursing, Salt Lake City, Utah, United States*, 5. *University of Utah College of Nursing, Salt Lake City, Utah, United States*

The Utah Geriatric Education Consortium seeks to enhance healthcare provider workforce capacity. The purpose of our interprofessional education (IPE) in Long Term Care (LTC) course is to enhance students’ understanding of team-based care for older adults, presenting avenues for career opportunities. The course was offered via distance learning technology to adapt to the COVID-19 pandemic. Health sciences students (n=55) enrolled in the course and completed pre- and post-course work asynchronously. The course also included a two-hour virtual session in partnership with a LTC interprofessional team with a resident case study and discussion using the 4M’s Framework. We will discuss the a) COVID-19 course adaptations, b) IPE case study using the 4M’s Framework to help students conceptualize older adult care, and c) student pre- and post-course discussion responses demonstrating their prior experience with older adults and course impact on their views about caring for older adults in LTC settings.

Session 1410 (Paper)

Health Promotion (BSS Paper)

DIABETES DIAGNOSIS, SOCIAL SUPPORT, AND HEALTH BEHAVIOR CHANGES IN OLDER ADULTS

Weidi Qin, *University of Michigan*

The growing disease burden of diabetes in older adults highlights the importance of health-promoting behaviors in this population. A new diagnosis of diabetes can be a teachable moment that motivates older adults to engage in health behavior changes. Guided by the convoy model of social relations, social support from family and friends may influence health behaviors, and moderate the effects of a diabetes diagnosis on health behaviors. The current study investigates health behavior changes in drinking, smoking, and physical activity before and after a diabetes diagnosis, and whether social support moderates the relationships. A sample of 13,143 older adults without diabetes at baseline were selected from the Health and Retirement Study, and followed up for six waves. Social support from family and friends were measured separately. Mixed-effects regression models were performed. Sampling weights were adjusted to generate population estimates. After a diabetes diagnosis, older adults reduced alcohol consumption and were more likely to quit smoking. More social support from family was associated with decreased alcohol consumption, and more social support from friends was associated with increased physical activity. Significant interaction between social support from family and diabetes diagnosis was found. Specifically, among older adults with a diabetes diagnosis, more social support from family was associated with less drinking and smoking cessation. The study findings suggest that health practitioners can consider the timing of diabetes diagnosis to facilitate health behavior changes. Furthermore, diabetes educators can help older adults mobilize support from family and friends to better engage in health-promoting behaviors.

DOES MONEY MATTER? CHARACTERISTICS ASSOCIATED WITH JOINT PAIN MEDICATION ACCESS AMONG OLDER ADULTS

Aviad Tur-Sinai,¹ Netta Bentur,² and Jennifer Shuldiner,³
 1. *Yezreel Valley College, Mevasseret Zion, Yerushalayim, Israel*, 2. *Tel Aviv University, Tel Aviv University, Tel Aviv, Israel*, 3. *University of Toronto, University of Toronto, Ontario, Canada*

The experience of pain is a widespread phenomenon among adults, especially older adults, and entails high costs to both individuals and society. The objective of the current research is to determine if the ability to pay and supplementary insurance are factors associated with pain medication among individuals over 50. Data came from Survey of Health, Aging and Retirement in Europe (SHARE). The sample included 64,281 individuals 50+ from nineteen European countries and Israel. Joint pain was common with one out of three reporting joint pain. Prevalence of pain was similar among different age groups, and more women reported joint pain. Among those in pain, about 21.5% of the individuals reported mild pain, 52.9% moderate and 26% severe pain. In the multivariate logistic regression, we found that men and those older than 60 suffered more from joint pain, while controlling for education and subjective assessment of the ability to cope economically (Able to make ends meet). A large percentage of those with pain were not taking medication to manage their pain, and there were significant demographic differences between those that did and did not take medication. Those that took medication were younger, male, had more education, were able to cope economically and had supplementary insurance. Our study showed that about half of the individuals with pain were not taking medication to manage their pain. Our results demonstrate that among individuals over 50 in Europe income is strongly associated with taking pain medication and that there is economic inequity in medication access.

HOME AND COMMUNITY BASED SERVICE USE AMONG VETERANS WITH DEMENTIA LIVING IN RURAL VIRGINIA

Jyoti Savla,¹ Mamta Sapra,² Lauren Hagemann,³ and Katherine Luci,⁴
 1. *Virginia Tech, Blacksburg, Virginia, United States*, 2. *Salem Veteran Affairs Medical Center, Salem VAMC, Virginia, United States*, 3. *Salem VAMC, salem, Virginia, United States*, 4. *Salem VA Medical Center, Salem, Virginia, United States*

Despite the overall expansion of rural Veteran health care facilities, older Veterans in these areas are still underserved and face challenges and barriers to access services. Using data from 60 family caregivers of persons with dementia (PwD; Mean Age = 67 years, Range = 39-84; 92% White; 71% Spouse) we examined the types of home-based and community services they utilized. We also examined reasons that family caregivers provided for not using these services. Next, we applied Andersen's Behavioral Model of Health Services to examine how predisposing factors such as demographics, available resources, and PwD's needs were associated with the use of services. We found that Veterans living in rural counties had lower access to caregiver support groups, homemaker services, adult day centers, and home-based respite services. The top three reasons for not

using services were that the family caregiver chose to do it themselves, the PwD did not want the service or the service provider to help, or it was too far from the caregiver's home. Regression analysis further showed that caregivers caring for PwDs with greater ADL challenges and memory and behavior problems were more likely to need and utilize paid services. Disparities based on gender, age, and race were also explored. Findings suggest the need to develop effective service promotion strategies and destigmatizing the use of paid services among Veteran families to reduce health disparities in rural regions.

REFLECTIONS ON IDENTITY IN MEMOIRS OF WRITERS WITH APHASIA: LESSONS LEARNED ON THE PATH TOWARD RECOVERY

Hanna Ulatowska,¹ and Gloria Olness,²
 1. *University of Texas at Dallas, Dallas, Texas, United States*, 2. *University of North Texas, Denton, Texas, United States*

Personal stories provide insight into the experience of illness as it intersects with one's identity. Prior studies by the first author examined identity as manifested in personal accounts of U.S. World War II veterans with and without dementia. The current study examines identity as revealed through written memoirs of middle-aged and older adults who have aphasia, from a cross-section of North American, European, and Australian cultures. The abrupt onset of stroke and associated aphasia, and the subsequent path toward re-engagement in life with an often-chronic communicative impairment, provide a unique window into the nature and evolution of the identity of the writer. The written modality offers an opportunity for reflective formulation that is not afforded to the memoir-writers in their verbal expression. Nineteen memoirs and biographical accounts of individuals with aphasia from a range of primarily individualistic cultures were examined for content reflective of the identity of the author, focused on post-stroke phases of restitution and quest. Primary authors were people with aphasia or rarely their close family member. Some were professional editors, poets or authors. Gender and life backgrounds were varietal. Manifestations of personal identity, its reinforcement, and its evolution were evidenced in: the provision of lessons learned from living with aphasia; content of letters exchanged with friends; engagement with family in life and recovery; fictional and poetic expression; spiritual insight; renewed or altered occupational pursuits; and comments on facing one's mortality. Findings hold implications for the cross-cultural practice of narrative medicine with the older adult population.

THE PERKS OF DOING HOUSEWORK: ITS IMPACTS ON PHYSICAL HEALTH, MENTAL WELL-BEING, COGNITIVE PERFORMANCE, AND SURVIVAL

Li Chu,¹ Xianmin Gong,² Jennifer Lay,³ Fan Zhang,⁴ Timothy Kwok,⁵ and Helene Fung,⁶
 1. *Stanford University, Stanford University, California, United States*, 2. *The Chinese University of Hong Kong, Hong Kong, Hong Kong*, 3. *University of Exeter, Exeter, England, United Kingdom*, 4. *Jinan University, Jinan University, Guangzhou, Guangdong, China (People's Republic)*, 5. *The Chinese University of Hong Kong, Shatin, N.T., Hong Kong, Hong Kong*, 6. *The Chinese University of Hong Kong, Shatin, N.T., Hong Kong, Hong Kong*

Previous research has shown mixed results regarding the effects of doing housework. While some earlier studies have found no association between performing heavy housework and health, other studies have found various benefits of doing housework, including body leanness and lower mortality rate. This study examined the effects of housework on older adults' survival over a period of 14 years, and investigated the underlying mechanisms. A total of 2,768 older adults in Hong Kong (female: 47.29%; age: 65-98) from a longitudinal survey study were included in the current analyses. Linear regression analysis revealed that doing more housework was significantly associated with surviving more days ($\beta = 45.36$, $SE = 6.40$, $p < .001$). We then examined whether the association between housework and survival was mediated by physical health, mental health and/or cognitive functioning using a parallel mediation model with multiple mediators. Results showed a significant partial mediating effect of physical health ($\beta = 1.20$, $SE = .53$, $p = .003$), a marginally significant partial mediating effect of cognitive functioning ($\beta = 1.35$, $SE = .70$, $p = .054$) and no mediating effect of mental health. All the analyses remained consistent after controlling for sex, education, marital status, subjective social status and living arrangement. These results suggest that doing housework may benefit survival by improving physical and cognitive functioning. Our findings have implications for better understanding factors that influence mortality, developing accessible physical activity interventions for older adults, and supporting aging in place.

Session 1415 (Symposium)

HETEROGENEITY IN VULNERABILITY AND RESILIENCE AMONG CENTENARIANS

Chair: Daniela Jopp

Co-Chair: Charikleia Lampraki

Discussant: Dario Spini

Given their exceptional longevity, centenarians have long been considered as examples of successful aging. Yet, with increases in empirical studies, findings suggest that they may show vulnerability and resilience at the same time. This symposium offers a more in-depth perspective on both constructs in centenarians. Zaccaria and colleagues investigated the link between social isolation and loneliness within the Fordham Centenarian Study. Results indicate the existence of four subgroups combining expressions of isolation and loneliness, suggesting different vulnerability patterns in centenarians. Uittenhove and colleagues analyzed patterns of coping strategies in the Second Heidelberg Centenarian Study. Cluster analysis identified two coping profiles, one characterized by a wide coping repertoire including problem-directed and internal strategies, while the other showed low problem-solving. Lampraki and Jopp examined the effects of (lacking) resources and psychological strengths (optimism) on depressive symptoms in the Fordham Centenarian Study. Findings suggest that the effect of resources is mediated by psychological strengths, demonstrating their beneficial value in very old age. Jopp and colleagues report findings from the ongoing SWISS100 Study. Based on telephone interviews conducted during the COVID-19 pandemic, they found that centenarians did not feel vulnerable. While half of the centenarians and their proxies reported no changes in everyday life,

the other half experienced substantial challenges due to lack of activities and absence of social contacts due to governmental regulations. In sum, centenarians are vulnerable and resilient at the same time, highlighting the future research needs on its predictors, and the application of this knowledge within the context of crisis.

LONELINESS AND SOCIAL ISOLATION AMONG CENTENARIANS AND NEAR-CENTENARIANS: RESULTS FROM THE FORDHAM CENTENARIAN STUDY

Daniele Zaccaria,¹ Stefano Cavalli,² Barbara Masotti,¹ and Daniela Jopp,³ 1. *University of Applied Sciences and Arts of Southern Switzerland, Manno, Ticino, Switzerland*, 2. *University of Applied Sciences and arts of southern switzerland, Manno, Ticino, Switzerland*, 3. *University of Lausanne, Lausanne, Vaud, Switzerland*

Although loneliness and social isolation are often discussed together, they are mainly examined separately. The few studies examining both concepts simultaneously focus usually on the wider category of older people (65+), with no or little attention to very old age. Our main aim was to investigate loneliness and social isolation in combination among near-centenarians and centenarians. Analyzing data from the Fordham Centenarian Study (N=94; MAge=99.2; range=95-107), we found no or very weak associations between loneliness and social isolation. Combining measures of loneliness (UCLA Loneliness scale) and social isolation (Lubben Scale) we built a typology with four different groups (Not lonely or isolated; Lonely and isolated; Lonely but not isolated; Isolated but not lonely). The factors that most strongly predicted the distribution among these four groups were gender, widowhood, education, and self-rated health. Findings highlight the importance of jointly studying both concepts to better understand social risks in very old age.

COPING IN CENTENARIANS: PATTERNS AND CORRELATES

Kim Uittenhove,¹ Daniela Jopp,² and Kathrin Boerner,³ 1. *UNIL, Lausanne, Vaud, Switzerland*, 2. *University of Lausanne, Lausanne, Vaud, Switzerland*, 3. *University of Massachusetts Boston, Boston, Massachusetts, United States*

Coping strategies are a source of resilience, yet little is known about their use in centenarians. We examined patterns in coping strategy use and determined how these patterns were associated with characteristics such as personality, cognitive status, quality of life, and health. We analyzed data from the Fordham Centenarian Study (N = 119), where centenarians responded to 40 items covering 10 coping dimensions (e.g., active problem-solving, support seeking, re-appraisal). Findings revealed two clusters which differed in amount and strategy types: One was characterized by high use of many strategies which addressed the problem and its appraisal. The other was characterized by a smaller strategy repertoire, with very limited use of problem-focused strategies. The more varied and problem-focused coping pattern was associated with other characteristics, such as personality (e.g., extraversion) and quality of life (e.g., well-being). Findings suggest variation in coping profiles associated with resilience in centenarians.

BASIC RESOURCES AND PSYCHOLOGICAL STRENGTHS AS PREDICTORS OF DEPRESSIVE SYMPTOMS

Charikleia Lampraki, and Daniela Jopp, *University of Lausanne, Lausanne, Vaud, Switzerland*

Loss of personal resources is expected to have a negative effect on well-being in all ages, however, in very old age, this effect may be exacerbated. Centenarians, who are confronted with accumulated age-related losses, may be at higher risk of experiencing depressive symptoms. This study investigated the link between basic resources (i.e., health, social network) and depressive symptoms and whether it was mediated by psychological strengths (i.e., meaning, optimism) in 119 centenarians and near-centenarians (Mage = 99.7 years). Results indicated that meaning in life fully mediated the link between health and depressive symptoms, and the link between social network size and depressive symptoms. Similarly, optimism mediated the link between network and depression, but no mediation effect was found when considering health as basic resource. In sum, basic resources are only indirectly associated to depressive feelings, with psychological strengths playing an important intervening role in very old age.

CENTENARIANS' EXPERIENCE OF THE COVID PANDEMIC IN SWITZERLAND

Daniela Jopp,¹ Stefano Cavalli,² Armin von Gunten,³ François Herrmann,⁴ Carla Gomes Da Rocha,⁵ Garnelle Ziade,⁶ and Kim Uittenhove,⁷ 1. *University of Lausanne, Lausanne, Vaud, Switzerland*, 2. *University of Applied Sciences and arts of southern switzerland, Manno, Ticino, Switzerland*, 3. *CHUV - University Hospital of Vaud, Lausanne, Vaud, Switzerland*, 4. *University of Geneva, Geneva, Geneve, Switzerland*, 5. *HES-SO Valais Wallis, Sion, Valais, Switzerland*, 6. *University of Lausanne, lausanne, Vaud, Switzerland*, 7. *UNIL, Lausanne, Vaud, Switzerland*

Being considered as individuals with elevated risk of severe health reactions to the COVID19 infections, governments around the world have put in place wide-ranging measures to protect very old individuals from the virus. In the present study, we investigated centenarians' experience of the COVID19 pandemic, to reach a better understanding of their vulnerability and resilience. As part of the SWISS100 study, we conducted telephone interviews with 30 centenarians and 40 family members. While almost all centenarians felt not, qualitative data suggested the existence of two groups: One included centenarians lived rather withdrawn and isolated before the crisis and therefore did not experience major changes. The other group included centenarians who suffered substantially from no longer being able to see family and friends and missed valued activities. Family members reported challenges, including centenarians' decline in mental and physical health. Findings highlight the importance of different vulnerability profiles and lock-down side effects.

Session 1420 (Symposium)

IMPLICATIONS OF THE COVID-19 PANDEMIC ON ADULT DAY SERVICES

Chair: Katherine Marx

Co-Chair: Laura Gitlin

Discussant: Tina Sadarangani

Adult day service (ADS) centers serve an important role in care provision for people living with dementia (PLWD). These programs provide socialization, activities, and access to many therapies for PLWD. Additionally, they offer respite to family caregivers so they can work, run errands, and recharge. In March 2020, like much of the nation, ADS sites across the nation were shut down. This left many PLWD and their caregivers without access to the services they depended on to manage day to day care. It also left many sites without a revenue source to pay employees and maintain buildings. Almost a year later, many states have still not reopened ADS and sites that have reopened have done so with a lower census, increased costs, and the lingering fear of a second closure. Much focus has been on the care of older adults in nursing homes or other residential long-term care settings but the challenges of ADS and the people they serve has been mostly ignored. The purpose of this symposium is to highlight the implications of the COVID-19 pandemic on ADS centers. Holly Dabelko-Schoeny will present data gathered from ADS Centers across Ohio. Lauren Parker, will then present data from ADS sites across the United States that examines the effect of COVID-19 on closures and programming during the closures. Katherine Marx will present the effect of ADS closures on family caregivers of persons living with dementia. Finally, Joseph Gaugler will explore this from a policy perspective and provide recommendations moving forward.

CARING FOR A FAMILY MEMBER LIVING WITH DEMENTIA WHEN ADULT DAY SERVICES CLOSE

Katherine Marx,¹ Lauren Parker,² Joseph Gaugler,³ Holly Dabelko-Schoeny,⁴ and Laura Gitlin,⁵ 1. *Johns Hopkins School of Nursing, Baltimore, Maryland, United States*, 2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 3. *University of Minnesota, Minneapolis, Minnesota, United States*, 4. *The Ohio State University, The Ohio State University, Ohio, United States*, 5. *Drexel University, College of Nursing and Health Professions, Drexel University, Pennsylvania, United States*

Adult Day Service (ADS) centers play an important role in community services that help families keep a person living with dementia (PLWD) at home. We interviewed 33 family caregivers about their experience during the COVID-19 Pandemic and the shutdown of the ADS centers where the PLWD attends. All 33 (100%) reported that the ADS center was shut for a period of time (range: 2 weeks – remain closed). Caregivers reported a decline in their physical health (33%,n=11) and mental health (52%,n=17) and an increase in feelings of loneliness (48%,n=16). For the PLWD, the caregivers noted, a decline in physical (48%,n=16) and mental (55%,n=18) health and an increase in behaviors (39%,n=13). The shutdown of most ADS centers across the country due to the COVID-19 pandemic has had implications not only for the ADS sites but for the families that entrust them with the care for a family member.

THE IMPACT OF COVID-19 ON ADULT DAY SERVICES' CLOSURES AND PROGRAMMING

Lauren Parker,¹ Katherine Marx,² Joseph Gaugler,³ and Laura Gitlin,⁴ 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 2. *Johns Hopkins*

School of Nursing, Baltimore, Maryland, United States, 3. University of Minnesota, Minneapolis, Minnesota, United States, 4. Drexel University, College of Nursing and Health Professions, Drexel University, Pennsylvania, United States

Nationally, adult day services (ADS) were forced to closed due to the COVID-19 pandemic. The forced closure of ADS programming consequentially impacted the services provided to clients. Many ADS continued to provide telephonic/remote services to clients, despite limited reimbursement from national and state sources for these services. Using data from ADS sites participating in the ADS-Plus Program (n=22), this presentation examines the effects of COVID-19 on ADS closures and programming provided during the closure. About 86% (n=19) of the centers reported having to closed due to COVID-19. One-hundred percent of the sites reported offering telephone support to clients. Nearly 45% (n=10) of the centers reported not being reimbursed for this service. As ADS is a vital community-based resource for many families, it is important to demonstrate the crucial services provided by ADS to inform policymakers of the essentiality of day centers.

ADULT DAY SERVICES AND COVID: A CRISIS IN OHIO

Holly Dabelko-Schoeny,¹ Susan Wallace,² and Salli Bolin,³
1. The Ohio State University, The Ohio State University, Ohio, United States, 2. LeadingAge Ohio, Columbus, Ohio, United States, 3. MemoryLane Care Services, Toledo, Ohio, United States

An Ohio Executive Order forced adult day service providers across the state to close from March 24, 2020 until September 21, 2020 due to COVID, resulting in significant hardship for providers and families. In fact, 65% of programs reported laying off or reducing staff and 83% of directors reported participants had to move to higher and more expensive levels of care such as nursing homes and assisted living. Programs reported that 74% of caregivers had to choose between working and taking care of their family members. Ninety-one percent of ADS program directors in Ohio reported their caregivers were experiencing an increase in stress and anxiety. This paper explores the experiences of Ohio adult day providers during the COVID epidemic, and identifies the challenges and opportunities to coalition building to educate policy makers about day services and the crucial care centers provide.

ADULT DAY SERVICES AS AN ESSENTIAL SERVICE AND SUPPORT

Joseph Gaugler,¹ Katherine Marx,² Holly Dabelko-Schoeny,³ Lauren Parker,⁴ Keith Anderson,⁵ Elizabeth Albers,¹ and Laura Gitlin,⁶
1. University of Minnesota, Minneapolis, Minnesota, United States, 2. Johns Hopkins School of Nursing, Baltimore, Maryland, United States, 3. The Ohio State University, The Ohio State University, Ohio, United States, 4. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 5. University of Texas at Arlington, Arlington, Texas, United States, 6. Drexel University, College of Nursing and Health Professions, Drexel University, Pennsylvania, United States

Throughout the COVID-19 pandemic, the significant challenges and gaps related to the care of older people in the

U.S. were made distressingly apparent. This summary presentation will consider the effects of COVID-19 and associated shutdowns on older persons who use ADS programs, their family caregivers, and programs/staff themselves. Among recommendations to consider are the classification of adult day services and similar community-based long-term care providers as essential (and clarifying their difference from senior centers). In addition, considering new financing approaches and utilizing ADS or similar community-based programs as incubators of evidence-based innovation are options to consider to better align ADS with optimal dementia care.

Session 1425 (Symposium)

INNOVATIVE POPULATION AND INTERVENTION RESEARCH FOR LGBTQ+ OLDER ADULTS WITH DEMENTIA IN A COVID WORLD

Chair: Charles Emler

Co-Chair: Karen Fredriksen Goldsen

This past year, the lives of vulnerable older adults, including those within the older LGBTQ+ community have been disrupted dramatically, as has the research agendas designed to improve their lives. Older people, including LGBTQ+ older adults with dementia, have been placed at increased risk for social isolation and mental health issues during COVID, making viable interventions even more crucial. Additionally, how research is conducted within these communities needed to be adjusted in order to preserve viability. This symposium draws upon data from the National Health Aging and Sexuality/Gender study, the first longitudinal study of LGBTQ+ older adults in the United States, as well as data from Aging with Pride: IDEA (Innovations in Dementia Empowerment and Action), the first randomized controlled trial (RCT) designed to improve quality of life of LGBTQ+ adults living with dementia and their care partners. (1) Kim and Fredriksen Goldsen examine modifiable behavioral and social factors that can improve quality of life among LGBTQ+ older adults with cognitive impairment. (2) Fredriksen Goldsen, Teri, Emler and colleagues present initial efficacy findings from the IDEA study and how the intervention needed to be altered to be viable in a COVID world. (3) The importance of Motivational Interviewing (MI) as part of a LGBTQ+ sensitive intervention designed for LGBTQ+ older adults with dementia and their care partners is discussed by Petros, Fredriksen Goldsen and Teri. As COVID continues to impact vulnerable populations as well as research and service delivery, identifying new and innovative strategies will become increasingly important.

THE FIRST INTERVENTION STUDY FOR LGBTQ+ OLDER ADULTS WITH DEMENTIA AND CAREGIVERS: COVID-19 LESSONS LEARNED

Karen Fredriksen Goldsen,¹ Linda Teri,¹ Hyun-Jun Kim,¹ Charles Emler,² Ryan Petros,¹ Charlotte Brown,¹ Glenise McKenzie,³ and David La Fazia,¹
1. University of Washington, Seattle, Washington, United States, 2. University of Washington, Tacoma, Washington, United States, 3. Oregon Health & Science University, Portland, Oregon, United States

LGBTQ+ older adults face significant health disparities with higher rates of cognitive impairment and social

isolation. Yet, the cognitive health needs of LGBTQ+ adults and caregivers have not been adequately addressed in clinical trials and services. In this presentation, we will share findings from Aging with Pride: IDEA (Innovations in Dementia Empowerment and Action), the first randomly controlled trial (RCT) intervention study designed to improve quality of life of LGBTQ+ adults living with dementia and caregivers, and to reduce institutionalization. In this presentation, we will share preliminary efficacy findings, the effectiveness of culturally responsive approaches, and Covid-19 adaptations, including delivery by virtual chat rather than in-home, technology training, ensuring safety of virtual intervention components, and providing on-going technology support. Preliminary findings suggest a higher intervention retention rate in the virtual delivery as compared to in-home. This study illustrates innovative ways to serve disadvantaged communities in dementia care and aging services.

MODIFIABLE FACTORS OF HEALTH-RELATED QUALITY OF LIFE AMONG LGBTQ OLDER ADULTS LIVING WITH COGNITIVE IMPAIRMENT

Hyun-Jun Kim, and Karen Fredriksen Goldsen, *University of Washington, Seattle, Washington, United States*

Cognitive impairment can lead to significant decline in health-related quality of life (HRQOL) in later life especially among those who are socially marginalized. While Lesbian, gay, bisexual, transgender, and queer (LGBTQ) older adults are documented to be at heightened risks of cognitive impairment, they may face unique challenges due to discrimination, social isolation, and other LGBTQ-related risks. This study examined factors associated with psychological and physical HRQOL among LGBTQ adults aged 50 and older analyzing a sub-set of longitudinal data (N = 646) from National Health, Aging, and Sexuality/Gender Study: Aging with Pride. Lifetime LGBTQ discrimination and victimization and insufficient food intake were negatively, and physical and leisure activities were positively associated with both HRQOL dimensions. Community engagement, social support, and social activities were positively associated with psychological HRQOL. Culturally responsive interventions addressing these modifiable factors are needed to improve HRQOL of this socially marginalized but resilient population.

AGING WITH PRIDE: CULTURAL RELEVANCE OF MOTIVATIONAL INTERVIEWING FOR LGBTQ ADULTS WITH DEMENTIA

Ryan Petros, Karen Fredriksen Goldsen, and Linda Teri, *University of Washington, Seattle, Washington, United States*

LGBTQ adults disproportionately experience dementia and are more likely to rely on informal social support to meet care needs in the community compared to cisgender, heterosexual peers. Culturally responsive interventions will accommodate the unique strengths and independence of this population and support self-determination as they navigate reduced capacity for self-care, increased need for support, and changes to autonomous, independent decision-making. Motivational Interviewing (MI) is a culturally responsive approach to treatment, amenable to integration with other evidence-based practices (EBP), and is especially relevant for the LGBTQ community for its compatibility with self-determination theory. This paper describes the unique contributions of MI that

resulted in culturally relevant adaptations to a leading EBP for dementia and culminated in an efficacious intervention (Aging with Pride: IDEA) that is compatible with self-determination theory, designed for individuals and care providers in the LGBTQ community affected by dementia, and adapted for online delivery during the COVID pandemic.

Session 1430 (Symposium)

MANY FACES OF SLEEP: DIVERSE SLEEP CHARACTERISTICS AND THEIR JOINT ASSOCIATIONS WITH STRESS ON HEALTH IN ADULTHOOD

Chair: Hye Won Chai

Co-Chair: Soomi Lee

Discussant: Nancy Sin

Two separate bodies of literature point to the significant roles of sleep and stress and their associations with health outcomes in adulthood. To further extend the field's knowledge on sleep, stress, and health, it is essential to consider the multi-dimensional aspects of sleep and diverse stress contexts and identify ways in which the three factors are interrelated to each other. Different sleep characteristics may have varying implications for stress processes that, in turn, shape health outcomes. Therefore, this symposium integrates diverse characteristics of sleep (duration, quality, and pileup) in conjunction with various stress processes and experiences (bereavement, stressor exposure and appraisals, rumination), and examines their associations with cognitive, emotional, and physiological health outcomes. The first paper by Vigoureux and colleagues investigates the interaction between daily sleep and stressor frequency and severity on daily rumination. The second paper by Slavish and colleagues examines the bidirectional associations between daily stress and sleep duration and efficiency. The third paper by Mu and colleagues explores the mediated associations of sleep quality and sufficiency with work impairment through perceived cognitive abilities and rumination. The fourth paper by Lee uses the stress concept of pileup and tests how pileup of insufficient sleep is associated with day-to-day trajectories of affective and physical well-being. The final paper by Chai and colleagues examines whether sleep quality moderates the association between family bereavement and heart rate variability. The discussant, Dr. Nancy Sin, will integrate key points and discuss considerations for mechanisms and long-term implications of sleep, stress, and health.

SLEEPING IT OFF: SLEEP QUALITY MODERATES THE ASSOCIATION BETWEEN FAMILY BEREAVEMENT AND HEART RATE VARIABILITY

Hye Won Chai,¹ Dylan Jester,² Soomi Lee,³ Susanna Joo,⁴ Debra Umberson,¹ and David Almeida,⁵ 1. *The University of Texas at Austin, Austin, Texas, United States*, 2. *University of California San Diego, La Jolla, California, United States*, 3. *University of South Florida, Tampa, Florida, United States*, 4. *Yonsei University, Seodaemun-gu, Seoul-t'ukpyolsi, Republic of Korea*, 5. *Pennsylvania State University, University Park, Pennsylvania, United States*

While previous studies evince a strong link between family bereavement and worse cardiovascular functioning, factors

that may influence the association remain unexplored. This study examined the relation between experiencing the death of an immediate family member and heart rate variability (HRV) and whether the associations differed by sleep quality. The sample included respondents from the Midlife in the United States (MIDUS) Biomarker Project who reported losing an immediate family member – parents, spouse, siblings, or children – within a year before project ($n = 94$) and those who did not experience any deaths ($n = 872$). Results showed that the death of a family member was associated with worse HRV only among those who reported having a poor sleep quality and not for those with good sleep quality. These findings suggest that poor sleep quality may indicate psychophysiological vulnerability for those who experienced the death of an immediate family member.

PILEUP OF INSUFFICIENT SLEEP AND DAY-TO-DAY TRAJECTORIES OF AFFECTIVE AND PHYSICAL WELL-BEING

Soomi Lee, *University of South Florida, Tampa, Florida, United States*

This study examined whether and how pileup of insufficient sleep is associated with day-to-day trajectories of affective and physical well-being. Participants from the Midlife in the United States Study ($N=1,795$) provided diary data for eight days. Pileup of insufficient sleep was operationalized as the number of consecutive nights with <6 hours of sleep. Multilevel models evaluated the linear, quadratic, and cubic effects of pileup of insufficient sleep on daily well-being, adjusting for sociodemographic covariates. Daily negative affect increased and positive affect decreased in curvilinear fashion as the pileup of insufficient sleep increased. For example, daily negative affect increased, but the rate of increase decelerated as the pileup of insufficient sleep increased. In the days most distal to baseline, the rate of increase in negative affect accelerated again. Results were consistent for physical symptoms. Findings suggest that making efforts to break the vicious cycle of insufficient sleep may protect daily well-being.

ASSOCIATIONS OF DAILY SLEEP AND STRESS WITH RUMINATION: AN ECOLOGICAL MOMENTARY ASSESSMENT AND ACTIGRAPHY STUDY

Taylor Vigoureux, and Soomi Lee, *University of South Florida, Tampa, Florida, United States*

Unconstructive repetitive thoughts are indicative of rumination about daily experiences. Given that poor sleep is associated with greater reactivity to daily stressors, we examined joint associations of daily sleep and stress with daily rumination. 143 nurses completed 14 days of ecological momentary assessments (EMA; assessments of daily sleep, stress, and rumination) and actigraphy. After controlling for age, sex, education, income, inpatient vs. outpatient nurse, workday, and day vs. night shift, there were significant joint associations of sleep and stress with daily rumination. Daily rumination was lowest when lower (-1SD) stressor severity or stressor frequency were paired with longer (+1SD) EMA or actigraphy sleep duration. Daily rumination was highest when higher stressor frequency was paired with higher actigraphy wake after sleep onset (i.e., poorer sleep quality). Future studies should assess whether rumination about daily experiences is associated with quality of patient care provided by nurses in a hospital setting.

DAILY STRESS AND SLEEP ASSOCIATIONS VARY BY WORK SCHEDULE: A BETWEEN- AND WITHIN-PERSON ANALYSIS IN NURSES

Danica Slavish,¹ Jessica Dietch,² Heidi Kane,³ Joshua Wiley,⁴ Yang Yap,⁴ Kimberly Kelly,¹ Camilo Ruggero,¹ and Daniel Taylor,⁵ 1. *University of North Texas, Denton, Texas, United States*, 2. *Oregon State University, Corvallis, Oregon, United States*, 3. *University of Texas at Dallas, Richardson, Texas, United States*, 4. *Monash University, Clayton, Victoria, Australia*, 5. *University of Arizona, Tucson, Arizona, United States*

Nurses experience poor sleep and high stress due to demanding work environments. Night shift work may exacerbate stress-sleep associations. We examined bidirectional associations between daily stress and sleep, and moderation by shift worker status and daily work schedule. 392 nurses (92% female, mean age = 39.54) completed 14 days of sleep diaries and actigraphy, plus daily assessments of stress and work schedule upon awakening. Nurses were classified as recent night shift workers if they worked 1+ night during the past 14 days. Greater daily stress predicted shorter diary sleep duration and lower diary sleep efficiency. Shorter diary and actigraphy sleep duration and lower diary sleep efficiency predicted higher next-day stress. Compared to recent night workers, day workers had higher stress after nights with shorter sleep. Associations did not vary by daily work schedule. Sleep disturbances and stress may unfold in a toxic cycle and are prime intervention targets among nurses.

SUBJECTIVE AND PERSEVERATIVE COGNITION MEDIATE THE RELATIONSHIP BETWEEN SLEEP AND WORK IMPAIRMENT

Christina Mu, Brent Small, and Soomi Lee, *University of South Florida, Tampa, Florida, United States*

The study examined the mediating role of subjective and perseverative cognition on sleep and work impairment. Sixty nurses completed a background survey and 14-days of ecological momentary assessments (EMA) and sleep actigraphy. Each day, participants evaluated their subjective cognition (mental sharpness, memory, processing speed), perseverative cognition (rumination) and work impairment (how much did you cut back on normal paid work, how much did the quality of your work suffer). Multiple sleep characteristics were measured by EMA and actigraphy. Multilevel mediation models adjusted for sociodemographics and work shift. At the between-person and within-person levels, there were mediated associations of sleep quality and sufficiency (but not actigraphy-measured sleep) with work impairment through subjective and perseverative cognition. Better sleep quality or higher sleep sufficiency were associated with better subjective and perseverative cognition, which, in turn, were associated with less work impairment.

Session 1435 (Paper)

Mild Cognitive Impairment

ACCEPTANCE OF TELE-TECHNOLOGY-BASED MIND-BODY CLASSES FOR INDIVIDUALS WITH MILD COGNITIVE IMPAIRMENT

Kara Cohen,¹ Patricia Griffiths,² and Tracy Mitzner,³ 1. *Georgia Institute of Technology, Atlanta, Georgia*,

United States, 2. GA Tech, Atlanta, Georgia, United States, 3. Georgia Institute of technology, Atlanta, Georgia, United States

Individuals with Mild Cognitive Impairment (MCI) face many challenges, including cognitive declines and reduced independence which are associated with poor health outcomes. Although there is no cure for MCI, mind-body exercise classes may improve cognitive function and reduce risk of falls (Wayne, Yeh, & Mehta, 2018). However, such classes are often not accessible for individuals with MCI due to lack of transportation, fear of being stigmatized, or inability to find instructors who have experience working with individuals with MCI (Hobson & Middleton, 2008; Rimmer, 2005). Tele-technology, such as video-conferencing software, has the potential to remove barriers to participation by allowing individuals to attend classes from home. The goal of this study was to assess the feasibility of using tele-technology to deliver mind-body classes to individuals with MCI. We evaluated technology acceptance and usability for OneClick.chat, a web-based video-conferencing platform designed for older adults. Stakeholders (4 subject matter experts, 2 individuals with MCI, and 2 care partners) participated in a user study that included questionnaires and a short interview. The technology acceptance data indicate that OneClick.chat was perceived as easy to use. Some individuals expressed privacy and security concerns which could be addressed with additional education and support. These findings have implications for interface design, education, and training for deployment of tele-technology delivered mind-body classes for those with MCI.

BODY MASS INDEX TRAJECTORY AND INCIDENT MILD COGNITIVE IMPAIRMENT AMONG AFRICAN AMERICAN OLDER ADULTS

Adrienne Aiken Morgan,¹ Ana Capuano,² Robert Wilson,² and Lisa Barnes,³ *1. University of North Carolina at Chapel Hill, North Carolina, United States, 2. Rush, Chicago, Illinois, United States, 3. Rush University Medical Center, Chicago, Illinois, United States*

Previous research suggests a decline in body mass index (BMI) among older adults is associated with negative health outcomes, including mild cognitive impairment (MCI) and incident dementia (Gao et al., 2011). However, few studies have examined BMI longitudinal trajectories and how they change after MCI diagnosis among older African Americans. To characterize trajectories of change in BMI among older African American participants with no cognitive impairment at baseline we used data from the Minority Aging Research Study, MARS (N=408, 76.5% women, mean age = 73.5, mean education = 15.0). We constructed piecewise linear mixed-effects models that included a random intercept and two random slopes. The first slope began at baseline. The second slope began at MCI diagnosis allowing for acceleration in the rate of decline after the diagnosis. The results showed BMI declined over time ($B=-0.19$, $SE=0.04$, $p<.001$), and there was a faster decline after MCI (additional decline, $B=-0.18$, $SE=0.068$, $p=.007$). In a second model controlling for age, higher education was associated with a lower BMI at baseline ($B=-0.36$, $SE=0.092$, $p<.001$) but slower decline before MCI ($B=0.02$, $SE=0.006$, $p=.001$). However, after MCI the decline of participants with higher education was faster ($B=-0.06$, $SE=0.022$, $p=.003$). These results suggest an

accelerated decline in BMI following MCI diagnosis, with higher education related to an even faster BMI decline, possibly a consequence of cognitive reserve.

EARLY VERSUS LATE MILD COGNITIVE IMPAIRMENT: NEURAL EVENT-RELATED OSCILLATIONS DURING A GO/NO GO TASK

Elizabeth Lydon,¹ Lydia Nguyen,² Shraddha Shende,¹ Hsueh-Sheng Chiang,³ and Raksha Mudar,⁴ *1. University of Illinois Urbana-Champaign, Champaign, Illinois, United States, 2. iN 2. L, Denver, Colorado, United States, 3. UT Southwestern Medical Center, UT Southwestern Medical Center, Texas, United States, 4. University of Illinois-Urbana Champaign, Champaign, Illinois, United States*

Amnesic mild cognitive impairment (aMCI) is marked by episodic memory deficits, which is used to classify individuals into early MCI (EMCI) and late MCI (LMCI). Growing evidence suggests that individuals with EMCI and LMCI differ in other cognitive functions including cognitive control, but these are less frequently studied. Using a semantic Go/NoGo task, we examined differences in cognitive control between EMCI and LMCI on behavioral (accuracy and reaction time) and neural (scalp-recorded event-related oscillations in theta and alpha band) measures. Although no behavioral differences were observed between the groups, EMCI and LMCI groups differed in patterns of neural oscillations for Go compared to NoGo trials. The EMCI group showed differences in theta power at central electrodes and alpha power at central and centro-parietal electrodes between Go and NoGo trials, while the LMCI group did not exhibit such differences. Furthermore, the LMCI group had higher theta synchronization on Go trials at central electrodes compared to the EMCI group. These findings suggest that while behavioral differences may not be observable, neural changes underlying cognitive control processes may differentiate EMCI and LMCI stages and may be useful to understand the trajectory of aMCI.

PAIN PERSISTENCE IS ASSOCIATED WITH INCREASED ODDS OF MCI IN LATE MIDLIFE AND EARLY OLDER ADULTHOOD

Tyler Bell, Jeremy Elman, Carol Franz, and William Kremen, *University of California San Diego, La Jolla, California, United States*

Twenty percent of older adults will experience persistent pain, the sensation of bodily harm lasting three or more months. Persistent pain doubles the risk of dementia, but we know less about the impact on earlier stages, such as mild cognitive impairment (MCI). As a step for clarification, this study leveraged data from the Vietnam Era Twin Study of Aging (VETSA) to understand how pain persistence relates to MCI in late midlife to early older adulthood. Participants ($n=1,465$, 100% male) were recruited across three waves at average ages 56, 62, and 68. At each wave, participants completed the SF-36 and were asked to rate their pain intensity from none (1) to very severe (6). Clinical pain was coded as pain intensity rated more than mild ($>3/6$). As a time-varying predictor, pain persistence was then calculated as a running frequency of the total waves reporting clinical pain. MCI diagnosis was based on Jak-Bondi criteria. Age, depressive symptoms, comorbidities, and opioid use were included as

time-varying covariates. Age and education were included as time-invariant covariates. General estimating equations showed that pain persistence over two waves, reported in 35% of the sample, increased MCI odds by 57% (OR=1.57, 95%CI: 1.28 to 1.94). Pain persistence over three waves, reported in 17% of the sample, increased MCI odds by 98% (OR=1.98, 95%CI: 1.44 to 2.70). The findings emphasize the role of pain in earlier stages of dementia and the potential importance of pain management in offsetting cognitive decline.

Session 1440 (Symposium)

NEW DIRECTIONS IN DIETARY RESTRICTION: REMEMBERING EDWARD MASORO

Chair: Arlan Richardson

In 1935, Clive McCay reported that severe restriction of food increased the lifespan of male rats. In the following four decades, several laboratories replicated this observation with less severe restrictions, which will be referred to as dietary restriction (DR). However, there were concerns even in the aging community in the 1970s as to whether DR increased lifespan by retarding aging. It was the research of two former Kleemeier Awardees, Edward Masoro and Roy Walford, that conclusively demonstrated in the 1980s that DR retarded aging resulting in improved healthspan and reduced pathology. Ed Masoro's research was focused on lipid metabolism when he was invited to attend a workshop on metabolism and aging in 1969. His interest in aging was piqued such that the more he learned about aging, the more interested he became. In a subsequent workshop in 1973, Ed heard Morris Ross describe his research on restricting food intake on cancer and longevity. Ed was impressed that a relatively simple manipulation had such dramatic effects, and he decided to focus his research on DR. After an extensive review of the DR literature up to the 1970s, Ed established the 40% restriction paradigm, which is used in almost all DR studies to date. Ed's group was the first to study aging and DR under barrier conditions which he established at San Antonio. Over the next two decades, Ed would direct a Program Project that showed DR had a dramatic effect on most age-related pathologies and improved many physiological functions. Studying the restriction of fat, protein, micronutrients, Ed came to the conclusion that total calories consumed was a key factor in the effect of DR on longevity. His group was the first to show that DR significantly reduced circulating levels of glucose and insulin, which was subsequently shown to occur because of increased insulin sensitivity and is now recognized as a hallmark of DR and potentially important in the anti-aging action of DR. Ed was chair of the Biological Sciences Section of GSA in 1979 and President in 1995. This session is dedicated to Edward Masoro who passed away on July 11, 2020 at the age of 95. Dr. Masoro was president in 1995 and BS chair in 1979, Clive McCay was President in 1949.

INTERMITTENT FASTING: FROM CALORIES TO TIME RESTRICTION

Rafael de Cabo, *NIA, Baltimore, Maryland, United States*

Classic implementation of calorie restriction (CR) in laboratory animals increases health and longevity in most model organisms. Traditionally, chronic CR is the reduction

of daily energy intake without malnutrition. Recently, paradigms have emerged that recapitulate some of the beneficial aspects of this intervention, avoiding some of its challenges. The length of daily fasting length and periodicity have emerged as potential drivers behind CR's beneficial health effects. Numerous strategies and eating patterns, including prolonged periods of fasting, have been successfully developed to mimic many of CR's benefits without its austerity. These new feeding protocols range from short mealtimes designed to interact with our circadian system (daily time-restricted feeding) to more extended fasting regimens known as intermittent fasting. We will discuss the current status of knowledge on different strategies to reap the benefits of CR on metabolic health in rodent models and humans without the rigor of chronic reductions in caloric intake.

IMPACT OF CALORIC RESTRICTION ON MOLECULAR AND FUNCTIONAL NETWORKS IN RHESUS MONKEYS

Rozalyn Anderson, *University of Wisconsin-Madison, Madison, Wisconsin, United States*

Caloric restriction (CR) delays aging and the onset of age-related disease in diverse species. Several diseases of aging including diabetes, cancer, and neurodegeneration, have an established metabolic component. Although the mechanisms of CR remain unknown, numerous factors implicated in longevity regulation by CR converge on regulation of metabolism. The reprogramming of metabolism with CR is tissue specific, but mitochondrial activation and changes in redox metabolism are among the shared features. Changes in non-coding miRNA and in processing of transcripts are contributing mechanisms in integrating metabolic and growth pathways. Our studies in simple cell culture shows that small changes in metabolic status can precipitate large-scale multi-modal functional changes across cellular processes. We propose that modest failures in metabolic integrity with age broadly impact homeostasis and adaptation, creating shared vulnerability to diseases and conditions despite differences in their etiology, and that CR harnesses this same axis to promote health and enhanced longevity.

CIRCADIAN ALIGNMENT OF FEEDING REGULATES LIFESPAN EXTENSION BY CALORIC RESTRICTION

Victoria Acosta-Rodriguez,¹ Filipa Rijo-Ferreira,¹ Mariko Izumo,¹ Pin Xu,³ Carla Green,¹ and Joseph Takahashi,¹ 1. *UT Southwestern Medical Center, Dallas, Texas, United States*, 3. *Icahn School of Medicine at Mount Sinai, New York, New York, United States*

Caloric restriction (CR) promotes longevity in several species. Classic CR protocols often lead to chronic cycles of 2h-feeding/22h-fasting, raising the question whether calories, fasting or time of day are causal. To address this, we tested an AL control group and five CR protocols with different timing and duration of feeding/fasting cycles. C57BL/6J male mice were subjected to 30% CR as one single meal a day at the beginning of the day or night (classical protocols with < 2h feeding, CR-day and CR-night), or smaller meals distributed for 12h (CR-day-12h and CR-night-12h), or evenly spread out throughout 24h (CR-spread) to abolish the otherwise daily feeding pattern adopted by nocturnal animals. We found that CR alone is sufficient to extend lifespan without

fasting. However, the benefits are enhanced if feeding/fasting cycles are present and match their normal nocturnal activity. Circadian alignment of feeding with at least 12h fasting boosts CR-mediated increase on survival in mice, independently body weight. Aging leads to widespread upregulation of inflammation-related genes and downregulation of metabolic pathways in liver from ad lib fed mice; whereas CR at night ameliorates these aging-related changes and preserves circadian oscillations in gene expression. Overall, our results demonstrate that circadian interventions promote longevity and provide a novel perspective for elucidating mechanisms of aging.

THE IMPACT OF SHORT-TERM DIETARY RESTRICTION ON STEM CELL FUNCTION

Archana Unnikrishnan, *University of Oklahoma, Oklahoma City, Oklahoma, United States*

Stem cells play a critical role in the maintenance of tissue function and their proliferative/regenerative capacity is essential to this role. Because stem cells persist over the lifespan of an animal, they are susceptible to gradual accumulation of age-associated damage, resulting in the loss of regenerative function that can impair organ function. Understanding the mechanism(s) that regulates stem cell function is essential for retarding the aging process, and stem cells are attractive targets for aging interventions. Dietary restriction (DR), the most robust anti-aging intervention to-date, has been shown to enhance the activity and integrity of stem cells in a variety of tissues (e.g., muscle, bone marrow, and intestine), and it is believed that effect of DR on stem cells plays an important role in the anti-aging action of DR. For example, DR has been shown to preserve and increase the number of intestinal stem cells (ISCs) and enhance their regenerative capacity in young animals. Data from my lab shows that ISCs from old mice have limited proliferation activity and form few if any organoids in vitro (a surrogate for a fully functional crypt) and that ISCs isolated from old mice on life-long DR showed an improved ability to form organoids. While it is well accepted that life-long DR increases lifespan and has anti-aging effects an important aspect of DR that has been largely overlooked is that DR implemented only for a short time early in life can increase lifespan of rodents even when rodents are fed ad libitum the remainder of their life. In line with this, we recently found that ISCs from old mice fed DR for only a short-period resulted in a dramatic increase in ability of the ISCs to form organoids. This is the first evidence that short-term DR administered late in life can rescue the loss in ISC function that occurs with age.

Session 1445 (Symposium)

NURSING HOME SOCIAL WORK WITH RESIDENTS WITH SEVERE MENTAL ILLNESS, THOUGHTS OF SUICIDE, OR DEMENTIA

Chair: Mercedes Bern-Klug

Discussant: Amy Restorick Roberts

Many of the close to 3 million persons who receive care in a U.S. nursing home in any given year face mental-health-related challenges that range from minor to severe. One of the core professionals involved with care planning for the psychosocial needs of nursing home residents with mental health concerns is the social worker. Reporting data from a

2019 nationally representative survey of nursing home social services directors, this session provides information about the training needs of nursing home social workers in terms of their work with residents diagnosed with a severe mental illness such as schizophrenia or severe depression, residents who are suicidal, and residents with dementia.

DEMENTIA CARE INVOLVEMENT AND TRAINING NEEDS OF SOCIAL SERVICES DIRECTORS IN U.S. NURSING HOMES

Jung Kwak,¹ Kevin Smith,² and Mercedes Bern-Klug,²

1. *The University of Texas at Austin, Austin, Texas, United States*, 2. *University of Iowa, Iowa City, Iowa, United States*

This study describes social services directors' involvement in dementia care in U.S. nursing homes, focusing on interest in and needs for dementia care training. Respondents were 841 social service directors from U.S. nursing homes. We found that 87% of social service departments engaged in cognitive assessment; 59% of social services directors were strongly interested in dementia care training, and 23% would need up to 10 hours of preparation time or would not be able to train staff on dementia-related care. Racial minority background, fewer years of experience in nursing homes, and barriers to staffing predicted strong interest in dementia care training. These findings demonstrate social services directors' active involvement in dementia care and need for training.

NURSING HOME SOCIAL SERVICES DIRECTORS CARING FOR RESIDENTS WITH SERIOUS MENTAL ILLNESS

Denise Gammonley,¹ Xiaochuan Wang,¹ Kelsey Simons,²

Kevin Smith,³ and Mercedes Bern-Klug,³ 1. *University of Central Florida, Orlando, Florida, United States*, 2. *University of Rochester School of Medicine & Dentistry, Department of Psychiatry, Rochester, New York, United States*, 3. *University of Iowa, Iowa City, Iowa, United States*

Psychosocial care for residents with serious mental illness (SMI) requires understanding of co-morbidities and careful attention to needs, rights, and preferences. Analyses of social services directors (SSDs) responses (n=924) to the National Nursing Home Social Service Director Survey considered perceived roles and competence to provide care stratified by the percentage of NH residents with SMI. Depression screenings and biopsychosocial assessments were common roles regardless of the percentage of residents with SMI. About one-quarter lacked confidence to train colleagues in recognizing distinctions between depression, delirium and depression (23.4% unable) or to develop care plans for residents with SMI (26% unable). A bachelor's degree (OR=0.64, 95% CI:0.43, 0.97) or less (OR= 0.47, 95% CI:0.25, 0.89) was associated with less perceived competence in care planning compared to those with a master's degree. SSDs reported less involvement in referrals or interventions for resident aggression in homes with a high proportion of residents with SMI.

NURSING HOME SOCIAL SERVICES DIRECTORS' ROLES AND SELF-EFFICACY IN SUICIDE RISK MANAGEMENT

Xiaochuan Wang,¹ Kelsey Simons,² Denise Gammonley,¹

Amy Restorick Roberts,³ and Mercedes Bern-Klug,⁴

1. *University of Central Florida, Orlando, Florida, United States*,

2. *University of Rochester School of Medicine & Dentistry, Department of Psychiatry, Rochester, New York, United States*, 3. *Miami University, Oxford, Ohio, United States*, 4. *University of Iowa, Iowa City, Iowa, United States*

Nursing home (NH) residents face many risk factors for late life suicide, and transitions into and out of NHs represent risk periods for suicide. Based on data from the 2019 National Nursing Home Social Services Directors survey (n = 924), this presentation describes NH social services directors (SSDs) roles in managing suicide risk and factors that influence self-efficacy in this area. Nearly one-fifth (19.7%) of SSDs lack of self-efficacy in suicide risk management, reporting needing significant preparation time or being not able to train others on this topic. Results of ordinal logistic regression indicate that SSDs who consider insufficient social services staffing as a minor barrier (comparing with a major barrier) to psychosocial care, those who report greater involvement in safety planning for suicide risk, and those with Master's degree, are more likely to perceive greater self-efficacy in suicide risk management. Implications for training and staffing will be discussed.

Session 1450 (Symposium)

OPPORTUNITIES TO IMPACT DISABILITY: TRENDS, COSTS, AND EVIDENCE-BASED INTERVENTIONS

Chair: Sarah Szanton

Discussant: David Grabowski

As healthcare shifts to a focus on social determinants and population health, and older adults increasingly seek to "age in community," it is vital to understand the functional capabilities and related costs for older adults with disability. This symposium will present data on five major areas related to older adult disability. The 1st presenter will describe recent national disability trends. The 2nd will present Medicare costs by disability, dementia, and community-dwelling status in order to illustrate how these different demographic groups vary in Medicare expenditures over time. This information is critical to policymakers and health systems leaders to plan for these populations. They will then describe a 3rd project, which employs a novel longitudinal modeling approach, Group Based Trajectory Modeling, to identify and describe the distinct trajectories of Emergency Department use after incident disability. This work assesses the heterogeneity in health care use after disability, which may be shaped by available supports. The 4th presentation will describe a combined analysis of the 11 sites that have published data from implementations of the CAPABLE program. This program is a 10 session, home-based interprofessional program that provides an occupational therapist, a nurse, and a handyworker to addresses older adults' self-identified functional goals by enhancing individual capacity and the home environment. Taken together, these presentations can inform interventions and policies that improve the health and quality of life of older adults with disabilities.

CAPABLE PROGRAM IMPROVES DISABILITY IN RESEARCH AND IMPLEMENTATION SETTINGS

Sarah Szanton,¹ Qiwei Li,² and Laura Gitlin,³ 1. *Johns Hopkins University, Baltimore, Maryland, United States*, 2. *Johns Hopkins School of Nursing, Baltimore, Maryland, United States*, 3. *Drexel University, College of Nursing and*

Health Professions, Drexel University, Pennsylvania, United States

Interventions to reduce disability are crucial for older adults with disabilities to avert unnecessary hospitalizations or nursing home placements and improve daily life. Developed and tested at one research site, multiple health systems and community based organizations have since implemented CAPABLE. All published or peer reviewed tests of CAPABLE were reviewed (six studies, 11 sites) with a total of 1087 low-income community-dwelling older adults with disabilities. Participants were an average age of 74-79, cognitively intact, and self-reported difficulty with one or more activities of daily living (ADL). These trials were reviewed by extracting the participants' scores on main outcomes, ADLs and IADLs, and when available, fall efficacy, depression, pain and cost savings. All studies yielded improvements in ADL and IADL limitations, with small to strong effect sizes. Studies with the complete dose of CAPABLE showed more improvement in ADLs and cost savings than the studies that implemented a decreased dose.

MEDICARE COSTS BY DISABILITY AND COMMUNITY-DWELLING STATUS

Claire Ankuda, and Katherine Ornstein, *Icahn School of Medicine at Mount Sinai, New York, New York, United States*

Understanding population-level Medicare expenditure patterns for older adults with functional disability is critical to focus supports to reduce costly and potentially burdensome health care use. We used the National Health and Aging Trends Study (NHATS) to assess quarterly Medicare expenditures over the 12 months following NHATS interview. We examine Medicare expenditure patterns for older adults in nursing homes (N=386), in the community and without disability (N=20,103), with disability and dementia (N=2,008), and with disability but not dementia (N=2,945). One-year mortality ranged from 2.0% for those without disability in the community to 25.9% for those residing in nursing homes. Among those surviving 1 year, Medicare expenditures the first quarter after NHATS survey ranged from \$1,794 (95% CI \$1,690-\$1,898) for those with no disability to \$5,177 (95% CI \$4,535-\$5,818) for those with disability and dementia. We assess trends over the following two years, and find that trajectories vary by clinical grouping.

DISABILITY TRENDS AMONG COMMUNITY-DWELLING OLDER ADULTS AND RELATED DETERMINANTS OF DISABILITY

Qiwei Li,¹ and Sarah Szanton,² 1. *Johns Hopkins School of Nursing, Baltimore, Maryland, United States*, 2. *Johns Hopkins University, Baltimore, Maryland, United States*

The growing aging population with disabilities poses challenges to caregiving and health care services but there is little recent data on disability trends. Some studies have shown that disability is decreasing while others have shown it increasing. Understanding these trends among community-dwelling older adults is critical for communities to allocate resources and develop policies. This study updates disability trend data among community-dwelling older adults using nationally representative National Health & Aging Trends Study data. Results revealed that about 30% of Medicare beneficiaries had at least one limitation of the activity of daily

living (ADL) from 2011 to 2019. Age 75-79 (IRR=1.55), 80-84 (IRR= to 4.60), 85-89 (IRR=2.99), 90+ (IRR=4.60), female, (IRR=1.18), not a house owner (IRR=1.51), financial strain (IRR=1.71), and receiving Medicaid (IRR=1.84) are associated with a higher likelihood of becoming ADL limited or having more ADL limitations. We will discuss potential policy, intervention, and research implications.

TRAJECTORIES OF EMERGENCY DEPARTMENT USE AFTER INCIDENT FUNCTIONAL DISABILITY

Katherine Ornstein, and Claire Ankuda, *Icahn School of Medicine at Mount Sinai, New York, New York, United States*

Emergency department (ED) visits for older adults with functional disability may represent unmet needs and are often burdensome to patients and families. While it is known that older adults with functional disability use the ED at high rates, this does not capture the heterogeneity of experience after the onset of disability. Using NHATS, we identified a cohort of older adults with incident disability, or who reported they began to receive help with self-care and/or mobility in the prior year. Using the month that they report first receiving help, we linked to Medicare data to assess quarterly patterns of ED use. We used Group Based Trajectory Modeling to assess the trajectories of ED use after disability. We identified three distinct trajectories of ED use: persistently high, declining, and persistently low. We describe the clinical, household, and sociodemographic characteristics associated with likely membership in each trajectory group.

Session 1455 (Symposium)

PROVIDING SPECIALTY TELEHEALTH CARE TO OLDER, RURAL PATIENTS: VOICES FROM FIELD

Chair: Eileen Dryden

Co-Chair: Lauren Moo

Older, rural adults have limited access to quality geriatric specialty care for several reasons including relatively few geriatric specialists in rural areas and lack of transportation options or patient ability to travel to more urban centers. GRECC Connect is a promising telehealth-hub and spoke model that provides rural patients access to teams of multidisciplinary geriatric specialists in more urban medical centers primarily by video connection with affiliated community-based outpatient clinics (CBOCs). This model provides a viable option for increasing access to geriatric specialty care for rural patients but is not used to the extent it could be. To date, much of our understanding of this model has come from the experts at the hub medical centers. To learn more about the experience of this model from the field we interviewed CBOC staff and providers as well as Veterans and their caregivers about geriatric specialty telehealth services. In this symposium we will discuss facilitators and barriers to implementing this model from the perspective of the field and then explore more deeply both the context of the CBOC environment and the older patient population served by rural CBOCs to further understand the challenges that are faced in attempting to connect older patients with telehealth services. Finally, we will share the perceived value of the service and alignment with local needs. This deeper understanding of the

experience of the ‘spoke’ may help enhance access to much needed geriatric specialty care for rural veterans.

QUALITATIVE EVALUATION: GRECC CONNECT AS A METHOD OF DELIVERING HEALTH CARE TO RURAL OLDER VETERANS

Lauren Moo,¹ William Hung,² Eileen Dryden,³ Camilla Pimentel,⁴ Laura Kernan,³ and Kathryn Nearing,⁵
 1. *VA Bedford Health Care System, Bedford, Massachusetts, United States*, 2. *Veterans Health Administration, New York City, New York, United States*, 3. *Veterans Health Administration, Bedford, Massachusetts, United States*, 4. *VA Bedford Healthcare System, Bedford, Massachusetts, United States*, 5. *Veterans Health Administration, Denver, Colorado, United States*

The VA Office of Rural Health-funded GRECC Connect program uses telehealth modalities to provide geriatric specialty care to rural older veterans and education to clinicians in VA Community-based outpatient clinics (CBOCs). Qualitative evaluation of GRECC Connect has included interviews with three stakeholder groups: geriatrics specialty teams at 15 hub medical centers, rural CBOC staff, and patients/family caregivers. CBOC staff interviews included 50 individuals from 13 different CBOCs. Staff roles included clinic managers, social workers, psychologists, physicians, nurses, and telehealth technicians. Older veterans who had recently been involved in a GRECC Connect video visit were also invited to share their views on the visit. By including multiple perspectives on the program, we are better positioned to increase reach, access, and improve care for older rural veterans.

THE INTEGRAL ROLE OF CBOCS IN RURAL HEALTHCARE: PROMISES AND CHALLENGES

Camilla Pimentel,¹ Kathryn Nearing,² Laura Kernan,³ Eileen Dryden,³ and Lauren Moo,⁴ 1. *VA Bedford Healthcare System, Bedford, Massachusetts, United States*, 2. *Veterans Health Administration, Denver, Colorado, United States*, 3. *Veterans Health Administration, Bedford, Massachusetts, United States*, 4. *VA Bedford Health Care System, Bedford, Massachusetts, United States*

Community-based outpatient clinics are critical to extending the geographic reach of VA's healthcare delivery system. Nationwide, 733 CBOCs provide outpatient care to nearly half of the VA's patient population. The 13 rural CBOCs in the study sample provide outpatient primary care, mental health care, and a limited number of specialty care services. Located 1–3.5 hours away from their closest VA Medical Center, these CBOCs have a wide—sometimes interstate—service catchment area. To effectively serve increasingly older and medically complex patient populations, they rely heavily on partnerships with larger VA Medical Centers and local community providers for inpatient, residential, and additional outpatient services. CBOCs experience myriad staffing challenges, including staff turnover, “access providers” working at multiple CBOCs, and highly variable training in rural health and geriatrics. While some CBOCs have robust telehealth offerings, others cannot currently grow their telehealth capacity owing to constraints in clinic space and provider schedules.

ANOTHER SET OF EYES: RECIPIENTS' VIEWS OF THE BENEFITS OF GERIATRIC SPECIALTY TELEHEALTH SERVICES

Eileen Dryden,¹ Laura Kernan,¹ Kathryn Nearing,² Camilla Pimentel,³ and Lauren Moo,⁴ 1. *Veterans Health Administration, Bedford, Massachusetts, United States*, 2. *Veterans Health Administration, Denver, Colorado, United States*, 3. *VA Bedford Healthcare System, Bedford, Massachusetts, United States*, 4. *VA Bedford Health Care System, Bedford, Massachusetts, United States*

The aim of GRECC Connect is to increase access to specialty care for medically complex, older, rural patients through e-consultations and telehealth visits. We interviewed 50 outpatient clinic staff and providers as well as 30 patients and caregivers about these services. Overall, the services were considered beneficial. For patients and caregivers, services alleviated the stress and cost of travel, they improved quality of life by increasing their understanding of the progression of an illness and providing treatment and guidance to increase patient functioning and reduce disruptive behaviors, and they eased anxiety associated with not receiving needed care. Having 'another set of eyes' on the patients reduced stress and anxiety for providers. Concerns included alignment of telehealth modality with the capabilities of older patients with cognitive problems, hearing loss and/or limited technological abilities and, for some providers, that the referral for and recommendations resulting from the service added to their workload.

DIGITAL DIVIDE MAGNIFIED FOR OLDER VETERANS LIVING OFF THE GRID

Kathryn Nearing,¹ Camilla Pimentel,² Eileen Dryden,³ Laura Kernan,³ and Lauren Moo,⁴ 1. *Veterans Health Administration, Denver, Colorado, United States*, 2. *VA Bedford Healthcare System, Bedford, Massachusetts, United States*, 3. *Veterans Health Administration, Bedford, Massachusetts, United States*, 4. *VA Bedford Health Care System, Bedford, Massachusetts, United States*

Compared to urban Veterans, rural Veterans are more likely to be older (55-74), not employed, have less education, more service-related disabilities and unmet healthcare needs. Interviews with a national sample of community-based outpatient clinic providers described highly-rural Veterans who are "off the grid." These Veterans, by choice and/or circumstance, do not have access to reliable internet, associated devices or knowledge/skills. Providers described the difficulties of connecting with these Veterans even by phone. The healthcare shift to virtual telehealth modalities in response to COVID-19 highlights the digital divide as a social determinant of health. For "off-the-grid" Veterans, past experiences and present-day circumstances converge to perpetuate and exacerbate inequalities in accessing healthcare. Their situation underscores that telehealth is not a panacea for increasing access to care and confronts us with the moral imperative to reach those with whom it may be most difficult to connect to span social, geographic and digital divides.

A STRATEGY MATCHING TOOL FOR BOOSTING IMPLEMENTATION OF GERIATRIC TELEHEALTH SERVICES IN RURAL CBOCS

Laura Kernan,¹ Eileen Dryden,¹ Camilla Pimentel,² Kathryn Nearing,³ and Lauren Moo,⁴ 1. *Veterans Health*

Administration, Bedford, Massachusetts, United States, 2. *VA Bedford Healthcare System, Bedford, Massachusetts, United States*, 3. *Veterans Health Administration, Denver, Colorado, United States*, 4. *VA Bedford Health Care System, Bedford, Massachusetts, United States*

Fifteen Veterans Administration Medical Centers (VAMCs) offer geriatric specialty care telehealth services through a hub and spoke model to patients at affiliated community-based outpatient clinics (CBOCs). These services are not used to the extent they could be. Through interviews with 50 staff and providers at rural CBOCs we identified several implementation facilitators and barriers. CBOC-level barriers included space constraints, low staffing, internet connection issues, and limited knowledge of services available and referral processes. Patient-level barriers included discomfort with technology, cognitive decline, and inability to travel to the CBOC. We found that champions within the CBOC and iterative, targeted outreach from the hub helped facilitate uptake of services. We entered the identified barriers into the CFIR-ERIC (Consolidated Framework for Implementation Research-Expert Recommendations for Implementing Change) Implementation Strategy Matching Tool to help generate targeted strategies that will be used to refine each hub's implementation approach.

Session 1460 (Symposium)

SLEEP, LIFESTYLE, AND SOCIOECONOMIC MARKERS OF MENTAL AGING AND WELL-BEING: LESSONS FROM ENGLAND, CHINA, AND JAPAN

Chair: Andrew Steptoe

Healthy ageing has become a popular topic worldwide. We investigated the role of sleep, leisure activities, and socioeconomic inequalities in relation to cognitive decline, wellbeing, and quality of life in data from the English Longitudinal Study of Ageing (ELSA), Chinese Health and Retirement Longitudinal Study (CHARLS), and Japanese Study of Aging and Retirement (JSTAR), national representative samples of England, China and Japan, respectively. We found an inverted U-shaped association between sleep quality and memory in English adults and a positive dose-response association in Chinese older adults (Brocklebank). In another examination, we found that younger English individuals playing games had lower quality-of-life than older participants who game, and this association is more pronounced for widowed individuals than others (Almeida-Meza). Cognitive impairment and dementia represent significant challenges worldwide. In a cross-country investigation, we found that the prevalence of MCI was twice as great in England compared with Japan, but that the two nations differ slightly across socioeconomic correlates (Gireesh). In another cross-country comparison between England and China, we found that the rate of memory change appeared socioeconomically patterned, primarily by education and area-based characteristics (urban vs. rural), with a more substantial impact on rural China inequalities compared to England (Cadard). Our results indicate more robust educational and geographical disparities in China and increased occupational impact among English and Japanese participants. Our findings highlight the imperative need for policy interventions and tailored strategies to protect those particularly disadvantaged in England and China.

SLEEP QUALITY AND COGNITIVE DECLINE: A CROSS-COUNTRY COMPARISON BETWEEN ENGLAND AND CHINA

Laura Brocklebank,¹ Dorina Cadar,¹ Li Yan,² Yaohui Zhao,² and Andrew Steptoe,¹ 1. *University College London, London, England, United Kingdom*, 2. *Peking University, Guangzhou, Guangdong, China (People's Republic)*

Too little or too much sleep is associated with accelerated cognitive decline in older adults. However, sleep duration does not capture other sleep problems prevalent in older adults, such as difficulties with falling or staying asleep. Less is known about the impact of sleep quality on cognitive ageing, and if this relationship differs between England and China. Therefore, the aim of this study is to examine the relationship of self-reported sleep quality with cognitive performance and rate of change over 6-7 years follow-up in two nationally-representative samples of English and Chinese older adults. The primary outcome was a memory score (range 0-20), which was assessed using immediate and delayed 10-word recall tests in both cohorts. The results of bivariate descriptive analyses at baseline suggest there may be an inverted U-shaped association between sleep quality and memory in English older adults, and a positive dose-response association in Chinese older adults.

ONLINE GAMING AND WELL-BEING IN THE ENGLISH LONGITUDINAL STUDY OF AGEING

Pamela Almeida-Meza, Dorina Cadar, Andrew Steptoe, and Carrie Ryan, *University College London, London, England, United Kingdom*

Play is considered an important contributor to healthy ageing. Using data from 3,067 participants aged 50+ from the English Longitudinal Study of Ageing, we explored online gaming assessed at wave 6 (2012/13) and quality-of-life, loneliness, and depression at wave 9 (2018/19). Covariates were age, sex, marital status, education, work status, depression, self-rated health, physical activity, smoking and alcohol consumption. We found that 22% of respondents engaged in gaming. Interaction analyses indicated that for younger individuals (<65 years), gaming predicted lower scores in the self-realization sub-scale of the quality-of-life scale in comparison to older gamers. Furthermore, there was a significant association between gaming and lower quality-of-life for widowed individuals only, particularly in terms of autonomy, self-realization, and pleasure. There were non-significant associations between gaming and loneliness and depression. Online gaming might be independently associated with lower levels of quality of life, especially for younger and widowed adults.

SOCIOECONOMIC INEQUALITIES AND MILD COGNITIVE IMPAIRMENT: EVIDENCE FROM ENGLAND AND JAPAN

Aswathikutty Gireesh,¹ Pamela Almeida-Meza,¹ Hashimoto Hideki,² Andrew Steptoe,¹ and Dorina Cadar,¹ 1. *University College London, London, England, United Kingdom*, 2. *University Of Tokyo, Tokyo, Tokyo, Japan*

Japan is the world's fastest ageing population, with a higher prevalence of dementia than in the UK. Less clear is the role of socioeconomic inequalities in neurocognitive disorders between these countries. This study aims to assess comparatively

the relationship between education, a marker of cognitive reserve, and income in relation to mild cognitive impairment (MCI) and dementia in England and Japan. We ascertained MCI using a validated algorithm based on one standard deviation below the mean on two standardised cognitive tests. Multinomial logistic regression models were used to study the associations between socioeconomic markers and MCI/dementia. The prevalence of MCI was almost twice as high among English adults compared to Japanese. Results suggest that nations are similar in overall socioeconomic inequalities of MCI/dementia, but this might differ across socioeconomic markers. Considerable variability in the health inequalities could be attributed to the country-specific socio-cultural-political factors, which remains to be further explored.

SOCIOECONOMIC DETERMINANTS OF COGNITIVE AGING: A CROSS-COUNTRY COMPARISON BETWEEN ENGLAND AND CHINA

Dorina Cadar,¹ Yaohui Zhao,² Li Yan,² Laura Brocklebank,¹ and Andrew Steptoe,¹ 1. *University College London, London, England, United Kingdom*, 2. *Peking University, Guangzhou, Guangdong, China (People's Republic)*

Lower educational attainment is associated with a higher risk of dementia and a steeper cognitive decline in older adults. However, less clear is how other socioeconomic markers contribute to cognitive ageing and if these socioeconomic influences on cognitive ageing differ between England and China. We examined the relationship of education, household wealth, and urbanicity with cognitive performance and rate of change over 7-8 years follow up in the English Longitudinal Study of Ageing and Chinese Health and Retirement Longitudinal Study, national representative samples of England and China. We found that the rate of cognitive change appears to be socioeconomically patterned, primarily by education and area-based characteristics (urban vs rural), with a stronger impact of inequalities seen in rural China. Public health strategies for preventing cognitive decline and dementia should target socioeconomic gaps to reduce health disparities and protect those particularly disadvantaged in England and China.

Session 1465 (Paper)

Social Isolation and Mental Health

CATASTROPHIC HEALTH EXPENDITURES AND MENTAL HEALTH IN OLDER CHINESE PEOPLE: THE ROLE OF SOCIAL HEALTH INSURANCE

Wei Yang,¹ and Bo Hu,² 1. *King's College London, London, England, United Kingdom*, 2. *London School of Economics and Political Science, London, England, United Kingdom*

Catastrophic health expenditure (CHE) has considerable effects on household living standards, but little is known regarding the impacts of CHE on people's mental health. Using China as an example, this study examines the association between CHE and mental health and investigates whether and to what extent social health insurance (SHI) can lessen the impacts of CHE on mental health among older people aged over 60 in China. The data come from three waves of the China Health and Retirement Longitudinal Study (CHARLS

2011, 2013, and 2015, $N = 13,166$). We built fixed-effects quantile regression models to analyse the data. We found that incurring CHE has significantly detrimental effects on older people's mental health, whereas the SHI demonstrates a protective effect. The observed protective effects of SHI are the strongest among those with relatively mild mental health problems, i.e., people whose CES-D scores are below the 50th percentile. Our findings provide empirical evidence that encourages the integration of psychologically informed approaches in health services. We also urge governments in low- and middle-income countries to consider more generous health financing mechanisms for those with higher healthcare needs.

LIVING ARRANGEMENTS AND PSYCHOSOCIAL WELL-BEING AMONG OLDER ADULTS: EVIDENCE FROM THE HEALTH AND RETIREMENT STUDY

Rashmita Basu,¹ Huabin Luo,¹ Adrienne Steiner,² and Alan Stevens,³ 1. *East Carolina University, Greenville, North Carolina, United States*, 2. *East Carolina University, East Carolina University, North Carolina, United States*, 3. *Baylor Scott & White Health Research Institute, Temple, Texas, United States*

Despite growing attention to the association between living arrangements and health outcomes, less is known about how emotional well-being and life satisfaction vary by living arrangements. Using data from the 2014 and 2016 Leave Behind Questionnaires from the Health and Retirement Survey ($N=13,275$), we estimated generalized linear regression models comparing emotional well-being (a ratio of positive to negative emotion) and life satisfaction (the satisfaction with life scale, SWLS) by living alone versus living with others, controlling for socioeconomic and other health-related characteristics. Overall, individuals who lived alone had lower emotional well-being ($\beta=-0.11$; $p<0.01$), and SWLS score ($\beta=-0.42$; $p<0.001$), compared to those living with others. The direction of these relationships stratified by the cognitive status was the same. Policies and programs designed to support the growing population of older adults living alone should focus on improvement in these positive outcomes to enhance the quality of life.

LONELINESS, STRESS, AND DEPRESSIVE SYMPTOMS AMONG OLDER IMMIGRANTS: A MODERATING ROLE OF FAMILIAL RELATIONSHIPS

Heejung Jang, *University of Michigan, Ann Arbor, Michigan, United States*

Objectives: Immigration is a stressful life event, and immigrants commonly experience loneliness, a risk factor for depression. However, little is known about how and whether older immigrants' perceived stress exposure/appraisals mediate the association between loneliness and depressive symptoms. Further, this study explores whether familial relationships moderate the indirect or direct effects of the mediation models. Method: This study uses the 2012 Health and Retirement Study from a sample of 719 immigrants age 57 and older. A series of moderated mediation analyses were conducted across the total number of stress exposure and eight stress appraisal domains. Results: The findings indicate that the total number of stress exposure and five domains of stress appraisals (health problems in self, physical/

emotional problems in spouse/child, financial strain, housing problems, and close relationships in others) mediate the association between loneliness and depressive symptoms. In addition, the perceived negative strain from family moderated the mediating effect of health problems and housing problems in the relationship between loneliness and depressive symptoms. Discussion: This study suggests that negative relationships with family may increase upsetting in stress appraisals on health and housing problems, which turn in increased depressive symptoms for lonely older immigrants. Practitioners need to assess older immigrants' stressors and family relationships to understand their loneliness and depressive symptoms.

SOCIAL ISOLATION AS A RISK FACTOR FOR CIGARETTE SMOKING IN OLDER ADULTS

Gilbert Gimm,¹ Mary Lou Pomeroy,² and Thomas Cudjoe,³ 1. *George Mason University, Vienna, Virginia, United States*, 2. *George Mason University, George Mason University, Virginia, United States*, 3. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*

Objective: This study examined the prevalence of social isolation and cigarette smoking in a national sample of community-dwelling older adults, and assessed the role of social isolation on the risk of cigarette smoking. Methods: Using data from 8,044 participants (age 65+ years) across two waves of the National Health and Aging Trends Study (NHATS), we analyzed the prevalence of social isolation in older adults and as a risk factor for cigarette smoking. Social isolation was measured across 4 relationship domains (Cudjoe, 2018) on a scale of 0 to 4, using objective measures of social interactions. Descriptive and logistic regression analyses were conducted to assess how social isolation is associated with smoking. Results: Preliminary results showed that 18.2% of older adults were socially isolated (3.5% severely isolated) and 7.1% of participants reported current smoking. We found that both social isolation (OR = 2.5, $p<.001$) and severe isolation (OR = 5.9, $p<.001$) increased the odds of smoking. Also, older adults with depression (OR = 1.6, $p<.01$) and dual-eligible beneficiaries (Medicare and Medicaid) with TRICARE coverage (OR = 4.6, $p<.05$) had greater odds of smoking. However, we did not find evidence that the odds of smoking varied significantly by the number of chronic conditions. Conclusion: Social isolation is associated with an increased risk of cigarette smoking among older adults. Smoking may be an important behavior in the pathway between social isolation and its association with morbidity and mortality.

THERE IS NO COMMUNITY HERE: LIVING ALONE, PLACE, AND OLDER PEOPLES' RISK OF SOCIAL ISOLATION

Rachel Weldrick, *Simon Fraser University, Vancouver, British Columbia, Canada*

Existing research has identified significant risk factors for experiencing social isolation in later life including chronic health conditions, mobility impairments, and living alone among others. Although many older people who live alone maintain active social lives, living alone remains a top predictor of social isolation. Less is known about other types of risk factors, such as place-based risks and social exclusion.

Despite calls to examine the role of place and social exclusion in social isolation risk, few studies have investigated the links. Models of isolation risk have often omitted place-based factors and social exclusion and focused largely on individual-level risks. In order to address these gaps, this paper presents the findings of 17 in-depth, qualitative interviews with community-dwelling older people who live alone (aged 65-93). Participants were recruited using a theoretical sampling strategy to ensure that a diverse range of neighbourhood types were represented among the participants (e.g., walkable vs. car-dependent neighbourhoods). Interview transcripts were analyzed using a constructivist grounded approach resulting in several major themes. Participants described aspects of their local environments as shaping their risk of isolation including infrastructure and amenities delivered in place, and neighbourhood makeup, among others. These themes are further examined through the lens of place-based exclusion and used to conceptualize how dimensions of both place and social exclusion fit into the model of known isolation risk factors. An adapted model of risk is presented to guide future research and intervention planning.

Session 1470 (Symposium)

TEACHING ANTI-RACISM IN GERONTOLOGY: AN INTERACTIVE PROGRAM OF RECOGNITION, SELF-WORK, PEDAGOGY, AND ACTION

Chair: Althea Pestine-Stevens

Discussant: Tina K. Newsham

Older adults with intersecting identities as persons of color experience disparities in health and well-being due to racism in individual and structural spheres, which have been amplified by health, economic, and social consequences of COVID-19. We can begin the work to reduce these inequities by training scholars and practitioners to disrupt the systems within which we work that relegate advantages and disadvantages throughout the life course and in later life by racial groups. This interactive symposium presents resources on anti-racist gerontological education and provides an opportunity to engage critically with peers in all stages of their careers and anti-racism journeys who are interested in integrating anti-racism into their teaching. The first presenter introduces conversations to begin anti-racist pedagogy and assumptions to dismantle. The second presenter describes cultural humility as an essential step towards self-awareness and critical self-reflection for educators and practitioners. The third presenter presents how anti-racist pedagogy, a teaching approach that combines racial content, pedagogy, and organizing, may be applied to gerontology education. Fourth, an example will be presented from an online course module developed to guide Master of Social Work students toward recognizing racial disparities in aging services systems and identifying concrete suggestions for improvement. Finally, strategies for curriculum design will be presented with examples from Public Health education. This symposium is designed to include ample time for group discussion on this critical and under-addressed area of teaching in gerontology across disciplines, such that participants can better connect with others to build awareness, competency, and resources.

TEACHING ANTI-RACISM IN AN AGING SERVICES COURSE: LESSONS DEVELOPED AND LESSONS LEARNED

Althea Pestine-Stevens,¹ and Emily Greenfield,² 1. *Rutgers Social Work, New Brunswick, New Jersey, United States*, 2. *Rutgers, The State University of New Jersey, New Brunswick, New Jersey, United States*

Despite high levels of racial disparities in health and well-being among older adults, curricula addressing how aging services systems contribute to or work to ameliorate these disparities are scarce. This paper introduces a module on inequalities and anti-racism in aging developed for an on-line course on aging services within a Master of Social Work program. First, materials that help students identify and understand racial inequalities in aging and in the programs that serve older adults are presented. Next, students are introduced to the applied context of how COVID-19 has exacerbated these inequalities. Finally, students critically engage in reflections and assessments of the available resources within aging services and advocacy organizations, providing recommendations for how these systems may better incorporate anti-racist practices. Challenges and opportunities will be discussed, including piloting this module in a virtual, asynchronous environment.

THE MASTER'S TOOLS WILL NEVER DISMANTLE THE MASTER'S HOUSE: THE ROLE OF DIVERSITY IN ANTI-RACIST EDUCATION

Karen Lincoln, *University of Southern California, Los Angeles, California, United States*

Diversity is a strange fruit that requires critical analysis to understand its meaning, value and impact on education. Depending on the era, diversity has been defined in a number of different ways and has a variety of meanings across a range of contexts. The lack of shared meaning and understanding of diversity and who controls the diversity narrative have significant implications for the development of anti-racist pedagogy in gerontological education. This presentation will discuss the history and evolution of the "diversity discourse" and how mainstream notions of diversity impact diversity initiatives, curriculum design and anti-racist pedagogy. Strategies for engaging in an historical analysis of diversity and how this process relates to the design, leadership and ownership of anti-racist curriculum will be discussed, as well as the role of gerontology in leading these efforts.

CULTURAL HUMILITY: THE BIAS CHECKER

Natalie Moore-Bembry, *Rutgers, The State University of New Jersey, Camden, New Jersey, United States*

Historically we have been taught to understand and embrace cultural competency, however, this focus has often led to a superficial understanding of others and seldom required one to better understand themselves. Cultural humility is based on one's ability to engage in individual accountability and institutional accountability. Individual accountability is based on critical self-reflection and critique, lifelong learning, and the challenging of power imbalances. Institutional accountability requires one to challenge structural power. This session will: (1) explore ways to engage in critical self-reflection and critique; (2) describe how values and beliefs impact the interactions of our personal and professional lives; and

(3) strategize ways to collectively model and practice in cultural humility in one's personal and professional life.

REFLECTIONS ON APPLYING ANTI-RACIST PEDAGOGY TO TEACHING ABOUT AGING

Rona Karasik, and Kyoko Kishimoto, *Saint Cloud State University, SAINT CLOUD, Minnesota, United States*

Racial disparities are well documented in all facets of aging (e.g., health, housing, retirement). Helping gerontology students to recognize racial inequity, however, is only the first step toward effecting change. Empowering students to investigate root causes of these disparities (e.g., power relations) is essential in order to begin to identify ways to dismantle institutional racism and create systems that are more equitable. With its attention to historical/political context and fostering skills for critical analyses and social change, anti-racist pedagogy offers educators a framework from which to introduce and explore these issues (Karasik & Kishimoto, 2020). This session will consider how anti-racist pedagogy may be applied within the gerontological curriculum using examples of teaching about (1) retirement and (2) housing for older adults. Associated challenges such as finding and preparing appropriate material, as well as engaging students and faculty in work they are unfamiliar and/or uncomfortable with will also be discussed.

CONSIDERATIONS IN CURRICULUM DESIGN FOR TEACHING ABOUT RACE AND RACISM IN GERONTOLOGY

Darren Liu,¹ and Betty Burston,² 1. *Des Moines University, Des Moines, Iowa, United States*, 2. *University of Nevada, Las Vegas, Las Vegas, Nevada, United States*

The recognition of structural racism as a public health crisis has enlarged the breadth and depth of discussions of the unique "isms" in higher education classrooms. A significant number of undergraduate or graduate level gerontology programs participate in the delivery of training through instruction on the topics of aging, gerontology, or long-term care administration to future labor market participants. Absent from these classroom conversations, however, has been an analysis of how syntax, the analytical vocabulary, and other framing of such conversations can impact learners. While these educational programs provide highly critical information on disease, illness and injury prevention, self-care, population health, and other topics, professors can also introduce perspectives on race, racism, and how they may be related to the delivering of care to the aging population. Specifically, this session will introduce an example of curricular design for the identification of structural racism in the operation of long-term care institutions.

Session 1475 (Symposium)

TECHNOLOGY TO SUPPORT SELF-REGULATION IN OLDER ADULTHOOD: INSIGHTS FROM DESIGN TO IMPLEMENTATION

Chair: Shannon Meija

Discussant: Hans-Werner Wahl

Across the lifespan, individuals adapt to change through the careful monitoring and adjustment of goals, demands, and performance—processes of self-regulation. Technology

in support of self-regulatory processes may compensate for deficiencies in the ability to set, monitor, and work toward goals. Our purpose in this symposium is to forward the discourse on how health technology—from design to implementation—can assist older adults in their efforts to support their health and well-being in daily life. Our symposium begins with design considerations for technologies that support processes of information seeking, reflection, and action. Chin presents a process for designing conversational agents that guide dialogues with older adults to support informal self-regulated learning of health information. Nie and colleagues synthesize the literature on visual feedback to provide a framework that illustrates how visual design elements can link feedback to action. The symposium continues with papers that speak to older adults' experiences using technology to accomplish their goals. Mejía and colleagues use insight from older adults who had self-assessed their balance for 30 consecutive days to explore themes of self-monitoring accuracy and feedback preferences. Francis and colleagues use data from the Detroit-based Social Relations Study to illustrate how technology use and its implications vary when older adults engage with their weaker social ties. The symposium will conclude with a discussion led by Wahl, who will situate the papers, and the discourse on health technology design and application, within lifespan developmental and action perspectives on aging.

DESIGNING CONVERSATIONAL AGENTS TO SUPPORT SELF-REGULATED LEARNING FOR OLDER ADULTS

Jessie Chin,¹ and Smit Desai,² 1. *University of Illinois at Urbana-Champaign, University of Illinois at Urbana-Champaign, Illinois, United States*, 2. *University of Illinois, Urbana Champaign, Champaign, Illinois, United States*

The rapid growth of the off-the-shelf smart speakers (such as Amazon Alexa and Google Home), also called Conversational Agents (CAs), creates potential to deliver everyday life support to users at home (such as checking weather, listening to news, scheduling events). Literature demonstrated the technology acceptance of CAs among older adults (including novice users) given the low barriers to use CAs. The natural conversations among CAs and users enable the opportunities to build deeper understandings about a topic through theory-driven guided dialogues. Our study has designed the metacognition strategies in the guided dialogues of CAs to support informal self-regulated learning of health information among older adults. The study has shown the feasibility and acceptance of CAs to help older adults learn new health information on their own through these guided dialogues. Additional analyses on the feasibilities to implement different metacognitive strategies in guided dialogues in the off-the-shelf CAs were also conducted.

DESIGNING BEHAVIORAL FEEDBACK VISUALIZATIONS TO SUPPORT HEALTH BEHAVIOR CHANGE

Qiong Nie,¹ Daniel Morrow,² Maurita Harris,¹ and Wendy Rogers,² 1. *University of Illinois at Urbana Champaign, Champaign, Illinois, United States*, 2. *University of Illinois Urbana-Champaign, Champaign, Illinois, United States*

Health technology has the potential to support behavior change by measuring performance and providing users with visualizations of this performance as feedback. Such visual feedback has had limited success in changing health behaviors, but it is not clear why. We conducted a systematic review of the visual feedback literature to develop an organizational framework representing the visual feedback-action process. We identified the components that have been investigated in the context of visual feedback. These components are classified into four categories: visualization types (e.g., bar graph) and variables (e.g., color); feedback characteristics (e.g., social comparison); psychological processes (e.g., motivation) and action (e.g., exercise). The insights will inform the design of feedback visualizations in a smartphone application to support medication adherence for older adults. More broadly, this integrative perspective will yield principles of feedback visualization techniques and components that influence the behavior change process and develop a roadmap to facilitate the design.

PERSPECTIVES ON HOW FALL PREVENTION TECHNOLOGIES CAN SUPPORT OLDER ADULTS' SELF-MONITORING PROCESSES

Shannon Meija,¹ Sungjae Hong,¹ Aileen Griffin,² Tai-Te Su,³ and Jacob Sosnoff,⁴ 1. *University of Illinois, Champaign, Illinois, United States*, 2. *University of Illinois at Urbana-Champaign, Aurora, Illinois, United States*, 3. *University of Illinois at Urbana-Champaign, Champaign, Illinois, United States*, 4. *School of Health Professions, University of Kansas Medical Center, Kansas City, Kansas, United States*

Fall risk increases as older adults lose the functional resources necessary to maintain balance while completing everyday activities. As functional resources often decline gradually with age, momentary deficits may not be apparent until after a fall occurs. Mobile fall prevention technologies could support older adults in self-monitoring their ability to safely navigate their environments. In this paper we present perspectives on self-monitoring and feedback in a sample of older adults (n = 20, 50% female, age 65+) who had self-assessed their balance via a smartphone for 30 consecutive days. Thematic analysis of semi-structured interviews showed that fall history differentiated a) participants' awareness of day-to-day variation in functional ability; b) trust in the accuracy of self-monitoring; and c) imaginations of what types of feedback a mobile fall prevention technology should provide. Insight on older adults' internal self-monitoring processes and guidelines for feedback design are discussed.

WEAK TIES THAT BIND: ICT USE, SOCIAL RELATIONS, AND DEPRESSIVE SYMPTOMS AMONG OLDER ADULTS

Jess Francis, Noah Webster, and Nour Fakhoury, *University of Michigan, Ann Arbor, Michigan, United States*

Information and communication technology (ICT) use has been associated with well-being among older adults. This link is often attributed to the fact that technology use facilitates connecting with social relations generally. What is less known, however, is the extent to which distinct dimensions of social relations uniquely influence how ICT use affects health. Thus, the importance of weak ties is receiving increased attention. Using data from the Detroit-based Social

Relations Study collected in 2015, we examine the extent to which separate dimensions of weak ties (contact frequency and network size) mediate and moderate the link between technology use and depressive symptoms among adults age 65+ (n=213). A greater number of less close relations mediated the link as it was associated with technology use and fewer depressive symptoms. A moderating effect was also found as technology use was associated with fewer depressive symptoms only among those with lower contact frequency.

Session 1480 (Symposium)

THE STUDY OF MUSCLE, MOBILITY, AND AGING (SOMMA): AN OVERVIEW

Chair: Steve Cummings

Co-Chair: Peggy Cawthon

Discussant: Russell Hepple

SOMMA is an NIA-funded cohort study to identify biological determinants of mobility and fitness. The overall aim of SOMMA is to use biopsies, novel biomarkers, advanced imaging, and intensive physical and cognitive assessments to elucidate the biological processes that contribute to changes in mobility and physical fitness with aging. SOMMA will recruit 875 people age 70+ (of whom about 200 have been enrolled.) We take biopsies of the vastus lateralis muscle to quantify mitochondrial content and function of the electron transport chain. We use ³¹PMR spectroscopy to quantify mitochondrial capacity to generate ATP in quadriceps muscle (ATPmax). We will quantify other biological properties in biopsies including denervation, autophagy and accumulated biochemical damage and use gene expression to discover pathways that contribute to mobility and fitness. SOMMA uses MR for quadriceps volume and D3Cr dilution for total skeletal muscle mass, cardiopulmonary exercise testing to measure fitness (VO₂ peak). We are also making many other intensive assessments of physical and cognitive function. Mobility endpoints include baseline and three year change in 400 m and 4 meter gait speed and fitness. SOMMA is building a large biobank of muscle, adipose blood, and urine specimens that will be available for ancillary studies. In this Symposium, we will present results from analyses of associations between muscle mitochondrial function and strength, muscle mass, cognitive performance, gait speed, and fitness. The symposium will also preview opportunities for collaborations and ancillary studies with SOMMA.

INITIAL RESULTS FROM SOMMA: CONTRIBUTION OF MITOCHONDRIAL FUNCTION TO WALKING AND FITNESS

Steve Cummings,¹ Peggy Cawthon,¹ Bret Goodpaster,² Russell Hepple,³ Nancy W. Glynn,⁴ Stephen Kritchevsky,⁵ Anne Newman,⁶ and Paul Coen,² 1. *California Pacific Medical Center, San Francisco, California, United States*, 2. *AdventHealth, Orlando, Florida, United States*, 3. *University of Florida, Gainesville, Florida, United States*, 4. *University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania, United States*, 5. *Wake Forest School of Medicine, Winston Salem, North Carolina, United States*, 6. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

We hypothesize that the capacity of mitochondria in quadriceps skeletal muscle to generate ATP energy by respirometry (OXPHOS) in biopsies from the vastus lateralis, and in whole quadriceps muscle by 31PMRS (ATPmax) would contribute to 4 and 400m gait speed and to peak oxygen consumption on treadmill testing (VO₂peak). In analyses from the first SOMMA participants recruited (N=122), OXPHOS was similarly associated with 4m (r=0.21) and 400 m (r=0.21) walking speed (P<0.01). However, ATPmax was not associated with either 4m or 400m walking speed (r=-0.02 and -0.07 respectively). In contrast both OXPHOS (r=0.43) and ATP max (r=0.35) were more strongly correlated with fitness (VO₂ peak). These findings suggest that in older people, the mitochondrial capacity to generate ATP plays an important role walking speed and may be even more important to fitness.

MUSCLE QUALITY REVISITED: BIOPSY ENERGETICS, MR SPECTROSCOPY, AND MUSCLE POWER AND STRENGTH

Anne Newman,¹ Adam Santanasto,² Elsa Strotmeyer,¹ Barbara Nicklas,³ Paul Coen,⁴ Bret Goodpaster,⁴ and Steve Cummings,⁵ 1. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2. *University of Pittsburgh, Pittsburgh, Pittsburgh, Pennsylvania, United States*, 3. *Wake Forest School of Medicine, Winston-Salem, North Carolina, United States*, 4. *AdventHealth, Orlando, Florida, United States*, 5. *California Pacific Medical Center, San Francisco, California, United States*

With age, strength may decline faster than muscle mass pointing to a deterioration in muscle quality. Aspects of muscle quality and function are being measured in SOMMA; we hypothesized that in vitro and in vivo bioenergetics capacity of muscle would be related to muscle strength and power. Associations differed between men and women. In men (n=48, ATPMAX, 70, max OXPHOS and max ETS) but not women (n=68, ATPMAX, n=103, max OXPHOS and max ETS), muscle ATP regeneration by 31P MR spectroscopy was correlated with leg power (r = 0.27, p= 0.05). Energy production in tissue was similarly more strongly correlated with power in men than women, though not statistically significant. Correlations between the tissue measures and strength were also stronger in men than women. In ongoing follow-up, we will be able to determine what role that muscle tissue energetics plays in explaining the loss of strength and power with aging.

MUSCLE BIOENERGETICS AND COGNITIVE EXECUTIVE FUNCTION: THE SOMMA STUDY BASELINE

Stephen Kritchevsky,¹ Steve Cummings,² Anne Newman,⁴ Paul Coen,⁵ Anthony Molina,⁶ Russell Hepple,⁷ and Peggy Cawthon,² 1. *Wake Forest School of Medicine, Wake Forest School of Medicine, North Carolina, United States*, 2. *Wake Forest School of Medicine, Winston Salem, North Carolina, United States*, 3. *California Pacific Medical Center, San Francisco, California, United States*, 4. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 5. *AdventHealth, Orlando, Florida, United States*, 6. *UCSD, La Jolla, California, United States*, 7. *University of Florida, Gainesville, Florida, United States*

Better executive function has been associated with faster walking speed, but the basis for this association is unclear.

Systemic factors appear to contribute mitochondrial function across multiple tissues including muscle and brain. We hypothesized that muscle-based measures of bioenergetics capacity would be associated with cognitive function at SOMMA's baseline. MRI-based ATPMAX and muscle fiber respirometry-based max OXPHOS were correlated with scores on the MoCA (mean: 24.0; SD: 3.2); Trails B (mean: 138 seconds; SD: 73) and the Digit Symbol Coding Tests (mean: 50.8; SD: 14.9). The spearman correlations between ATPmax and the three measures were: 0.10 (p=0.29); -0.20 (p=0.03) and 0.16 (p=0.09), respectively. The association between max OXPHOS were: 0.18 (p=0.02); -0.20 (p<0.01) and 0.11 (p=0.13), respectively. Some associations appeared stronger in men than women. Gender interactions and whether energetics mediate some of the association between cognitive function and gait speed will be explored in the full baseline sample.

ASSESSING MITOCHONDRIAL ENERGETICS OF SKELETAL MUSCLE IN THE STUDY OF MUSCLE MOBILITY AND AGING (SOMMA)

Bret Goodpaster,¹ Peggy Cawthon,² Stephen Kritchevsky,³ Anne Newman,⁴ Russell Hepple,⁵ Steve Cummings,² and Paul Coen,¹ 1. *AdventHealth, Orlando, Florida, United States*, 2. *California Pacific Medical Center, San Francisco, California, United States*, 3. *Wake Forest School of Medicine, Winston Salem, North Carolina, United States*, 4. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 5. *University of Florida, Gainesville, Florida, United States*

Mitochondria produce energy as ATP that essential for muscle contraction and movement. We hypothesize that age-related decreases in the capacity to generate ATP in muscle plays a major role in loss of mobility with aging. In SOMMA, we use high-resolution respirometry to measure the activity of electron transport system (ETS) in permeabilized muscle fibers from muscle biopsies. This allows us to assay ETS function in a highly controlled ex vivo experiment at the myocellular level, removed from other potentially limiting physiological factors including supplies of substrates and oxygen. We are also measuring the maximal capacity to generate ATP (ATPmax) in vivo by 31PMRS. ATPmax reflects the rate of phosphocreatine replenishment via oxidative phosphorylation. Analysis from the first 113 participants indicates that ATPmax correlates with Maximal OXPHOS (r=0.27, P=0.005), and Maximal ETS capacity (r=0.17, P=0.08). This suggests that these approaches provide complementary information on skeletal muscle energetics.

ASSOCIATIONS OF BODY COMPOSITION AND MITOCHONDRIAL FUNCTION IN OLDER ADULTS

Peggy Cawthon,¹ Paul Coen,² Bret Goodpaster,² Russell Hepple,³ Stephen Kritchevsky,⁴ Anne Newman,⁵ and Steve Cummings,¹ 1. *California Pacific Medical Center, San Francisco, California, United States*, 2. *AdventHealth, Orlando, Florida, United States*, 3. *University of Florida, Gainesville, Florida, United States*, 4. *Wake Forest School of Medicine, Winston Salem, North Carolina, United States*, 5. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

SOMMA assessed body composition by whole body magnetic resonance imaging (MRI) scans analyzed by AMRA

(fat-to-weight ratio, mean: $57\% \pm 0.1$; thigh muscle volume, mean: $8.9L \pm 2.4$; weight-to-muscle volume ratio, mean: $9.0 \text{ kg/L} \pm 1.6$). Deuterated creatine dilution (D3Cr muscle mass, mean: $21.8\text{kg} \pm 6.8$) was used to measure muscle mass. Mitochondrial function was measured in fresh muscle tissue by respirometry (maximum OXPHOS and maximum ETS) and non-invasively by ^31P MRS (ATPmax). Maximum OXPHOS and maximum ETS capacity were positively correlated with thigh muscle volume ($r=0.42$ and 0.44 , respectively; $p<.001$) and D3Cr muscle mass ($r=0.37$ and 0.33 , respectively; $p<.001$) and negatively correlated with fat-to-weight ratio ($r=-0.36$ and 0.26 , respectively; $p<.001$) and weight-to-muscle volume ratio ($r=-0.42$ and -0.37 , respectively; $p<.001$). Stratified analyses suggest that some associations may differ by sex. Associations between ATPmax and these body composition measures were more modest.

Session 1485 (Paper)

Transportation Issues at Older Ages

ALCOHOL- AND DRUG-ASSOCIATED INJURY OUTCOMES AMONG OLDER ADULTS INVOLVED IN CAR CRASHES

Oluwaseun Adeyemi,

New York University Grossman School of Medicine, Newark, New Jersey, United States

Understanding how recent alcohol or drug use among older adults involved in car crashes can inform emergency care team on the morbidity and mortality risks. This study aimed to assess the odds of worsened health outcomes among older adults with evidence of alcohol or drug ingestion. This cross-sectional analysis used crash census data from the National EMS Information System. The outcome variable was the health outcome after EMS care, measured on a four-point ordinal scale: lower acuity, emergent, critical, and dead. The predictor variable was alcohol/drug use (present/not present). Age, race, gender, part of the body injured, and the revised trauma score of the patients were used as confounders. Odds ratio were calculated using proportional ordinal logistic regression. A total of 42,992 individuals, aged 65 years and older, were involved in car crash events, which required EMS activation. About 22.9% needed emergent care, 4.4% were classified as critical, and 0.4% died without resuscitation efforts. At the time of crash, 3.8% of the older population had evidence of alcohol or drug use. After adjusting for age, gender, race, injury location and revised trauma score of the crash patients, alcohol/drugs were associated with 54% increased odds of worse clinical outcome (AOR:1.54; 95% CI: 1.32-1.80). The adjusted odds remained elevated in urban (AOR: 1.69; 95% CI: 1.42-2.02) and suburban (AOR: 2.21; 95% CI: 1.12-4.35) and not significantly elevated in rural areas. Study findings can inform EMS service and emergency room care as well as policies that strengthen the urban and suburban EMS.

CAREGIVING IS DRIVING MY TIME: CAREGIVER AND CARE RECIPIENT DRIVING BEHAVIORS AND HOURS OF CARE

Athena Koumoutzis,¹ Jonathon Vivoda,¹ and Jiawei Cao,²

1. Miami University, Oxford, Ohio, United States, 2. Miami University, Miami University, Ohio, United States

Informal caregivers often provide transportation assistance as older adult care recipients (CRs) begin regulating their driving (e.g., avoid certain driving situations, decrease/cease driving). This study examined how caregiver and CR driving frequency and CR's driving avoidance behaviors impact caregiving intensity. Using data from Round 7 of the National Health and Aging Trends Study and the linked National Survey of Caregiving ($n=1048$ dyads), results indicated that caregiving intensity was highest among caregivers who drove everyday (5.38 hours) and for CRs who had not driven in the last month/did not drive (4.65 hours). Negative binomial regression techniques were used to assess and compare driving-related predictors. Compared to CRs who reported no avoidance of nighttime driving, caregivers of CRs who do not drive at all can expect to provide about 36% more hours of caregiving per day. Caregiving intensity was not significantly related to CR's driving alone, on the highway, or in bad weather avoidance behaviors. CRs who drove every day, most days, and rarely required between 33% and 40% fewer expected hours per day of caregiving compared to CRs who had not driven in the past month. The expected number of hours spent providing care per day was 36% higher among caregivers who drove the care recipient every day, 28% higher among most-day drivers, and 30% higher among those who never drove as opposed to caregivers who drove some days per week. Results suggest that caregiving intensity is related more to caregiver and CR driving frequency than CR driving avoidance behaviors.

CHANGES IN TRANSPORTATION DURING THE COVID-19 PANDEMIC: RESULTS FROM A SURVEY OF MIDDLE-AGED AND OLDER FLORIDIANS

Anne Barrett, Cherish Michael, and Jessica Noblitt,
Florida State University, Tallahassee, Florida, United States

The pandemic's numerous effects on everyday life include reductions in driving and changes in the use of other transportation modes, like getting rides from family and friends, walking, and biking. Aside from broad patterns, however, little is known about these changes, including how they affected different groups of the population and how they felt about them. Our study addresses these issues using data collected from an online survey of over 4,000 Floridians aged 50 or older, conducted between December 2020 and April 2021 and funded by the Florida Department of Transportation to support its aging road user program, Safe Mobility for Life. Changes in driving and in rides from family and friends were more striking than those in other transportation modes. Nearly 30 percent of respondents decreased their driving during the pandemic, while 20 percent got fewer rides from family and 25 percent got fewer rides from friends. In contrast, only 11 percent decreased their walking, and the same percentage increased it. Less common were changes in biking, with percent 7 decreasing and only 4 percent increasing it. Multivariate analyses revealed that these changes were influenced by gender, race, age, socioeconomic status, and health. Further insight was gained from analysis of an open-ended item, revealing positive and negative assessments of the changes. Positive assessments centered on feeling satisfied with working at home, spending more time outdoors, having more free time, and saving money. Negative assessments centered on social isolation, dissatisfaction with government responses to the pandemic, and reduced transportation options.

DRIVER SPEED PROFILES INDEX WARNING SIGNS OF MCI

Jennifer Merickel,¹ Ruiqian Wu,² Matthew Rizzo,² and Ying Zhang,² 1. *University Of Nebraska Medical Center, Omaha, Nebraska, United States*, 2. *University of Nebraska Medical Center, Omaha, Nebraska, United States*

Goal: Use driver behavior profiles to screen and index early warnings of cognitive decline and Alzheimer's disease (AD). **Hypothesis:** Real-world driver speed behavior profiles discriminate mild cognitive impairment (MCI). **Methods:** Sensors were installed in personal vehicles of 74 legally-licensed, active drivers (age: 65-90 years, $\mu = 75.85$) who completed 2, 3-month real-world driving assessments, including demographic and cognitive assessments, 1 year apart (244,564 miles driven). MCI status was indexed using 8 neuropsychological tests (spanning executive function, visuospatial skills, processing speed, and memory), relevant to MCI and driving. Driving environment was indexed from state speed limit (SL; roadway type: residential, commercial, interstate) and sunrise-sunset databases (time of day: day vs. night). **Models:** Data were randomly split into training (66%) and validation (33%) sets. An optimal mixed effects logistic regression model was determined from validation data AUC values. **Results:** MCI drivers drove slower with optimal discrimination (estimated for every 5 mph decrease in speeding) in 1) residential roads (SL 25-35 mph; MCI odds increased by 6% [95% CI: 2-11%]), 2) interstate roads (SL >55 mph; MCI odds increased by 14% [95% CI: 8-20%]), and 3) night environments (MCI odds increased by 7% [95% CI: 2-12%]). **Conclusion:** Quantitative indices of real-world driver data provide "ground truth" for screening and indexing phenotypes of cognitive decline, in line with ongoing efforts to link driver behavior with age-related cognitive decline and AD biomarkers. Behavioral biomarkers for diagnosing early warnings of dementia could ultimately bolster our ability to detect and intervene in early AD.

MODES OF TRANSPORTATION TO MEDICAL AND PRIMARY CARE AMONG OLDER ADULTS

Zainab Suntai, Kefentse Kubanga, Emmanuel Adanu, and Abhay Lidbe, *University of Alabama, Tuscaloosa, Alabama, United States*

Transportation is an increasingly meaningful concern for older adults as physical, cognitive, and psychological changes in older adulthood impact mobility and accessibility. While several studies have examined the modes of transportation used among older adults, few have explored specifically how older adults are accessing primary care/medical care services. As such, this study aimed to determine the specific modes of transportation used among older adults for primary care visits. Data were derived from the 2018 National Health and Aging Trends Study (NHATS), an annual longitudinal panel survey of older adults aged 65 and older living in the United States. Descriptive analyses were conducted to examine the prevalence of several modes of access and logistic regression models were used to predict the likelihood of using the two most prevalent transportation modes, based on sociodemographic and socioeconomic factors. Results showed that 70% of older adults drive themselves to their doctor, 34.8% rely on a family member, friend, or paid person, 2.4% have a home visit, 2.1% use public

transportation, 1.5% walk to their doctor and 1.1% use a taxi. Additionally, having higher income, being of younger age, being White, and having post-secondary education was associated with driving oneself to the doctor. These results indicate that while most older adults are still self-reliant on transportation to medical providers, those with lower socioeconomic status are particularly at risk of losing driving independence. Transportation-related interventions should therefore consider targeting individuals with lower economic capital by providing financial assistance, ride-share programs, and other innovative approaches.

Session 1490 (Symposium)

USING CLINICAL TRIALS AS AGENTS OF TRANSFORMATION IN POPULATIONS BURDENED BY DISPARITIES

Chair: Daniel Jimenez

Discussant: Giyeon Kim

Older adults from racial/ethnic backgrounds as well as those from rural areas experience a disproportionate burden of physical and mental health risk factors. Given the prevalence of comorbid physical and mental health conditions in later life, the inadequacies of current treatment approaches for averting years living with disability, the disparities in access to the health care delivery system (including mental health care), and the workforce shortages to meet the mental and physical health needs of racial/ethnic and rural populations, development and testing of innovative strategies to address these disparities are of great public health significance and have the potential to change practice. This session will illustrate how four different interventions are being used to address mental and physical health needs in Latino and rural-dwelling older adults with the goal of reducing and ultimately eliminating disparities in these populations. Particular attention will be paid to the use of non-traditional interventions (e.g. social support, health promotion, technology). Results of clinical research studies will be presented alongside clinical case presentations. This integrated focus highlights the importance of adapting research interventions to real-world clinical settings.

OVERCOMING HEALTH PROMOTION BARRIERS IN RURAL HEALTH: A QUALITATIVE ANALYSIS

John Batsis, *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States*

Weight loss interventions are fraught with difficulties for older adults in rural areas due to transportation difficulties, reduced availability of staff, and lack of programs. Telemedicine can overcome these barriers. A qualitative analysis of data from 44 exit-interviews from a rural-based, older adult weight loss study, informed by thematic analysis, was conducted. Participant's age was 73 years (73% female) and BMI was 36.5kg/m². Distance to the site was 24 miles (31 min). Key themes included: a) telemedicine can help improve one's health, is more practical than in-person visits, is less costly, and time efficient; b) the majority (60%) were initially apprehensive about using telemedicine, a fear that resolved quickly; c) setting up telemedicine was easy and acceptable, despite a quick learning curve; d) having a team member for troubleshooting was important. Using

telemedicine in older adults with obesity residing in rural areas should be considered in health promotion interventions.

CERTIFIED OLDER ADULT PEER SUPPORT SPECIALISTS' USE OF TECHNOLOGY TO SUPPORT OLDER ADULTS IN THE COMMUNITY

Karen Fortuna, *Dartmouth College, Lebanon, New Hampshire, United States*

Middle-aged and older adults with mental health conditions have a high likelihood of experiencing comorbid physical health conditions, premature nursing home admissions, and early death compared with the general population of middle-aged and older adults. An emerging workforce of certified older adult peer support specialists aged 50 years or above is one of the fastest growing mental health workforces and may be a suitable community-based workforce to simultaneously support the mental health, physical health, and aging needs of middle-aged and older adults with a serious mental illness. Older adult peer support specialists are people with a lived experience of aging into middle age and older adulthood with a mental health condition. This presentation will present three single-arm pilot studies examining how certified older adult peer support specialists' incorporate technology, including text messaging, ecological momentary assessments, and smartphone applications into practice and clinical outcomes among older adults with serious mental illness.

ENGAGING ISOLATED HISPANIC AND LATINO OLDER ADULT CAREGIVERS IN REMOTE BEHAVIORAL INTERVENTIONS

Caroline Silva, *University of Rochester School of Medicine, Rochester, New York, United States*

Recruiting Hispanic/Latino older adults for behavioral clinical trials is challenging, particularly those who are isolated. This presentation describes the recruitment process and feasibility/acceptability outcomes for the adaptation of two interventions (Connect for Caregivers and Engage Coaching) aimed at improving the social relationships and supports of older adult Hispanic/Latino caregivers of a family member with dementia. We compare online and community-based recruitment methods for English and Spanish-speaking Hispanic/Latino caregivers across the United States and present recruitment challenges during COVID-19. Of eligible participants, 82% were identified via online (e.g., research registry) and 18% via community-based (including snowball sampling) methods. Of participants recruited via online methods, 22% were Spanish-speaking, versus 100% of those recruited by community-based methods. Overall, 91% of all eligible/interested participants enrolled in at least one of the interventions. We discuss further the feasibility/acceptability of study procedures and the interventions, as the study was conducted remotely (via phone/Zoom) due to COVID-19.

Session 1495 (Symposium)

VOICES IN MOTION: HOW SOCIAL SINGING CAN FACILITATE PSYCHOLOGICAL HEALTH FOR PERSONS WITH DEMENTIA AND CAREGIVERS

Chair: Stuart MacDonald

Co-Chair: Debra Sheets

Discussant: Theresa Allison

Dementia is a global public health priority that exerts significant impact on individuals, families, healthcare systems, and society. Worldwide, over 35 million individuals are estimated to have some subtype of dementia – a projection expected to triple by 2050. Despite progress, a cure for dementia remains elusive, and approved pharmacotherapies are selectively effective for but a limited duration. Increasingly, arts-based interventions for persons with dementia (PwD) and their caregivers are being recognized as inexpensive, non-invasive, and non-pharmacological lifestyle interventions with the potential to improve psychological function as well as reduce healthcare costs. This symposium overviews the Voices in Motion (ViM) study – a sociocognitive intervention exploring the impact of participation in an intergenerational choir on psychological, social, and cognitive function for PwD and their caregivers (n=32 dyads). PwD, caregivers, and local high school students sang in a professionally-conducted choir for as many as three seasons (each ~12 weeks long), spanning up to 18 months of follow-up. Employing an intensive repeated measures design, psychosocial, physiological, and cognitive function was measured every four to six weeks (up to 9 total assessments). The symposium papers provide a representative overview of the broad impact that this novel, non-pharmacological lifestyle intervention can offer vis-à-vis mitigating dementia symptoms and facilitating the psychological health of caregivers. Choir participation has important and significant impacts on psychosocial well-being and quality of life. Discussion focuses on policy implications and the need for community-based programs that reflect a social model for dementia and support living well through engaging and meaningful activities.

THE EMERGENCE AND BENEFITS OF SOCIAL RELATIONSHIPS IN TWO COMMUNITY-BASED DEMENTIA CHOIRS

Andre Smith, Debra Sheets, Mary Kennedy, Tara Erb, Ruth Kampen, Chandra Berkan Hozempa, and Stuart MacDonald, *University of Victoria, Victoria, British Columbia, Canada*

Community choir participation for persons with dementia (PwD) confers benefits to health and well-being, including the benefit of socializing which can reduce feelings of loneliness and social isolation. Using the concept of social capital, this study examines the degree to which two intergenerational Voices in Motion choirs facilitate the development of social relationships between PwD, caregivers, and high school students. Data collection involved interviews with 17 dyads of PwD and caregivers, completion of a social relationship questionnaire, and focus groups with a total of 29 high school students. The results show a gradual increase in the level of interactions between all participants, with students in particular interacting more frequently with PwD. Over time, trust and reciprocity emerged within the choirs as more people shared information about themselves. Students' understanding of dementia changed over time as they learned to appreciate PwD as unique human beings with rich life stories and experiences.

THE PROMISING IMPACT OF A VIRTUAL MUSIC INTERVENTION FOR PERSONS WITH DEMENTIA
Cynthia McDowell,¹ Jannell Walton,² Debra Sheets,² Andre Smith,² Robert Stawski,³ and Stuart MacDonald,²
1. *University of Victoria, Port Moody, British Columbia,*

Canada, 2. University of Victoria, Victoria, British Columbia, Canada, 3. Oregon State University, Corvallis, Oregon, United States

This study examines the within-person association between negative affect and global cognitive function for persons with dementia. Participants (n=33) engaged weekly in the Voices in Motion (ViM) sociocognitive choral intervention spanning up to 18-months and 9 individual assessments. Results revealed a significant time-varying association whereby within-person improvements in negative affect dynamically covaried with improvements on the Mini Mental State Examination ($p < .05$) across months of participation. These findings imply that, within-persons, reducing comorbidities associated with dementia (e.g., elevated negative affect) through participation in a lifestyle intervention, may facilitate increases in cognitive function. During the current pandemic, ViM transitioned to an online choir allowing for individuals to continue participating in the intervention and to maintain necessary social connections. The discussion focuses on the implications of this virtual choral intervention and the importance of modifiable risk factors such as negative affect and social isolation on the maintenance of cognitive health.

INVESTIGATING THE CORTICAL CORRELATES OF SINGING: POTENTIAL NEURAL BENEFITS OF CHOIR FOR PERSONS WITH DEMENTIA

Nicholas Tamburri, Debra Sheets, Drew Halliday, Andre Smith, and Stuart MacDonald, *University of Victoria, Victoria, British Columbia, Canada*

Through leveraging the known advantages of musical engagement and socialization, choir interventions are known to facilitate psychological and cognitive benefits for persons with dementia (PwD). Surprisingly, no research has explored whether social singing may also confer neurological advantages. In this study, we employed functional near infrared spectroscopy (fNIRS) to investigate the cortical correlates of both social and solo singing in PwD (n=13). Paired-sample t-tests were used to evaluate within-person differences in frontal cortical activation between the social vs solo singing. Results showed significant activation differences in three frontal channels, with social singing requiring comparatively less frontocortical activation. These findings indicate potential neural benefits of social singing – with less frontal activation being a proxy for greater reliance on intact proceduralized systems – and serve to highlight the utility of fNIRS in better understanding the neural correlates underlying the benefits of social singing interventions for PwD.

MODULATORS OF CAREGIVER DISTRESS AND CORRESPONDING IMPACTS ON PERSONS WITH DEMENTIA

Michaela Trites,¹ Sebastian Santana,¹ Debra Sheets,¹ Andre Smith,¹ Robert Stawski,² and Stuart MacDonald,¹
1. University of Victoria, Victoria, British Columbia, Canada, 2. Oregon State University, Corvallis, Oregon, United States

Extensive literature documents the detrimental effects of caregiver distress (CD) for caregivers. Less is known about the impact that CD exerts upon their care recipients, particularly persons with dementia (PwD). Using multilevel

modeling, this study employed dyadic data from the Voices in Motion study to examine time-varying within-person associations between key caregiver and care recipient indicators of psychosocial function. An initial dyadic coupling model indicated that cognitive functioning for PwD and caregiver well-being significantly predicted shifts in CD. A second time-varying dyadic model found that, within dyads, high levels of CD predicted lower positive affect and increased depression scores in PwD. Most sociocognitive interventions target a sole member of a dyad; our results suggest that both dyad members are impacted simultaneously. Caregiver well-being impacts CD, which in turn, impacts well-being in PwD. The symbiotic relationship between care partners and PwD is nuanced, with further research required to understand the interdependencies.

Session 1500 (Symposium)

VULNERABILITY AND RESILIENCE AMONG OLDER ADULTS DURING THE COVID PANDEMIC

Chair: Carolyn Aldwin

The COVID-19 pandemic is particularly challenging for many older adults. They are strongly encouraged to practice social distancing and sheltering in place to decrease morbidity and mortality risks. However, social isolation and loneliness increase the risk of mental and physical health problems. Nonetheless, there are indications that older adults may be more resilient than originally thought. Park et al. present longitudinal findings that younger adults fared worse than middle-aged or older ones, reporting greater distress and less social support, mindfulness, and emotion regulation skills. For older participants, acceptance of negative emotions and social support predicted lower distress. Choun et al. also present longitudinal data, showing that depressive symptoms decreased among older adults during the lockdown phase of the pandemic, but reflected changes in loneliness and physical health symptoms. Stelman et al. found that moderate levels of combat experience were helpful for some older Vietnam veterans coping with the pandemic, although a few found that it made coping more difficult. Turner et al. found that positive, non-familial intergenerational contacts were associated with a higher number of positive pandemic-related changes, such as finding new hobbies and meaning in work. Finally, Aldwin et al. present a social ecological approach to vulnerability and resilience. Using qualitative data, they found that stressors and resources were reported at personal, interpersonal and societal levels. Further, older adults both took comfort from and contributed to community resources during this pandemic. In summary, this symposium identified factors that contribute to older adults' resilience during this pandemic.

EMOTION REGULATION RESOURCES EXPLAIN MIDDLE-AGED AND OLDER ADULTS' COVID-19-RELATED DISTRESS

Cystal Park,¹ Beth Russell,² and Michael Fendrich,²
1. University of Connecticut, Storrs Mansfield, Connecticut, United States, 2. UCONN, Storrs Mansfield, Connecticut, United States

As the pandemic caused widespread disruption across the world, studies suggested younger adults were faring more poorly than other adults. We hypothesized that younger

adults might possess fewer emotion regulation resources and skills, accounting for their greater distress. In a national sample of 1528 adults, we examined how baseline resources (in mid-April, during initial peak infections) predicted distress (depression, anxiety, PTSD symptoms) five weeks later, when states began initial reopenings. Younger adults reported greater distress and less social support, mindfulness, and emotion regulation skills than did middle aged and older adults.. Controlling for stress exposure, younger adults' distress was predicted by impulsivity and lack of perceived strategies while middle-aged and older adults' distress was predicted by acceptance of negative emotions; perceived social support was related to lower distress for both groups but mindfulness was unrelated. Results suggest that emotion regulation skills are a promising prevention and intervention focus.

LONELINESS, SOCIAL CONTACT, AND HEALTH AMONG OLDER ADULTS DURING THE COVID-19 PANDEMIC

Soyoung Choun, Carolyn Aldwin, and Dylan Lee, *Oregon State University, Corvallis, Oregon, United States*

The COVID-19 pandemic is a challenging situation for many older adults at elevated risk for mortality. Social distancing and lockdown to prevent contagion may result in social isolation and feelings of loneliness, which can have adverse effects on health. We examined how depressive symptoms were associated with between-person differences and within-person variations in loneliness, social contacts, and daily physical problems during 8 weeks. We sampled 247 older adults (Mage = 71.1, SD = 7.3, range = 51 - 95), who participated at micro-longitudinal online surveys (baseline and 7 weekly follow-ups) from April 28 to June 23. Multilevel modeling analysis controlling age, gender, marital status, and education showed that depressive symptoms were significantly decreased during 8 weeks. Further, depressive symptoms were positively coupled with both loneliness and physical problems for both the within-and between-person levels. Increase in social contact was related to decreases in depressive symptoms only at the between-person level.

COPING WITH COVID: DOES PRIOR MILITARY SERVICE PLAY A ROLE FOR VIETNAM VETERANS?

Jeanne Stellman,¹ Steven Stellman,² Anica Kaiser,³ Avron Spiro,⁴ and Brian Smith,⁵ 1. *Mailman School of Public Health, Columbia University, Mailman School of Public Health, Columbia University New York, New York, United States*, 2. *Department of Epidemiology, Mailman School of Public Health Columbia University New York, New York, United States*, 3. *National Center for PTSD at VA Boston Healthcare System, Boston University School of Medicine, VA Boston Healthcare System Boston, Massachusetts, United States*, 4. *Boston University, Boston, Massachusetts, United States*, 5. *Women's Health Sciences Division, National Center for PTSD, VA Boston Healthcare System Boston, Massachusetts, United States*

We investigated the impact of earlier military combat on ability to cope with the COVID-19 pandemic in 379 male Vietnam veterans who responded to surveys in 1984, 1998, and 2020. Combat exposure was scored with a validated scale, contrasting lowest tertile (8-15) vs. medium/high (16-40). About one-fourth of veterans (26%) reported that their

military experience made it easier to cope with the pandemic, while over half (59%) said it had no effect. Medium/high-combat veterans were more likely to report that their military experience made coping easier (OR = 1.8, $p = 0.03$), but were less likely to report no effect of service on their coping than low-combat veterans (OR = 0.40, $p < 0.001$). All 19 respondents (5%) who said military experience made coping more difficult were medium/high combat veterans. Military experience, and combat particularly, affected many of these veterans' ability to cope with the pandemic decades after their service.

INTERGENERATIONAL RELATIONSHIPS AS A RESOURCE FOR RESILIENCE DURING THE COVID-19 PANDEMIC

Shelbie Turner,¹ Karen Hooker,² Shannon Jarrott,³ and John Geldhof,¹ 1. *Oregon State University, Oregon State University, Oregon, United States*, 2. *Oregon State University, Corvallis, Oregon, United States*, 3. *The Ohio State University, Columbus, Ohio, United States*

The intergenerational ties that offer support to older adults are likely useful for resilience during the COVID-19 pandemic. We analyzed whether positive and negative intergenerational contact was associated with positive pandemic-related personal change. We utilized data collected from 566 adults aged 50 and older between August 2020 and January 2021 via MTurk and a statewide research registry. Participants reported the quality of their contact with younger adults, and whether they experienced positive changes (i.e. new hobbies, healthier behavior, greater meaning in work) as a result of the pandemic. Higher positive, but not lower negative, non-familial intergenerational contact was associated with a higher number of positive pandemic-related changes (estimate = 0.07, SE = 0.03, $p = 0.02$). The quality of familial intergenerational relationships were not associated with positive pandemic-related changes. Non-familial intergenerational relationships may be especially important for resilience, and should be supported during a time when they may be difficult to maintain.

A SOCIAL ECOLOGICAL MODEL OF VULNERABILITY AND RESILIENCE IN OLDER ADULTS DURING THE COVID-19 PANDEMIC

Carolyn Aldwin,¹ Heidi Igarashi,² Maria Kurth,³ Hye Soo Lee,¹ Soyoung Choun,¹ and Dylan Lee,² 1. *Oregon State University, Corvallis, Oregon, United States*, 2. *Oregon State University, Oregon State University, Oregon, United States*, 3. *Oregon State University, Wilsonville, Oregon, United States*

Objectives: We used a social ecological model to examine vulnerability and resilience among older adults during the COVID-19 pandemic. Methods: We analyzed two open-ended questions included in a survey of 235 respondents, 51-95 years old (M = 71.35; SD = 7.39; 74% female), which asked about COVID-19-related difficulties and positive experiences during the past week. We identified three different levels for difficulties and positives at the personal, interpersonal, and/or societal levels. Results: Fewer than half of the respondents reported on difficulties (41%) and positives (40%) just at the personal level. In terms of crossing levels, people were most likely to report events spanning the

personal and interpersonal levels (14% and 18%, respectively). A few individuals reported difficulties and positives at the societal level. Discussion: Older individuals were acutely aware of challenges and positives existing at all three levels, and contributed to resources at the interpersonal and community levels.

Session 1505 (Symposium)

THE DIVERSE SPIRIT: SPIRITUAL CARE PERSPECTIVES AND THE IMPLICATIONS FOR OLDER ADULTS IN VARIOUS SETTINGS

Chair: Lydia Manning

Co-Chair: Chad Federwitz

Discussant: Julie Hicks Patrick

Religiosity and spirituality are commonly supported and viewed as essential elements of well-being in old and very old age, particularly at end of life. These essential elements often include the exploration of the meaning in life, inner peace, belonging, contentment, and near-end-of-life-completion. The positive outcomes of religious and spiritual beliefs and practices have been well established. However, these experiences and related positive outcomes may not always include a diverse array of older adults. The spiritual care of older adults is becoming more culturally diverse and includes differing perspectives on what constitutes spiritual care, both in approach and practice. This symposium will explore the current state of spiritual care for older adults through a lens of cultural diversity and inter-religious/spiritual perspectives. A focus on the current practices of spiritual care for older adults and future implications will also be considered. Recommendations pertaining to future gerontological inquiry in the importance of spiritual care, as well as diverse approaches within gerontological practice will be highlighted and discussed.

SELF-TRANSCENDENT WISDOM MEDIATES THE ASSOCIATION BETWEEN SPIRITUALITY AND WELL-BEING IN SIX NATIONS

Monika Ardel, ¹Juensung Kim, ²and Michel Ferrari, ²

1. *University of Florida, Gainesville, Florida, United States,*

2. *University of Toronto, Toronto, Ontario, Canada*

Distraught individuals sometimes turn to religion for solace, particularly in old age, so spirituality is not necessarily positively related to well-being. However, spirituality might lead to greater well-being if it promotes self-transcendent wisdom. Using a sample of 307 respondents from six nations (USA, Canada, Serbia, Ukraine, Iran, and China), ranging in age from 59 to 99 years ($M=73.00$, $SD=8.13$), this study tested the generalizability of the hypothesized mediated pathway. Results showed only weak correlations between spirituality and well-being measures in the whole sample. Yet, as predicted, spirituality, mediated by self-transcendent wisdom, was indirectly related to greater well-being in all six nations, despite significant differences by nation in variable means. Spirituality had additional direct positive effects on life satisfaction in Canada, Iran, and China and on general well-being in Iran and China. These findings suggest that spirituality likely results in greater well-being when it transcends egocentric concerns.

SPIRITUALITY TRAINING AS AN ESSENTIAL ELEMENT OF PERSON-CENTERED CARE

Raya Kheirbek, *University of Maryland School of Medicine, University of Maryland School of Medicine, Maryland, United States*

Palliative Medicine, built on the biopsychosocial-spiritual model of care, has long recognized the critical role of spirituality in the care of patients with complex, serious, and chronic illnesses. We conducted focus groups to arrive at a consensus definition of “spiritual care.” Additionally, we collected and compared frameworks and models that recognize that providers cannot be made compassionate simply through the imposition of rules; methods were needed to achieve behavior change. The created curricula covered the definitions of spiritual care, self-awareness, cultural sensitivity, assessment, and skills. As part of ongoing curriculum development processes, training included evaluation tools to accompany competency standards. Results demonstrated improvements in self-reported abilities to (a) establish appropriate boundaries with patients; (b) apply the concept of compassionate presence to clinical care; (c) understand the role of spirituality in professional life; (d) identify ethical issues in inter-professional spiritual care. Clinicians need to address patients’ spiritual needs.

COPING WITH UNCERTAINTY: USE OF CONTEMPLATIVE PRACTICES AMID A PANDEMIC

Nirmala Lekhak, ¹Tirth Bhatta, ²Tim Goler, ³and Eva Kahana, ⁴ 1. *University of Nevada Las Vegas, Las Vegas, Nevada, United States,* 2. *University of Nevada, Las Vegas, Nevada, United States,* 3. *Norfolk State University, Norfolk, Virginia, United States,* 4. *Case Western Reserve University, Cleveland, Ohio, United States*

Contemplative practices have been used as coping resources to reduce the negative influences of adverse life situations on mental health. The COVID-19 pandemic has disproportionately impacted older adults, causing immense uncertainty, stress, and anxiety. By using data from our “Coping with Pandemic” nationwide web-based survey ($n=1861$), we examine the utilization of practices such as meditation, prayer, and yoga across social, economic, and health status during the pandemic. Consistent with studies conducted before the pandemic, we find significantly greater utilization of meditation and yoga among women and higher educated individuals. Findings showed significantly greater usage of prayer among women and Blacks. Unlike previous studies, we documented greater usage of meditative practices among Blacks than Whites. Older adults with higher anxiety were significantly more likely to practice meditation and yoga. Our study offers much needed guidance for future intervention studies aimed at improving mental health among diverse groups of older adults.

AN EVOLVING INQUIRY OF MONASTIC SPIRITUAL CARE FOR AGING INMATES

Alex Bishop, ¹and Kevin Randall, ² 1. *Oklahoma State University, Oklahoma State University, Oklahoma, United States,* 2. *Sam Houston State University, Sam Houston State University, Texas, United States*

This investigation involved focus-group inquiry of the Oblates in Prison Program, a faith-based ministry founded

on monastic principles in the Rule of St. Benedict. Data from a Benedictine Order monk and program coordinator, ordained prison minister, and lay ministry volunteer were collected. Participants were asked a series of questions regarding the spiritual care of aging prisoners. Responses were coded and cross-compared for thematic content. Of central thematic importance was implementation of a spiritual care model using traditional monastic rules for daily living. A second theme centered on purposeful rebuilding of self-renewal through stability and obedience. A final emergent theme encompassed institutional acceptance in the provision of religious sacraments, sacred texts, and artifacts. Results highlight the broader implications of providing spiritual care and outreach to aging prisoners. The role of restorative justice for successful delivery of faith-based spiritual care for improved rehabilitation of aging inmates will be further addressed.

Session 2000 (Symposium)

ADVANCE CARE PLANNING IN THE CONTEXT OF COVID-19: COMPLEXITIES ACROSS A RANGE OF CONSTITUENTS

Chair: Brian Carpenter

Discussant: Karen Hirschman

The COVID-19 pandemic brought serious illness and death into close proximity for a large number of people, whether through personal experience, infection in family members or friends, or unremitting media coverage on the effects of the virus and widespread mortality. Because of a collective vulnerability to illness and the heightened possibility of death, more people began to contemplate what kinds of medical care they would want if they ever became seriously ill. In other words, more people began the process of advance care planning (ACP). This symposium explores how the COVID-19 pandemic shifted interest in and execution of ACP across a range of groups. The first presentation reviews survey data from a large, community-based sample of older adults about their ACP conversations before and after the start of the pandemic. Shifting to the experience of clinicians, the second presentation summarizes a survey with multidisciplinary healthcare professionals about ACP conversations in their personal lives during the pandemic and how their observations of patients influenced their own plans. The third presentation describes the reactions of undergraduate students to an ACP class exercise, including COVID-19 as a motivating factor for pursuing ACP. The final presentation concludes with a review of two clinical cases that illustrate how COVID-19 has upended traditional ACP and highlighted the need for new policies and processes, with a particular focus on ethics and equity. Together, these presentations offer diverse insights into how ACP may shift in a post-pandemic world.

HAS THE COVID-19 PANDEMIC INCREASED ADVANCE CARE PLANNING DISCUSSIONS HELD BY OLDER ADULTS?

Gloria Gutman,¹ Brian deVries,² Robert Beringer,³ Paneet Gill,⁴ and Helena Daudt,⁵ 1. *Simon Fraser University, Vancouver, British Columbia, Canada*, 2. *San Francisco State University, San Francisco, California, United States*, 3. *University of Victoria, Victoria, British Columbia, Canada*, 4. *Simon Fraser University, Surrey, British Columbia, Canada*, 5. *Victoria Hospice, Victoria, British Columbia, Canada*

In an online survey exploring older Canadians' experiences during the COVID-19 pandemic, 3989 respondents aged 55-99 indicated whether they had discussed their future care preferences and with whom, prior to and since the outbreak. Pre-pandemic, 62% had held such discussions; since the pandemic 43% did so, 11% for the first time. Rates were significantly higher among white respondents than among persons of color, women than men, and those 65+ than younger respondents. Respondents were most likely to have talked, respectively, with their spouse (58% before; 40% since), family (35%; 22%), and friends (12%; 10%)—with higher rates for white, women and older respondents. Surprisingly, only 4% before and 2% since the pandemic had discussed their care preferences with a doctor. Initiation of some new discussions was encouraging but there were fewer than expected, perhaps due to denial, superstition, or disbelief of pandemic severity. Advance care planning remains an under-utilized resource.

WHEN THE PROFESSIONAL TURNS PERSONAL: HEALTHCARE PROVIDERS AND THEIR OWN ADVANCE CARE PLANNING DURING THE PANDEMIC

Brian Carpenter, *Washington University in St. Louis, Saint Louis, Missouri, United States*

As healthcare professionals counseled patients and care partners during the pandemic about treatment options, clinical probabilities, and preparations for death, they had opportunities to reflect on how they themselves would want to be treated if they fell ill. We conducted a survey with healthcare professionals who were caring for patients during the pandemic and asked their work had affected their own advance care planning. Based on their clinical observations, 28% revised their personal interest in life-prolonging medical interventions. Substantial proportions had initiated conversations with partners (45%), parents (46%), and their primary care physician (29%) about their medical preferences. Similarly high percentages had encouraged family members and friends to update or complete their advance care plans, and 26% intended to initiate planning in the near future. Interest in advance care planning is high among healthcare professionals, who may benefit from tailored resources that acknowledge their clinical experience.

COVID-19 AND DEATH ANXIETY: THE IMPACT ON STUDENTS' APPRAISALS TO COMPLETING ADVANCE DIRECTIVES

Carlyn Vogel,¹ Debra Dobbs,² Maureen Templeman,¹ Victoria Marino,¹ and William Haley,¹ 1. *University of South Florida, Tampa, Florida, United States*, 2. *University of South Florida, School of Aging Studies, University of South Florida, Florida, United States*

This study examined possible effects of COVID-19 on students' appraisals, coping, and responses to completing advance directives (ADs). We used the transactional model of stress and coping to explore 93 undergraduate students' responses to an AD assignment completed in an undergraduate course during COVID-19. Students watched a recorded lecture, read content related to ADs, and examined a sample copy of a 5 Wishes document. Students completed an assignment reflecting on reactions to completing ADs. Content analysis of 65 responses indicated almost 10% of students mentioned COVID-19 or the pandemic as a reason to complete ADs. Approximately 18% mentioned their youth and 40% mentioned sudden or serious illness as reasons to complete ADs. Nearly 30% mentioned death anxiety as a reason for being unprepared to complete ADs. Instructors should consider ways to inform and help students process their emotions given contextual factors (e.g. the pandemic) when teaching about ADs.

ADVANCE CARE PLANNING IN THE TIME OF COVID: REAL-WORLD CASE DISCUSSIONS

Erica Frechman,¹ and Harleah Buck,² 1. *Vanderbilt University, Nashville, Tennessee, United States*, 2. *University of Iowa, Iowa City, Iowa, United States*

COVID has accelerated the science and practice of palliative care while creating a sense of urgency in advance care planning (ACP). Past palliative care principles and practices have been stressed to the breaking point, causing the need for new ACP approaches to elicit patient-and-family goals/values/preferences. In this presentation, two cases will be used to discuss pragmatic implications and real-world implementation strategies in the trenches of the major health care system disruptor of this generation. We will discuss access to documentation, immediacy and complexity of the decision-making process, provider impacts, role of the family, and even an upside to this crisis. This will include questions of ethics and equity. The first case involves an older man whose family disregarded his wishes, while the second case discusses the pitfalls and pearls when family cannot visit. These two cases highlight COVID's impact on ACP and cause us to re-think its process and delivery.

Session 2005 (Paper)

Ageism (SRPP Paper)

AGEISM AND PERCEPTIONS OF VULNERABILITY: FRAMING OF AGE DURING THE COVID-19 PANDEMIC

Jasmin Tahmaseb McConatha,¹ Jordan Broussard,¹ and Jacki Magnerelli,¹ *West Chester University, West Chester, Pennsylvania, United States*

Media representations of the Covid-19 pandemic and its devastating consequences have shaped people's fears, anxiety, and perceptions of vulnerability. Social scientists have examined the consequences of how information is "framed." Framing theory asserts that issues can be portrayed differently by emphasizing or de-emphasizing aspects and information. According to Lakoff (2004) the impact of a message is not based on what is said but how it is said. Theories of framing focus on how the media frames issues, which then structure and shape attitudes and policies. A news article serves as a frame for an intended message. The purpose of this project is to analyze the ways that "age" has been framed during the Covid-19 pandemic. One of the most dominant frames in terms of COVID-19 coverage is how the pandemic has been analyzed through the lens of age and framed in terms of age discrimination. Method: A thematic analysis of New York Times and Washington Post news articles addressing older adults and illness vulnerability was conducted. The results of news articles appearing in these prominent newspapers indicated that the perceptions of older men and women tended to focus on the relationship between age and vulnerabilities to severe consequences from Covid-19. The frames in which these new articles were presented indicated ageist tones and messages that had the potential to either reinforce or lead to age stereotyping and discrimination.

AGEIST POLICIES THAT FAVOR OLDER PEOPLE: WHAT DO OLDER PEOPLE THINK?

Hakan Jonson,¹ and Tove Harnett,² 1. *Lund University, Lund University, Skane Lan, Sweden*, 2. *Lund University, Lund, Skane Lan, Sweden*

Policies on supportive services have frequently used chronological age to determine rights and needs of people within the adult population. Such policies have been described as ageist, but could also be regarded as favoring older people in cases where chronological age is used as a proxy for needs. In Sweden, municipalities have recently been allowed to grant people above a certain age some home care services without individual needs testing, and several political parties have suggested that a nursing home guarantee at the age of 85 should be introduced. The aim of the study that this presentation reports on was to investigate views among older people on age as an organizing principle for distributing eldercare services. Data was collected through an online surveys to members of pensioners' organisations (N=1540). Respondents were asked about their views on a number of age-related policies that are used or proposed as part of the eldercare system in Sweden. The analysis revealed a general support for the use of chronological age as a proxy for needs. This suggest that respondents used an interest groups perspective and supported stereotypical arrangements that favored older people. When free-text answers were included in the analysis, it became evident that the use of chronological age was not related to the problem of ageism. In the presentation we will discuss the potential gap between anti-ageism and views of older people and what a framework on ageism brings into the moral economy of eldercare.

EMPLOYERS' SUPPORT OF OLDER ADULTS FACING AGEISM IN THE WORKPLACE: A SCOPING REVIEW OF THE LITERATURE

Amanda Bull,¹ Raza Mirza,² Andrea Gardiola,³ Christopher Klinger,² and Jessica Hsieh,² 1. *University of Toronto, Whitby, Ontario, Canada*, 2. *University of Toronto, Toronto, Ontario, Canada*, 3. *Queen's University, Toronto, Ontario, Canada*

As the Canadian population continues to age rapidly, addressing the social structures that negatively impact older adults is of increasing importance. The most prominent of these social structures is the workplace, which can be a potential source of age discrimination. The goal of this scoping review was to analyze the literature that addresses strategies for employers to support older workers experiencing ageism, in order to answer the research question: How can employers support older adults (50+) facing ageism in the workplace? Following Arksey and O'Malley's five-step framework, an electronic database and grey literature search was conducted between September and December 2020. Thematic content analysis was performed to establish key themes. The search revealed 3,635 peer-reviewed and grey literature sources that were evaluated by three investigators. Thirty-six articles, published between 2006 and 2020, met inclusion criteria and examined various support strategies for employers. Five major emerging themes were identified from the literature: (1) Recruitment practices, (2) Training opportunities, (3) Education for managers, leaders, and employees in the workplace, (4) Flexible employment opportunities, and (5) Methods to change the psycho-social environment of the workplace. Implementation of these interventions is required to support older adults who may be experiencing workplace ageism. Longitudinal research of these interventions is required to determine the lasting effects of these strategies; however, the existing literature supports the implementation of these supportive actions, which is vital to ensuring that older adults are able to attain and maintain valuable work, in healthy environments, now and into the future.

THE OTHERING OF OLDER PEOPLE IN DISABILITY POLICIES

Hakan Jonson, *Lund University, Lund University, Skane Lan, Sweden*

Disability policies in Sweden rest on the idea that all humans have equal value and a goal of policies has been to enable persons with disabilities to be able to live like other members of society, but older people do not seem to be included as part of this goal. The presentation concerns the Swedish support system's legal discourse, and investigates the rationale for excluding people over the age of 65 from services that younger people with disabilities may obtain. Data consists of government texts and court decisions under the Severe Disability Act about services for people over the age of 65. It was found that little in the legal discourse concerns the needs and rights of older people, and the general belief is that the Severe Disability Act is primarily intended for children, young people, and adults of working age. The legal discourse contained a type of "residual ageism" that was justified through the indirect construction of older people as different. Othering of older people was present in assumptions about differences in categorizations (people with disabilities

vs older people with support needs), needs (active age vs not active age), and comparisons (with people without disabilities of the same age vs with others receiving eldercare). The presentation outlines potential changes of these policies.

Session 2010 (Symposium)

AGING IN PLACE: SOCIAL CONNECTEDNESS AND THE HEALTH OF OLDER SUBSIDIZED HOUSING RESIDENTS

Chair: Thomas Cudjoe

Co-Chair: Judith Gonyea

Discussant: Robyn Stone

Findings on the prevalence and impacts of loneliness and social isolation on the lives of older adults have led to the lack of social connectedness being viewed as a major public health issue. Although an understudied population, emerging evidence suggests that for the nearly 3 million older low-income adults living in subsidized housing the impacts of lack of social connection may be especially profound. From a life course perspective, "cumulative economic disadvantage," if combined with a "cumulative connectedness disadvantage," may heighten exposure to health risk factors and negative health outcomes. Addressing social risk factors in this population thus may have the potential to reduce health disparities as well as improve quality of life. Decades of epidemiologic evidence suggest that social isolation is a key factor in disparate outcomes. Evidence-based interventions are needed to improve aging in place for this population, but little is known about the individual or contextual factors that influence social connectedness and health among this high-risk population of older adults. This symposium includes interdisciplinary perspectives and methods as well as present results from four studies that examine 1) perspectives on aging in place in subsidized housing, 2) relationship between social connection and food insecurity 3) relationship between social isolation and healthcare utilization and 4) between resident ties and links to health outcomes. Papers in this symposium will highlight the implications of study findings for informing future interventions to improve aging in place for older adults living in subsidized housing.

RESOURCES WITHIN: BETWEEN RESIDENT TIES AND LINKS TO HEALTH AMONG OLDER SUBSIDIZED HOUSING RESIDENTS

Noah Webster, *University of Michigan, Ann Arbor, Michigan, United States*

Increasing evidence points to the importance of non-family ties in promoting health among older adults. Less is known though about these ties within the context of subsidized housing. In this study we examine prevalence of social ties between residents and examine links to health. Data were collected through interviews conducted with 39 residents age 62 and older living in a subsidized housing community in Southeast Michigan. Residents reported knowing on average 10 (SD=6.5) other residents, and nominated three (SD=4.2) residents into their close social networks. Residents who reported getting out of the community less often and those with one or more health limitations nominated significantly more residents into their network. Also, getting out of one's apartment more often was associated with knowing

more residents in the community. Findings highlight between resident ties may serve as an important resource for those geographically restricted and may be useful to integrate into interventions.

AGING IN PLACE FOR OLDER SUBSIDIZED HOUSING RESIDENTS: THE INFLUENCE OF SOCIAL CONNECTION AND SOCIAL ENVIRONMENT

Rebecca Brown,¹ David Reyes-Farias,² Erin Finucane,² Amanda Watson,² Momana Jahan,² Sonia Pandit,² Carolina Reid,³ and Barbara Resnick,⁴ 1. *Perelman School of Medicine of the University of Pennsylvania, Wynnewood, Pennsylvania, United States*, 2. *University of Pennsylvania, Philadelphia, Pennsylvania, United States*, 3. *University of California, Berkeley, Berkeley, California, United States*, 4. *University of Maryland School of Nursing, Baltimore, Maryland, United States*

Older adults living in subsidized housing experience health disparities including disproportionate rates of social isolation and nursing home admission. Little is known about how social relationships and social environment influence aging in place for this population. We interviewed 58 residents aged 62 or older. Qualitative thematic analyses revealed that social relationships both inside and outside the building contributed to residents' experience of aging in place. Relationships with other residents and staff members provided social support, while connections to family and friends outside the building "opened up" the residents' world and provided a sense of connection to the larger community. Social and physical environment also contributed, with residents' ability to move between private and public spaces leading to feelings of freedom and independence. Discussion focuses on expanding definitions of aging in place to encompass residents' experiences and implications for improving aging in place for this population.

SOCIAL ISOLATION AND HEALTHCARE UTILIZATION AMONG OLDER ADULTS LIVING IN SUBSIDIZED HOUSING

Thomas Cudjoe,¹ Laura Prichett,² Katherine Runge,³ Laura Andes,³ Carl Latkin,⁴ and Cynthia Boyd,⁵ 1. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*, 2. *Johns Hopkins BEAD, Baltimore, Maryland, United States*, 3. *Mercy Housing, Denver, Colorado, United States*, 4. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 5. *Johns Hopkins University, Baltimore, Maryland, United States*

Older adults living in subsidized housing are often at high risk for having multiple chronic conditions and nursing home placement. Previous studies in this population have not examined the relationship between social isolation and healthcare utilization. We examine this using Lubben Social Network Scale-6 and self-reported healthcare utilization. Utilizing data from a multi-state non-profit subsidized housing provider, we performed descriptive and multivariate analyses on a sample of older adults (N=3,822). Overall, 95 % reported having a checkup within the last 12 months and an average of less than one emergency room visits (mean=0.58) or hospitalizations (mean=0.34). In adjusted models, socially isolated older adults had lower levels of routine

checkup (OR=0.50, CI 0.36,0.70) and higher levels of hospitalizations (IRR=1.30, CI 1.10,1.54) compared to older adults who were not socially isolated. Efforts to address healthcare utilization should identify social isolation and explore strategies to promote social connectedness to improve health.

FOOD INSECURITY AMONG OLDER URBAN SUBSIDIZED HOUSING RESIDENTS: THE IMPORTANCE OF SOCIAL CONNECTEDNESS

Judith Gonyea,¹ Arden O'Donnell,¹ and Alexaandra Curley,² 1. *Boston University, Boston, Massachusetts, United States*, 2. *Case Western Reserve University, Cleveland, Ohio, United States*

Poverty and food insecurity are associated with poor health in later life. Although housing is recognized as a social determinant of health; relatively little research has explored food insecurity in the marginalized population of older subsidized housing residents. In this study, we examined factors associated with food insecurity and particularly how social connectedness was associated with food insecurity. We hypothesized that social connection measures (i.e., loneliness, sense of belonging) independent of sociodemographic, health and food program variables would contribute to food insecurity. Our data are from interviews with 216 residents ages 55-plus (50% Black, 45% LatinX). The 6-item USDA Household Food Security Survey found high rates of food insecurity, 40% for ages 55-69 and 20% for ages 70-plus. Multivariate logistic regression models revealed that loneliness was significantly related to food insecurity even after other factors were controlled. Discussion centers on strategies for addressing social risk factors to ameliorate food insecurity.

Session 2015 (Symposium)

ALZHEIMER'S DISEASE RESEARCH AND OUTREACH IN THE NEW NORMAL: TRANSITIONING TO THE VIRTUAL WORLD

Chair: Stacy Andersen
Co-Chair: Patricia Heyn

Following disruptions to research, clinical trials, and support for individuals with Alzheimer's disease and related dementias (ADRD), 2020 taught us important lessons about the need for creativity, flexibility, and resourcefulness during an urgent and global public health crisis. The COVID-19 pandemic showed that we have knowledge and technology that can be rapidly implemented, adopted, and utilized by many sectors to allow the continued care and research of our older adult population with ADRD. Thus, this symposium will address virtual methods that are transforming ADRD research and support. First, Dr. Rhodus will discuss the implementation of online assessments in clinical trials at an Alzheimer's Disease Research Center and the effects of sociodemographic disparities in online accessibility. Next, Dr. Bazzano will describe methods of remote collection of brain health data through tablets, smartphones, and wearables in the Bogalusa Heart Study. Then, Dr. Andersen will report on the transition from in-person to virtual assessments of cognitive and physical function in centenarian studies and address strategies for inclusivity of individuals

with limited technology experience. Next, Dr. Fazio will introduce Project VITAL which aims to impact social isolation by increasing accessibility to virtual education and support for care community staff, family caregivers, and individuals with dementia. Finally, Dr. Penfold will report on the translation of a paper-based, face-to-face intervention for reducing caregiver burden into a self-directed online learning program. Overall, these presentations highlight successes and challenges in incorporating virtual-based methods to maintain engagement with participants, individuals with ADRD, and caregivers during the pandemic and beyond.

LONGEVITY STUDIES IN THE NEW NORMAL: THE MOVE TO VIRTUAL ASSESSMENT

Stacy Andersen,¹ Sandra Rizer,² Lance San Souci,¹ Melissa Berlin,¹ Emily Harris,¹ Stephanie Cosentino,³ Paola Sebastiani,⁴ and Thomas Perls,⁵ *1. Boston University School of Medicine, Boston, Massachusetts, United States, 2. Columbia University Irving Medical Center, New York, New York, United States, 3. Columbia University Medical Center, New York, New York, United States, 4. Tufts Medical Center, Physician Organization, BOSTON, Massachusetts, United States, 5. Boston University, Boston, Massachusetts, United States*

Extreme longevity is associated with resilience to Alzheimer's disease. A major goal of centenarian studies is therefore to identify factors associated with maintaining cognitive function throughout life. Over the past year, two studies of centenarians and their offspring (age 60-110+ years) have pivoted from in-home assessments of cognitive and physical function to hybridized, Zoom-based assessments including comprehensive cognitive testing, blood pressure, grip strength, and accelerometry and biological sample collections. Protocols were optimized for accessibility for individuals with limited technology experience (e.g., investigator remotely controls all functions of the participant's tablet) and sensory impairments (e.g., integration of wireless headphones) and include high-sensitivity data collection (e.g., sensor-based wearables and digital recording of cognitive test responses). Advantages of virtual administration included the ability to accommodate fatigue through multi-day assessment and to include geographically-isolated individuals. Disadvantages included participant burden due to equipment setup and inability to collect certain measures virtually (e.g., carotid ultrasounds).

A NEW NORMAL? CONTINUED IMPACT OF COVID19 ON ALZHEIMER'S CLINICAL TRIALS RESEARCH

Elizabeth Rhodus,¹ Allison Gibson,² Shoshana Bardach,³ Erin Abner,¹ and Gregory Jicha,¹ *1. University of Kentucky, Lexington, Kentucky, United States, 2. University of Kentucky, University of Kentucky, Kentucky, United States, 3. Dartmouth University, Dartmouth University, New Hampshire, United States*

The COVID-19 pandemic has led to unprecedented challenges in Alzheimer's disease and related dementias (ADRD) clinical trials research. Scientists continue to grapple with the potential and multifaceted consequences of COVID-19. This presentation will discuss strategies used at a U.S. Alzheimer's Disease Research Center to implement virtual methods to counter COVID-19's impact on safety for continued research

engagement; address the disparate impact by age, race, and ethnicity for online accessibility; and plans for virtual engagement in future research. As scientists navigate lasting implications of COVID-19, future study planning, design, and management will likely be altered. Specifically, increased awareness of participant-centered approaches, inclusion of psychosocial implications, and focus on ways to meet older adults' unique needs of virtual accessibility will be needed. We must be intentional to counter COVID-19's lasting impact on ADRD clinical trials research while maintaining rigor and reproducibility to uphold and progress advances toward treatment and cures for ADRD.

BUILDING ON EXISTING TECHNOLOGY TO ENHANCE REMOTE ASSESSMENTS OF BRAIN HEALTH

Lydia Bazzano,¹ Camilo Fernandez,¹ Philip Hwang,² Ileana DeAnda-Duran,¹ Enejda Senko,² Honghuang Lin,² Vijaya Kolachalama,² and Rhoda Au,² *1. Tulane University, New Orleans, Louisiana, United States, 2. Boston University, Boston, Massachusetts, United States*

Tablets, smartphones, linked devices have features such as high-fidelity microphones, accelerometers, GPS locators, and gyroscopes can be used to capture brain health-related data. Collection of data remotely is especially important given the vulnerability of older adults to COVID and the need to protect from such exposure. As part of an American Heart Association/Gates Venture Strategically Funded Network, a number of remote assessments are being deployed to capture information related to brain health in a subset of the Bogalusa Heart Study cohort (mean age 51.4, SD 5.3). The Linus Health Platform includes applications that measure cognitive abilities, and collect digital voice features and phone sensor data that can be derived into surrogate measures of cognitive function and mood. A readily available suite of games (Lumosity) is also being used to assess cognitive health. These devices and applications offer a largely unexplored opportunity for acquiring and assessing data related to brain health.

PROJECT VITAL: A STATEWIDE INITIATIVE USING TECHNOLOGY TO IMPACT SOCIAL ISOLATION

Sam Fazio, *Alzheimer's Association, Chicago, Illinois, United States*

Project VITAL leverages customized technology to enhance connection, engagement, education and support to individuals with dementia and their caregivers. The goal was to positively impact social isolation, stress, and well-being and help mitigate the effects of isolation experienced during the pandemic and beyond. Phase One included three components designed to impact connection, engagement, education and support. It's Never Too Late provided 300 customized tablets to 150 care communities to facilitate connections to family members and increase individualized, person-centered engagement. Project ECHO, a video-based learning platform, educated and supported care community staff. Virtual education and support were offered to family caregivers at home. Phase Two provided the program to an additional 150 care communities and added online professional training/certification. Phase Three focuses on 150 family caregivers and individuals with dementia living at home. In addition to connection and individualized engagement, family caregivers now had direct access to virtual programs and services.

STAR CAREGIVERS: VIRTUAL TRAINING AND FOLLOWUP: IMPLEMENTATION

Robert Penfold,¹ Maggie Ramirez,² Susan McCurry,³ Linda Terry,⁴ James Ralston,⁵ and Kelly Hansen,¹ 1. *Kaiser Permanente Washington Health Research Institute, Seattle, Washington, United States*, 2. *University of Washington School of Public Health, Seattle, Washington, United States*, 3. *University of Washington School of Nursing, Seattle, Washington, United States*, 4. *University of Washington School of Nursing, Seattle, Washington, United States*

STAR Caregivers is an evidence-based intervention designed to reduce caregiver burden for caregivers of people living with dementia. This study translated the paper-based, face-to-face intervention into a 6-session, self-directed on-line learning program supported by 6, 30-minute telephone calls with a clinically trained coach. Our approach is designed to overcome issues of access to training. Eligible caregiver-patient dyads at Kaiser Permanente Washington were identified automatically via electronic health records. Qualitative interviews were conducted with a sample of patients to elicit information about their needs and preferences for training. We developed a “learning management system” (analogous to compliance training modules) complete with slides, voice-over narration, and testing. The training sessions are mounted on the KP Learn site and accessible to anyone. Baseline and outcomes data on standardized instruments are collected remotely via REDCap. Recruitment for the study is ongoing and initial participant feedback on the program is very positive.

Session 2020 (Paper)

Biology and Environment of Aging

AIR POLLUTION EXPOSURE IS ASSOCIATED WITH COGNITIVE PERFORMANCE: RESULTS FROM THE EINSTEIN AGING STUDY

Nelson Roque,¹ Charles Hall,² Mindy Katz,² and Martin Sliwinski,³ 1. *University of Central Florida, Orlando, Florida, United States*, 2. *Albert Einstein College of Medicine, Bronx, New York, United States*, 3. *The Pennsylvania State University, University Park, Pennsylvania, United States*

Prior research has established that those exposed to higher levels of fine particulate matter (PM₁, PM_{2.5}) air pollution have higher levels of accumulated amyloid-beta (A β) and tau in frontal cortex at autopsy, higher error rates on cognitive function assessments, and lower scores on memory and both verbal and non-verbal intelligence assessments. We explored the relationship between regional air quality monitoring measures (EPA AirData) and baseline cognitive performance of 312 older adults, from the Einstein Aging Study (EAS, NIA P01AG003949). Participants completed neuropsychological assessments at baseline and each followup wave (i.e., delayed free recall and total recall; Trails A & B, Digit Symbol substitution task (DSST), MoCA). For each participant, based on their zipcode, we computed average PM_{2.5} exposure at various exposure windows (1-15, 30-60, 60-90, 90-120 days prior to baseline). Adjusting for age, education, and gender across all models, mean of daily particulate matter exposure

at various exposure windows (30-60, 60-90 days) was significantly related to performance on the MoCA and Trails A & B, in expected directions (i.e., higher pollution, worse cognitive performance - more error, slower speed). Models with memory performance as the outcome indicated that only distant time horizons were related to memory performance (i.e., 60-90, 90-120 days prior). These findings suggest that particulate matter air pollution likely affects different cognitive domains at different timescales. This methodology cannot address contributions from indoor air quality and mobility - an exposure misclassification likely resulting in significant biases towards the null in the estimation of the effects of air pollution.

BLOOD PRESSURE VARIABILITY AND COMPLEXITY IN NURSING HOME RESIDENTS BEFORE DEATH

Laura Graham,¹ Sei Lee,² Michael Steinman,² Carmen Peralta,³ Anna Rubinsky,³ Bocheng Jing,⁴ Kathy Fung,⁴ and Michelle Odden,⁵ 1. *VA Palo Alto Health Care System, Menlo Park, California, United States*, 2. *University of California San Francisco, San Francisco, California, United States*, 3. *University of California, San Francisco, San Francisco, California, United States*, 4. *San Francisco VA Medical Center, San Francisco, California, United States*, 5. *Stanford University, Stanford, California, United States*

Blood pressure (BP) is a complex dynamic system in the human body and an important determinant of healthy aging. Exploring BP as a dynamic data system may provide important insights into how BP patterns can provide complementary information to the static, one-time BP measurements that are more commonly used for clinical decision making. Thus, we sought to describe BP as a dynamic data system in older adults nearing death. Using a prospective cohort study design, we assessed BP measures 6 months before death in Veterans Health Administrative nursing home residents between 10/1/2006 and 9/30/2017. Variability was characterized using standard deviation and mean square error after adjusting for diurnal variations. Complexity (i.e., amount of novel information vs. redundancy) was examined using Shannon's entropy (bits). Generalized linear models were used to examine factors associated with overall BP variability. We identified 17,953 patients (98.0% male, 82.5% White, mean age 80.2 years, and mean BP 125.7/68.6 mmHg). In the last 6 months of life, systolic BP decreased slightly (\square -7.2mmHg). Variability was stable until the last month of life, at which point variability increased by as much as 30%. In contrast, complexity did not change in the 6 months before death (\square 0.02 bits). Factors associated with BP variability before death include hospitalizations, hospice care, and medication changes. Systolic BP decreases in the last 6 months before death, and BP variability increases in the last month of life. Further, the increase in BP variability may be driven by increasingly complex care patterns as one approaches death.

NOVEL POSITIONAL AND BIOLOGICAL CANDIDATE GENE FOR GRIP STRENGTH IN OLDER ADULTS: THE LONG LIFE FAMILY STUDY

Adam Santanasto,¹ Mary Wojczynski,² Ryan Cvejkus,³ Lihua Wang,⁴ Bharat Thyagarajan,⁵ Kaare Christensen,⁶ E. Warwick Daw,⁷ and Joseph Zmuda,³ 1. *University of*

Pittsburgh, Pittsburgh, Pittsburgh, Pennsylvania, United States, 2. Washington University School of Medicine, Washington University School of Medicine, Missouri, United States, 3. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 4. Washington University School of Medicine, St. Louis, Missouri, United States, 5. University of Minnesota, Minneapolis, Minnesota, United States, 6. Department of Public Health, University of Southern Denmark, Odense, Syddanmark, Denmark, 7. Washington University in St. Louis, St. Louis, Missouri, United States

Grip strength is a robust indicator of overall health, is moderately heritable and predicts longevity in older adults. Using genome-wide linkage analysis, we identified a novel locus on chromosome 18p linked to grip strength in 4534 individuals from 582 families (age 70.0 ± 15.8 , range 24–110 years; 54% women). DNA sequencing was completed to identify single nucleotide variants (SNVs) in the 3.44 – 4.04 mega-basepair region on chromosome 18p. Using the sequencing data, we performed association analyses between the 7312 SNVs in the region and grip strength in families exhibiting evidence for linkage. Models were adjusted for age, age², sex, height, field center and population substructure. There were 23 families (263 individuals) that contributed to the linkage peak (cumulative logarithm of the odds [LOD] score = 12.4). Six families (112 individuals) accounted for most of the linkage signal (LOD = 6.4). In these 6 families, we found highly significant associations between SNVs in the Disks Large-associated Protein 1 (DLGAP1) gene and grip strength (lead SNV: $\beta = -0.75\text{kg} \pm 0.15$, $p\text{-value} = 4.3 \times 10^{-6}$). Correcting for the top SNV in DLGAP1 reduces the LOD by 72% in these families. Further, the effect allele frequency is much higher in these 6 families (39.7%) compared with both the NHLBI's Trans-OMICs for Precision Medicine (23.5%) and 1000Genomes (28.0%) reference panels. The DLGAP1 gene plays an important role in post-synaptic density of neurons; thus, it is a novel positional and biological candidate gene for follow-up studies aimed at uncovering genetic determinants of muscle strength.

PLEIOTROPIC GENES FOR PULMONARY FUNCTION AND AGING-RELATED TRAITS: THE LONG LIFE FAMILY STUDY (LLFS)

Mary Feitosa,¹ Mary Wojczynski,² Jason Anema,³ E. Warwick Daw,⁴ Lihua Wang,⁵ Marianne Nygaard,⁶ Adam Santanasto,⁷ and Michael Province,² 1. Washington University School of Medicine in St. Louis, St. Louis, Missouri, United States, 2. Washington University School of Medicine, Washington University School of Medicine, Missouri, United States, 3. Washington University School of Medicine, St. Louis, Missouri, United States, 4. Washington University in St. Louis, St. Louis, Missouri, United States, 5. Washington University School of Medicine, St. Louis, Missouri, United States, 6. Department of Public Health, University of Southern Denmark, Odense, Syddanmark, Denmark, 7. University of Pittsburgh, Pittsburgh, Pittsburgh, Pennsylvania, United States

Pulmonary function progressively declines with aging. Forced expiratory volume 1-second (FEV1) and forced vital capacity (FVC) are predictors of morbidity of cardiovascular diseases and all-cause mortality. Reduced pulmonary function

has shown association with elevated chronic low-grade systemic inflammation and low muscle strength, and glycosylated hemoglobin (HbA1c). We evaluated whether FEV1 and FVC share common genetic factors with interleukin-6 (IL-6), high-sensitivity C-reactive protein (hsCRP), body mass index (BMI), handgrip strength, plasma glucose, and HbA1c employing correlated meta-analysis (CMA) in up to 3888 individuals (age range: 26–106). CMA tests whether combining genome-wide association (GWA) P-values from two or more traits enhances the ability to detect variants concomitantly influencing such traits. We considered a variant pleiotropic if the univariate GWA $P \leq 1.0 \times 10^{-2}$ and CMA $P \leq 5.0 \times 10^{-8}$. We identified pleiotropic loci for FEV1 (or FVC), IL-6 and hsCRP within CYCS, CALN1, TRIM9, AXIN2, MICAL3, and CMIP; FEV1 (or FVC) and BMI within CYP2U1, LINC00871-RPL10L-MDGA2, and LOC105372472; FEV1 (or FVC) and grip strength within XXYLT1 and MAL2; FEV1 and FPG within MAF; and FVC and HbA1c within HDHD3. Some loci were reported as GWAS suggestive ($P < 10^{-6}$) for pulmonary function. Additionally, the identified loci harbor genes with roles in pro-inflammatory cytokine production, immune and inflammatory pathway, T-helper signaling pathway, transforming growth factor-beta, and T-cell receptor-alpha enhancer. Our findings suggest that inflammation is a feature of reduced pulmonary function with IL-6, hsCRP, BMI, low muscle strength, glucose, and HbA1c. Pleiotropic genetic associations across these traits may explain part of the correlated genetic architecture between pulmonary function and aging-related traits.

THE POSITIVE IMPACT OF A NOVEL AIR PURIFICATION TECHNOLOGY ON ENVIRONMENTAL AND CLINICAL OUTCOMES

Susan Schlenker,¹ and Kathryn Worrirow,² 1. Phoebe Ministries, Allentown, Pennsylvania, United States, 2. LifeAire Systems, Allentown, Pennsylvania, United States

Reducing sources of illness improves resident care. An advanced air purification technology (AAPT) was designed to destroy the DNA and RNA of all bacteria, fungi and viruses, rendering them non-infectious and to remediate volatile organic compounds (VOCs). This study compares the biological, fungal and VOC loading using the AAPT to standard high efficiency particulate air (HEPA) filtration. It was hypothesized that the AAPT would be associated with reductions in airborne and surface pathogens, VOCs and improved clinical metrics. A control floor with HEPA filtration and study floor with AAPT remediation were studied. Measurements of total VOCs and airborne and surface bacteria and fungi were measured in five locations on each floor. The facility acquired infection (FAI) rate, the number of infections divided by total patient days, showed a 57% difference between the control floor (2.33 FAIs/month) and the study floor (1.00 FAIs/month) and a decrease of 39.75% pre-installation (1.66 FAIs/month) to post-installation (1.00 FAIs/month). The viable pathogen loading measured on the study floor was reduced from an average of 483.8 colony forming units (CFU)/m³ pre-installation to an average of 56 CFU/m³ post-installation. VOCs were reduced from an average of 641.66 parts per billion (PPB) to 64.96 PPB and viable surface bacteria from an average of 110.6 CFU/m³ to 97.2 CFU/m³. The AAPT significantly reduced levels of

infectious airborne and surface pathogens and VOC levels. As a result, residents on the AAPT floor demonstrated significant improvements in FAI rates. The findings support the hypothesis that environmental factors impact resident wellness.

Session 2025 (Paper)

Challenges of COVID-19

CHALLENGES FOR CHILDREN 65+ CARING FOR PARENTS 90+ WITH DEMENTIA DURING COVID-19

Elizabeth Gallagher,¹ Kathrin Boerner,² Yijung Kim,³ Kyungmin Kim,⁴ and Daniela Jopp,⁵ 1. *University of Massachusetts Boston, Boston, MA, Massachusetts, United States*, 2. *University of Massachusetts Boston, Boston, Massachusetts, United States*, 3. *The University of Texas at Austin, Austin, Texas, United States*, 4. *Seoul National University, Seoul, Seoul-t'ukpyolsi, Republic of Korea*, 5. *University of Lausanne, Lausanne, Vaud, Switzerland*

With the rise of the novel coronavirus, family caregivers of persons with dementia have been tasked with adapting to an entirely new caregiving landscape. Adult children caring for parents in the 'oldest old' age group bear an additional burden. Namely, children that are older adults themselves are navigating the joint vulnerability of both their own and their parents' aging-related issues (e.g., health problems). The aim of this study was to explore the experiences of dementia caregivers during COVID-19 from the unique perspective of children aged 65 and older caring for parents aged 90 and older. Participants were 30 caregivers from the Boston Aging Together Study with whom we conducted in-depth interviews between March 2020 and February 2021. Thematic analysis revealed key challenges related to COVID-19. Children were worried about the prospect of their parent contracting the virus and took steps to minimize their parent's exposure, such as discontinuing use of formal supports (e.g., home health aides) or assistance from other family and friends. Forgoing these supports often created greater responsibilities for caregivers as well as contributed to greater social isolation for both child and parent. In situations where parents resided in institutional settings, children were often unable to provide necessary help and support to parents due to restrictions. Caregivers also faced difficulties due to their parent not understanding or practicing COVID-19 regulations and in utilizing alternative means of communication with their parent (e.g., video conferencing). Supports and services should be designed in light of the unique challenges of this group.

COVID-19 AND EMANCIPATORY GERONTOLOGY: PERSPECTIVES OF POLITICAL ECONOMY AND THE AMERICAN RESCUE PLAN

Carroll Estes,¹ Nicholas DiCarlo,² and Jarmin Yeh,³ 1. *UCSF, University of California San Francisco, California, United States*, 2. *University of California, San Francisco, institute for Health and Aging, UCSF, California, United States*, 3. *University of California, San Francisco, San Francisco, California, United States*

The present historic moment – a pandemic worsened by far-right extremism – reveals how mounting individual

and collective precarity across the lifecourse and in old age resides within societal institutions of colonialism, white supremacy, patriarchy, and capitalism. Contradictions between systems of democracy and capitalism construct an ageist society aligned with neoliberal ideologies attempting to dismantle and privatize Social Security, Medicare, and Medicaid. These issues confront the call for a critical inquiry that matters in the lives of those who daily experience social injustices (Denzin, 2017). This paper presents emancipatory gerontology (Estes & DiCarlo, 2019) as a critical praxis to challenge assumptions, frameworks, and delirium writ large in American society as it relates to how we conceive of age, aging, and generations. We elucidate how the \$1.9 trillion 2021 American Rescue Plan represents a paradigm shift that aims to supplant austerity economics with human, public, and community benefit. This knock on the hegemonic commitment to austerity and its mantra is an opportunity to interrogate the effects of, and advance, emancipatory policies and practices. Gerontology is inadequate without a lens for examining how critical analysis and social action might inform one another. To shift from disruption to transformation in the "new normal," scholars must bring the past and future into the present to engage realistic utopian pedagogies of hope. Emancipatory gerontology offers a theoretical framework and vocabulary for interrogating individual and social consequences of major policy and institutional forces in relation to aging and generations across the lifecourse.

HOW STATES SUPPORTED OLDER ADULTS AND PERSONS WITH DISABILITIES DURING COVID-19 THROUGH THE MEDICAID PROGRAM

Edward Miller,¹ Lisa Beauregard,² Pamela Nadash,³ Elizabeth Simpson,³ Molly Wylie,⁴ and Michael Gusmano,⁵ 1. *University of Massachusetts Boston, Boston, Massachusetts, United States*, 2. *Executive Office of Elder affairs, Executive Office of Elder Affairs, Massachusetts, United States*, 3. *University of Massachusetts Boston, University of Massachusetts Boston, Massachusetts, United States*, 4. *University of Massachusetts Boston, University of Massachusetts boston, Massachusetts, United States*, 5. *Rutgers University School of Public Health, Rutgers University School of Public Health, New Jersey, United States*

COVID-19 has presented challenges for older adults who receive Medicaid home and community-based services. The federal government has allowed states to seek approval for certain flexibilities to better serve this population, including increasing provider payment rates, allowing family members to be caregivers, and permitting case management entities to provide direct services. This study uses cross-sectional data to identify factors associated with states' adopting these Medicaid flexibilities using multivariate methods. The results indicate that the factors associated with state adoption varied depending on the flexibility. The findings suggest that states increased provider payment rates in response to prevalence of COVID-19 within their state. As cases increase, states may come under pressure to increase provider rates further which may not be feasible because of budget constraints. The results also suggest that demand for and supply of services may be a factor in whether states allowed family members to be paid caregivers. States with a higher proportion of individuals aged 85 years and older were more likely

to permit caregivers to be paid which may suggest that these states may not have enough providers to care for the population. Lastly, the results suggest that provider supply was associated with whether a state allowed case management entities to provide direct care services. States with fewer home health agencies were more likely to allow this flexibility. Based on these results, states may be pursuing available Medicaid flexibilities to address provider and workforce shortages which existed prior to COVID-19 but have been exacerbated by the pandemic.

MODERATING EFFECTS OF LONELINESS ON COVID-19-RELATED STRESS AND ANXIETY IN MIDDLE AND LATER LIFE IN SOUTH KOREA

Sukyung Yoon,¹ and Soo Chan Choi,² 1. *University of Wyoming, Laramie, Wyoming, United States*, 2. *Yonsei University, Seoul, Seoul-t'ukpyolsi, Republic of Korea*

Many people have suffered from psychological distress in the form of stress, loneliness, and anxiety resulting from the COVID-19 epidemic (Havnen et al., 2020; Luchetti et al., 2020). Along with these factors, physical health (hereafter health), resilience, and living arrangements as protective factors were examined. The research aims were to investigate 1) factors affecting the association between COVID-19-related stress (hereafter stress) and anxiety, and 2) moderating effects of loneliness on this association. Data was collected on 450 middle-aged and older adults (ages 45 through 76) living in South Korea during COVID-19. A multi-group path analysis was employed. Measurement invariance was examined by comparing unconstrained and fully constrained models. Both models fit. Moderating effects of loneliness existed. Stress was negatively associated with health and living arrangements for people with both higher and lower levels of loneliness. Health was positively associated with resilience for both groups. Resilience was negatively associated with anxiety for both groups. For people with higher levels of loneliness only, stress and health were negatively associated with resilience and anxiety, respectively. The association between stress and anxiety was significant for both groups. However, the impact of stress on anxiety was significantly larger for people with higher levels of loneliness than for people with lower levels of loneliness. Health practitioners and service providers should develop programs to maintain and promote resilience, social support, and good health among middle-aged and older adults in South Korea to mitigate negative mental health consequences during the pandemic.

THE IMPACT OF COVID RESTRICTIONS AMONG RATES OF FALLING IN ASSISTED LIVING RESIDENTS

Margaret Danilovich,¹ Melanie Fong,² and Kamil Hester,³ 1. *CJE SeniorLife, Skokie, Illinois, United States*, 2. *University of Chicago, Chicago, Illinois, United States*, 3. *Loyola University, Chicago, Illinois, United States*

As a result of the COVID-19 pandemic, assisted living group activities and congregate dining stopped and residents were confined to their rooms. While this may have kept residents safer from contracting the virus, it also reduced their physical activity levels. The aim of this study was to investigate if rates of falls in one assisted living community varied as a result of COVID-19 restrictions. We analyzed fall incident

reports from n=155 residents from October 2019 to October 2020. Results showed a total of n=802 falls in the year-long period (range of 1-30 falls per resident; mean = 5.17; SD=5.6 in the 12 month period). The majority (65%) of falls occurred in resident rooms. 55% of falls occurred between 6am and 6pm. The primary cause of these falls was loss of balance (30%). Comparing falls that occurred 5 months pre-restriction (Oct 2019-Feb 2020) with 5 months post-restriction (April 2020-August 2021) showed non-significant differences between time periods (p=.59). However, analyzing rates of falls by month showed a range of 46 - 88 falls by month with the lowest number occurring in winter months and the peak number of falls occurring in both Oct 2019 and 2020. Despite the majority of falls occurring in resident rooms, Covid restrictions of room confinement did not appear to impact the prevalence of falls in this sample. However, the seasonal variation warrants further research and those in assisted living should consider seasonal variations and proactively implement policies to prevent falls during these times.

Session 2030 (Symposium)

CHANGES IN MENTAL HEALTH, SOCIAL ENGAGEMENT, AND PHYSICAL ACTIVITIES DURING THE COVID-19 PANDEMIC

Chair: Wenjun Li

Discussant: Su-I Hou

The current COVID-19 pandemic has profoundly changed our behaviors and health, especially vulnerable community-dwelling older adults. This symposium includes three presentations that evaluated the pandemic's impacts on mental health, social engagement and physical activity in healthy community-living older adults and those with dementia. Dr. Wenjun Li and his team examined the pandemic impact on mental health and social engagement among relatively healthy older adults residing in suburban and rural neighborhoods in Central Massachusetts, USA. The study reported significant variations in pandemic impacts by sex, age, race, income, living arrangement, and neighborhood housing density, suggesting the pandemic has had disproportionately negative impacts on socially and economically disadvantaged vulnerable older adults. Dr. W. Quin Yow and her team evaluated the impacts of government mandated social distancing and lockdowns on older adults with dementia and their caregivers in Singapore. The study found significant increases in irritability, aggression and hallucinations among older adults with dementia, and possible deterioration of health conditions and heightened moderate level of stress. The results suggest that social distancing may have resulted in negative outcomes in this vulnerable population with dementia and their caregivers. Dr. Ladda Thiamwong reported her team's efforts on forming an international aging research collaborative to mitigate health consequences of COVID-19 crisis from the international perspective. The team consists of ten scholars from five countries, including Hong Kong, Nepal, Singapore, Thailand, and the United States. They collect data using combinations of online and face-to-face surveys. Their important findings will be discussed in detail in this symposium.

CHANGES IN SOCIAL ISOLATION, ANXIETY AND DEPRESSION AMONG OLDER ADULTS DURING THE COVID-19 PANDEMIC

Wenjun Li, Linda Churchill, Hannah Siden, Annabella Aquirre, and Elizabeth Procter-Gray, *University of Massachusetts Lowell, Lowell, Massachusetts, United States*

Social distancing and business lockdowns may have severe negative impact on daily living, mental and physical health of community-living older adults. Our Healthy Aging and Neighborhood Study surveyed 370 older adults in Central Massachusetts in 2020 and 2021. Participants were queried about pre-post pandemic changes in social and physical activities, mental and physical health, and lifestyle factors including food purchasing, diet and physical exercise; and attitude towards and receiving of vaccination. The study is ongoing and data are being accumulated. Preliminary analysis suggested that social distancing and lockdowns have negative impacted social engagement, communications with close friends, relatives and family members, food purchasing, frequency of outdoor exercises, especially group activities. The impact appeared to differ by sex, advancing age, and living arrangement. In summary, social distancing and business lockdowns may have negative impacts on most older adults while the impacts were more severe in those older and socioeconomically disadvantaged.

COVID-19 LOCKDOWN MEASURES: IMPACT ON OLDER ADULTS WITH DEMENTIA AND THEIR CAREGIVERS IN SINGAPORE

W.Quin Yow,¹ Tharshini Lokanathan,² and Hui-Ching Chen,² *1. Singapore University of Technology & Design, Singapore, Singapore, 2. Singapore University of Technology and Design, Singapore University of Technology and Design, Singapore*

Family caregivers typically rely on community-based services and social support networks to supplement their caregiving of older adults with dementia (OAwd). In April 2020, the Singapore government implemented a partial lockdown to contain the spread of COVID-19. We assessed the policy's impact on the physical and mental health of caregivers and their OAwd. As part of a larger study, 30 caregivers were interviewed and rated the stress they experienced when caring for an OAwd during the partial lockdown. Qualitative analyses found significant behavioral changes in OAwd such as irritability, aggression and hallucinations, which led some caregivers to believe their dependents' condition had deteriorated, as well as heightened levels of caregiving stress. Overall, our preliminary results suggested that although social distancing measures may be effective in containing the spread of COVID-19, these measures could lead to negative outcomes on vulnerable populations such as OAwd and their caregivers.

AN INTERNATIONAL AGING RESEARCH COLLABORATION DURING THE COVID-19 CRISIS: MITIGATING GLOBAL HEALTH CONSEQUENCES

Ladda Thiamwong,¹ Wayne Chong,² Rick Kwan,³ Inthira Roopsawang,⁴ Ramraj Gautam,⁵ and Vivian, W. Q. Lou,⁶ *1. College of Nursing, University of Central Florida, Orlando, Florida, United States, 2. Nanyang*

Technological University, Singapore, Singapore, 3. The Hong Kong Polytechnic University, Hong Kong, Hong Kong, 4. Mahidol University, Bangkok, Thailand, 5. UMass Lowell, Lowell, Massachusetts, United States, 6. The University of Hong Kong, Hong Kong, Hong Kong

There are several reasons for forming an aging international research collaboration; however, creating a successful and productive research team during the global crisis may require extensive planning and efforts. Our team consists of ten scholars from five countries, including Hong Kong, Nepal, Singapore, Thailand, and the United States. To accomplish this initiative, we employ ten simple rules for establishing international research collaborations proposed by R. de Grijis (2015). We aim to examine impacts of the pandemic on physical activity, frailty, falls, depression and social networks in diverse older adults. We collect data by online survey and/or face-to-face survey using questionnaires including fear of the COVID, face mask use, Social Network, Rapid Assessment of Physical Activity, a simple frailty questionnaire, CDC fall risk checklist, short Fall-Efficacy Scale International and Patient Health Questionnaire-9. Topics of discussion included: research progression, lessons learned and barriers to international collaboration during the COVID-19 crisis.

Session 2035 (Symposium)

CLARK TIBBITTS AWARD AND HIRAM J. FRIEDSAM MENTORSHIP AWARD LECTURES

Chair: Kara Dassel

The Clark Tibbitts Award lecture will feature an address by Debra Dobbs, PhD, FGSA in memory of the 2021 award recipient, Kathryn Hyer, PhD, FGSA. AGHE's Clark Tibbitts Award was established in 1980 and named for an architect of the field of gerontological education. The award is given each year to an individual or organization that has made an outstanding contribution to the advancement of gerontology and geriatrics education. The Hiram J. Friedsam Award lecture will feature an address by the 2021 award recipient, Pamela Elfenbein, MSW, PhD, FAGHE, HS-BCP. Hiram J. Friedsam was the professor, co-founder, and director of the Center for Studies in Aging and dean of the School of Community Service at the University of Northern Texas. Dr. Friedsam was an outstanding teacher, researcher, colleague, and mentor to students, faculty, and administrators, as well as a past president of AGHE. The purpose of this award is to recognize those who emulate Dr. Friedsam's excellence in mentorship.

KATHRYN HYER'S LASTING LEGACY IN GERONTOLOGY EDUCATION AND AGING POLICY RESEARCH

Debra Dobbs, *University of South Florida, Tampa, Florida, United States*

Kathy Hyer, our dear friend, colleague, former Gerontological Society of America President and Professor and Director of the Florida Policy Exchange Center on Aging, University of South Florida posthumously has been awarded the Clark Tibbett's Award for her achievements in the advancement of the field of gerontological education in higher education. This lecture will reflect on some

of her decades of accomplishments including her dedication to AGHE's mission to train and educate students in gerontology. Her greatest achievement is in the area of training and education of long-term care administration and aging studies undergraduate students to be nursing home and assisted living administrators. This lecture will also highlight several initiatives of Dr. Hyer's that involved undergraduate, graduate students, and junior faculty who she mentored including the Geriatric Workforce Enhancement Project, NIA SAFEHAVEN and COVID research on disasters, the Dementia Training Academy, Age Friendly Initiatives both nationally and internationally and student mentorship for graduate assistantships through the USF Center for End of Life Care.

HIRAM J. FRIEDSAM AWARD: REFLECTIONS OF MENTORS AND MENTORSHIP

Pamela Efenbein, *University of North Georgia, Gainesville, Georgia, United States*

Being honored with the AGHE Hiram J. Friedsam Mentorship Award brought into sharp focus the mentors who have guided my journey and a desire to share this moment with them. Preparation for this session provided the opportunity to reach out to those who have shaped my path and share memories of our journeys. Lesa Huber, when awarded the Hiram Friedsam Mentorship Award in 2013, wrote "those of us who have had great mentors know it is not so much what is said, but how it is said that is at the core of effective mentorship." This presentation reflects on relationships built, wisdom shared, guidance offered, lessons learned by design and unintentionally, and passed on in my own way to the next generation.

Session 2040 (Paper)

Cognitive Impairment Programs

CHILDHOOD ADVERSITY ACROSS THE LIFESPAN: ASSESSING THE RELATIONSHIP BETWEEN ACES AND SUBJECTIVE COGNITIVE DECLINE

Elizabeth Avent,¹ Jeanine Yonashiro-Cho,² Roberta Peterson,² Laura Mosqueda,³ and Zachary Gassoumis,³ 1. *University of Southern California, Los Angeles, California, United States*, 2. *Keck School of Medicine of USC, Los Angeles, California, United States*, 3. *Keck School of Medicine of USC, Alhambra, California, United States*

Adverse childhood experiences (ACEs) have long-term impacts on health throughout the life course. Emerging research found that 3+ ACEs are associated with increased risk of cognitive impairment, nearly 11 times more than those who have not experienced childhood adversity. This study further investigates the ACEs-SCD relationship using data from the 2011 Behavioral Risk Factor Surveillance System (BRFSS). Seven ACE questions were asked of respondents in California, Washington, and Wisconsin (n=5,898, aged 55+); SCD was measured as experiencing progressive confusion or memory loss in the last 12 months. A series of logistic regressions were run to separately model the presence of ACEs and ACE score on SCD. Fourteen percent reported SCD,

with 65.4% of those reporting 1+ ACE. More SCD respondents reported 4+ ACEs (10.8%) than non-SCD respondents (4.8%). The most frequently reported ACEs among those with SCD were psychological abuse (34.9%) and substance abuse in the household (30.5%). Regression results showed greater SCD risk with increased ACE scores, up to 2.90 odds of SCD for 4+ ACEs compared to 0 ACEs (p<.0001). Those reporting physical abuse and sexual abuse had the greatest odds (1.75 & 1.70, p<.0001) of SCD. Findings demonstrate a strong association between childhood adversity and SCD, with physical and sexual abuse placing individuals at greatest risk. Results show possible pathways to which ACEs can lead to cognitive impairment. Findings implicate the importance of considering a lifespan perspective in childhood adversity and family violence work and the importance of considering early-life adversity when assessing risk for cognitive impairment.

COMPARATIVE ANALYSIS OF DEMENTIA CARE PROGRAMS AND DELIVERY MODELS

Allie Peckham,¹ Marianne Saragosa,² Madeline King,³ Monika Roerig,³ and Gregory Marchildon,³ 1. *Arizona State University, Phoenix, Arizona, United States*, 2. *University of Toronto, Toronto, Ontario, Canada*, 3. *University of Toronto, Toronto, Ontario, Canada*

Dementia has significant social and economic impacts for those living with dementia and their caregivers. Despite an increase in prevalence of complex chronic conditions and dementia, long-term care services are continuously pushed out of institutional settings and into the home and community. The majority of people living with dementia in Canada and the United States (U.S.) live at home with support provided by family, friends, or other unpaid caregivers. Ten dementia care programs and service delivery models across five different North American jurisdictions in Canada and the U.S. are compared using a deductive analytical approach using a comparative policy framework developed by Richard Rose. The policy efforts included in this research attempt to improve health system flow and access for vulnerable populations. One common theme among all jurisdictions are long-standing institutional barriers that can make change difficult. These barriers can prevent the ability for systems to be flexible and adapt to meet the changing needs of populations. Incrementalism is often considered an appropriate approach to health system reform. Yet, incremental change efforts lead to policy layers and these layers can lead to tension between different policy mixes and unintended consequences. These programs were introduced in a manner that did not fully consider how to patch current structures and risk creating further system redundancies. One approach to reduce this risk is to combine evaluative efforts that assess 'goodness of fit'. The degree to which these programs have embedded these efforts successfully is low, with the possible exception of DSRIP from NY.

EDUCATION, OCCUPATION, AND THE COGNITIVE PERFORMANCE DISTRIBUTION OF SOUTH KOREAN OLDER ADULTS

Katherine Ford,¹ and Anja Leist,² 1. *University of Luxembourg, Esch-sur-Alzette, Luxembourg*, 2. *University of Luxembourg, Esch-sur-Alzette, Diekirch, Luxembourg*

Earlier research suggests that educational attainment up to early adulthood are crucial for the development of cognitive reserve, while intellectually stimulating activities later in the life course are of limited impact. We sought to explore the effects of educational attainment and occupational factors (occupation type and currently having work) across the distribution of cognitive performance for adults aged 45-65 years in South Korea. We analysed scores from the Korean Mini Mental State Exam (MMSE) provided in the 2006 wave of the Korean Longitudinal Study of Aging. We used quantile regressions to both investigate relationships across the distribution and to reduce bias for measures of the central tendency as the MMSE is known for its ceiling effects. The quantile function at the lowest conditional decile of MMSE scores suggested that education level was the dominant significant factor for adult performance on the MMSE (lowest MMSE decile, primary education: $\beta = 6.11$ points, $p < 0.001$; secondary education $\beta = 9.56$ points, $p < 0.001$). All occupational factors were non-significant. Further factors with a significant association with the MMSE were hearing loss, the log-transformed household income, and age squared. With the conditional median function, occupational factors became significant in the middle of the distribution but remained much less important than education levels. In summary, educational levels were more important to explain variation in cognitive functioning than occupational factors, echoing studies with Western samples. We discuss the findings with regard to the historically gender unequal educational and occupational opportunities in Korea.

RETURN HOME INTERVIEWS FOR MISSING OLDER ADULTS WITH DEMENTIA: A SCOPING REVIEW

Noelannah Neubauer,¹ Elyse Letts,² Christine Daum,² Antonio Miguel-Cruz,³ Lauren McLennan,² and Lili Liu,²
 1. *University of Waterloo, University of Waterloo, Ontario, Canada*, 2. *University of Waterloo, Waterloo, Ontario, Canada*, 3. *University of Alberta, Edmonton, Alberta, Canada*

Introduction: Persons living with dementia are at risk of becoming lost. When a person is returned home safely after a missing incident, an interview with the person or care partner may identify ways to prevent repeat incidents. It is not known if these interviews are being conducted for this population. **Objectives:** The purpose of this review was to understand return home interviews and whether they are being used with persons who have dementia. **Methods:** Scholarly and grey literature were searched in 20 databases. Articles were included from any language, year, study design if they included terms resembling “return home interview”, “missing,” “lost,” or “runaway”. **Results:** Eleven articles in scholarly, and 94 in grey literature sources were included, most from the United Kingdom. The majority of academic (55%) and grey (61%) articles were related to missing children, and none were specifically about persons living with dementia. Interviews were typically conducted within 72 hours after a missing person was returned, and by police or charitable organizations. The main reasons were to understand the causes of the incident and confirm the missing person’s safety, identify support needs, and to provide support to reduce repeat missing incidents. **Conclusion:** Existing reasons for interviews can also apply to persons with dementia. This review informs future

research on return home interviews. It also informs community organizations, and police services interested in adopting this practice with persons living with dementia. Evaluations would confirm if these interviews can reduce repeat incidents and help keep people with dementia safe.

THE STRONGERMEMORY PROGRAM: A BRAIN HEALTH INTERVENTION FOR MILD COGNITIVE IMPAIRMENT

Catherine Tompkins,¹ Emily Ihara,¹ Rob Liebreich,² Jessica Fredericksen,² and Lauren Bradley,² 1. *George Mason University, Fairfax, Virginia, United States*, 2. *Goodwin House, Falls Church, Virginia, United States*

The StrongerMemory program is a brain health intervention targeting older adults with mild cognitive impairment (MCI). Approximately 20% of individuals over 65 years old have MCI and 38% will potentially develop dementia after 5 years of MCI onset. Participants in the 16-week StrongerMemory program practice exercises involving math, writing, and reading aloud for 20-30 minutes a day, stimulating the prefrontal cortex of the brain, which governs the brain’s ability to retrieve memories. The current research exploring participants’ experiences with the StrongerMemory program was approved by the University’s Institutional Review Board. A semi-structured interview was implemented with each participant and the interviews took about 15 to 30 minutes to complete. There was a total of 24 respondents associated with a local continuing care retirement community, each providing their verbal consent to be interviewed and recorded over Zoom. The respondents were mostly female ranging in age from 65 to 90. Most respondents reported having advanced degrees and were participating in the program on their own, with a spouse or friend. Each interview transcript was coded by at least two members of the Mason research team. Participants reported being motivated to participate in the program due to fearing memory loss because of experiences of family members and friends and others wanted to remain “cognitively fit.” Codes and themes representing participants’ perceptions and reactions to exercises and their challenges and lessons learned from their participation will be discussed, including participants feelings of being “less foggy” and better able to remember information.

Session 2045 (Symposium)

COMMON DATA ELEMENTS FOR WORKFORCE AND STAFFING MEASUREMENTS IN LONG-TERM CARE

Chair: Charlene Chu

Co-Chair: Franziska Zúñiga

Discussant: Kirsten Corazzini

The workforce in residential long-term care (LTC) is key in providing high-quality, person-centered care for residents. However, low staffing and adverse staffing outcomes such as turnover or job dissatisfaction hinder the provision of high-quality care. International research can add valuable insights for policy and practice by learning from different settings and cultures. The initiative “To Harmonize Research In long-term care liVing Environments (WE-THRIVE)”, is led by an international group of LTC researchers to identify common data elements (CDE) for cross-comparative research that support older adults thriving in LTC. In this symposium,

we will present an overview of the WE-THRIVE initiative with a specific focus on CDEs and measurement. The first talk will provide the context for the WE-THRIVE initiative, and discuss the collaborative and iterative processes required to develop the initial CDEs in the area of workforce and staffing. In the second talk, we will discuss which staff should be “in the house” to meet the needs of residents during and after a pandemic, and what type of workforce data system should be available to ensure the best quality outcomes for residents and carers. Next, current issues in the measurement of staffing in LTC based on a review of reviews of staffing’s relationship to quality of care will be discussed. Finally, we extend the debate to consider theoretical and empirical explanations for the relationship between staffing and quality in LTC and the promotion of person-centred care outcomes.

LAYING DOWN THE GROUNDWORK FOR AN INTERNATIONAL MEASUREMENT INFRASTRUCTURE

Charlene Chu,¹ Katherine McGilton,² Franziska Zúñiga,³ Michael Lepore,⁴ and Kirsten Corazzini,⁵ 1. *University of Toronto, Toronto, Ontario, Canada*, 2. *KITE-Toronto Rehabilitation, University Health Network, Toronto, Ontario, Canada*, 3. *University of Basel, Basel, Basel-Stadt, Switzerland*, 4. *LiveWell Alliance, Southington, Connecticut, United States*, 5. *University of Maryland School of Nursing, Baltimore, Maryland, United States*

The COVID-19 epidemic has brought to light the significant problems in the long-term care (LTC) sector, specifically the lack of an infrastructure to collect and aggregate data between LTC sectors in different countries. This talk will briefly describe goals of the WE-THRIVE initiative, and focus on exploring the development of “workforce and staffing” common data elements for LTC. We will describe how the subgroup is “laying down the groundwork” within this domain with various methodologies to develop CDEs related to workforce and staffing. The CDEs aim to measure staff retention and turnover, evaluating nursing supervisor effectiveness, and staff training in LTC. Anticipated challenges of this international work will also be highlighted. International research on LTC can valuably inform LTC policy and practice, and the proposed CDEs can facilitate data sharing and aggregation internationally, including low-, middle-, and high-income countries.

CHALLENGES IN THE MEASUREMENT OF STAFFING: A REVIEW OF REVIEWS

Franziska Zúñiga, Magdalena Osinska, Catherine Blatter, and Michael Simon, *University of Basel, Basel, Basel-Stadt, Switzerland*

The question concerning the relationship of staffing and quality of care of residents in residential long-term care (LTC) has been explored extensively; however, no consistent evidence has been brought forth so far. Inconsistent measurement of staffing might hinder this research field to move forward. We assessed its measurement in a narrative review of reviews that explore the staff – quality of care relationship. We identified 12 systematic reviews, covering 1960 to May 2018. Most studies included had a cross-sectional design, were performed in the USA and worked with secondary, administrative data (e.g., OSCAR). Comparability of studies

was limited by diverse definitions and measurement methods for staffing, including data about grade-mix, number of staff, and staff-resident ratios. We suggest performing international multi-case studies to compare and contrast LTC staffing and develop appropriate international common data elements. Logic models support the description of the expected relationship between staffing aspects and quality.

WHO’S IN THE HOUSE: STAFFING IN LONG-TERM CARE HOMES DURING THE COVID-19 PANDEMIC

Katherine McGilton,¹ Shirin Vellani,² Charlene Chu,³ Annica Backman,⁴ Astrid Escrig-Pinol,⁵ José Tomás Mateos,⁶ Franziska Zúñiga,⁷ and Karen Spilbury,⁸ 1. *KITE-Toronto Rehabilitation, University Health Network, Toronto, Ontario, Canada*, 2. *McMaster University, Toronto, Ontario, Canada*, 3. *University of Toronto, Toronto, Ontario, Canada*, 4. *Umea University, Umea, Vasterbottens Lan, Sweden*, 5. *The Mar Nursing School, Universitat Pompeu Fabra, Barcelona, Catalonia, Spain*, 6. *University of Lleida, Lleida, Catalonia, Spain*, 7. *University of Basel, Basel, Basel-Stadt, Switzerland*, 8. *University of Leeds, University of Leeds, Leeds, England, United Kingdom*

There is an absence of high-quality workforce data that could be used globally for comparative research on workforce planning in the residential long-term care (LTC) sector. We know that older adults residing in the LTC settings have multimorbidities resulting in complex care needs, yet the workforce is insufficiently able to meet their needs. A further reduction in LTC workforce was noted during the COVID-19 pandemic which increased the risk of adverse outcomes for residents. Survey results focused on the workforce in LTC homes collected from several countries during the current pandemic, highlighted that several members of the workforce were either absent or worked virtually (e.g., physicians, social workers). A better understanding of who is/or should be in the house to meet the needs of residents during or after future pandemics requires a workforce data system that routinely collects this information to ensure best quality outcomes for residents and their carers.

UNDERSTANDING AND EXPLAINING HOW STAFF PROMOTE QUALITY FOR OLDER PEOPLE LIVING IN LONG-TERM CARE FACILITIES

Karen Spilbury,¹ Julienne Meyer,² Kirsty Haunch,¹ Carl Thompson,¹ 1. *University of Leeds, University of Leeds, Leeds, England, United Kingdom*, 2. *City, University of London, Guildford, England, United Kingdom*

Little is known about how the workforce influences quality in long term care facilities for older people. Conceptually, quality is complex, often contested, and dynamic, has overlapping physical, social, psychological and emotional dimensions and can refer to both quality of life and quality of care. Assuming ‘more staff equates to better quality’ is intuitively appealing but research suggests that a more nuanced, non-linear, relationship exists. A programme of research in the UK is developing theoretical and empirical explanations of how staff promote quality for older people living in long-term care facilities. It shifts the debate from numbers of staff and their relationship to quality indicators toward recognising the ways in which staff more broadly influence quality. Our work will be useful for people

and organisations making policy and delivering services on the best ways to deploy and support quality in long term care through the most valuable resource: its staff.

Session 2050 (Symposium)

COMMUNITY COLLEGE GERONTOLOGY PROGRAMS: REVISITING AND RE-VISIONING WORKFORCE, CAREER PATHWAYS, AND TRANSFER

Chair: Jennifer (Jenny) Sasser

Co-Chair: Roger Anunson

Discussant: Michael Faber

The session will focus on new and existing innovative ways that Community Colleges are effectively addressing workforce needs resulting from a rapidly aging population; the ever-expanding career pathways available to students in the field of gerontology; as well as the continuing higher education needs of students transferring to bachelor's and graduate-level gerontology programs. A panel of Community College and University gerontology professionals, representing both the GSA Community College and Aging Workforce Interest Groups, will share the innovative ways that they are working to address the three focus areas of this symposium. We will also include opportunities for discussion with participants about their experiences with and ideas for addressing these issues.

INNOVATIONS IN GERONTOLOGY EDUCATION

Jennifer Ellis,¹ and Kimberly McDonald,² 1. *Northwood Technical College, Superior, Wisconsin, United States*, 2. *Northwood Technical College, New Richmond, Wisconsin, United States*

This session examines innovative approaches to effectively address the aging services workforce needs in rural, Midwestern settings. Presenters will explore career pathways and transfer opportunities in gerontology education, as well as best practices for addressing the educational, professional and personal needs of diverse student populations.

THE IMPACT OF DECLINING ENROLLMENT AND RE-CAREERING ON COMMUNITY COLLEGE GERONTOLOGY PROGRAMS

Judith Robertson Phillips, *California State University San Marcos, California State University San Marcos, California, United States*

According to Inside Higher Ed (2020), community college enrollment declined by 10.1% during the fall 2020 semester and this decline in enrollment continued into the spring 2021 semester for many community colleges. Gerontology programs within community colleges were among curriculums impacted by this downswing in enrollment. This presentation will discuss what this means for community college Gerontology programs across the United States in a time when the older adult population is rapidly increasing, and a qualified workforce is needed to fill the multiple fields serving this aging population. One area of discussion will be the number of returning adults who are re-careering into Gerontology, some because of the impact of a family caregiving situation while others are motivated to change careers because of their interest in the numerous career pathways available in the field of aging. Suggestions for encouraging and supporting these newly returning adults will be discussed.

ADULT LEARNING AND EMPLOYMENT OPPORTUNITIES FOR OLDER WORKERS IN AUSTRALIA AND THE UNITED STATES: LESSONS FOR ADULT EDUCATION

Phyllis Cummins,¹ Philip Taylor,² Takashi Yamashita,³ and Leah Janssen,⁴ 1. *Miami University, Oxford, Ohio, United States*, 2. *Federation University Australia, Berwick, Victoria, Australia*, 3. *University of Maryland, Baltimore County, Baltimore, Maryland, United States*, 4. *Scripps Gerontology Center, Oxford, Ohio, United States*

This study examined the role community colleges (U.S.) and Technical and Further Education (TAFE; Australia) institutes play in providing educational opportunities to older workers in the U.S. and Australia. Employment for adults of all ages has been impacted by job automation in recent decades. We analyzed national level data to estimate the impacts of job automation by age group. In both the U.S. and Australia, about 65% of older workers in sales occupations are at risk for job loss due to automation. Additionally, we reviewed occupational projection data and employment opportunities for workers who may be displaced by automation. Needs for health care support occupations, such as nursing assistants and occupational and physical therapy assistants are expected to grow rapidly. We will provide several recommendations based on the integration of our findings related to education/training programs and the aging workforce in the context of community colleges and TAFEs.

ADDRESSING THE CALIFORNIA MASTER PLAN ON AGING THROUGH INNOVATIVE GERONTOLOGY SPECIALIZATIONS

Pamela Abbott-Enz, *Chaffey College, Rancho Cucamonga, California, United States*

The 2021 Master Plan for Aging outlines five bold goals to pursue over the next ten years, including addressing the issues of housing, health, and quality of life, finance, and caregiving, the plan also addresses public safety and emergency services, community programs and public spaces, access, inclusion, and equity. In order to prepare the workforce to meet these goals, California Community Colleges have the unique opportunity to collaborate and develop Aging Specialists in fields not traditionally age-focused. This presentation explores the possible scope and path toward curriculum development of five innovative collaborations that will prepare Gerontology specialists for the workforce that will be created through the execution of the California Master Plan.

Session 2055 (Paper)

COVID-19 Vaccinations, Education, and Awareness

AN INTERNATIONAL PERSPECTIVE ON THE IMPACTS OF COVID-19 ON ADULT EDUCATION AND TRAINING

Oksana Dikhtyar,¹ Abigail Helsinger,¹ Phyllis Cummins,² and Nyasia Hicks,³ 1. *Scripps Gerontology Center, Miami University, Oxford, Ohio, United States*, 2. *Miami University, Oxford, Ohio, United States*, 3. *GRECC - STVHCS Department of Veterans Affairs, San Antonio, Texas, United States*

The COVID-19 pandemic has caused one of the worst economic crises since the Great Depression and the current recession has been more detrimental to older workers compared to other age groups. Not only has it forced more older workers out of their jobs, but it has also made it much harder for jobless older workers to find a new job. Furthermore, due to increased automation and digitalization in the workplace, older workers will likely need upskilling or reskilling to improve their employment prospects in the changed labor market. This situation brings the importance of offering training and continuous education programs that target older workers to the forefront of adult education policy and practice. This qualitative study examines measures taken in response to COVID-19 in adult education and training (AET) in seven countries including Sweden, Norway, the Netherlands, Australia, Singapore, Canada, and the United States. The findings are based on key informant interviews with international policy experts and scholars in the field of AET in addition to information gathered from written materials (e.g., government and organizational reports). To expedite their economic recovery and improve labor market outcomes for their workers, some countries have increased government funding for vocational and continuing education or offered financial support for post-secondary students while others have provided funds to employers to offer training and retraining for their employees. Some of these measures have the potential to expand adult educational opportunities in the post-pandemic world. Implications for policy and practice are discussed.

COVID-19 VACCINATION IN HOME HEALTH AND HOSPICE: BARRIERS TO VACCINATION AND RESULTS FROM A HOME VACCINATION PROGRAM

Robert Rosati, Steven Landers, and Tami Videon, *VNA Health Group, Holmdel, New Jersey, United States*

Little is known about vaccination rates in home health and hospice populations. Results draw upon two separate data sources from The Visiting Nurse Association Health Group (VNAHG). Among VNAHG patients surveyed between February 2 and March 1, 2022, 24% had received at least one COVID-19 vaccine. Among vaccinated patients, roughly one quarter did not travel to get the vaccine (received inpatient vaccination). They mostly traveled by car (88%), and 70% received help from a family member. Of patients who had not received a vaccine (76%), 81% were pursuing or planning to pursue obtaining a vaccine. Additionally, of those not pursuing a vaccine, 30% indicated it was because they could not get to a vaccine site. 44% of patients in the VNAHG "in home" vaccination pilot were bedbound, and 100% of patients had ambulation difficulties that make it impossible for them to leave home. All (100%) had a health care provider(s) recommended they get the vaccine. Only 38% have internet access. A quarter tried to call to schedule a vaccine, but only one was able to speak to someone. 40% of the patients attempted to get a COVID-19 vaccine prior to enrollment in the program. Most patients (81%) did not have someone available to assist with their transportation to get vaccinated, and most indicated difficulty securing an appointment. Many indicated severe traveling difficulties (requiring oxygen, needing ambulance transport). These findings highlight the high barriers for homebound patients, and

the need and value of clinicians traveling to provide in-home vaccines.

COVID-19 VACCINE HESITANCY AMONG OLDER ADULTS: EVIDENCE FROM THE MEDICARE CURRENT BENEFICIARY SURVEY

Divya Bhagianadh,¹ and Kanika Arora,² *1. University of Iowa, IOWA CITY, Iowa, United States, 2. University of Iowa, Iowa city, Iowa, United States*

Objective: Older adults have been the most enthusiastic cohort about the COVID-19 vaccine since its rollout. However, there is limited evidence on vaccine hesitancy, particularly among community-dwelling older adults. In this study, we examine the prevalence and predictors (especially information sources) of vaccine hesitancy in this group. Methods: We use the Medicare Current Beneficiary Survey (MCBS)- Fall 2020 supplement data and employ multivariable logistic regression models to explore this association. We study heterogeneous effects by gender, metro/non-metro residence status, race, and age. Results: Depending on healthcare providers (HCP), social media, the internet, and family/friends as the main COVID-19 information source was associated with higher odds of negative vaccine intent when compared to those who rely on regular news. We did not find any association of 'unsure' vaccine intent and different information sources. Discussion: Recommendation from an HCP is a strong predictor of any vaccine acceptance and higher negative intent for COVID-19 vaccine among those who depend on HCP for information is concerning. This could be due to vaccine hesitancy among HCPs themselves or due to other mechanisms like infrequent interactions with the health system.

COVID-19 VACCINE INTENTIONS WITHIN THE MEDICARE POPULATION

Tami Swenson, *Des Moines University, Des Moines, Iowa, United States*

COVID-19 vaccine intentions by older adults reflect individual care seeking behavior and medical system trust and broader systemic cultural shifts related to vaccine hesitancy. The purpose of this paper is to examine the October wave of the rapid response panel survey fielded by the Centers for Medicare and Medicaid Services (CMS) to track and monitor the effects of the pandemic within the Medicare population. With a sample size of 9686 Medicare beneficiaries, the calculated statistics use replicate weights to adjust for the complex survey sample design and balanced repeated replication using Fay's adjustment of 0.3 for variance estimation. When asked about the likelihood of getting the COVID-19 vaccine if one were available, 58 percent of the Medicare population definitely or probably intended to get the vaccine, 16 percent expressed they would probably or definitely not, and 26 percent were not sure. Black or Hispanic Medicare beneficiaries were significantly more likely to express they would probably not or definitely not get the vaccine than White, non-Hispanic Medicare beneficiaries. Distrust of what government says about the vaccine and concern about the safety or side effects were the most common reasons for not intending to get the vaccine. Those expressing intentions to not get the COVID-19 vaccine in the October 2020 survey wave were more likely to lack access to the internet, which is

a potential systematic barrier if they changed their intentions following the FDA approvals of the COVID-19 vaccines and more information became available in the winter and spring of 2021.

PERCEPTIONS OF THE GOVERNMENT'S RESPONSE TO THE PANDEMIC: VOICES FROM THE COVID-19 COPING STUDY

Haley Gallo,¹ Lindsay Kobayashi,² and Jessica Finlay,²

1. USC, Discovery Bay, California, United States,

2. University of Michigan, Ann Arbor, Michigan, United States

The COVID-19 pandemic was met with conflicting government strategies in the handling of the virus. Older adults were disproportionately impacted by the pandemic, yet little is known about their perspectives of the government response. Using data collected in September and October, 2020 from the online, nation-wide COVID-19 Coping Study, we conducted qualitative thematic analysis on a subsample of respondents (N=500) proportionate to the age, gender, race/ethnicity, and education of the U.S. population age 55+. Two researchers individually coded a random subsample of 50 open-ended responses to the question "How do you feel about federal government responses to and handling of the COVID-19 pandemic?" Using NVivo qualitative software, the researchers compared codes and reconciled differences to achieve a Kappa score of >0.8. The first author coded the remaining responses using the established coding strategy. Analyses identified themes related to President Trump's leadership, Congress, the broader federal government, and science. Some participants indicated that the federal government's response to the pandemic was "inadequate," "too political," and "lacking coordination." Others expressed that the president "did the best he could" or that "it's not the federal government's responsibility." While some praised vaccine development efforts and expressed their appreciation for Dr. Fauci, others expressed scientific distrust. Participants' perspectives were divergent, reflective of the country's polarization surrounding COVID-19 policies and practices. Differences in perspectives exist by race/ethnicity, gender, geographic region, and age. Study results can help identify groups of older adults who may need targeted programs and policy support.

Session 2060 (Paper)

Disparities and Health

HEALTH DISPARITIES IN DELIRIUM

Robert Dicks,¹ Jimmy Choi,² Christine Waszynski,³

Kadesha Collins-Fletcher,³ Beth Taylor,⁴

Catherine Martinez,⁵ and David O'Sullivan,⁶ 1. *Hartford Hospital, West Simsbury, Connecticut, United States,*

2. *Institute of Living, Institute of Living, Hartford,*

Connecticut, United States, 3. *Hartford Hospital, Hartford,*

Connecticut, United States, 4. *Evernorth, Saint Louis,*

Missouri, United States, 5. *Vanderbilt University, Nashville,*

Tennessee, United States, 6. *Hartford Healthcare, Hartford,*

Connecticut, United States

Racial and ethnic minority populations in the US experience greater cumulative disease burden, as well as social and

economic barriers, stressors, and limited advocacy/access to culturally informed healthcare. This increased risk burden is expected to be associated with an increased risk for delirium during acute care encounters. Previous studies on health disparity and delirium are limited and report equivocal findings regarding delirium incidence, possibly related to sample bias or non-validated measures. Risk for delirium during acute care in health disparity populations (HDP) that include Black African Americans (BAA) and Hispanic-Latinx (HL) has not been systematically studied using validated measures. We conducted a retrospective analysis utilizing our delirium program (ADAPT) registry that systematically assessed all hospitalized patients through their entire hospital stay for the years 2018-2019 (36K patients, 80% NHW, 11% HL, 9% BAA). The Confusion Assessment Method (CAM and CAM-ICU) and Richmond Agitation Sedation Scale (RASS) were used as screening assessments to identify delirium. We know from previous studies that negative CAM results in our environment have high specificity. The incidence of delirium between populations was compared using a chi-square test. Delirium incidence was higher in HDP (BAA combined with HL) compared to NHW in 71-80yo (16.0% vs 12.6%, $p=0.003$). Delirium incidence was not different in all other age groups compared; <65yo ($p=0.191$), 61-70yo ($p=0.223$), 81-90yo ($p=0.644$). Understanding the association, or lack thereof, between health disparities, ethnic and race-based risks for delirium is expected to provide important insights into more focused delirium assessment, prevention and mitigation strategies in these populations.

HEALTH RISKS, PERCEPTIONS, AND SELF-CARE PATTERNS: A COMPARATIVE STUDY BETWEEN OLDER AND YOUNGER FILIPINOS

Julienne Ivan Soberano,¹ Marysol Caciata,² Jo Leah Flores,³

Erwin William Leyva,³ Mary Abigail Hernandez,³

3. *University of the Philippines, University of the Philippines, National Capital Region, Philippines,*

4. *University of Texas Medical Branch School of Nursing,*

University of Texas Medical Branch School of Nursing, Texas, United States

Worldwide trends in health risks, lifestyle behaviors, health perceptions, and health-seeking patterns suggest alarming disparities among individuals from low- and middle-income countries; particularly for older individuals (≥ 60 years). This study aims to compare health risks, perceptions, lifestyle behaviors, and health-seeking patterns between younger (< 60 years) and older (≥ 60 years) Filipinos from rural communities in the Philippines; and assess relationships between demographic, health risks and perceptions, and lifestyle behaviors to bolster health promotion efforts. A comparative cross-sectional study was employed with 863 younger and 427 older Filipinos. Results show that older participants were more likely to be single/widowed and had \leq high school education. Older participants had higher rates of hypertension, dyslipidemia, diabetes, and depression but were more likely to report higher quality of life, ≥ 150 minutes of physical activity per week, ≥ 5 servings of fruits

and vegetable per day, more difficulty falling asleep, report seeing a physician regularly, going to the community health center when sick, and attend stress management classes compared to their younger counterparts (all p 's < .001). There were no differences in rates of obesity, self-medication, and use of integrative health. Older age was associated with higher risks, improved health perceptions, healthier lifestyle behaviors, and better health-seeking patterns. Our data suggest that health risks are higher in older individuals but risky lifestyle behaviors were higher in younger individuals and suggest the need to design separate health promotion interventions that target the unique needs of older and younger Filipinos from rural communities.

IMMIGRATION-RELATED FACTORS AND DEPRESSION HELP-SEEKING AMONG OLDER CHINESE AMERICANS

Dexia Kong,¹ Man Guo,² Melissa Simon,³ and XinQi Dong,⁴ 1. *The Chinese University of Hong Kong, Hong Kong, Hong Kong*, 2. *The University of Iowa, Iowa City, Iowa, United States*, 3. *Northwestern University Feinberg School of Medicine, Chicago, Illinois, United States*, 4. *Rutgers University, Rutgers Institute for Health, New Jersey, United States*

Asian Americans have the lowest mental health service utilization rate among all racial/ethnic groups. One important yet understudied aspect of this group's mental health service use is its potential associations with immigration-related factors such as migration reasons, years in U.S., acculturation, and ethnic enclave residence. Using data from the Population-based Study of Chinese Elderly in Chicago (collected 2013-2015, N=3,123), this study investigates whether and how immigration-related factors shape mental health service utilization. Four categories of help-seeking behaviors for depressive symptoms were examined, including not seeking help (23.5%), seeking help from informal source(s) only (40%), seeking help from both informal and formal sources (28.7%), and seeking help from formal source(s) only (8.8%). Results of logistic regressions showed that U.S. Chinese older adults who migrated for family reasons were less likely to seek help from informal sources only than those who migrated for other reasons [Odds Ratio (OR)=0.64, 95% Confidence Interval (CI)=0.42-0.99]. Less acculturated older immigrants (OR = 0.88, 95% CI = 0.79-0.97) and those who lived in Chinatown (OR = 2.34, 95% CI = 1.21-4.52) were more likely to seek help from formal sources only (relative to not seeking any help). Our findings showed that majority of the older Chinese Americans with depressive symptoms either did not seek help or sought help from informal sources only. Their help-seeking behaviors were shaped by their migration and acculturation experiences. Leveraging informal support networks and ethnicity-specific resources in Chinatown represent a culturally appropriate approach to facilitate mental health help-seeking among U.S. Chinese older adults.

ROLE OF DISEASE-SPECIFIC INCIDENCE AND SURVIVAL IN DISPARITIES IN LIFE EXPECTANCY IN THE UNITED STATES

Julia Kravchenko,¹ Bin Yu,² and Igor Akushevich,¹ 1. *Duke University, Durham, North Carolina, United States*, 2. *Duke University, Duke University/Durham, North Carolina, United States*

There are persisting geographic and racial disparities in life expectancy (LE) across the United States (US). We used 5% Medicare Claims data (2000-2017) to investigate how disease incidence and survival contribute to such disparities. Disease-specific hazard ratios (HRs) were calculated for Medicare beneficiaries living in the US states with the lowest LE (the states with the highest LE were used as a reference group), in gender- and race-/ethnicity-specific populations. Analysis of incidence showed that the greatest contribution to between-the-state disparities in LE was due to higher incidence (HRs \geq 1.30) of atherosclerosis, heart failure, influenza/pneumonia, Alzheimer's disease, and lung cancer among older adults living in the states with the lowest LE. The list of diseases that contributed most to LE through the differences in their survival substantially differed from the above listed diseases: namely, diabetes, chronic ischemic heart disease, and cerebrovascular disease had HRs \geq 1.28 for their respective survival rates, with the highest HRs for lung cancer (HR=1.37, in females) and prostate cancer (HR=1.30). Respective race-/ethnicity-specific patterns of incidence and survival HRs were investigated and diseases contributed most to racial disparities in LE were identified. Study showed that when planning the strategies targeting between-the-state differences in LE in the US, it is important to address both 1) primary and secondary prevention for diseases demonstrating substantial differences in contributions of incidence, and 2) treatment choice, adherence to treatment, and comorbidities for diseases contributing to LE disparities predominantly through the differences in survival. Such strategies can be disease-, race-/ethnicity-, and geographic area-specific.

SLOWDOWN IN LIFE EXPECTANCY IMPROVEMENTS FOR EUROPEAN COUNTRIES FROM 2000 TO 2019

Nicholas Steel,¹ John Ford,² and Jurgen Schmidt,³ 1. *University of East Anglia, Norwich, England, United Kingdom*, 2. *Cambridge University, Cambridge, England, United Kingdom*, 3. *Public Health England, London, England, United Kingdom*

Life expectancy improvements have slowed across Europe since around 2010 for unknown reasons. We aimed to assess the contribution of specific conditions and risk factors to changes in life expectancy. We compared Global Burden of Disease (GBD) 2019 estimates for life expectancy at birth, years of life lost to premature mortality (YLLs) and population attributable fractions (PAFs) for risk factors, for 17 European Economic Area (EEA) countries from 2000 to 2010 and from 2010 to 2019. All 17 countries experienced a slowdown in life expectancy improvements after 2010, after decades of improvement. Denmark experienced the smallest drop in improvement from 2000 to 2010 compared to 2010 to 2019 (0.75 years drop), followed by Norway (0.79), Iceland (0.86), Finland and Sweden (both 0.89). The 5 countries with the largest drop in improvement were Spain (1.6 years drop), the Netherlands (1.88), Portugal (1.92), the United Kingdom (UK) (2.13), and Ireland (2.77). Ischaemic heart disease and stroke made the biggest contribution to the slowdown in life expectancy. Important risk factors for mortality varied by country and included tobacco, drug and alcohol use, and high fasting plasma glucose. The Nordic countries have maintained improvements in life expectancy substantially better than other European countries.

The different patterns in different countries suggest multiple factors are contributing to the changes, including specific conditions, risks and behaviours, and broader societal determinants of health. Large scale, international, co-ordinated research is needed to better understand these changes and inform policy actions, particularly as the COVID-19 pandemic will increase international differences.

Session 2065 (Symposium)

DISRUPTION TO TRANSFORMATION: ENGAGED RESEARCH

Chair: Carol Geary

Co-Chair: Katherine Abbott

Discussant: Erin McGaffigan

With changes in funders' requirements, engagement of persons with "lived experience" in the planning, conduct, and dissemination of research is increasingly common. Although patient and stakeholder engagement is expected, the body of literature describing necessary structures and processes is severely limited. Therefore, the purpose of this symposium is to aid in the movement of engaged research from disruption to translation. To do so, we will describe gaps in researcher knowledge and skills associated with patient and stakeholder engagement; structures and processes in current use with older adults, and outcomes associated with engagement. We will begin by sharing findings within advisory board models of engagement. Dr. Lessem will describe the Sage Resource Project researcher needs assessment. Researchers (N=103) shared both their engagement interests and their perceived knowledge and capability gaps. Dr. Berman will describe training developed within the same project to overcome researchers' perceived gaps. Then, Dr. Roes will describe a qualitative evaluation of persons with dementia perspectives on rewards and benefits of advisory board involvement. Our final two presenters will describe engagement using a variety of engagement approaches. Dr. Douglas will share experiences with adapting Montessori philosophies and processes to engage CNAs in development of innovative programming for dementia care within a long term care environment. Finally, Dr. Geary will share her team's findings from interviews completed using appreciative inquiry with sites with over five-years' experience engaging patients in research. Each site has developed unique infrastructures and processes to most effectively achieve desired outcomes.

STRUCTURE, PROCESS AND OUTCOMES IN PATIENT ENGAGEMENT

Carol Geary,¹ June Eilers,² Cheryl Jernigan,³ and Kim Kimminau,⁴ 1. *University of Nebraska Medical Center, University of Nebraska Medical Center, Nebraska, United States*, 2. *UNMC, Omaha, Nebraska, United States*, 3. *Retired, University of Kansas Medical Center, Kansas, United States*, 4. *MU, MU, Missouri, United States*

Although patient engagement in research is gaining acceptance by researchers and funding bodies, descriptions of implementation options and associated outcomes are limited. In this appreciative inquiry of the 12 institutions involved in the Great Plains Collaborative of the Patient-Centered Outcomes Research Network (PCORnet), we interviewed patient engagement officers and patient partners to enhance understanding of approaches to organizational structure,

research engagement processes, and associated outcomes of the engaged research. Multiple structures have been identified including operational affiliations in both hospital and multiple university departments. Professional affiliations of patient engagement officers vary widely, including nurses, social workers, and public health professionals, among others. Patient engagement processes also vary, but with the majority using forms of advisory boards. All sites reported outcomes of their work including completed and/or ongoing research and co-authored publications.

THE SAGE RESOURCE PROJECT: READYING RESEARCHERS TO TRANSFORM RESEARCH THROUGH ENGAGEMENT

Rachel Lessem,¹ Rebecca Berman,² Jesse Bella,³ and Margaret Danilovich,⁴ 1. *CJE SeniorLife, Chicago, Illinois, United States*, 2. *Leonard Schanfield Research Institute, CJE SeniorLife, Illinois, United States*, 3. *Gerontology Department, Northeastern Illinois University, Illinois, United States*, 4. *CJE SeniorLife, Skokie, Illinois, United States*

The Sage Model enables engagement of older adults receiving Long Term Services and Supports (LTSS), a group typically excluded in research. This presentation focuses on lessons learned from The Sage Resource Project, a Patient Centered Outcomes Research Institute funded project. We collaborated with RCMAR and Roybal centers to encourage NIH-affiliated researchers to embrace stakeholder engagement through promotion of the Sage Model. Few studies include an assessment of researcher needs when it comes to stakeholder engagement. We conducted a needs assessment (n=103) finding <50% of researchers presented work to older adults and only 41% interacted with older adults receiving LTSS. However, >90% were likely to attend webinars to learn more. Additionally, 70% of respondents were interested in setting up their own Sage Model research advisory boards. We identify opportunities for transforming LTSS research by including older adults as well as directions for future research on engagement, based on researchers' identified needs.

BUILDING RESEARCHERS' CAPACITY FOR EMBRACING THE ENGAGEMENT OF OLDER ADULTS IN RESEARCH

Rebecca Berman,¹ Rachel Lessem,² and Margaret Danilovich,³ 1. *Leonard Schanfield Research Institute, CJE SeniorLife, Illinois, United States*, 2. *CJE SeniorLife, Chicago, Illinois, United States*, 3. *CJE SeniorLife, Skokie, Illinois, United States*

The Sage Resource Project aimed to broaden the pool of researchers who include the voice of older adults using long-term services and supports (LTSS) in research processes. We developed training to build researcher capacity to engage older adults through the development of Sage Model research advisory boards. Methods included training strategies for learning mode, design, duration, and emphasis of content that were informed by results of a researcher needs assessment and input from 2 older adult research advisory boards. Over 100 researchers registered for a 4-webinar series. All respondents to webinar evaluations (22) reported learning about topics that aligned with webinar objectives and had interest in engaging older adult stakeholders and/or developing an older adult research advisory board in the future. Representatives from five universities expressed interest attending online

interactive workshops to build advisory boards. Lessons learned identify directions for research on best practices for developing older adult advisory groups.

MOTIVATION FOR PEOPLE LIVING WITH DEMENTIA TO ENGAGE IN RESEARCH ADVISORY BOARDS

Martina Roes,¹ Dianne Gove,² and Ana Diaz,² 1. *German Center for Neurodegenerative Diseases (DZNE), Witten, Nordrhein-Westfalen, Germany*, 2. *Alzheimer Europe, Luxembourg, Diekirch, Luxembourg*

The importance of Public Involvement (PI) is increasingly being recognized in the field of dementia research. In 2012, Alzheimer Europe set up the European Working Group of People with Dementia (EWGPWD) which provides advice and input for all activities of the organization including several large European-funded research projects. The German Center for Neurodegenerative Diseases (DZNE) created a research advisory patient board in 2020 with the intention of supporting the board in strategic research decisions. Both groups are composed of people with dementia and act independently. With the aim of finding out whether PI in research is mutually rewarding and beneficial, members of both groups were asked about their motivation to be involved in PI research activities and the value this had for them. This was collected either through narrative interviews or during meetings. People with dementia described several reasons for being involved in PI activities in dementia research.

ENGAGING DIRECT CARE PROVIDERS IN THE IMPLEMENTATION OF MONTESSORI PROGRAMMING FOR DEMENTIA

Natalie Douglas, *Central Michigan University, Mt Pleasant, Michigan, United States*

There is a need to engage direct care providers such as certified nursing assistants (CNAs) explicitly in efforts to implement innovative programming in long-term care environments. This presentation will outline engagement strategies that supported the implementation of Montessori programming in a community of 20 individuals living with severe dementia. Examples about positioning the CNA at the center of decision making, negotiating and building trust, cultivating opportunities for mutual consultation, creating spaces for new ideas to emerge, and synthesizing diverse perspectives will be highlighted. Although the program achieved positive outcomes on a number of measures including decreased responsive behaviors from people living with dementia, decreased negative qualities of relationships between CNAs and persons with dementia, and increased positive qualities of relationships between CNAs and persons with dementia, this presentation will focus on the “how” of engagement between the project team and the CNAs by highlighting qualitative data.

Session 2070 (Paper)

Elder Abuse Screening and Prevalence

EMERGENCY DEPARTMENT UTILIZATION PATTERNS AMONG PHYSICAL ELDER ABUSE VICTIMS IN COMPARISON TO OTHER OLDER ADULTS

Tony Rosen,¹ Katherine Wen,² Sunday Clark,³ Alyssa Elman,⁴ Philip Jeng,⁵ Yiye Zhang,⁵ Karl Pillemer,²

and Yuhua Bao,⁵ 1. *Weill Cornell Medical College / New York-Presbyterian Hospital, PELHAM, New York, United States*, 2. *Cornell University, Ithaca, New York, United States*, 3. *Boston University School of Medicine, Boston, Massachusetts, United States*, 4. *Weill Cornell Medical College / New York-Presbyterian Hospital, New York, New York, United States*, 5. *Weill Cornell Medical College, New York, New York, United States*

Background: Physical elder abuse is common and has serious health consequences. Little is known, however, about the patterns of health care utilization among these victims, including whether opportunities may exist for earlier identification and intervention. Our goal was to describe Emergency Department (ED) utilization known physical elder abuse victims compared with non-victims. Methods: We used Medicare insurance claims to examine ED utilization patterns among a well-characterized cohort of 139 known physical elder abuse victims in the year before abuse was identified and compared this to control subjects matched on age, sex, race, and residential zip code. Results: Physical elder abuse victims were significantly more likely than control subjects to visit the ED (47.5% vs. 35.9%, $p=0.01$) during the year before identification and to have at least one visit for an injury-related complaint (14.4% vs. 8.3%, $p=0.03$). Victims were also more likely to have multiple visits (18.7% vs. 14.6%, $p=0.24$), visit multiple EDs (7.9% vs. 6.7%, $p=0.63$), or be high frequency utilizers (≥ 4 visits, 3.6% vs. 2.7%, $p=0.58$), but differences did not reach statistical significance. The most common diagnoses in ED visits among victims were: open wound of knee/ankle, exacerbation of chronic bronchitis, pneumonia, and chest pain. Conclusion: This work provides preliminary evidence that physical elder abuse victims use the ED more frequently and potentially have different patterns of utilization than other older adults. We plan to further characterize these different patterns to potentially use them to develop tools for earlier identification.

PATIENT-CENTERED DIGITAL SCREENER FOR ELDER ABUSE IN THE EMERGENCY DEPARTMENT

Fuad Abujarad,¹ Esther Choo,² James Dziura,³ Chelsea Edwards,¹ Michael Pantalon,¹ Karen Jubanyik,⁴ Gail D'Onofrio,⁵ and Thomas Gill,¹ 1. *Yale University, New Haven, Connecticut, United States*, 2. *Oregon Health & Science University, Portland, Oregon, United States*, 3. *Yale University, New H, Connecticut, United States*, 4. *Yale University School of Medicine, New Haven, Connecticut, United States*, 5. *Yale University School of Medicine, Yale University School of Medicine, Connecticut, United States*

Elder abuse is a growing problem where many cases are left unidentified by professionals. For some older adults, the emergency department may be the sole point of care where they have an opportunity to be identified as victims of abuse. However, current methods of screening tend to miss less obvious forms of abuse and may deter older adults from self-reporting due to either a lack of understanding of abuse or fear of potential consequences. VOICES is an innovative, self-administrated, and automated tablet-based tool that combines screening, educational content, and brief motivational interviewing to enhance and improve identification of elder abuse cases. Combining an elder abuse screener and digital coach designed to guide the older adult through a customized pathway to encourage self-identification and

self-reporting of abuse, VOICES is a robust tool engineered to place the screening process in the hands of the older adults, rather than the providers. We will discuss preliminary results of the ongoing feasibility study currently being conducted in the ED, which has successfully enrolled over 500 older adults. Current data indicate that 93% of patients find the tool to be satisfying, engaging, and easy to use. Preliminary findings also suggest that older adults who come in with “Little to none” knowledge of elder abuse increase knowledge of abuse after using the tool. In summary, VOICES appears to be a feasible tablet-based screening tool in the emergency department.

SELF-ADMINISTRATED ELDER ABUSE SCREENING TOOL FOR OLDER ADULTS WITH VISUAL AND HEARING DISABILITIES

Sarah Swierenga,¹ Fuad Abujarad,² Jennifer Ismirle,¹ and Chelsea Edwards,² 1. *Michigan State University, Michigan State University, Michigan, United States*, 2. *Yale University, New Haven, Connecticut, United States*

Older adults age 60+ with disabilities are at greater risk of elder abuse compared to those without disabilities. We will describe results from our study to evaluate the usability and feasibility of the VOICES tablet-based elder abuse screening tool with older adults who have visual and hearing disabilities. VOICES is a digital health tool that screens, educates, and motivates older adults to self-report elder abuse. The VOICES tool has been developed and tested to be used with older adults without disabilities. We conducted a usability study with (n=14) older adults who were blind, had low vision, or were hard of hearing. Our evaluation method included both quantitative and qualitative measures to evaluate the ease of use and usefulness of the VOICES tool. Usability was measured as the percentage of tasks completed successfully, the average time to perform a task and the issues observed during performance of the tasks. Usability satisfaction was measured by written or verbal feedback on the questionnaires, and verbal comments from each session. Six participants completed the tasks successfully on their own; seven participants (mostly blind participants) completed the tasks with some intervention or help from the moderator. The majority of participants had System Usability Scale (SUS) scores 80 or above. Of all the participants, twelve (92%) stated that they would recommend the VOICES tool to others. Our findings generated universal considerations for more inclusive digital health interventions that accounts for the needs, wants and limitations for older adults with disabilities.

SOCIAL PARTICIPATION AND ELDER MISTREATMENT IN A NATIONAL SAMPLE OF OLDER ADULTS

Emmy Yang,¹ Nadra Lisha,² Ashwin Kotwal,³ Jaclyn Wong,⁴ and Alison Huang,² 1. *Icahn School of Medicine at Mount Sinai, New York, New York, United States*, 2. *University of California San Francisco, San Francisco, California, United States*, 3. *University of California San Francisco, University of California San Francisco, California, United States*, 4. *University of South Carolina, Columbia, South Carolina, United States*

Little is known about how social participation influences older adults' susceptibility to elder mistreatment. We

conducted a cross-sectional analysis of a national probability sample of community-dwelling U.S. adults from 2015-2016 (1,268 women and 973 men; mean age 75 and 76 years, respectively; 82% non-Hispanic white). Frequency of participation in formal activities (community meetings, religious services, and volunteering) and informal social activities (socializing with friends and family) was assessed by questionnaire. Additional measures assessed emotional, physical, and financial mistreatment since age 60. Multivariable logistic regression examined associations between social participation and elder mistreatment, adjusting for age, race/ethnicity, education, and comorbidity. Forty percent of women and 22% of men reported at least one form of mistreatment (emotional, physical, or financial). Women reporting at least monthly formal social participation were more likely to report emotional mistreatment (adjusted odds ratio (AOR) 1.57, 95% confidence interval (CI) 1.08-2.29) and financial mistreatment (AOR 1.56, 95% CI 1.02-2.38) than women with less frequent engagement. Older women who socialized at least weekly were more likely to report emotional mistreatment (AOR 0.59, 95% CI 0.44-0.78) and financial mistreatment (AOR 0.59, 95% CI 0.42-0.85). These associations were not seen among older men. Frequent social engagement in the community does not preclude risk for elder mistreatment, and informal socializing may be associated with decreased exposure to certain forms of mistreatment. Assessment of older adults' social activities may help guide strategies for detecting and mitigating elder mistreatment in the community.

Session 2075 (Paper)

Family Caregiving and Persons With Dementia

CAREGIVING INTENSITY AND DEPRESSIVE SYMPTOMS AMONG OLDER ADULTS AFTER PARTNERS' ONSET OF DEMENTIA

Melissa Harris,¹ Jinkyung Ha,² and Geoffrey Hoffman,² 1. *Duke University, Durham, North Carolina, United States*, 2. *University of Michigan, Ann Arbor, Michigan, United States*

Caring for a partner with Alzheimer's disease or related dementia (ADRD) can create tremendous care burdens. However, the extent to which onset of ADRD in a partner impacts caregiving intensity and emotional health, the relationship of increased care intensity to emotional health, and whether relationships vary across the older adult population, are less clear. We used 9 waves (years 2000-2016) of the nationally representative Health and Retirement Study dataset to examine the number of weekly caregiving hours provided and depressive symptoms for older (ages ≥ 51) individuals after partners' ADRD onset (measured with the Telephone Cognitive Interview Survey). We compared changes in outcomes from before to after partners' ADRD onset using zero-inflated negative binomial regression models, overall and among sub-populations with potential vulnerability to excess care burdens – women and racial/ethnic minorities. In our sample of 2,186 older Americans with 10,120 unique observations, we observed a 215% increase ($p < 0.001$) in weekly caregiving hours provided and 21% increase ($p < 0.001$) in depressive symptoms reported by older respondents after

partners' ADRD onset. Even larger impacts were observed for women and for non-Hispanic whites. Increased amounts of caregiving were associated with increases in depressive symptoms after a partner's ADRD onset. In all, ADRD has substantial impacts on family. Improved support mechanisms, including enriched community resources, clinician focus on dyadic needs, respite care, and policy efforts such as tax credits for caregivers, will be needed to meet the needs of couples increasingly affected by ADRD.

FEASIBILITY OF THE ACTPLAN PROGRAM FOR AFRICAN AMERICAN DEMENTIA CAREGIVERS: A SELF-DIRECTED MULTIMEDIA DELIVERY

Yashika Watkins,¹ William Collinge,² Alysha Hart,³ Rita Tharpe,⁴ Neelum Aggarwal,⁵ and Gloria Bonner,⁶
 1. *Chicago State University, Cliffside Park, New Jersey, United States*, 2. *Collinge and Associates, Inc., Eugene, Oregon, United States*, 3. *University of Illinois at Chicago College of Nursing, Chicago, Illinois, United States*, 4. *University of Illinois at Chicago College of Nursing, Chicago, Illinois, United States*, 5. *Rush University, Chicago, Illinois, United States*, 6. *University of Illinois at Chicago College of Nursing, Chicago, Illinois, United States*

African Americans (AA) are less likely than White Americans to complete advance care plans or end-of-life treatment documents. They face significantly greater risk of Alzheimer's Disease, a silent epidemic for this population, and other dementias. The healthcare system's lack of dementia support for AAs contributes to disparate care. A four-session caregiver group education program was conducted on advance care planning for AA dementia family providers. The program was based on Kolb's Experiential Learning Model and initially found effective in an R01 study using in-person delivery by a professional. The present pilot assessed feasibility of delivering the program in a self-directed multimedia format without professional facilitation, using Session 1 on tube feeding decisions as the test session. Twenty-six AA dementia caregivers completed the session in groups of 5 to 8 at a church equipped with a large TV screen. On-screen prompts guided navigation through the program which included recorded lecture, slides, short videos on decision-making, and group discussions. Using quantitative and qualitative methods, pre-and post-survey instruments were administered and interviews conducted. Usability ratings averaged 84%. Knowledge and self-efficacy gains exceeded those of the R01, with a 35% increase in correct responses on knowledge items, versus 18% for the R01 subjects; and increase in perceived decisional self-efficacy of 31% versus 30% for the R01 subjects. Qualitative feedback was universally positive. These findings confirm the feasibility of the self-guided multimedia approach to delivery of the program. A large RCT is planned which, if successful, will support wide dissemination to AA caregivers in need.

HOME-VISIT INTERVENTION TO REDUCE STRESS OF UNDERSERVED FAMILY CAREGIVERS FOR PERSONS WITH DEMENTIA

Jung-Ah Lee,¹ Seyed Amir Hossein Aqajari,² Eunae Ju,² Priscilla Kehoe,² Lisa Gibbs,³ and Amir Rahmani,²
 1. *University of California, Irvine, Irvine, California, United States*, 2. *University of California Irvine, Irvine, California,*

United States, 3. *UC Irvine Health, UC Irvine Health, California, United States*

Immigrant family caregivers for persons living with dementia (PWD) have constant stress due to the 24/7 responsibility. These family caregivers of PWD often have high morbidity and mortality. We provided a cultural and language specific home-visit intervention for these vulnerable family caregivers. There is a lack of an objective measure of stress for caregivers. We assessed caregivers' stress by measuring heart rate variability (HRV), a physiological measure of stress, using a smartwatch for a one-month intervention. Weekly home visits for a month were provided to dementia family caregivers by trained community health workers with stress reduction techniques: mindful breathing and compassionate listening. Linear mixed-effect models were used to analyze the trends for the daily stress levels as measured by HRV from the smartwatch. We had 22 participants who completed the 4-week intervention (8 Latinos, 8 Koreans, 6 Vietnamese). The models showed a significant decrease in the stress level of all participants for 3 weeks (all $P < 0.01$). At 28 days (4 weeks) all three groups showed a decrease in stress: Korean group (Beta = -0.405, $P < 0.001$), Vietnamese group (Beta = -0.150, $P = 0.028$), Latino group (Beta = -0.154, $P = 0.073$) and all caregivers (Beta = -0.235, $P < 0.001$). The findings demonstrated a reduction of immigrant family caregiver stress with a home-visit weekly intervention for one month using mindful breathing and compassionate listening by culturally/linguistically appropriate community health workers. Large-scale studies to determine long-term outcomes of family dementia caregivers are necessary and should be carried out.

NEGATIVE IMPACT AND POSITIVE VALUE OF CAREGIVING IN SPOUSE CARERS OF PERSONS WITH DEMENTIA IN SWEDEN

Marcus Johansson,¹ Kevin J McKee,¹ Lena Dahlberg,¹ Martina Summer-Meranius,² Christine Williams,³ and Lena Hammar,⁴
 1. *Dalarna University, Falun, Dalarnas Lan, Sweden*, 2. *Mälardalen University, Västerås, Västmanlands Lan, Sweden*, 3. *Florida Atlantic University, Boca Raton, Florida, United States*, 4. *Mälardalen University / Dalarna University, Västerås, Västmanlands Lan, Sweden*

As welfare providers struggle to meet the care needs of persons with dementia (PwDs), most of their needs are being met by a family carers, most often a spouse. The situation for spouse carers is unique, e.g., with grief, loneliness and loss of intimacy combining with stress and poor health. Research is needed to develop adequate support for spouse carers based on evidence of what influences negative and positive outcomes of care. The present study investigated psychosocial correlates of spouse carers' (i) negative impact and (ii) positive value of caring. Data from a cross-sectional survey of 165 spouse carers community-resident in Sweden was analysed in two hierarchical regression models to predict negative impact and positive value of caring. Results found that negative impact and positive value were explained by different variables, significant predictors for negative impact included carer stress, health, and emotional loneliness, and change in intimacy with the care-recipient, while positive value was predicted by mutuality, change in closeness to the care-recipient and quality of support. Negative impact and

positive value shared variance of only 17.2%. Thus, negative impact and positive value represent different aspects of the carer situation. Consequently, support needs to target several aspects in carers' life, aiming to; facilitate for spouses to manage PwD's impairment, increase emotional support while also strengthening the relationship between carer and PwD to reduce negative impact while increasing positive value.

PERCEPTIONS OF FAMILY CAREGIVERS OF PEOPLE WITH DEMENTIA REGARDING SYMPTOM MANAGEMENT AND THE COVID-19 PANDEMIC

Melissa Harris,¹ and Marita Titler,² 1. *Duke University, Durham, North Carolina, United States*, 2. *University of Michigan, Ann Arbor, Michigan, United States*

Nearly 98% of older adults with Alzheimer's disease and related dementias (ADRD) experience behavioral and psychological symptoms of dementia (BPSD). Although BPSD are linked to caregiver burden, perceptions of family caregivers on the impact of BPSD and their experiences addressing them in the home are unclear, and little is known about the impact of the pandemic on these experiences. Study aims were to explore: 1) the experiences of family caregivers of community dwelling older adults with ADRD regarding BPSD and how they manage BPSD in the home, and 2) how the pandemic impacted family caregivers' experiences, BPSD of their relatives, and BPSD management. A qualitative, exploratory approach was used; 21 family caregivers were interviewed virtually. Content analysis and constant comparative methods were used. Ten major themes emerged: 1) Emotional and psychological responses of caregiver, 2) Loss, 3) Anticipation, 4) Reliance, 5) Learning to caregive, 6) Rewarding, 7) Emotional and psychological responses of care recipient 8) Cognition of care recipient, 9) Care strategies, 10) Caregiver perspectives. Caregivers did not use terms "behaviors" or "symptoms", instead they described their relatives' and their own experiences interdependently. Caregiving challenges presented before the pandemic (e.g. equivocal effects of medications, increasing care demands), many of which were compounded by the pandemic. Future research should explore the experiences of caregivers from a range of backgrounds. Findings illustrate communication barriers exist between clinicians, community services, people with ADRD and their families which may be addressed through clinician education, family-centered care planning, and policies to expand support service access.

Session 2080 (Symposium)

FINDINGS FROM IMPLEMENTATION OF THE EIT-4-BPSD TRIAL

Chair: Barbara Resnick

Co-Chair: Marie Boltz

Discussant: Ann Kolanowski

Behavioral and psychological symptoms of dementia (BPSD) include aggression, agitation, depression, anxiety, apathy and hallucinations and are exhibited by up to 90% of nursing home (NH) residents with dementia. BPSD result in negative health outcomes, functional decline, high care costs, increased risk for inappropriate use of antipsychotic medications and social isolation. Behavioral approaches are endorsed as the first line of treatment for BPSD. Despite

regulatory requirements, less than 2% of nursing homes consistently implement these approaches. The EIT-4-BPSD Trial was done to test a novel implementation approach to assure that staff in nursing homes use non-pharmacologic, behavioral approaches for the management of BPSD. EIT-4-BPSD is a theoretically-based four-step approach that includes: 1. Assessment of the environment and policies; 2. Education of staff; 3. Establishing person-centered care plans; and 4. Mentoring and motivating staff. Implementation of the four-step approach was guided by the Evidence Integration Triangle (EIT). The EIT brings together evidence and key stakeholders from the NH and uses a participatory implementation processes, practical evidence-based interventions, and pragmatic measures of progress toward goals. A total of 55 nursing homes from two states and 553 residents were included in this study. Nursing homes were randomized to EIT-4-BPSD or education only. This symposium will describe the utility of the EIT as an implementation framework based on the Reach, Effectiveness, Adoption, Implementation, and Maintenance model, report detailed effectiveness outcomes of EIT-4-BPSD at the setting and resident levels, and address recruitment and measurement challenges and future solutions to these challenges.

TESTING THE USEFULNESS OF THE EVIDENCE INTEGRATION TRIANGLE FOR IMPLEMENTATION OF EIT-4-BPSD

Barbara Resnick, *University of Maryland School of Nursing, Baltimore, Maryland, United States*

The effectiveness of evidence-based practices, such as use of behavioral interventions, can be improved when delivered under conditions of an implementation framework. This pragmatic trial used the Evidence Integration Triangle (EIT) which is a parsimonious, community-engaged participatory framework that brings evidence and facility stakeholders together. Active engagement empowers key stakeholders to integrate evidence into practice using a simple three-pronged framework: (1) A participatory implementation process which was done via monthly meetings and weekly emails between stakeholders and a clinical expert as they worked on facility based goals; (2) Implementation of the four steps delineated in the EIT-4-BPSD; and (3) evaluation using practical progress measures. There was some evidence of implementation of the EIT-4-BPSD based on participation in Stakeholder team meetings, settings working towards goal achievement, and increased use of behavioral interventions among staff. The EIT approach is a useful implementation framework to help change staff behavior in long term care.

EFFECTIVENESS OF THE EIT-4-BPSD INTERVENTION ON RESIDENT AND SETTING OUTCOMES

Elizabeth Galik, *University of Maryland School of Nursing, Baltimore, Maryland, United States*

The effectiveness of EIT-4-BPSD was based on testing the following hypotheses: (1) Settings exposed to EIT-4-BPSD will demonstrate improvements in Environment and Policy assessments, better quality of care interactions, and more person-centered care approaches for management of behavioral symptoms in care plans compared to Education Only settings; and (2) Residents in EIT-4-BPSD settings will have fewer behavioral symptoms and less pain, maintain

or improve function, use fewer psychotropic medications, and have improved quality of life compared to residents in Education Only settings. There was not a significant treatment effect at the setting or resident level. Reasons for lack of effectiveness include limited evidence of behavioral symptoms at baseline, nationally based environment and policy requirements related to behavioral management, and measurement challenges in identifying behaviors and other outcomes. Future work should focus more on process and changing how staff approach care which was demonstrated in this trial.

FACILITATORS AND BARRIERS TO IMPLEMENTATION OF THE EIT-4-BPSD INTERVENTION

Liza Behrens,¹ Kiernan Riley,² Marie Boltz,³ Ann Kolanowski,⁴ and Kimberly Van Haitsma,⁵

1. *Ross and Carol Nese College of Nursing, Pennsylvania State University, University Park, Pennsylvania, United States*, 2. *Penn State University, College Station, Pennsylvania, United States*, 3. *Pennsylvania State University, University Park, Pennsylvania, United States*, 4. *Penn State, University Park, Pennsylvania, United States*, 5. *The Pennsylvania State University, University Park, Pennsylvania, United States*

This study aimed to explore the perceptions of stakeholders (site champions, administrators, and front-line, social service, and activity staff) regarding the EIT-4-BPSD implementation strategy, including its utility, and the barriers and facilitators to implementation in real-world settings. A process evaluation included qualitative data from focus groups conducted with 93 stakeholders of 21 nursing homes (NHs) that implemented the EIT-4-BPSD strategy. Data were analyzed using a conventional content analysis. Emerging codes were sorted into categories then organized in meaningful clusters based on the domains of the RE-AIM framework. Challenges, facilitators, and contextual factors explain variability in implementation of EIT-4-BPSD strategy among NHs in six key categories: multi-stakeholder engagement, multi-level outcomes, process adaptations, uptake and utility of EIT resources, adoption barriers and facilitators, and future planning. Overall, stakeholders reported that the EIT-4-BPSD strategy can be successfully implemented in NHs and is helpful in improving staffs' approach to BPSD.

RECRUITMENT AND MEASUREMENT CHALLENGES AND FUTURE SOLUTIONS

Kimberly Van Haitsma, *The Pennsylvania State University, University Park, Pennsylvania, United States*

Recruitment of residents in the EIT-4-BPSD study required that residents have evidence of at least one behavioral symptom noted by staff in the past month. Even with this inclusion criteria 25% of the sample had no behavioral symptoms at baseline based on the Cornell Scale for Depression in Dementia, the Cohen-Mansfield Agitation Inventory, the Resistance to Care Scale, Pain in Advanced Dementia Scale, and Quality of Life in Late-stage Dementia Scale. Further, settings had good quality of care. Challenges to recruitment included the lack of willingness of residents with significant behavioral symptoms to assent to participate and legally authorized representatives to consent. Challenges

to measurement included recall by staff and assumptions that behavioral symptoms were normal, short observation periods, and resident inability to provide input. Future solutions include some revisions in measures that will be described, longer assessment periods, and elimination of requirements that make recruitment of this population difficult.

Session 2085 (Symposium)

HEARING AND VISION IMPAIRMENT IN OLDER ADULTS: IMPLICATIONS FOR COGNITIVE, MENTAL, AND BRAIN HEALTH

Chair: Jennifer Deal

Co-Chair: Frank Lin

Discussant: Bonnielin Swenor

Sensory impairment impacts over 55% of Americans aged 60 years or older and may have important downstream consequences for the cognitive health of older adults. This session will present evidence for a relationship between sensory impairment and accelerated cognitive decline, increased risk of incident dementia, and increased mental and physical fatigability from two observational cohort studies. Additionally, this session will investigate the possible nature of these relationships. It may be that sensory impairment is a marker of dementia-related pathological changes in the brain, with potential ramifications for risk prediction and stratification. Alternatively, sensory impairment may have a direct impact on the aging brain, a potential causal mechanism linking sensory impairment and brain health, with implications for disease prevention. As part of this session, we will present evidence for associations between central auditory processing, a potential risk marker, and brain volumes measured with structural magnetic resonance imaging (MRI), and retinal vasculature density, as measured with optical coherence tomography. We will conclude by describing associations between age-related macular degeneration, a leading cause of blindness, and neurocognitive test performance and regional changes in brain atrophy and connectivity.

VISION, COGNITIVE IMPAIRMENT, AND DEMENTIA IN THE AGING, DEMOGRAPHICS, AND MEMORY STUDY

Joshua Ehrlich,¹ Bonnielin Swenor,² Yunshu Zhou,³ and Kenneth Langa,³ 1. *University of Michigan, University of Michigan, Michigan, United States*, 2. *Johns Hopkins School of Medicine, Baltimore, Maryland, United States*, 3. *University of Michigan, Ann Arbor, Michigan, United States*

Vision impairment (VI) is common in late-life and may be a modifiable risk factor for cognitive decline and dementia. In this study, using data from the population-based Aging, Demographics and Memory Study (ADAMS), we analyzed the association of VI with cognitive impairment no dementia (CIND) and dementia. We found that VI (binocular presenting acuity <20/40) was significantly associated with incident CIND (OR=3.5, 95% CI=1.4-8.9, p=0.008) and dementia (OR=1.8, 95% CI=1.0-3.1, p=0.040) after adjusting for age. However, among those with CIND, VI was not associated with dementia (OR=0.9, 95% CI=0.4-1.8, p=0.733). The association between VI and CIND remained significant

in models fully adjusted for demographic and health factors (OR=2.7, 95% CI=1.0-7.5, $p=0.049$). We conclude that VI is associated with development of CIND but not with subsequent onset of dementia. These findings suggest that the association between VI and dementia is driven by the elevated risk of dementia among those with CIND.

WORSE SELF-REPORTED HEARING ABILITY IS ASSOCIATED WITH GREATER PERCEIVED PHYSICAL AND MENTAL FATIGABILITY

Theresa Gmelin,¹ Kyle Moored,² Frank Lin,³ Justin Golub,⁴ Mary Wojczynski,⁵ Robert Boudreau,² Angeline Galvin,⁶ and Nancy W. Glynn,⁷ 1. *University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania, United States*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 3. *Johns Hopkins University, Johns Hopkins University, Maryland, United States*, 4. *Columbia University, New York, New York, United States*, 5. *Washington University School of Medicine, Washington University School of Medicine, Missouri, United States*, 6. *University of Southern Denmark, Odense, Hovedstaden, Denmark*, 7. *University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania, United States*

Older adults with hearing loss often report higher fatigue due to effortful listening. We evaluated whether self-reported hearing ability is associated with perceived physical and mental fatigability (a more sensitive measure than fatigue) using the Pittsburgh Fatigability Scale (PFS). Older adults (N=2,558) from the Long Life Family Study Visit 2 (71.5±11.4 years; 54.8% women) completed PFS and self-reported hearing ability (worse=[fair,poor,very poor,deaf] or better=[good, excellent]). Age-adjusted PFS Physical and Mental scores were 2.3 and 2.5 lower, respectively, for worse vs. better hearing ($p<.0001$). Generalized estimating equations adjusted for family-relatedness, site, age, sex, cognitive function (Mini-Mental State Examination), education, and self-reported health. Compared to individuals with better hearing, those with worse hearing had a 42% and 44% greater odds of physical (≥ 15) (CI:1.12-1.80, $p=0.0042$) and mental (≥ 13) (CI:1.13-1.84, $p=0.0034$) fatigability, respectively. These observed associations may potentially be explained via complex psychosocial and cognitive aging pathways (e.g. effortful listening) to be examined in future work.

RETINAL VASCULAR DENSITY ON OCT-A AND AGE-RELATED CENTRAL AND PERIPHERAL HEARING LOSS IN AN ITALIAN OLDER POPULATION

Rodolfo Sardone,¹ Ilaria Bortone,² Francesco Panza,³ Giancarlo Sborgia,⁴ Gianluigi Giuliani,⁴ Valentina Pastore,⁴ Francesco Boscia,⁴ and Nicola Quaranta,⁵ 1. *Population Health - Sensorial Frailty Laboratory - NATIONAL INSTITUTE IRCCS "S DE BELLIS" Research Hospital, Castellana Grotte, Puglia, Italy*, 2. *Institute of Clinical Physiology - National Research Council, Pisa, Toscana, Italy*, 3. *Gerontology Unit, National Institute of Gastroenterology "Saverio de Bellis", Research Hospital, Castellana Grotte, Bari, Italy., Castellana Grotte, Puglia, Italy*, 4. *Eye Clinic, Department of Basic Medical Sciences, Neuroscience and Sense Organs, University of Bari "Aldo Moro", Bari, Italy., Bari, Puglia, Italy*, 5. *Otolaryngology*

Unit, Department of Basic Medical Science, Neuroscience and Sense Organs, University of Bari Aldo Moro, Bari, Italy., Bari, Puglia, Italy

Age-related hearing loss (ARHL) and retinal vessel changes have both been associated to neurodegeneration/dementia, suggesting a possible link between these two conditions in older age. We analyzed data on 886 older participants (65 years+, age range: 65-92 years) in the cross-sectional population-based Salus in Apulia Study. OCT-A scan was used to measure SVD and DVD of the capillary plexi of the macula in different retinal quadrants. Peripheral ARHL was defined as >40 dB HL of PTA (0.5,1,2, and 4KHz) in the worst ear, and age-related CAPD as $<50\%$ at the SSI-ICM test in at least one ear. DVD at the whole retina and at the parafoveal quadrant were inversely associated only with age-related CAPD [OR:0.93; 95%CI: 0.88-0.96 and OR:0.94; 95 CI:0.90-0.99, respectively]. The association of retinal vascular density with age-related CAPD may bring us a further step forward in understanding the biological mechanisms underlying the links between neurodegeneration/dementia and ARHL.

ASSOCIATIONS OF CENTRAL AUDITORY PROCESSING WITH BRAIN VOLUMES

Kening Jiang,¹ Josef Coresh,² Kathleen Hayden,³ Clifford Jack,⁴ Thomas Mosley,⁵ James Pankow,⁶ Frank Lin,⁷ and Jennifer Deal,⁸ 1. *Johns Hopkins Cochlear Center for Hearing and Public Health, Baltimore, Maryland, United States*, 2. *Department of Epidemiology, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 3. *Wake Forest School of Medicine, Winston-Salem, North Carolina, United States*, 4. *Department of Radiology, Mayo Clinic, Rochester, Minnesota, United States*, 5. *The University of Mississippi Medical Center, Jackson, Mississippi, United States*, 6. *Division of Epidemiology and Community Health, University of Minnesota School of Public Health, Minneapolis, Minnesota, United States*, 7. *Johns Hopkins University, Johns Hopkins University, Maryland, United States*, 8. *Johns Hopkins University, Baltimore, Maryland, United States*

We investigated the cross-sectional associations of speech-in-noise performance with magnetic resonance imaging brain volumes among 588 cognitively normal participants (77±4 years, 56% female) from the Aging and Cognitive Health Evaluation in Elders Study (randomized trial embedded in the Atherosclerosis Risk in Communities (ARIC) Study) baseline in 2018-19 (N=427, with hearing loss) and ARIC (N=161, normal hearing) Visit 6/7 in 2016-17/2018-19. Central auditory processing was measured by Quick Speech-in-Noise (QuickSIN) test; range: 0 to 30, lower scores=worse performance. In models adjusted for demographic and disease covariates, every 5-point decrease in QuickSIN score was associated with smaller volumes of the temporal lobe overall (-0.07SD, 95% CI:-0.13,-0.01) as well as subregions including but not limited to those important for auditory processing (amygdala:-0.13SD, 95% CI:-0.21,-0.04; middle temporal gyrus:-0.08SD, 95% CI:-0.15,-0.00; superior temporal gyrus:-0.08SD, 95% CI:-0.15,-0.01). Further research is needed to understand the mechanisms underlying these observed associations.

AGE-RELATED MACULAR DEGENERATION AND THE AGING BRAIN

Heather Whitson,¹ Alexandra Badea,² Jacques Stout,² Simon Davis,² Jie Zhuang,³ and David Madden,² 1. *Duke University School of Medicine, Durham, North Carolina, United States*, 2. *DUKE UNIVERSITY, Durham, North Carolina, United States*, 3. *Shanghai University of Sport, Durham, North Carolina, United States*

Age-related macular degeneration (AMD), a leading cause of vision loss in older Americans, is associated with cognitive decline and, particularly, worse performance on verbal fluency tasks. To determine whether AMD is associated with changes in brain structure that may underlie decline in cognition, we conducted a longitudinal, observational study of 39 visually impaired AMD patients and 33 age-matched peers with healthy eyes. Participants (mean age 74.3) underwent cognitive assessments and 3T magnetic resonance imaging (MRI) at baseline and two years. At baseline, AMD patients exhibited lower cortical volume and worse white matter tract integrity, especially in inter-hemispheric connections (FDR <0.05). Principal components analyses revealed faster white matter decline in the AMD group, especially in visual cortex and left hemisphere, which is implicated in language tasks. Understanding patterns of regional brain atrophy in AMD sheds light on mechanisms for the AMD-cognition link and opens windows of opportunity for intervention.

Session 2090 (Symposium)

IMPLICATIONS OF DISABILITY FOR FUNCTIONAL TRAJECTORY, SERVICE USE, AND EXPENDITURES

Chair: Wayne Anderson

Discussant: Gretchen Alkema

People with disabilities face a diverse array of health care and support needs. These needs can vary by disability type, degree, and timing of the advent of functional limitations. These differences have implications for needed health care service use and related expenditures. The symposium will open with a Centers for Disease Control and Prevention-sponsored analysis of adult disability-associated health care expenditures, both nationally and by U.S. state, in total, by per adult, by per adult with disability, and by payer, to illustrate the contribution and variation of these expenditures to individual states and the health care system. We will next present a U.S. Department of Health and Human Services' Office of the Assistant Secretary for Planning and Evaluation effort to identify onset and patterns of reduced functional ability at end of life for older adults with and without dementia as related to other comorbidities. The last paper will present a Commonwealth Foundation study on older adults with functional disabilities and multiple chronic conditions, comparing those with high health care needs versus the subset of those people who are also high cost. Patterns of utilization differed between these two groups, and by state. These findings have implications for the development of care models that might best meet people's needs. Our discussant will respond to the studies' findings and discuss the important role that efforts to understand the nature of disability and functional status and the scale and scope of service use and costs have for people with disabilities.

STATE-LEVEL HEALTH CARE EXPENDITURES ASSOCIATED WITH DISABILITY

Wayne Anderson,¹ Olga Khavjou,¹ Amanda Honeycutt,¹ Laurel Bates,¹ NaTasha Hollis,² Scott Grosse,² and Hilda Razzaghi,² 1. *RTI International, Research Triangle Park, North Carolina, United States*, 2. *Centers for Disease Control and Prevention (CDC), Atlanta, Georgia, United States*

This study updated prior (2003) state-level estimates of disability-associated health care expenditures (DAHE). We combined 2013-2015 data from three national data sets to estimate using multivariate regression all state-level DAHE for US adults in total, by payer, and per adult and per (adult) person with disability (PWD). In 2015, DAHE were \$868 billion nationally (State range, \$1.4 billion to \$102.8 billion) accounting for 36% of total health care expenditures (range, 29%-41%). From over a decade ago, total DAHE increased by 65% (range, 35%-125%). DAHE per PWD was \$17,431 (range \$12,603 to \$27,839). From over a decade ago, per-PWD DAHE increased by 13% (range, -20% to 61%). In 2015, Medicare DAHE per PWD ranged from \$10,067 to \$18,768. Medicaid DAHE per PWD ranged from \$9,825 to \$43,365. DAHE are substantial and vary by state and payer. Stakeholders can use these results to develop public health programs to support people with disabilities.

UTILIZATION AND EXPENDITURES OF HIGH-NEED, HIGH-COST OLDER ADULTS WITH DISABILITIES

Sarita Karon,¹ Cleanthe Kordomenos,² Molly Knowles,² and Micah Segelman,² 1. *RTI International, Waltham, Massachusetts, United States*, 2. *RTI International, Research Triangle Park, North Carolina, United States*

The factors that lead people to have high needs for care can vary greatly, with implications for the best approaches to serving their needs. One high need group of interest is older adults with disabilities and multiple comorbidities. There is variation in need within this group. Of particular interest is the subset that is both high need and high cost (HNHC). We present work describing Medicare and Medicaid utilization and expenditures for this high need group and the HNHC subset. Over 7.6 million people were identified as high need; 13.6% of them also were defined as HNHC. Patterns of utilization differed between these groups, with the HNHC group more likely to use inpatient care and nursing home care, but less likely to use community-based long-term services and supports. These findings have implications for the development of care models that might best meet the needs of this population.

FUNCTIONAL TRAJECTORIES FOR PEOPLE WITH DEMENTIA AND OTHER COMORBIDITIES IN THE LAST YEARS OF LIFE

Ila Broyles,¹ Lauren Palmer,² Emily Graf,³ Qinghua Li,⁴ Zhanlian Feng,⁴ Helen Lamont,⁵ Judith Dey,⁵ and Iara Oliveira,⁵ 1. *RTI International, RTI International, North Carolina, United States*, 2. *RTI International, RTI International, Massachusetts, United States*, 3. *UC Berkeley, Berkeley, California, United States*, 4. *RTI International, Research Triangle Park, North Carolina, United States*, 5. *Office of the Assistant Secretary for Planning and Evaluation, Washington, District of Columbia, United States*

A hallmark of end-of-life (EOL) is reduced functional ability. However, the impact of dementia and other comorbidities on EOL decline for older adults is less well understood. We estimated the effect of having dementia and comorbidities on activity of daily living (ADL) scores using the 2000-2012 Health and Retirement Study. We identified 5,853 people over age 65 who died and predicted monthly ADL impairments in the last 4 years of life controlling for dementia and other characteristics. Stroke and obesity were associated with significantly higher ADL scores, regardless of dementia status. However, if both dementia and either stroke or obesity were present, dementia was associated with significantly higher ADL scores approximately 1-4 years before death. Functional decline occurred closer to death if they had these conditions and no dementia. Differences in function when patients have dementia and comorbidities may affect understanding of survival time and access to appropriate care.

Session 2095 (Paper)

Long-Term Care and COVID-19

BREATHING UNEASY: FIT-TESTED N95 RESPIRATOR ACCESS IN WASHINGTON STATE LONG-TERM CARE FACILITIES

Carolyn Ham,¹ and Mikkie Nakamura,² 1. *Washington State Department of Health, Olympia, Washington, United States*, 2. *Washington State Department of Health, Shoreline, Washington, United States*

Long-term care facilities (LTCF) have been disproportionately impacted by illness and death from COVID-19. Shortages of respirators for staff, especially Particulate Filtering Facepiece Respirators (N95), have limited LTCFs ability to follow public health recommendations for preventing COVID-19 transmission. Use of N95 respirators was infrequent in Washington State (WA) LTCFs prior to May 2020. N95 respirators must be individually fit tested to provide intended protection; a fit test is a procedure that tests the seal between the N95 respirator and the wearer's face. The WA Department of Health (WA DOH), collaborated with stakeholders to survey LTCFs in November 2020 regarding needs for fit tested respirators and analyzed responses (n=384). Responses by facility type: 8.3% nursing homes, 17.7% assisted living, 62.8% adult family home, 11.2% other. In WA, adult family homes (AFH) are licensed for six or fewer residents. 23.70% of LTCFs indicated they did not have any N95 respirators in stock at their facility; 96.7% of these were AFH. In August 2020 WA DOH surveyed AFH owners and received 110 responses; 9.76% reported having at least one staff member fit tested for respirators. Smaller facilities may experience increased burden in accessing N95 respirators and fit testing due to lack of established relationships with suppliers and small volumes being purchased. WA DOH used federal COVID funding to contract with mobile fit testing providers and prioritized AFHs for this service. Between December 1, 2020-February 28, 2021, staff at 290 LTCFs were fit tested. The project will continue throughout 2021.

LTSS DIRECT CARE WORKER EMPLOYMENT DURING COVID-19

Janette Dill,¹ and Bianca Frogner,² 1. *University of Minnesota, Minneapolis, Minnesota, United States*, 2. *University of Washington, Seattle, Washington, United States*

The crisis of COVID-19 in long-term care services and supports (LTSS) has brought attention to challenges in staffing long-term care organizations, as shortages of direct care workers led to a dramatic inability to provide needed care for many residents in nursing homes and other residential care settings. In this study, we examine unemployment among LTSS direct care workers during the crisis and recovery. This study uses monthly data from January 2019 to December 2020 from the Current Population Survey, a monthly household survey collected by the Bureau of Labor Statistics, and we compare an individual's 2019 monthly employment patterns to their 2020 monthly employment. Long-term care workers had an unemployment rate of 2.8% in April 2020, when unemployment rates in the US reached a peak; however, new unemployment among long-term care workers has not declined as consistently as in other settings. Female health care workers were significantly more likely to be unemployed compared to their male counterparts, a trend that is consistent with the overall economy, and workers who earned the lowest wages were more likely to have transitioned to unemployment. COVID-19 has added significant complexity to the provision of direct care services, making LTSS a hazardous place to work. Concerns remain about unemployment in long-term care where demand for workers remains high; additional measures need to be taken to ensure that direct care workers have the resources they need to remain employed.

STATE ADOPTION OF NURSING HOME IMMUNITY FROM LEGAL LIABILITY DURING THE COVID-19 PANDEMIC

Pamela Nadash,¹ Edward Miller,² Elizabeth Simpson,¹ Michael Gusmano,³ and Lisa Beauregard,⁴ 1. *University of Massachusetts Boston, University of Massachusetts Boston, Massachusetts, United States*, 2. *University of Massachusetts Boston, Boston, Massachusetts, United States*, 3. *Rutgers University School of Public Health, Rutgers University School of Public Health, New Jersey, United States*, 4. *Executive Office of Elder Affairs, Massachusetts, United States*

Twenty-eight states have provided nursing homes (NHs) with immunity from legal liability related to COVID-19. This study places these provisions in the context of prior actions protecting NHs from legal action and explores factors influencing the adoption of such immunity provisions across states. It uses cross-sectional data to examine patterns of policy adoption and to assess states' likelihood of adopting immunity provisions using multivariate methods. Variables of interest include information on state political, socioeconomic, programmatic, and COVID-19-related characteristics as well as data on campaign contributions and lobbying activity at the state level. Factors significantly related to NH immunity provision adoption included measures of state fiscal health (unemployment), ideology (percent legislators Democrat), governing capacity (unified

government), and NH characteristics (percent not-for-profit, hospital-based, and chain). Population density and Medicaid as a percentage of state general fund expenditures proved significant as well. Against these complex influences, organizations lobbying on behalf of NH residents and their families have found themselves ineffectual in creating avenues for accountability. Results indicate that enforcing accountability for NH deaths during the COVID-19 pandemic is a complex process, constrained by available policy tools and made more complicated by factors external to the NH environment that contributed to high death rates. Historically, the NH industry has been successful in avoiding consequences for poor quality care, a pattern that has persisted in that NHs have generally been successful in avoiding liability for negligence during the COVID-19 pandemic.

STAYING IN TOUCH DURING COVID-19: LONG-TERM CARE FACILITY COMMUNICATION STRATEGIES AND FAMILY PERCEPTIONS

Jane Straker,¹ and Mi Sun Choi,² 1. *Miami University, Oxford, Ohio, United States*, 2. *Silla University, Silla University, Pusan-jikhalsi, Republic of Korea*

During the COVID-19 pandemic, family concerns regarding residents in long-term care facilities (LTCFs) increased dramatically due to the higher proportion of deaths in LTCFs and an inability to visit, observe care, or easily communicate with residents. However, little is known about how these facilities communicated with families and how communications were related to family perceptions about the facility. To address these knowledge gaps, we implemented an online survey of family members or friends of residents in LTCFs from April 28 to June 19, 2020. A total of 174 responses nationwide reported the types of communications used, frequency of communication and alternative visits, and whether the families had peace of mind, would recommend the facility and whether they were considering removing the resident from the facility. We performed chi-square and t-tests to identify differences in perception among families. Results showed that respondents had more negative perspectives of a facility when they were not informed about confirmed COVID cases. There were no differences in family members' perceptions of a facility based on the frequency of alternative visits. When respondents could communicate with their family members in an LTCF by telephone, email, mail, and window visits, they had more peace of mind. Respondents were more likely to recommend the facility to others when they were able to communicate via mail with the facility. Our findings suggest multiple communications and transparency about COVID status were most effective in keeping positive family perceptions about the facility. Our results can inform future facility communication protocols.

THE ETHICAL DILEMMA OF SAFETY VERSUS SELF-DETERMINATION IN LONG-TERM CARE COMMUNITY RESIDENTS DURING COVID-19

Rebecca Davis,¹ Cheryl Monturo,² Maria O'Reilly,³ and Diana Sturdevant,⁴ 1. *Grand Valley State University, Grand Rapids, Michigan, United States*, 2. *West Chester University, West Chester, Pennsylvania, United States*, 3. *Central Queensland University, Bundaberg, Queensland, Australia*, 4. *University of Oklahoma HSC, Oklahoma City, Oklahoma, United States*

The pandemic profoundly affected the care of older adults in long term care communities (LTCC) across the world. More than one third of pandemic deaths were linked to nursing homes. Most nations and states had strict guidelines on visitation, with many, especially in the United States, totally prohibiting visitation for over an entire year. Well-intentioned measures to protect through isolation caused a profound ethical tension between safety and self-determination. The aim of the project was to examine this dilemma using a case study and the Madison Collaborative Ethical Reasoning in Action Framework. Eight key questions of fairness, outcomes, rights, responsibilities, character, liberty, empathy, and authority were applied in the context of federal and state mandates in the US and Australia. Results highlighted issues of ageism, paternalism vs empathy, regulatory vs family authority, a focus on short-term outcomes while forfeiting long-term outcomes, community responsibilities to the resident trumped individual resident rights, the potential loss of community character in lieu of basic care provision, a loss of personal freedoms, and the emphasis of physical well-being over holistic well-being. The results of this analysis can inform future policy and provide lessons learned for the future.

Session 2100 (Symposium)

MEASURING WHAT MATTERS IN LONG-TERM CARE: COMMON DATA ELEMENTS IN BRAZIL, CHINA, AND THE UNITED STATES

Chair: Michael Lepore

Co-Chair: Kirsten Corazzini

Discussant: Sheryl Zimmerman

Internationally sharable common data elements on residential long-term care (LTC) settings, such as nursing homes and assisted living facilities, can facilitate comparisons across diverse LTC settings for valuable insights on LTC regulation and oversight, practice and operations, infrastructure development, human resources issues, and quality and safety. However, such insights are predicated on the premise that data elements capture information that matters to the full LTC community, including residents, relatives and staff, and are able to be collected across diverse care settings, including low-resource contexts. A critique of much current LTC measurement is its focus on deficits and loss, rather than thriving, person-centered care, and healthy aging, which have been established as important to LTC communities internationally. Further, measurement burden, cultural differences in perceptions of data sharing, and data infrastructure differences are key issues for international data. An international collaborative of LTC researchers—Worldwide Elements to Harmonize Research in Long-Term Care Living Environments (WE-THRIVE)—has developed a set of common data elements that are recommended for parsimoniously assessing key outcomes, workforce and staffing, person-centered care, and the contexts within which LTC settings operate. The studies in this symposium provide insights into the validation and implementation of WE-THRIVE recommended measures in diverse, low-resource LTC contexts, including LTC settings in Brazil, China, and rural Midwest US. Study findings validate WE-THRIVE measures, and provide new knowledge to inform capacity-building for the measurement of person-centered care and healthy aging outcomes in diverse, low-resource, LTC settings.

MEASURING WHAT MATTERS ACROSS INTERNATIONAL LONG-TERM CARE SETTINGS

Michael Lepore,¹ and Kirsten Corazzini,² 1. *LiveWell Alliance, Southington, Connecticut, United States*, 2. *University of Maryland School of Nursing, Baltimore, Maryland, United States*

Measuring what matters most to residents, relatives and staff in residential long-term care settings is critical, yet underdeveloped in our predominantly frailty and deficits-focused measurement frameworks. The Worldwide Elements to Harmonize Research in Long-Term Care Living Environments (WE-THRIVE) consortium has previously prioritized measurement concepts in the areas of care outcomes, workforce and staffing, person-centered care, and care context. These concepts include knowing the resident and what matters most to the resident, and outcomes such as quality of life, and personhood. We present findings of our currently recommended measures, including both general population and dementia-specific measures, such as the Person-Centered Care Assessment Tool (PCAT), the Personhood in Dementia Questionnaire (PDQ), and the ICEpop CAPability Measure for Older People (ICECAP-O). We also describe remaining gaps in existing measures that will need to be addressed to fully specify common data elements focused on measuring what matters most to residents, relatives and staff.

PERSON-CENTERED CARE POST-PANDEMIC IN RURAL U.S. SETTINGS: USE OF WE-THRIVE MEASURES

Sarah Holmes,¹ Kirsten Corazzini,¹ Michael Lepore,² Nancy Kusmaul,³ Deanna Myer,¹ and Zahra Rahmaty,¹ 1. *University of Maryland School of Nursing, Baltimore, Maryland, United States*, 2. *LiveWell Alliance, Southington, Connecticut, United States*, 3. *University of Maryland, Baltimore County, Baltimore, Maryland, United States*

Frontier communities are rural counties that are sparsely populated with limited resources to provide residential long-term care; COVID-19 has heightened these barriers and adversely affected residents, their families and staff. This study describes the feasibility of implementing recommended WE-THRIVE measures in one residential long-term care setting in a frontier community in the rural Midwest, and the capacity for administrative leadership to draw upon results of measures to implement person-centered care post-pandemic. During the COVID-19 pandemic, early efforts to advance person-centered care in the setting were displaced by a focus on infection control and containment. WE-THRIVE measures assess person-centered care following immunization distribution, and are discussed in terms of how to develop a dashboard to 'de-escalate' a COVID-19 focus and rebuild momentum towards person-centered care. Particular attention is given to the context of measurement, including data sharing and measurement burden, to inform advancing person-centered long-term care in other frontier communities.

PERSPECTIVES TOWARD LONG-TERM CARE MEASUREMENT FROM FRONTLINE WORKERS IN BRAZIL

Ruth Caldeira de Mello,¹ Patrick Wachholz,² Paulo José Fortes Villas Boas,³ Vivian Schutz,⁴ Michael Lepore,⁵ Deanna Myer,⁶ Ester Villalonga Olives,⁷ and Kirsten Corazzini,⁶ 1. *University of São Paulo, São*

Paulo, São Paulo, Brazil, 2. *São Paulo State University, São Paulo State University - Unesp, São Paulo, Brazil*, 3. *University of São Paulo, Universidade de São Paulo, São Paulo, Brazil*, 4. *University of Maryland Baltimore, School of Nursing, Baltimore, Maryland, United States*, 5. *LiveWell Alliance, Southington, Connecticut, United States*, 6. *University of Maryland School of Nursing, Baltimore, Maryland, United States*, 7. *University of Maryland, School of Pharmacy, Baltimore, Maryland, United States*

The Brazilian long-term care (LTC) sector remains poorly structured and underdeveloped. COVID-19 did not bring unprecedented focus to the sector just because of the high mortality; it also affected the quality of care. In this pilot study, we evaluated the perspectives toward WE-THRIVE LTC measurements from Brazilian frontline workers in five long-term care facilities. For the four WE-THRIVE domains of LTC measurement (workforce and staffing, person-centered care, organizational context, and care outcomes), respondents used a 4-point Likert scale to rate their importance and answered open-ended questions about how these aspects of care changed since COVID-19. With few exceptions, respondents rated these aspects of LTC as extremely important or very important. Qualitative results highlighted concerns about and impacts of COVID-19, such as challenges related to the isolation of residents. The assessed measurement domains are confirmed to be important by frontline staff in Brazil. Measurement adoption must account for current issues.

PERSPECTIVES TOWARD PERSON-CENTERED LONG-TERM CARE IN CHINA

Jing Wang,¹ Kirsten Corazzini,² and Bei Wu,³ 1. *Fudan University, Chapel Hill, North Carolina, United States*, 2. *University of Maryland School of Nursing, Baltimore, Maryland, United States*, 3. *New York University, New York, New York, United States*

Health care aides provide direct care for older residents with advanced dementia in long-term care facilities. This study aims to understand care aides' perceptions of what is 'good' care, what is person-centered care, and how to provide person-centered care for older residents with advanced dementia, as preparatory work of the WE-THRIVE consortium's efforts to develop internationally-relevant common data elements of person-centered dementia care and launch comparative research in LMICs. Semi-structured interviews were conducted with health care aides (N=35) from 2 government-owned and 2 private long-term care facilities in urban China. Directed and conventional content analysis were used, drawing upon core constructs of person-centered dementia care and Nolan's (2006) senses framework. We found that although care aides were not trained in person-centered care, they did incorporate person-centeredness in their work by tailoring their care to the needs of older residents and facilitating interactions with residents and their peers through communication cues.

Session 2105 (Symposium)

MOBILITY PERFORMANCE IN OLD AGE: A WINDOW INTO BRAIN INTEGRITY

Chair: Qu Tian

Co-Chair: Andrea Rosso

Discussant: Caterina Rosano

Over two decades of research has established brain aging as a critical component of mobility decline. Studies consistently report that motor slowing predicts cognitive decline and neurodegenerative diseases, but reported associations are often modest. Both mobility and brain aging are complex processes and steady-state assessments are typically used (usual pace gait and structural MRI). We aim to elucidate the complex relations between brain aging and mobility by considering (a) strategies to maintain function such as interlacing periods of activity and rest (fractionation), (b) interventions that target brain and body (motor skill training), (c) multi-modal neuroimaging (functional connectivity and cerebral small vessel disease (cSVD)), (d) challenged walking (dual-tasks, uneven surfaces), and (e) reduced resources (hearing loss). This symposium focuses on community-dwelling older adults from observational and intervention studies using state-of-the-art and real-life assessments of gait (quality and fragmentation by tri-axial accelerometry) and brain (near-infrared spectroscopy (fNIRS), resting-state functional MRI). First, we examine activity strategies that modify the relation between slow gait and AD risk (Tian). Second, using fNIRS, we investigate the extent to which motor skill training increases automaticity of gait (Chen). Third, we examine how functional connectivity may compensate for the detrimental effects of cSVD on mild parkinsonian signs (Hengenius). Fourth, we investigate the effects of challenged walking on gait quality and the relation with cognitive function (Suri). Finally, we demonstrate relations of hearing and cognition with mobility (Pupo). We seek to generate discussions on shared pathways underlying motor slowing and the aging brain and future prevention and intervention strategies.

ACTIVITY FRACTIONATION MODERATES THE RELATIONSHIP OF GAIT SPEED WITH ALZHEIMER'S DISEASE RISK

Qu Tian,¹ Yang An,² Jennifer Schrack,³ Pei-Lun Kuo,⁴ Amal Wanigatunga,³ Eleanor Simonsick,⁵ Susan Resnick,¹ and Luigi Ferrucci,¹ 1. *National Institute on Aging, Baltimore, Maryland, United States*, 2. *NIA, Baltimore, Maryland, United States*, 3. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 4. *National Institute on Aging, National Institute on Aging, Maryland, United States*, 5. *National Institute on Aging/NIH, Baltimore, Maryland, United States*

Older adults with slow gait have a modestly elevated risk of Alzheimer's disease (AD). Whether strategies to maintain function, such as interlacing periods of activity and rest, modify this relationship is unknown. We analyzed 577 initially cognitively normal participants aged 50+(53% women, 26% Black) who had baseline data on gait speed and fractionation via ActiHeart. Diagnoses of mild cognitive impairment (MCI)/AD were adjudicated during an average 7.3 years follow-up. We examined gait speed, fractionation, and their interaction with MCI/AD risk using Cox proportional-hazards models, adjusted for demographics and APOE-ε4. Each 0.2m/sec faster gait speed was associated with 24% lower risk of MCI/AD ($p=0.04$). Fractionation was not associated with MCI/AD risk ($p>0.05$). There was a significant gait*fractionation interaction ($p=0.013$). At high fractionation, gait was not predictive of MCI/AD. Slow

gait speed is less predictive of future MCI/AD in individuals who fractionate their activity to maintain function, possibly indicating brain function that drives such compensatory strategy is still conserved.

MILD PARKINSONIAN SIGNS ARE RELATED TO LOWER CORTICO-STRIATAL CONNECTIVITY IN EXECUTIVE NETWORKS

James Hengenius, Theodore Huppert, Andrea Rosso, and Caterina Rosano, *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

Mild Parkinsonian signs (MPS) affect up to 24% of community-dwelling older adults. We hypothesize that MPS are associated with Parkinson's-like alterations of functional connectivity (FC) in sensorimotor, executive, and reward cortico-striatal networks. Participants ($N=266$; mean age=83; 57% female) without Parkinson's completed resting-state fMRI and Unified Parkinsonian Disease Rating Scale (UPDRS). FC between striatum and cortex was measured within each network. Logistic regression tested associations of each network's FC with MPS (UPDRS>0), adjusted for MPS risk factors, then including white matter hyperintensities (WMH). MPS was associated with lower cortical-striatal FC in the left executive cortico-striatal network (OR [95%CI]: 0.188 [0.043,0.824]). Association survived adjusting for risk factors (0.162 [0.030,0.874]) but was attenuated after including WMH (0.209 [0.036, 1.200]). In stratified analyses, left executive cortico-striatal FC was associated with MPS only for those with higher WMH (0.077 [0.010,0.599]). Future work should examine whether higher FC protects against the influence of WMH on MPS.

MOTOR SKILL TRAINING EFFECT ON REAL-TIME PREFRONTAL CORTEX ACTIVATION DURING WALKING

Andrea Rosso,¹ Nemin Chen,¹ Subashan Perera,¹ Theodore Huppert,¹ Jessie VanSwearingen,² Jennifer Brach,³ and Caterina Rosano,⁴ 1. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2. *School of Health and Rehabilitation Sciences, Pittsburgh, Pennsylvania, United States*, 3. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 4. *Graduate School of Public Health, University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

We aimed to test the effects of motor skill training (MST) on gait automaticity measured by changes in prefrontal cortex (PFC) activation during actual walking. We used data from a 12-week trial of older adults (mean age=75.5, 60.5% women) randomized to standard physical therapy and standard+MST in a 1:1 ratio. Functional near infrared spectroscopy (fNIRS) measured PFC activation during simple and dual task walking. We will apply linear mixed models to assess effects of task, time, and MST on PFC activation. We will compare the PFC activation 1) during dual task walking compared to simple walking; 2) across visits after intervention; and 3) between participants receiving MST compared to standard physical therapy. These results will demonstrate whether gait automaticity, as evidenced by PFC activation during walking, is affected by MST.

ASSOCIATION BETWEEN DUAL-TASK GAIT AND COGNITIVE FUNCTION IN OLDER ADULTS

Anisha Suri,¹ Jessie VanSwearingen,² Mark Redfern,³ Ervin Sejdic,³ and Andrea Rosso,¹ 1. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2. *School of Health and Rehabilitation Sciences, Pittsburgh, Pennsylvania, United States*, 3. *Swanson School of Engineering, University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

Community mobility involves walking with physical and cognitive challenges. In older adults (N=116; results here from initial analyses: N=29, Age=75±5 years, 51% females), we assessed gait speed and smoothness (harmonic-ratio) while walking on even and uneven surfaces, with or without an alternate alphabeting dual-task (ABC). ANOVA assessed surface and dual-task effects; Pearson correlations compared gait with global cognition and executive function composite z-scores. The four conditions (even, uneven, even-ABC and uneven-ABC) affected speed(m/s) (0.97±0.14 vs 0.90±0.15 vs 0.83±0.17 vs 0.79±0.16). Smoothness (2.19±0.48 vs 1.89±0.38 vs 1.92±0.53 vs 1.7±0.43) was affected by only surface (controlled for speed). Greater speed was associated with better global cognition($\rho=0.47$ to 0.49 , $p<0.05$) for all conditions and with better executive function for even-ABC($\rho=0.39$, $p=0.04$) and uneven-ABC($\rho=0.40$, $p=0.03$). Executive function was associated with smoothness during even($\rho=-0.42$, $p=0.03$) and uneven($\rho=-0.39$, $p=0.04$) walking. Type of walking challenge differentially affects gait quality and associations with cognitive function.

COGNITION MODERATES THE RELATIONSHIP BETWEEN HEARING AND MOBILITY IN COGNITIVELY NORMAL OLDER ADULTS

Daniel Pupo,¹ Brent Small,² Jennifer Deal,³ Nicole Armstrong,⁴ Susan Resnick,⁵ Frank Lin,⁶ Luigi Ferrucci,⁵ Qu Tian,⁵ 1. *University of South Florida, University of South Florida, Florida, United States*, 2. *University of South Florida, Tampa, Florida, United States*, 3. *Johns Hopkins University, Baltimore, Maryland, United States*, 4. *Warren Alpert Medical School of Brown University, Providence, Rhode Island, United States*, 5. *National Institute on Aging, Baltimore, Maryland, United States*, 6. *Johns Hopkins University, Johns Hopkins University, Maryland, United States*

Recent data has shown a consistent but modest association between hearing impairment and poor mobility; both are strongly associated with cognition. Cognitive function may moderate the relationship between hearing and mobility. We analyzed 601 cognitively normal older participants from the Baltimore Longitudinal Study of Aging who had concurrent data on cognition (attention, executive function, sensorimotor function), hearing (pure-tone average, PTA), and mobility (6-meter gait speed, 400-meter time). We performed multivariable-adjusted linear regression to test two-way interactions between each cognitive measure and PTA. There were significant PTA interactions with all cognitive measures on 400-meter time. There was a significant interaction between PTA and sensorimotor function on 6-meter gait speed. Among cognitively normal older adults, poorer hearing is more strongly associated with poor mobility in those with low cognition, especially sensorimotor function.

Future studies are needed to understand how cognition may moderate the relationship of hearing impairment with mobility decline over time.

Session 2110 (Symposium)

MOLECULAR RESILIENCY AND AGING

Chair: Adam Salmon

Resilience is described as the ability to respond to acute forms of stress and recover to normal homeostasis. There is growing evidence that biology of resilience is entwined with the biology of aging. With increasing age, resilience decreases and is a likely contributor to increased morbidity, frailty and susceptibility to death with age. Conversely, increased resilience across numerous physiological markers of function is associated with longevity and healthy aging. The variation in resilience in populations suggests biological and molecular regulatory mechanisms that might provide insight into interventions to improve resilience, healthy aging and longevity. In this session, speakers will provide insight regarding short-term assays of resilience in animal models that prove useful both in delineating these biological mechanisms as well as inform on potential translational models to better understand biological resilience in human populations. The sessions focus is on defining these assays and discussion of the biological relevance each resilience assay in terms of the regulation of aging. The goals of these studies range from identifying potential predictors of individual lifespan within markers of functional resilience to leveraging geroscience to define whether markers of resilience can be modified through interventions to the aging process. Moreover, better understanding of the biology of resilience could assist in defining novel interventions that improve resilience and thereby enhance longevity.

CELLULAR RESILIENCE AS A POTENTIAL PREDICTOR OF LIFESPAN

Adam Salmon, *University of Texas Health San Antonio, San Antonio, Texas, United States*

The progressive decline of resilience during the aging process across multiple functional systems suggests basic biological mechanisms of regulation. We exploited a primary cell model to identify markers of cellular resilience or the ability of cells in culture to respond and return to homeostasis following acute challenge including metabolic, oxidative, or proteostatic stress. Using primary fibroblasts from minimally-invasive skin biopsies of genetically heterogeneous mice, we are able to determine individual cellular resilience as well as the normal lifespan and healthspan of each donor. Our studies suggest donor age and sex affect cellular resilience and that this measure of resilience can predict functional outcomes in some interventional studies. While longevity studies continue, these studies point to a potential highly important marker of healthspan and longevity as well as a model to delineate the biology of resilience in animal and translational models.

RESILIENCE AS A DETERMINANT OF HEALTHSPAN AND LIFESPAN IN MICE

Nathan LeBrasseur, *Mayo Clinic, Rochester, Minnesota, United States*

Dynamic measures of physical resilience—the ability to resist and recover from a challenge—may be informative

of biological age far prior to overt manifestations such as age-related diseases and geriatric syndromes (i.e., frailty). If true, physical resilience at younger or middle ages may be predictive of future healthspan and lifespan, and provide a unique paradigm in which interventions targeting the fundamental biology of aging can be tested. This seminar will discuss research on the development of clinically relevant measures of physical resilience in mice, including anesthesia, surgery, and cytotoxic drugs. It will further highlight how these measures compare between young, middle-aged, and older mice, and how mid-life resilience relates to later-life healthspan and even lifespan. Finally, it will provide insight into whether interventions targeting the biology of aging can modify physical resilience in mice.

ROLE OF PHYSIOLOGICAL RESILIENCE IN AGING: CHALLENGES AND OPPORTUNITIES

Derek Huffman, *Albert Einstein College of Medicine, Bronx, New York, United States*

Lifespan and healthspan remain a cornerstone of documenting efficacy in aging research. However, it is becoming increasingly appreciated that housing rodents in conventional, unprovoked conditions, rather than exposed to the same variety of stressors normally encountered by free-living humans, has limited our understanding of how these strategies can be translated. Resilience can be defined as the ability of an organism to respond to a physical challenge or stress and return to homeostasis. Indeed, physiologic resilience is recognized to decline with age from a weakening of interactions among multiple physiologic regulatory functions. Here, we have attempted to optimize stress assays as a means of measuring physiologic resilience in mice. Our data demonstrate that these assays can readily detect age-related deficits in recovery, are amendable to geroprotector strategies, including rapamycin, while acute exposure to a stress can accelerate aging and mortality, thereby serving as a potentially useful paradigm for testing age-delaying interventions.

GENETIC VARIANTS CORRELATE WITH BETTER PROCESSING SPEED

Zeyuan Song,¹ Anastasia Gurinovich,² Kaare Christensen,³ Marianne Nygaard,³ Jonas Mengel-From,³ Stacy Andersen,⁴ Thomas Perls,² and Paola Sebastiani,⁵ *1. Boston University School of Public Health, Boston, Massachusetts, United States, 2. Boston University, Boston, Massachusetts, United States, 3. Department of Public Health, University of Southern Denmark, Odense, Syddanmark, Denmark, 4. Boston University School of Medicine, Boston, Massachusetts, United States, 5. Tufts Medical Center, Physician Organization, BOSTON, Massachusetts, United States*

Some cognitive abilities, such as vocabulary, are resilient to brain aging, while others such as conceptual reasoning, memory, and processing speed, decline with age and their rate of decline is genetically regulated. Despite the strong genetic heritability of processing speed assessed by the digit symbol substitution test (DSST), previous studies have failed to identify robust common genetic variants associated with this test. The Long Life Family Study (LLFS) includes long lived individuals and their family members who maintain good DSST scores as they age and who may carry variants associated with better DSST. We therefore conducted a genome-wide

association study (GWAS) of DSST in LLFS using ~15M genetic variants imputed to the HRC panel of 64,940 haplotypes with 39,635,008 sites and replicated the findings using genetic data imputed to the 1000 Genomes phase 3 reference panel combining two Danish cohorts: the Middle Aged Danish Twins and the Longitudinal Study of Aging Danish Twins. The GWAS in LLFS discovered 20 rare genetic variants reaching genome-wide significance (p -value $< 5 \times 10^{-8}$), including 18 variants associated with better processing speed with large effect size. The genetic associations of rs7623455, rs9821776, rs9821587, rs78704059 in chromosome 3 were replicated in the combined Danish cohort. These genetic variants tagged two hormone receptor related genes, THRB and RARB, both related to cognitive aging. Further gene-based tests in LLFS confirmed that these two genes have protective variants associated with better processing speed.

Session 2115 (Paper)

Morbidity, Mortality, and Aging

CREATION AND VALIDATION OF A POLYSOCIAL SCORE FOR MORTALITY AMONG COMMUNITY-DWELLING OLDER ADULTS IN THE UNITED STATES

Chenkai Wu,¹ Michelle Odden,² Robert Stawski,³ and Hoda Magid,⁴ *1. Duke Kunshan University, Kunshan, Jiangsu, China (People's Republic), 2. Stanford University, Stanford, California, United States, 3. Oregon State University, Corvallis, Oregon, United States, 4. Stanford University, Stanford University, California, United States*

The interrelatedness between social determinants of health impedes researchers to identify important social factors for health investment. Since the older population had highly diverse social backgrounds, a new approach is needed to quantify the aggregate effect of social factors and develop person-centered social interventions. Participants ($n = 7383$, 54.5% female) were aged 65 years or above who complete an additional psychosocial questionnaire in the Health and Retirement Study (HRS) at study entry in 2006 or 2008. Social determinants of health encompassing five social domains: economic stability, neighborhood and physical environment, education, community and social context, and health care system. Five-year mortality was calculated as the number of years from the interview date to the death date. We used the forward stepwise logistic regression to construct the polysocial score and multivariate logistic regressions to assess the associations between polysocial score and five-year mortality. Polysocial score (range: 7 to 59, mean \pm SD: 35.5 \pm 7.5) was created using 15 social determinants of health. Of the 7383 participants, 491 (30.8%), 599 (17.2%), and 166 (7.8%) deaths occurred over five years among participants with a low (0-29), intermediate (30-39), and high (40+) polysocial score, respectively. Participants with an intermediate (Odds Ratio [OR]=0.76; 95% CI, 0.65-0.89) or high (OR=0.46; 95% CI, 0.36-0.59) polysocial score had higher odds of death than those in the low category in the fully adjusted model, respectively. The polysocial approach may offer possible solutions to monitor social environments and suggestions for older adults to improve their social status for specific health outcomes.

EPIDEMIOLOGIC DETERMINANTS OF DYNAMICS IN HEART FAILURE PREVALENCE AND MORTALITY IN OLDER U.S. ADULTS

Bin Yu,¹ Igor Akushevich,² Arseniy Yashkin,³ and Julia Kravchenko,² 1. *Duke University, Duke University/ Durham, North Carolina, United States*, 2. *Duke University, Durham, North Carolina, United States*, 3. *Duke University, Morrisville, North Carolina, United States*

Recent declines in heart failure (HF) prevalence and increases in mortality among older adults in the US suggest the need for research to investigate the relative contribution of the epidemiological determinants of these two processes to their historical and current trends. Study data were derived from a 5% sample of Medicare beneficiaries, 1991-2017. Partitioning analysis was used to decompose age-adjusted prevalence and incidence-based mortality (IBM) into their constituent components. HF prevalence trend decomposition demonstrated three phases: (a) Decelerated Increasing Prevalence (1994-2006) mainly driven by decreasing incidence, overpowering increasing survival, (b) Accelerated Declining Prevalence (2007-2014) and (c) Decelerated Declining Prevalence (2015-2017), mainly driven by declining incidence, overpowering declining survival. For HF IBM four phases were identified: (a) Decelerated Increasing Mortality (1994-2001) with declining incidence and increasing survival driving deceleration, (b) Accelerated Declining Mortality (2002-2012), (c) Decelerated Declining Mortality (2013-2016), mainly driven by declining incidence, overpowering declining survival, and (d) Accelerated Increasing Mortality (2017) mainly driven by declining survival, overpowering declining incidence. Study findings suggest that the recent decade-long decline in HF prevalence and 15-year decline in HF mortality mainly reflected decreasing incidence, while the most recent increase in mortality was due to declining survival, which may be associated with the Hospital Readmission Reduction Program. If current trends of incidence and survival persist, HF prevalence and mortality are forecasted to grow, suggesting that actions to reduce HF risk factors and improve treatment and management of HF after diagnosis are warranted.

PREDICTORS OF MULTIMORBIDITY AMONG KOREAN OLDER ADULTS: LONGITUDINAL SECONDARY DATA ANALYSIS

Eunkyung Kim, TaeWha Lee, and Yoonjung Ji, *Yonsei University, Seoul, Seoul-t'ukpyolsi, Republic of Korea*

Multimorbidity has become a global concern for an aging society. It has been reported to be associated with increased health service utilization, leading to poor health outcomes including quality of life. However, the incidence of multimorbidity and its related factors are poorly understood. The aim of this study was to determine the socioeconomic and health-related factors predicting the incidence of multimorbidity in Korean older adults using longitudinal secondary data from the Korean Longitudinal Study of Aging (KLoSA) dataset from 2008 to 2018. The KLoSA aimed to collect basic data to be used for developing socioeconomic policy for the aging society in Korea. The sample included 3,019 older adults aged 65 years and over who had 0-2 chronic diseases at baseline in 2008. Multimorbidity was measured with the incidence of co-existence of three or

more chronic diseases using Cox's proportional-hazards model. Among 3,019 respondents (female 57.6%, mean age 73.07±6.30 years), 586 (19.4%) incidents of multimorbidity were reported after 10 years of follow-up. Low participation in social activities, being overweight or obesity, more depressive symptoms, current or past drinkers, and lower life satisfaction were identified as significant predictors of multimorbidity among Korean older adults. This study identified high risk groups with overlapping senility and multimorbidity, who require more attention from health care providers in the course of chronic disease monitoring and management. This longitudinal approach will contribute to the development of preventive strategies to reduce the incidence of multimorbidity among older adults.

SEX DIFFERENCE IN ALL-CAUSE AND INFECTION-SPECIFIC MORTALITY OVER 10 YEARS POST HIP FRACTURE

Rashmita Bajracharya,¹ Jack Guralnik,² Jay Magaziner,³ Michelle Shardell,⁴ Alan Rathbun,⁵ Takashi Yamashita,⁶ and Denise Orwig,² 1. *University of Maryland, School of Medicine, Catonsville, Maryland, United States*, 2. *University of Maryland, Baltimore, Baltimore, Maryland, United States*, 3. *University of Maryland School of Medicine, Baltimore, Maryland, United States*, 4. *University of Maryland School of Medicine, Baltimore, Maryland, United States*, 5. *University of Maryland Baltimore, Baltimore, Maryland, United States*, 6. *University of Maryland, Baltimore County, Baltimore, Maryland, United States*

Men die at a twice higher rate than women in the first two years after fracture and also experience higher infection-related mortality. Most research has only looked at differences in short-term mortality after hip fracture. The objective was to determine if cumulative incidence of all-cause mortality and infection-specific mortality is higher in men compared to women over ten years. Data came from Baltimore Hip Studies 7th cohort. Women were frequency-matched (1:1) to men on timing of fracture to ensure equal numbers of men and women. The association of sex and all-cause mortality was analyzed using Cox proportional hazard model and a cause-specific hazard model for infection-specific mortality. Both models controlled for age, cognition, comorbidity, depressive symptoms, BMI, and pre-fracture ADL limitations. Complete-case sample size was 300 (men=145, women=155). By the end of ten years from the date of admission for a hip fracture, there were 237 (men=132, women=105) all-cause deaths and 38 (men=25, women=13) infection-specific deaths. Men had significantly higher all-cause mortality risk [73.7% vs 59.3%; HR=2.31(2.02-2.59)] and infection-specific mortality [17.2% vs 8.3%; HR=4.43(2.07-9.51)] compared to women. In addition to sex, older age, cognition, and comorbidities were associated with all-cause mortality whereas only BMI was associated with infection-specific mortality in adjusted models. Men had a higher risk of mortality over 10 years compared to women, specifically two-fold higher risk of infection-specific mortality compared to all-cause mortality. Findings imply that interventions to prevent/treat infection, tailored by sex, may be needed to narrow significant differences in long-term mortality rates between men and women.

VALIDATION OF SELF-REPORTED CANCER DIAGNOSIS BY COGNITIVE STATUS IN THE HEALTH AND RETIREMENT STUDY

Megan Mullins, Jasdeep Kler, Marissa Eastman, Mohammed Kabeto, Lauren Wallner, and Lindsay Kobayashi, *University of Michigan, Ann Arbor, Michigan, United States*

Exploring the relationship between cognition and cancer is increasingly important as the number of older adults in the US grows. The Health and Retirement Study (HRS) has longitudinal data on cognitive status and self-reported cancer diagnoses, but these self-reports have not been validated. Using HRS linked to Medicare Fee for Service (FFS) claims (1998-2016), we evaluated the validity of self-reported cancer diagnoses (excluding non-melanoma skin) against Medicare claims by respondent cognitive status. We included 8,280 Medicare-eligible HRS participants aged ≥ 67 with at least 90% FFS coverage. Cognitive status was ascertained from the HRS interview following the date of cancer diagnosis (or reference claim date) using the Langa-Weir method and was classified as normal, cognitive impairment no dementia (CIND), or dementia. We calculated the sensitivity, specificity, and Cohen's kappa for first incident malignant cancer diagnosis by cognitive status group. The majority (76.4%) of participants scored as cognitively normal, 9.6% had CIND, 14.0% had dementia and, overall, 1,478 had an incident cancer diagnosis. Among participants with normal cognition, sensitivity of self-reported cancer diagnosis was 70.2% and specificity was 99.8% ($\kappa=0.79$). Among participants with CIND, sensitivity was 56.7% and specificity was 99.8% ($\kappa=0.66$). Among participants with dementia, sensitivity was 53.0% and specificity was 99.6% ($\kappa=0.64$). Results indicate poor validity of self-reported cancer diagnoses for older adults with CIND or dementia. These findings suggest researchers interested in cancer and cognition should use the HRS-Medicare linkage to ascertain cancer diagnosis from claims, and they highlight the importance of cognitive status in research among older adults.

Session 2120 (Paper)

Pain Assessment and Management

BARRIERS AND FACILITATORS OF PAIN MANAGEMENT IN PERSONS WITH DEMENTIA IN LONG-TERM CARE: A SCOPING REVIEW

Yo-Jen Liao,¹ Ying-Ling Jao,² Diane Berish,² and Lisa Kitko,³ *1. Penn State University, University Park, Pennsylvania, United States, 2. Pennsylvania State University, University Park, Pennsylvania, United States, 3. Pennsylvania State University, Pennsylvania State University, Pennsylvania, United States*

Approximately 50% of individuals with dementia regularly experience moderate to severe pain, which is largely undermanaged. Several studies have explored the barriers and facilitators of pain management for persons with dementia; yet the evidence has not been systematically reviewed. This review aimed to synthesize current evidence on the barriers and facilitators of pain management in persons with dementia in long-term care. A PRISMA guided literature search

was conducted in PubMed, CINAHL, and PsycINFO. Titles, abstracts, and full texts were screened. Included articles were original research examining the barriers or facilitators of pain assessment and treatment in individuals with dementia in long-term care. Quality assessment was conducted using the Risk of Bias tool and Johns Hopkins Level of Evidence. Ten studies were identified, including four quantitative studies, five qualitative studies, and one with both quantitative and qualitative research. Barriers of pain management identified include residents' ability to self-report pain, pain medication side effects, need discrepancy among residents and their families, reluctance in administering analgesics, lack of pain assessment tools, lack of guidance in providing nonpharmacological interventions, and lack of clinical guidelines. Facilitators of pain management include clinicians with caring and enthusiastic characteristics, clinicians' knowledge of residents, positive relationships among clinicians, good communication skills, using validated pain assessment tools, understanding pain indicators, clinical experience, and need-driven continuing education. These results can guide clinical practice in long-term care. Interventions should be developed to target these barriers and facilitators and improve pain management in persons with dementia.

PAIN ASSESSMENT IN IMPAIRED COGNITION (PAIC15) INSTRUMENT: CUTOFFS AGAINST THREE STANDARDS

Jenny van der Steen, Margot de Waal, and Wilco Achterberg, *Leiden University Medical Center, Leiden, Zuid-Holland, Netherlands*

Observational pain scales can help identify pain in persons with impaired cognition including dementia who may have difficulty expressing pain verbally. The Pain Assessment in Impaired Cognition-15 (PAIC15) observational pain scale covers 15 important items that are indicative of pain, but it is unclear how likely pain is for persons with each summed score (theoretical range 0-45). The goal of our study was to determine sensitivity and specificity of cut offs for probable pain on the PAIC15 against three possible standards. We determined cut offs against (1) self report when able, (2) the established Pain Assessment in Advanced Dementia (PAINAD) cut off of 2, and (3) observer's overall estimate based on a series of systematic observations. We used data of 238 nursing home residents with dementia who were observed by their physician in training or nursing staff in the context of an evidence-based medicine (EBM) training study, with 137 residents assessed twice. The area under the ROC curve was excellent against the PAINAD cut off ($\square 0.8$) at both assessments, but acceptable or less than acceptable for the other two standards. Across standards and criteria for optimal sensitivity and specificity, cut offs at the PAIC15 could be 3 or 4. Guided by self report we recommend PAIC15 scores of 3 and higher to represent probable pain with sensitivity and specificity in the 0.5 to 0.7 range.

RELATIONSHIPS OF PAIN TREATMENT WITH DEMENTIA AND FUNCTIONAL OUTCOME IN MEDICARE HOME HEALTH CARE

Jinjiao Wang,¹ Kenrick Cato,² Yeates Conwell,³ Kathi Heffner,¹ Fang Yu,⁴ Thomas Caprio,³ and Yue Li,¹

1. *University of Rochester, Rochester, New York, United States*, 2. *Columbia University, New York, New York, United States*, 3. *University of Rochester Medical Center, Rochester, New York, United States*, 4. *Arizona State University, Phoenix, Arizona, United States*

Adequate pain management is important to post-acute care functional recovery, yet persons with Alzheimer's disease and related dementias (ADRD) are often under-treated for pain. The objectives of this study were to examine in Medicare post-acute home health (HH) recipients with daily interfering pain 1) if analgesic use at home is related to functional outcome, and 2) if ADRD is related to the likelihood of analgesic use at home. We analyzed data from the Outcome and Assessment Information Set, Medicare claims, and electronic medical records of 6,039 Medicare beneficiaries ≥ 65 years who received care from a large HH agency in New York in 2019 and reported daily interfering pain. Analgesic use was identified in medication reconciliation of HH visits and categorized into any analgesics or opioid(s). ADRD was identified from ICD-10 codes and significant cognitive impairment. Functional outcome was measured as change in the composite score of Activity of Daily Living (ADL) limitations from HH admission to HH discharge. Use of any analgesics at home was associated with greater ADL improvement from HH admission to HH discharge ($\beta = -0.20$ [greater improvement by 0.2 ADLs], 95% Confidence Interval [CI]: -0.37, -0.04; $p = 0.017$). Compared with patients without ADRD, those with ADRD were less likely to use any analgesics (Odds Ratio [OR] = 0.66, 95% CI: 0.49, 0.90, $p = 0.008$) or opioids (OR = 0.53, 95% CI: 0.47, 0.62, $p < 0.001$) at home. Adequate pain management is essential to functional improvement in post-acute HH care. Patients with ADRD may be under-treated for pain in post-acute HH care.

REMOTELY SUPERVISED CRANIAL ELECTRICAL STIMULATION AND CLINICAL PAIN FOR OLDER ADULTS WITH KNEE OSTEOARTHRITIS

Hyochol Ahn,¹ Hongyu Miao,² and Yumna Ali,² 1. *Florida State University College of Nursing, Tallahassee, Florida, United States*, 2. *The University of Texas Health Science Center at Houston, Houston, Texas, United States*

Knee osteoarthritis (KOA) is one of the most prominent causes of chronic pain, functional impairment, and disability in older adults. The current standards of care for KOA are aimed toward reducing pain and are largely comprised of analgesic medications, but existing pharmacologic approaches often produce significant adverse effects. Moreover, recent evidence suggests that KOA pain is characterized by alterations in pain-related brain mechanisms. Cranial electrical stimulation (CES), which delivers a low-amplitude alternating electric current to the brain, can facilitate the reversal of maladaptive brain function. Portable CES devices can be used at home with real-time monitoring through a secure videoconferencing platform to facilitate high adherence. Thus, the purpose of this pilot clinical study was to examine the preliminary efficacy of remotely supervised CES on clinical pain severity in older adults with KOA. Thirty participants with KOA were randomly assigned to receive 10 daily sessions of remotely supervised CES with 0.1 mA at a frequency of 0.5 Hz for 60 minutes ($n = 15$) or sham CES ($n = 15$). We measured clinical pain severity using the numeric

rating scale (NRS; range, 0 – 100). Participants (67% female) had a mean age of 59 years. Active CES significantly reduced scores on the NRS (Cohen's $d = 1.43$, $P < 0.01$). Participants tolerated CES well without any adverse events. Our findings demonstrate the promising clinical efficacy of remotely supervised CES for older adults with KOA. Future studies with larger-scale randomized controlled trials with follow-up assessments are needed to validate and extend our findings.

Session 2125 (Symposium)

PATIENT, CAREGIVER, AND PHYSICIAN BARRIERS TO HOME-BASED PALLIATIVE CARE: FINDINGS FROM A TERMINATED STUDY

Chair: Susan Enguidanos

Discussant: Stephanie Wladkowski

Despite two decades of palliative care services, there remains numerous barriers to patient and caregiver use of palliative care. For many years, policymakers believed lack of funding for palliative care was the primary obstacle to accessing palliative care services. In 2017, we undertook a randomized controlled trial to test the effectiveness of a home-based palliative care (HBPC) program within accountable care organizations and in partnership with an insurance company that covered the cost of HBPC. After 20 months, we had recruited just 28 patients. This symposium will: (1) describe outcomes from various approaches undertaken to engage primary care physicians and recruit patients and their caregivers into this trial; (2) present barriers to HBPC referral identified from a qualitative study of primary care physicians; (3) present findings from a qualitative study of patient- and caregiver-identified barriers to HBPC; (4) describe physician and patient barriers to research participation; and (5) discuss implications of these findings for researchers and healthcare providers. Information presented in this symposium will inform researchers and policy makers about challenges and facilitators to recruiting patients, caregivers, and physicians to participate in research studies as well as inform healthcare practitioners of potential obstacles to increasing patient access to HBPC.

TRIALS AND TRIBULATIONS: PALLIATIVE CARE TRIAL RECRUITMENT APPROACHES AND CHALLENGES

Susan Enguidanos, Anna Rahman, and Sindy Lomeli, *University of Southern California, Los Angeles, California, United States*

In 2017, we received funding from the Patient-Centered Outcomes Research Institute to conduct a large, state-wide, randomized controlled trial to test the effectiveness of a home-based palliative care (HBPC) program within accountable care organizations. Participants were randomized to either HBPC or enhanced usual care, where physicians were provided added training and support in core palliative care practices. Originally, we planned to obtain patient referrals to the trial from primary care physicians, however we were unable to engage primary care physicians in patient identification processes. In this session we will describe the numerous trial modifications made to our trial recruitment methods and the success of each approach. Ultimately, after

20 months of trial recruitment, we had recruited just 28 patients and 10 of their caregivers. Findings from this terminated trial may inform other researchers in development of participant recruitment methods.

IT'S YET ANOTHER THING: BARRIERS TO AND RECOMMENDATIONS FOR PHYSICIAN REFERRALS TO HOME-BASED PALLIATIVE CARE

Alexis Coulourides Kogan,¹ Valeria Cardenas,² YuJun Zhu,² Jenna Giulioni,³ Anna Rahman,⁴ and Susan Enguidanos,⁴
 1. USC Keck School Of Medicine, Alhambra, California, United States, 2. University of Southern California, SOUTH PASADENA, California, United States, 4. USC Division of Biokinesiology and Physical Therapy, Los Angeles, California, United States, 5. University of Southern California, Los Angeles, California, United States

To understand primary care providers' (PCPs) experiences with referring patients to home-based palliative care (HBPC), we conducted individual, key-informant interviews with 31 PCPs. About half participants were male (54.8%), White (42.5%), US-born (58.1%), and were 57 years old (SD=9.17), on average. About one-third of participants (32.3%) indicated they refer 10+ patients annually to HBPC, while most (80.7%) reported "strong" comfort discussing palliative care with patients. Qualitative analysis revealed three prominent thematic categories, each related to barriers PCP experienced when referring patients to palliative care: (1) PCP-level (lack of knowledge and comfort); (2) perceived patient-level (culture, family disagreement, need, home-based aspect); and (3) HBPC program-level (need to close the loop with PCP, insurance coverage, program availability, and eligibility). PCP recommendations for overcoming identified barriers will be discussed. Findings hold important implications for timely patient-referrals to palliative care by PCPs and for sustaining palliative programs that rely on these referrals.

RELUCTANCE TO ACCEPT PALLIATIVE CARE AND RECOMMENDATIONS FOR IMPROVEMENT

Valeria Cardenas,¹ Anna Rahman,² Yujun Zhu,³ and Susan Enguidanos,² 1. University of Southern California, University of Southern California, California, United States, 2. University of Southern California, Los Angeles, California, United States, 3. University of Southern California, SOUTH PASADENA, California, United States

Although insurance companies are increasingly paying for home-based palliative care (HBPC), enrollment remains low. To identify patient and caregiver perceived barriers to HBPC and their recommendations for overcoming these barriers, we conducted semi-structured individual interviews. Our interview protocol elicited participants' perspectives on HBPC services; positive and negative aspects of the palliative program explanation; and suggestions for improving HBPC messaging. Seventeen patients and eight caregivers who were eligible for a randomized controlled trial of HBPC were interviewed. Themes related to HBPC referral barriers included reluctance to have home visits, enrollment timing, lack of palliative care knowledge, and patients' self-perceived health condition. Themes related to recommendations for overcoming these obstacles included ensuring that HBPC referrals come from healthcare providers or insurance companies and presenting HBPC more clearly. Findings reinforce

the need for palliative care education among seriously ill patients and the importance of delivering palliative care information and referrals from trusted sources.

BARRIERS TO AND RECOMMENDATIONS FOR RESEARCH RECRUITMENT OF INDIVIDUALS AFFECTED BY SERIOUS ILLNESS

Valeria Cardenas,¹ Anna Rahman,² Jenna Giulioni,³ Alexis Coulourides Kogan,⁴ and Susan Enguidanos,²
 1. University of Southern California, University of Southern California, California, United States, 2. University of Southern California, Los Angeles, California, United States, 3. USC Division of Biokinesiology and Physical Therapy, Los Angeles, California, United States, 4. USC Keck School Of Medicine, Alhambra, California, United States

Researchers are encountering increasing challenges in recruiting participants for healthcare research. We conducted semi-structured individual interviews to identify participant barriers to research and recommendations for overcoming these challenges. We recruited 17 patients and eight caregivers who were approached to participate in a randomized control trial. We also recruited 31 primary care physicians. Using grounded theory, three researchers independently coded the transcripts and then met to compare codes and reconcile discrepancies. Themes from patient and caregiver interviews included time constraints, privacy concerns, lack of research familiarity, disconnect with research institution, self-perceived health status, and concerns with study randomization and repetitive questions. Physician-identified barriers focused on time constraints and study randomization. Patient and caregiver recommendations for study recruitment included various recruitment techniques. Physician recommendations were related to incentives. Although patients and caregivers prefer that their physicians recruit them for health-related research studies, physicians identified time constraints as a barrier to research involvement.

Session 2130 (Paper)

Physical Functioning and Activity Measurement

EFFECTS OF AGE ON DUAL TASK WALKING PERFORMANCE AS MEASURED USING A SMARTPHONE APPLICATION IN MIDDLE-AGED ADULTS

Junhong Zhou,¹ Gabriele Cattaneo,² Wanting Yu,³ Jose Tormos,⁴ Lewis Lipsitz,³ David Bartres-Faz,⁴ Alvaro Pascual-Leone,⁵ and Brad Manor,⁶ 1. Harvard Medical School/Hebrew SeniorLife, Roslindale, Massachusetts, United States, 2. Universitat Autònoma de Barcelona, Barcelona, Catalonia, Spain, 3. Hebrew SeniorLife, Boston, Massachusetts, United States, 4. University of Barcelona, Barcelona, Catalonia, Spain, 5. Harvard Medical School, Boston, Massachusetts, United States, 6. Hinda and Arthur Marcus Institute for Aging Research, Harvard Medical School, Boston, Massachusetts, United States

After the age of 65, one's ability to walk while performing an additional cognitive task (i.e., dual-tasking) is predictive of both future falls and cognitive decline. However, while

it is well-known that older adults exhibit diminished dual-task performance, the time course of age-related dual-task decline has not been established. We thus conducted an analysis of data collected within the ongoing Barcelona Brain Health Initiative, a prospective population-based study characterizing the determinants of brain health maintenance in middle-aged adults. Cognitively-unimpaired participants (n=655) aged 40-65 years without neuro-psychiatric disease completed laboratory-based trials of walking normally (single-task) and walking while performing a verbalized serial subtraction task (dual-task). A smartphone-based gait assessment application was used to capture data and derive both the mean stride time (ST) and stride time variability (STV, defined as the coefficient of variation about the mean stride time) of each trial. The dual-task costs (DTC) to each gait metric were obtained by calculating the percent change from single- to dual-task conditions. We categorized participants into five groups according to age (e.g. Group 1: 40-45 years; Group 5: 60-65 years). Age group did not have an effect on single-task gait outcomes ($p>0.51$). However, the oldest age group, as compared to each of the other groups, exhibited greater DTC to both ST and STV ($p<0.03$). These results indicate that dual-task walking performance in particular may begin to diminish in late middle age even in the absence of detectable cognitive issues, DTC may offer a sensitive metric to age-related change in cognitive function.

OBJECTIVELY MEASURED PHYSICAL ACTIVITY, SEDENTARY BEHAVIOR, AND INCIDENT FRACTURE IN OLDER WOMEN: THE OPACH STUDY

Steve Nguyen,¹ John Bellettiere,¹ Michael LaMonte,² Carolyn Crandall,³ and Andrea LaCroix,¹ 1. *University of California, San Diego Herbert Wertheim School of Public Health and Human Longevity Science, La Jolla, California, United States*, 2. *University at Buffalo, Buffalo, New York, United States*, 3. *University of California, Los Angeles, Los Angeles, California, United States*

Women aged 65 and older experience nearly three-fourths of the 2 million osteoporotic fractures annually in the US, yet whether accelerometer-measured volumes and intensities of physical activity and sedentary behavior (SB) are associated with reduced fracture risk is understudied. We investigated associations of accelerometer-measured light physical activity (LPA), moderate-to-vigorous physical activity (MVPA), sedentary time (ST), and mean sedentary bout duration (MBD) with incident clinical fractures (hip, vertebral, pelvis, lower leg, upper arm, forearm, and wrist) in the WHI OPACH cohort. Participants (N=6248; mean±SD age=78.6±6.7; 34% Black, 17% Hispanic) without prior hip fracture wore the ActiGraph GT3X+ for 7 days between May 2012-April 2014 and were followed through March 2020 for incident clinical fracture (N=711). Cox models estimated hazard ratios (HR) and 95% confidence intervals (CI), adjusting for age, race-ethnicity, education, alcohol, smoking, height, weight, falls history, RAND-36 physical function, diabetes, thiazide use, prescription osteoporotic therapy, and age at menopause. The HR(95% CI) across MVPA quartiles was 1.00(reference), 1.15(0.93-1.41), 0.90(0.72-1.13), and 0.79(0.61-1.02); p -trend=0.01. The HR(95% CI) for a one-interquartile range increment in MVPA (42 minutes/day) was 0.86(0.76-0.97). Associations were modified

by prescription osteoporotic therapy [no: HR=0.77(0.66-0.89), yes: HR=1.03(0.85-1.25); p -interaction=0.01] and varied in magnitude by age[<80 : HR=0.78(0.64-0.96), ≥ 80 : HR=0.92(0.79-1.07); p -interaction=0.09], BMI [<30 kg/m²: HR=0.85(0.75-0.97), ≥ 30 kg/m²: HR=0.90(0.67-1.19); p -interaction=0.08], and race-ethnicity [Black: HR=0.63(0.44-0.89), Hispanic: HR=0.78(0.56-1.09), White: HR=0.92(0.80-1.06); p -interaction=0.16]. LPA, ST, or MBD were not associated with incident fractures. These data suggest that MVPA may reduce and not increase fracture risk and that LPA and SB do not increase fracture risk.

PREMENOPAUSAL BILATERAL OOPHORECTOMY EFFECTS ON CLINICAL AND REAL-WORLD PHYSICAL FUNCTION MEASURES

Emma Fortune, Omid Jahanian, Melissa Morrow, Virginia Miller, and Michelle Mielke, *Mayo Clinic, Rochester, Minnesota, United States*

Women with premenopausal bilateral oophorectomy (PBO) are at increased risk for physical function (PF) declines. This study investigated the relationships of field-based physical activity measures with clinical PF and strength parameters in post-menopausal women with and without PBO. Women with (n=21; age=64±4 years; BMI=32±8 kg.m⁻²) and without (n=15; age=67±6 years; BMI=28±6 kg.m⁻²) PBO performed PF and strength tests (walking speed, distance walked, short physical performance battery (SPBB), leg and chest strength), and wore ankle accelerometers for 7 days (daily step count and loading index [the cumulative sum of each step's skeletal loading]). Age, BMI, step count and loading index were entered into stepwise multiple regression to identify significant predictors of PF and strength parameters. Step count was a predictor of SPBB score in both groups. In women without PBO, step count was a predictor of walking speed; loading index was a predictor of leg strength; step count and loading index were predictors of distance; and step count and age were predictors of chest strength. For PBO women, loading index and BMI were predictors of walking speed and distance; BMI was a predictor of leg strength; and there were no predictors of chest strength. These data suggest while field-based physical activity was strongly and positively associated with clinical PF and strength measures for women without PBO, BMI was a dominant negative factor for PF in women with PBO. Future work will include a larger sample size and additional confounders to further elucidate underlying factors of reduced PF and mobility after PBO.

THE RELATIONSHIP BETWEEN KNEE PAIN AND HEART FAILURE IN OLDER BLACK AND LATINO WOMEN

Raya Kheirbek,¹ Bernadette Siaton,² Brock Beamer,³ Jacob Blumenthal,² Les Katzel,² John Sorokin,⁴ and Beth Hogans,⁵ 1. *University of Maryland School of Medicine, University of Maryland School of Medicine, Maryland, United States*, 2. *University of Maryland School of Medicine, Baltimore, Maryland, United States*, 3. *Baltimore Veterans Affairs Medical Center, BALTIMORE, Maryland, United States*, 4. *University of Maryland, Baltimore VA Medical Center, Maryland, United States*, 5. *Johns Hopkins University, Johns Hopkins University, Maryland, United States*

Background: Knee pain is the second-most prevalent and disabling common pain condition globally, having deleterious effects on daily function including mobility and exercise capacity; chronic knee pain is especially prevalent in older adults. There is substantial evidence to indicate that physically inactive individuals have higher rates of cardiovascular disease. Nonetheless, studies investigating cardiovascular risks with osteoarthritis have had mixed results. **Objective:** This study explores the relationship between knee pain and heart failure especially examining the factors of age, gender, race in U.S. older adults. **Methods:** Retrospective secondary analysis of Medicare claims data for 1.478 million adults over age 65. The standard analytical file for 2017 was segmented according to the presence of any of several ICD-10 codes for heart failure (HF). Medicare beneficiaries with and without HF diagnoses were evaluated for knee pain and other common pain-associated conditions; pain condition data was stratified by age, gender and race codes. **Results:** Knee pain was markedly increased in women with HF in the 65-70- and 70-75-year-old age-cohorts and relatively less increased in older age-cohorts and males. Knee pain in women was especially elevated in those with Medicare race codes indicating Black and Hispanic status. **Conclusion:** in a large cohort of Medicare beneficiaries, knee pain was noted to be markedly increased in younger cohorts of older women with HF, and more prevalent in Black and Hispanic women. Further studies should evaluate lifestyle, biomechanics, and inflammatory factors that may be contributing to this relationship.

THE SEX DIFFERENCE IN GAIT SPEED: HOW DO SOCIODEMOGRAPHIC, LIFESTYLE, SOCIAL, AND HEALTH DETERMINANTS CONTRIBUTE?

Lena Sialino,¹ Laura Schaap,¹ Sandra van Oostrom,² Susan Picavet,³ Johannes Twisk,⁴ Monique Verschuren,³ Marjolein Visser,¹ and Hanneke Wijnhoven,¹ 1. *Vrije Universiteit Amsterdam, Amsterdam, Noord-Holland, Netherlands*, 2. *National Institute for Public Health and the Environment, Amsterdam, Noord-Holland, Netherlands*, 3. *National Institute for Public Health and the Environment, Bilthoven, Utrecht, Netherlands*, 4. *Amsterdam University Medical Centre, Amsterdam, Noord-Holland, Netherlands*

This study explores whether a sex difference in sensitivity to (strength of the association) and/or in exposure to (prevalence) determinants of gait speed contributes to the observed lower gait speed among women compared to men. Data from the Longitudinal Aging Study Amsterdam (LASA) were used. In total 2407 men and women aged 55-81 years were included, with baseline measurements in 1992/2002 and follow-up measurements every 3-4 years for 15/25 years. Multivariable mixed model analysis was used to investigate sex differences in sensitivity (interaction term with sex) and in exposure to (change of the sex difference when adjusted) for socio-demographic, lifestyle, social and health determinants of gait speed. On average, women had a 0.054 m/s (95%CI:0.076-0.033, adjusted for height and age) lower mean gait speed compared to men. Higher BMI and lower physical activity were more strongly associated with lower gait speed in women compared to men (i.e. higher sensitivity). Lower educational level, living alone and having

more chronic diseases, pain and depressive symptoms among women compared to men also contributed to observed lower gait speed in women (i.e. higher exposure). In conclusion, both a higher sensitivity and higher exposure to determinants of gait speed among women compared to men contribute to the observed lower gait speed among women aged 55 years and older. The identified (modifiable) contributing factors should be taken into account when developing prevention and/or treatment strategies aimed to enhance healthy physical aging. This might require a sex-specific approach in both research and clinical practice.

Session 2135 (Symposium)

PRESIDENTIAL SYMPOSIUM: SOCIAL ENGAGEMENT, ISOLATION, AND LOSS DURING THE COVID-19 PANDEMIC

Chair: Toni Antonucci

Co-Chair: Debra Umberson

Discussant: Deborah Carr

The COVID-19 pandemic has transformed social life across the globe and had a particularly profound impact on older people. In this BSS Presidential Symposium, we address the annual meeting's theme—Disruption to Transformation: Aging in the “New Normal”—by inviting noted experts to address implications of the COVID-19 pandemic for social engagement and isolation. The speakers address this theme from sociological, psychological, demographic, and public health perspectives with attention to racial disparities and the impact of the pandemic on patterns of isolation and loneliness in the population, methods for conducting research with older populations, patterns of bereavement and loss of family ties, and caregiver mental health. The panel will shed light on these issues through individual presentations and dialogue.

INTERGENERATIONAL RELATIONSHIPS DURING THE COVID-19 PANDEMIC: CHALLENGES AND OPPORTUNITIES OF DATA COLLECTION

J. Jill Suito,¹ and Megan Gilligan,² 1. *Purdue University, Purdue University, Indiana, United States*, 2. *Iowa State University, Iowa State University, Iowa, United States*

Family scholars experienced numerous unique challenges and opportunities when studying intergenerational relationships during the COVID-19 pandemic. In this presentation, we draw examples from the Within-Family Differences Study to highlight some of the ways in which respondents' patterns of study participation, reports of their relationships with their late-life parents and their own young adult children, and their psychological well-being, subjective physical health, and health behaviors reflected the fluctuating waves of the pandemic. Among the patterns we discuss are systematic variations in the intensity of respondents' answers to both open and closed-ended items, respondents' expressions of concern regarding choosing the “right” answers to questions, and their attempts to negotiate their responses with interviewers. Our observations led us to conclude that measures family gerontologists use to capture many constructs central to the field are subject to different “meanings” by respondents in the face of disaster.

ISOLATION AND LONELINESS: IMPLICATIONS FOR HEALTH AND WELL-BEING OF OLDER POPULATIONS

Julianne Holt-Lunstad, *Brigham Young University, Provo, Utah, United States*

Evidence suggests social isolation and loneliness are prevalent within the population and may potentially be exacerbated due to the pandemic. Social connections have powerful influences on health and longevity, and lacking social connection qualifies as a risk factor for premature mortality. Evidence from the recent National Academy of Science consensus report on social isolation and loneliness among older adults will be summarized, providing the scope of the health effects, potential mechanisms and risk factors, as well as current gaps in the evidence. Importantly, this evidence points to several implications for solutions across sectors, including medical and healthcare practice and policy.

CARING DURING COVID-19: INEQUALITIES IN RESOURCE- AND INFORMATION-SHARING BY RACE, ETHNICITY, AND NATIVITY

Sung Park, *Princeton University*

Americans experienced significant challenges as a result of the pandemic, further magnifying the weak U.S. social safety net. With few institutional supports available, individuals turned to each other for assistance. Relying on multiple nationally representative surveys, this study examines resource-sharing by race, ethnicity, and nativity over a one-year period during COVID-19. Furthermore, this study examines knowledge-related behaviors, such as information-seeking and information-sharing, which were also important tools utilized during the pandemic. Differences in both resource- and information-sharing contributed to disparities in the perceptions of risk, the reported levels of need, and concomitant behaviors linked to well-being. This research emphasizes the importance of personal relationships during times of crisis, and the role of social connections in shaping health and economic inequalities between minority- and non-minority populations.

Session 2140 (Symposium)

RESEARCH APPLYING ADAPTIVE LEADERSHIP FRAMEWORK FOR CHRONIC ILLNESS ACROSS SETTINGS OF CARE

Chair: Ashley Leak Bryant

Co-Chair: Anna Beeber

Discussant: Bei Wu

The carepartner is an essential member of the team to facilitate and assist in maximizing the independence of the older adult. The four papers in this symposium apply the Adaptive Leadership Framework for Chronic Illness (ALFCI) at the point of design, as well as an analytic framework for literature synthesis, intervention design, and analysis of existing data. In the first paper, a qualitative metasummary of a scoping review synthesizes qualitative findings about fatigue adaptation and challenges for stroke survivors, care partners, and healthcare professionals. The second paper describes the use of the ALFCI in an intervention study to manage symptom challenges in older adults with acute myeloid leukemia. The third paper shares staff's experiences of providing direct care

for older residents with advanced dementia in long-term care facilities. The fourth paper describes use of the carepartner-assisted intervention to improve oral hygiene of older adults with cognitive impairment. The ALFCI is a useful framework for intervention design 1) this framework provides a comprehensive way to examine the context of symptoms/behaviors (not just the symptom/behavior in isolation), 2) the framework guides "collaborative work", 3) analytically it can help guide development of shared meaning of communication and "collaborative work" of dyads (family caregivers, long-term care staff and older adults), and 4) helps understand process of staff utilizing their strengths and doing adaptive work to facilitate interactions and communication, managing older residents' behavioral and psychological symptoms of dementia, and improving their care provision and work life.

USING THE ADAPTIVE LEADERSHIP FRAMEWORK FOR CHRONIC ILLNESS TO DESIGN A PALLIATIVE AND COLLABORATIVE INTERVENTION

Ashley Leak Bryant,¹ Stephanie Becantur,² Ya-Ning Chan,³ Rachel Hirschey,² Marianne Baernholdt,⁴ and Ruth Anderson,⁵ 1. *School of Nursing, Durham, North Carolina, United States*, 2. *UNC School of Nursing, Chapel Hill, North Carolina, United States*, 3. *UNC Chapel Hill, Chapel Hill, North Carolina, United States*, 4. *University of North Carolina at Chapel Hill School of Nursing, Chapel Hill, North Carolina, United States*, 5. *University of North Carolina at Chapel Hill, UNC Chapel Hill, North Carolina, United States*

Our study addresses symptoms and functional management early in acute myeloid leukemia treatment using a Palliative and Collaborative Care Intervention (PACT) delivered by clinical staff. PACT is an interdisciplinary nurse-led intervention of nursing [RN], occupational therapy [OT], physical therapy [PT] for adults ≥ 60 years of age at time of initial treatment. Findings from our preliminary qualitative work led to use of the Adaptive Leadership Framework for Chronic Illness to guide optimal engagement of the patient in self-management of symptoms and functional activities to address QOL outcomes. We share lessons learned of how the ALFCI was applied to the PACT intervention to empower patients with self-management skills to reduce symptoms and optimize function. In summary, the team and patient identify and address emotional, motivational, attitudinal barriers so that the patient can do the work required for self-management to reduce symptoms and avoid functional decline.

USING A THEORETICAL FRAMEWORK IN A QUALITATIVE METASUMMARY ABOUT FATIGUE ADAPTATION AFTER STROKE

Chiao-Hsin Teng,¹ Ruth Anderson,² and Leslie Davis,³ 1. *UNC Chapel Hill School of Nursing, Chapel Hill, North Carolina, United States*, 2. *University of North Carolina at Chapel Hill, UNC Chapel Hill, North Carolina, United States*, 3. *The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States*

We describe how we used a theoretical framework, Adaptive Leadership Framework for Chronic Illness (ALFCI), to complete a qualitative metasummary in a scoping review of 26 articles. We abstracted and grouped qualitative findings relevant to fatigue adaptation in stroke survivors using

constructs of the ALFCI as 4 main themes: 1) adaptive challenges, 2) adaptive work, 3) adaptive leadership and collaborative work, and 4) technical challenges and technical work. We found that stroke survivors encountered different aspects of challenges (e.g., physical dysfunction vs. mental distress) and utilized various adaptive work (e.g., conserving energy vs. restructuring normality) as well as what stroke survivors needed from healthcare professionals (e.g., basic knowledge about fatigue). The ALFCI provides a useful lens to synthesize qualitative findings regarding fatigue adaptation and therefore researchers can target different problems that need to be tackled for stroke survivors, care partners, or healthcare professionals, respectively.

PROVIDING CARE FOR OLDER RESIDENTS WITH DEMENTIA IN NURSING HOMES IN CHINA: THROUGH THE LENS OF ADAPTIVE LEADERSHIP

Jing Wang,¹ Xueli Bian,² Ruth Anderson,³ Anna Beeber,³ and Junqiao Wang,⁴ 1. *UNC Chapel Hill, Chapel Hill, North Carolina, United States*, 2. *Fudan University, Shanghai, Shanghai, China (People's Republic)*, 3. *University of North Carolina at Chapel Hill, UNC Chapel Hill, North Carolina, United States*, 4. *Fudan University, Shanghai, Shanghai, China (People's Republic)*

This study aims to understand staff's experiences of providing direct care for older residents with advanced dementia in long-term care facilities through the lens of Adaptive Leadership Framework for Chronic Illness (ALFCI). Semi-structured interviews were conducted with health care aides (N=35) from 2 government-owned and 2 private long-term care facilities in urban China. Directed and conventional content analysis were used, drawing upon core constructs of ALFCI. We found that health care aides are confronted with multiple challenges such as high intensity of work, stress from managing older residents' behavioral and psychological symptoms of dementia (BPSD), a lack of access to on-the-job dementia-specific training, and a lack of support from nurses and managing team. Some of the health care aides demonstrated use of their strengths and doing adaptive work to improve work life and care for older residents by using communication cues, enhancing person-centeredness in their care, and facilitate peer interactions.

QUALITATIVE ANALYSIS OF COACHING WITH CARE PARTNERS OF PEOPLE WITH COGNITIVE IMPAIRMENT

Bianca Shieu,¹ Chiao-Hsin Teng,² Ya-Ning Chan,³ Youngmin Choi,³ Cass Dictus,³ Janelle Perez,⁴ Jing Wang,⁵ and Victoria Bartoldus,⁶ 1. *University of Pittsburgh/ School of Medicine, Pittsburgh, Pennsylvania, United States*, 2. *UNC Chapel Hill School of Nursing, Chapel Hill, North Carolina, United States*, 3. *UNC Chapel Hill, Chapel Hill, North Carolina, United States*, 4. *University of North Carolina at Chapel Hill School of Nursing, Chapel Hill, North Carolina, United States*, 5. *Fudan University, Shanghai, China*, 6. *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States*

We apply the adaptive leadership framework for chronic illness in a care partner-assisted intervention to improve oral hygiene of older adults with cognitive impairment. Care partners receive four coaching sessions which we recorded

and transcribed verbatim. We will describe how our team of seven investigators codes the data using a priori codes from the framework. The data from 17 care-partners contributes 68 individual sessions for coding. We have two subgroups of 7 individuals with mild dementia (MD) and 10 with mild cognitive impairment (MCI). We will discuss the plan for multiple comparisons such as (a) longitudinal across 3 months of intervention, b) within MD and within MCI and c) between MD and MCI. To illustrate, we will discuss our approaches to reaching coding consensus and rigor and will present results of the within group analyses. Finally, we will discuss next steps and the end products we aim to achieve.

Session 2145 (Paper)

Sensory Impairment and Loneliness

HEARING LOSS AND PREVENTABLE HOSPITALIZATIONS

Nicholas Reed, and Emmanuel Garcia Morales, *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

Nearly half of all adults over the age of 60 years have hearing loss. Recent research suggests adults with hearing loss experience increased health care expenditures and hospitalization. However, little is known about whether these are preventable hospitalizations which may indicate poorer healthcare system engagement. In this cross-sectional analysis, we examined data from combined 2016-2018 Medicare Current Beneficiary Survey (MCBS) datasets. Participants are asked to describe their self-perceived trouble hearing. Preventable hospitalizations were defined and generated from administrative claims files based on the Agency for Healthcare Research and Quality identified conditions that should be manageable in ambulatory care settings. Multivariate regression models adjusted for demographic/socioeconomic characteristics and general health determinants were used to explore the association between trouble hearing and outcomes. The combined 2016-2018 MCBS administrative claims files included 18,814 participant-years, 49.8% reported no trouble hearing, 43.4% reported a little trouble and 6.8% a lot of trouble hearing, respectively. A higher proportion of those with a lot of trouble hearing (6.8%) experienced at least one preventable hospitalization compared to those with a little trouble hearing (3.4%) and no trouble hearing (2.5%). In a fully adjusted logistic regression model, hearing loss was associated with 1.35 times the odds of experiencing at least one preventable hospitalization per year (OR=1.35; 95% CI=1.03-1.77). Medicare beneficiaries with hearing loss experience higher rates of preventable hospitalizations. This may be due to avoidance of care due to communication barriers. Further work is needed to understand underlying reasons and whether addressing hearing loss modifies the observed association.

IMPACT OF VISION AND HEARING IMPAIRMENT ON COGNITION AND LONELINESS: EVIDENCE FROM THE MEXICAN HEALTH AND AGING STUDY

Kimberly Hreha,¹ Rafael Samper-Ternent,² Brian Downer,³ Joshua Ehrlich,⁴ Paige Downer,³ Timothy Reistetter,⁵ and

Heather Whitson,⁶ 1. *Duke University, Durham, North Carolina, United States*, 2. *The University of Texas Medical Branch, Galveston, Texas, United States*, 3. *University of Texas Medical Branch, Galveston, Texas, United States*, 4. *University of Michigan, University of Michigan, Michigan, United States*, 5. *University of Texas Health Science Center at San Antonio, Dickinson, Texas, United States*, 6. *Duke University School of Medicine, Durham, North Carolina, United States*

Poor vision and hearing have been associated with lower cognitive function and greater social isolation (i.e., loneliness) among older adults. However, this evidence is based largely on data from non-Hispanic populations. Therefore, we investigated whether self-reported vision and hearing was associated with cognitive function and loneliness in a nationally-representative study of Mexican adults aged 50 and older in Wave 3 of the Mexican Health and Aging Study. The final sample included 12,426 participants. The majority were female (58%), and the mean age was 67. Self-reported vision and hearing status were categorized as excellent-very good [ref], good, and fair-poor. Measures for global cognition, memory, and non-memory cognition were calculated using z-scores based on nine cognitive tests. Participants who reported frequently feeling a lack of companionship, left out, or isolated were categorized as feeling lonely. All analyses controlled for age, sex, and years of education. Participants with fair-poor vision had lower global ($\beta = -0.06$, $p < .01$), memory ($\beta = -0.07$, $p < .01$), and non-memory cognition ($\beta = -0.06$, $p < .01$) than participants with excellent-very good vision. In addition, participants with fair-poor hearing had higher non-memory cognition ($\beta = 0.03$, $p < .05$) but not global cognition ($\beta = 0.02$) or memory ($\beta = 0.001$). Fair-poor vision (OR=1.53, 95% CI=1.25-1.87) but not fair-poor hearing (OR=1.16, 95% CI=0.97-1.38) was associated with higher odds of being lonely. Poor vision may be a potentially modifiable risk factor for lower cognition and loneliness among Mexican adults. Future research should incorporate robust measures of sensory health and investigate the longitudinal association between vision, cognition, and loneliness.

INTERVENTIONS FOR QOL AND OTHER OUTCOMES AMONG CAREGIVERS OF OLDER ADULTS WITH VISUAL IMPAIRMENTS

Afeez Hazzan,¹ Pamela Haibach-Beach,² Lauren Lieberman,³ and Jamia Williams,³ 1. *State University of New York at Brockport, Brockport, New York, United States*, 2. *SUNY Brockport, State University of New York, Brockport, New York, United States*, 3. *State University of New York, Brockport, State University of New York, Brockport, New York, United States*

Unpaid family caregivers play a critical role in the care of older adults with visual impairments (VI). Caring for older adults with VI requires much time and energy, often resulting in psychological stress and reduced quality of life (QoL). However, there is a paucity of data on the impact of caregiving on QoL and related outcomes among these caregivers. The purpose of this study was to conduct a scoping review examining issues of QoL, health, stress, burden, and barriers among unpaid caregivers of older adults (i.e. aged 60 years or more) with VI. The study aimed to summarize interventions for addressing these issues. This study followed the

Arksey and O'Malley (2005) five stage approach for scoping reviews. We performed a search of published peer-reviewed articles available in PubMed, CINAHL Complete, and PsycINFO to identify relevant studies. Two reviewers conducted the screening of titles, abstracts, and full-texts. Of the 452 records identified, 24 were eligible for full-text screening and five articles met the final inclusion criteria. The following four themes were identified: (1) prevalence of QoL-related barriers among unpaid caregivers of older adults with VI; (2) adverse events among unpaid caregivers of older adults with VI; (3) interventions for unpaid caregivers of older adults with VI; and (4) potential impacts of intervention on unpaid caregivers of older adults with VI. These findings reveal a lack of interventions for unpaid caregivers of older adults with VI, despite the prevalence of QoL-related barriers and adverse events. Research addressing these issues are urgently needed.

LONELINESS, SLEEP QUALITY, AND COGNITIVE FUNCTION IN COMMUNITY-DWELLING OLDER ADULTS

Kexin Yu,¹ and Bernadette Fausto,² 1. *USC, LA, California, United States*, 2. *Rutgers University–Newark, Newark, New Jersey, United States*

Loneliness is a risk factor for cognitive decline in older adults, however, the underlying mechanisms are less understood. Individuals who experience frequent loneliness tend to have poorer sleep quality. Empirical evidence supports the influence of sleep on cognitive health. This study examined the possible mediating effect of sleep characteristics on the relationship between loneliness and cognition. The study sample included 557 participants from wave 2 of the National Social Life, Health, and Aging Project who had actigraphy sleep measures (mean age = 73.17, 52.6% female). Loneliness was assessed with the 3-item UCLA Loneliness Scale. Cognitive function was measured with the Montreal Cognitive Assessment. Five sleep quality indicators were objectively recorded with wearable devices: assumed sleep time; actigraphy sleep time; time spent awake after sleep onset (WASO); sleep fragmentation; and sleep percentage (actigraphy sleep/(assumed sleep + WASO)). Path analysis model results show that WASO, fragmentation, and sleep percentage mediate the link between loneliness and cognitive function. Loneliness was positively related to WASO, and WASO was negatively associated with cognition. Loneliness correlated with increased sleep fragmentation which was associated with worse cognitive function. Individuals who had more frequent loneliness had a lower sleep percentage, and sleep percentage was positively associated with cognitive function. Nonetheless, the path from loneliness to these three sleep characteristics became insignificant after controlling for depressive symptoms. Depressive symptoms and fragmentation were found to double mediate the association between loneliness and cognitive function. Sleep and depression could be underlying pathways for the association between loneliness and cognition.

THE LONGITUDINAL RELATIONSHIPS BETWEEN SOCIAL ISOLATION, FRAILTY, AND HEALTH OUTCOMES AMONG CANADIAN OLDER ADULTS

Fereshteh Mehrabi,¹ and François Béland,² 1. *School of Public Health (ESPUM), Université de Montréal, Montreal,*

Quebec, Canada, 2. *Université de Montréal, Montreal, Quebec, Canada*

Social isolation and frailty are global public health issues that may lead to poor health outcomes. We tested the two following hypotheses: 1) changes in social isolation and frailty are associated with adverse health outcomes over two years, 2) the associations between social isolation and health vary across different levels of frailty. We estimated a series of latent growth models to test our hypotheses using data from the FRÉLE longitudinal study among 1643 Canadian community-dwelling older adults aged 65 years and over. Missing data were handled by pattern mixture models with the assumption of missing not at random. We measured social isolation through social participation, social networks, and social support from different social ties. We assessed frailty using Fried's criteria. Our results revealed that higher frailty at baseline was associated with a higher rate of comorbidity, depression, and cognitive decline over two years. Less social participation at baseline was associated with comorbidity, depression, and changes in cognitive decline. Less social support from friends, children, partner, and family at baseline was associated with comorbidity, cognitive decline, and changes in depression. Fewer contacts with grandchildren were related to cognitive decline over time. The associations of receiving less support from partner with depression and participating less in social activities with comorbidity, depression, and cognitive decline were higher among frail or prefrail than robust older adults over time. This longitudinal study suggests that intimate connectedness and social participation may ameliorate health status in frail older populations, highlighting the importance of age-friendly city policies.

Session 2150 (Paper)

Sexuality

AGING LGBT ADULTS' ACCESS TO SOCIAL RESOURCES ACCORDING TO LGBT IDENTITY AND SOCIODEMOGRAPHICS

Krystal Kittle,¹ Kathrin Boerner,² and Kyungmin Kim,³
1. *University of Nevada, Las Vegas, Las Vegas, Nevada, United States*, 2. *University of Massachusetts Boston, Boston, Massachusetts, United States*, 3. *Seoul National University, Seoul, Seoul-t'ukpyolsi, Republic of Korea*

Research suggests that social resources positively influence the health and well-being of lesbian, gay, bisexual, and transgender (LGBT) aging adults, but their access to social resources may vary according to LGBT identity. Using data from Aging with Pride: National Health, Aging, and Sexuality/Gender Study (N=2,536), multivariate models tested how access to social resources varied by LGBT identity and whether the effect of LGBT identity showed additional variations by sociodemographic characteristics (i.e., age and education) among aging LGBT adults. Lesbian respondents had larger social networks than gay respondents, while gay respondents had smaller networks than transgender respondents. Lesbian respondents had more social support and community belonging than other identity groups. Bisexual male respondents and transgender respondents had less support than gay respondents and bisexual male respondents reported less

community belonging than gay respondents. Education and age moderated the association between LGBT identity and social support. Findings highlight the importance of considering social support separately from social network size with the understanding that large social networks do not necessarily provide ample social support and this distinction was particularly relevant for transgender respondents who had larger social networks, but less social support than gay respondents. Results also suggest that feelings of LGBT community belonging vary among LGBT identity groups. Health and human service professionals should not only consider the sexual and gender identity of their aging LGBT clients, but also consider the clients' additional sociodemographic characteristics when assessing their access to social resources.

COMPARISON OF TWO SURVEYS USING THE SEXUALITY ASSESSMENT TOOL (SEXAT) IN FLANDERS

Els Messelis,¹ Michael Bauer,² Elisabeth Vander Stichele,³ and els Elaut,⁴ 1. *LACHESIS, Ghent, Oost-Vlaanderen, Belgium*, 2. *La Trobe University, Melbourne, Victoria, Australia*, 3. *AZ Sint Jan, Brugge, West-Vlaanderen, Belgium*, 4. *UGent, Gent, Oost-Vlaanderen, Belgium*

From 2015 it is mandatory in Flanders, Belgium, to develop a policy to deal with sexual abuse in elderly care. Residential Aged Care Facilities (RACF'S) try to focus on this mandatory, but should also pay attention to implement an overall Sex and Intimacy Policy. This study contains a Comparison of two surveys (Messelis & Bauer, 2020 and Vander Stichele, e.a. 2020) in Flanders, Belgium, both using the Sexual Assessment Tool (SeAT, Messelis & Bauer, 2017). Both studies aimed to assess how supportive residential aged care facilities are of residents' sexual expression. In the survey of Messelis & Bauer 750 aged care facilities were contacted in 2017-2018 and 69 (9,2%) completed the SexAT survey after three reminders. Vander Stichele e.a. contacted 100 aged care facilities managers in 2019. Twenty of them (20% response rate) completed the SexAT after three reminders. Findings of the Messelis & Bauer survey indicate that 70% of the facilities rated 'very good' to 'good' (score between 21-59/69), while Vander Stichele e.a. found a prevalence of 76% of this score. Both found no facilities were rated 'excellent' (score greater than 60/69). In the category 'improvement needed' (score less than 20/69), percentages were 30% and 23%; a difference of 7% (CI95% of difference in percentage includes zero, not significant). There is room for improvement in residential aged care facilities for the support of sexual expression of residents. The more recent study confirms results of the previous one, and no significant evolution was observed in two consecutive cross-sectional surveys.

SEXUAL EXPRESSION, POLICY, AND PRACTICES IN SKILLED NURSING FACILITIES: AN UPDATED ASSESSMENT IN THE STATE OF KANSAS

Sarah Jen,¹ and Mijin Jeong,² 1. *University of Kansas, Lawrence, Kansas, United States*, 2. *University of Kansas, LAWRENCE, Kansas, United States*

Prior studies have reported barriers to meeting the sexual needs of older adults within skilled-nursing facilities, such as a lack of privacy, lack of supportive practices and policies, and judgement or discomfort on the part of the staff (Doll,

2013; Hajjar & Kamel, 2003). In 2008, Doll and colleagues assessed the scope of sexual behaviors, staff perceptions of and responses to such behaviors, and whether facilities had a sexual policy in place in SNFs in the state of Kansas (Doll, 2013). In the present study, an online survey was distributed to the same population to provide an updated assessment of sexual behaviors, policies, and practices. Of 60 survey respondents, 62.7% reported knowledge of individual sexual acts (e.g., masturbation) within the past year and 34.5% reported interactional (between two or more residents) sexual acts. When encountering a sexual event, staff were most likely to report the incident to an administrator (76.7%) and treat residents with respect (70.0%), while 35.0% and 41.7% were expected to respond with embarrassment and discomfort, respectively. Only 40% of administrators reported having a policy related to sexual expression. Findings indicate that staff are likely to respond differently to LGBTQ residents due to discomfort and those living with cognitive impairment due to concerns related to consent. The proportion of facilities in Kansas with policies related to sexual expression has increased from 26% to 40% in the past 12 years, but there remains a need for greater specificity of sexuality-related policies and trainings.

THE ROLE OF MINORITY STRESS AND SOCIAL RESOURCES IN THE HEALTHCARE UTILIZATION OF AGING LGBT ADULTS

Krystal Kittle,¹ Kathrin Boerner,² and Kyungmin Kim,³
 1. *University of Nevada, Las Vegas, Las Vegas, Nevada, United States*, 2. *University of Massachusetts Boston, Boston, Massachusetts, United States*, 3. *Seoul National University, Seoul, Seoul-t'ukpyolsi, Republic of Korea*

Research suggests that minority stress can influence the healthcare utilization of aging LGBT adults, and that social resources can buffer the effect of stress on healthcare utilization. Using data from Aging with Pride: National Health, Aging, and Sexuality/Gender Study (N = 2,560), multiple logistic regression assessed the associations between minority stress (i.e., internalized stigma and LGBT identity disclosure) and healthcare utilization (i.e., health screenings, emergency room use, routine checkups, and regular provider). We also examined the moderating effect of social resources, including social network size, social support, and LGBT community belonging, in these associations. Internalized stigma was negatively associated with having a routine checkup in the previous year (OR = 0.82, p = .038). Disclosure was positively associated with having a health screening within the past 3 years (OR = 1.52, p = .000) and having a regular provider (OR = 1.33, p = .021). Further, we found that social support moderated the association between disclosure and health screenings (OR = 1.52, p < .001); thus, having higher levels of social support and disclosure in tandem increased the likelihood of getting a health screening in the last three years. Health and human service professionals should provide information about internalized stigma and LGBT identity disclosure to educate their clients about the ways in which these minority stressors can impact their healthcare experiences. Providers should assess the social support of their aging LGBT clients and inform them about the added benefit that social support can have in their healthcare experiences.

Session 2155 (Symposium)

TRANSFORMING DEMENTIA CARE: IMPLEMENTATION CHALLENGES MOVING EVIDENCE-BASED PROGRAMS TO HEALTH CARE

Chair: Laura Gitlin

Co-Chair: Kenneth Hepburn

Discussant: Sara Czaja

Although evidence for dementia care programs continues to grow, families and health providers do not have ready access to programs, nor have they been widely disseminated and routinized in healthcare. Understanding implementation considerations when embedding evidence-based programs in healthcare systems can inform ways to effectively transform dementia care. This symposium will examine similarities and differences in implementation challenges encountered and strategies used when implementing four evidence-based programs being tested in different healthcare environments using distinct study designs. Dr. Gaugler et al., will discuss implementation challenges encountered with a staff-delivered intervention (ADS Plus) to support caregivers in adult day services that is being tested using a mixed methods hybrid trial design in >50 sites nationally. Dr. Hodgson et al., will discuss adaptations and their measurement to COPE, a home-based dyadic support program being embedded in 10 PACEs of a large healthcare system using a noninferiority trial testing staff training strategies. Dr. Forester et al., will examine implementation of the Care Ecosystem for dementia patients in a high-risk, integrated care management program using a pilot embedded pragmatic trial. Dr. Hepburn et al., will explore tactical challenges of implementing Tele-Savvy, an online caregiver psychoeducation program, within the context of a pilot pragmatic clinical trial. Drawing upon implementation science, themes discussed include balancing adaptations and fidelity, measurement of implementation outcomes and organizational readiness, and staff training implications. Also highlighted are research design considerations. Dr. Czaja, an expert in the design and implementation of dementia care interventions from in-person to technology-based will be the discussant.

ADDRESSING TACTICAL CHALLENGES IN EMBEDDING TELE-SAVVY IN A PILOT PRAGMATIC TRIAL

Kenneth Hepburn,¹ Carolyn Clevenger,¹ Karina Berg,² Richard Fortinsky,³ 1. *Emory University, Atlanta, Georgia, United States*, 2. *University of Connecticut, Farmington, Connecticut, United States*, 3. *University of Connecticut School of Medicine, Farmington, Connecticut, United States*,

This presentation describes how we plan to address the challenges of testing an evidence-based caregiver program in a real-world setting without the infrastructure and personal contact of a typical RCT. Instead of screening participants for eligibility, clinic staff will pre-identify participants whom clinicians then confirm. Each clinic will include Tele-Savvy as standard of care; we will thus be able to obtain IRB approval for a waiver of consent. By securing agreement from each clinic to incorporate a small set of standard instruments (e.g., Pearlin Caregiver Competence scale) into their standard operating procedure of routinely collecting caregiver data

gathering, we will be able to eliminate the need for a central research staff to conduct baseline and follow-up interviews and will, instead, collect key outcome data through the electronic health record. Instead of in person training of Tele-Savvy facilitators, we will rely on an online training program and facilitator manuals.

CHALLENGES IN IMPLEMENTING EVIDENCE-BASED DEMENTIA CARE PROGRAMS IN COMMUNITY-BASED SETTINGS: ADS PLUS

Joseph Gaugler,¹ Katherine Marx,² Lauren Parker,³ Keith Anderson,⁴ Holly Dabelko-Schoeny,⁵ Elma Johnson,⁶ Elizabeth Albers,¹ Laura Gitlin,⁷ 1. *Johns Hopkins School of Nursing, Baltimore, Maryland, United States*, 2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 3. *University of Texas at Arlington, Arlington, Texas, United States*, 4. *The Ohio State University, The Ohio State University, Ohio, United States*, 5. *University of Minnesota School of Public Health, University of Minnesota/ Minneapolis, Minnesota, United States*, 6. *University of Minnesota, Minneapolis, Minnesota, United States*, 7. *Drexel University, College of Nursing and Health Professions, Drexel University, Pennsylvania, United States*

The Adult Day Service Plus Program (ADS Plus) augments the usual care provided by ADS programs by integrating education, referrals, and problem-solving strategies for family caregivers of persons with dementia. Utilizing a mixed-methods, hybrid effectiveness design, we were in the process of conducting a national evaluation of ADS Plus across xx geographically and culturally diverse programs across the U.S. when the COVID-19 pandemic resulted in the shut-down of almost all of the programs participating in ADS Plus. Qualitative and quantitative data collected during the evaluation suggested that a more robust incorporation of implementation domains and measures (e.g., organizational readiness to change) may have helped avoid some of the challenges related to staff training, fidelity, and other critical intervention delivery aspects. Incorporating implementation science frameworks and measures as early as possible in intervention design may have helped to overcome some of the challenges experienced in ADS Plus.

TRACKING ADAPTATION AND FIDELITY WHEN EMBEDDING COPE, EVIDENCE-BASED DEMENTIA CARE, IN PACE SITES

Nancy Hodgson,¹ Laura Gitlin,² 1. *University of Pennsylvania, School of Nursing, Philadelphia, Pennsylvania, United States*, 2. *Drexel University, College of Nursing and Health Professions, Drexel University, Pennsylvania, United States*

One essential question in moving dementia care interventions to practice is, "What is the optimal balance between fidelity to, and adaptation of, a proven program in "real world" settings?" We present a protocol for measuring the adaptation/fidelity and implementation of an evidence-based dementia care program (Care of Persons in their Environment, COPE) in PACE settings. During pre-implementation, science-based elements of COPE were documented including the theory of change, logic model and core components. Possible adaptations to COPE in its delivery were identified and included program structure (sequence of sessions),

content (assessments), and delivery methods (online). During implementation, documentation of implementation strategies is captured using an evidence-informed checklist derived from the Expert Recommendations for Implementing Change (ERIC) workgroup. Ongoing documentation of fidelity/adaptation aspects of program implementation is conducted using the FRAME framework. Understanding methods and measures deployed in adaptation and implementation of evidence-based dementia programs can help guide future translation efforts.

ADAPTATION OF THE CARE ECOSYSTEM INTERVENTION FOR INDIVIDUALS WITH DEMENTIA IN A HIGH-RISK, CARE MANAGEMENT PROGRAM

Brent Forester,¹ Karen Donelan,² Christine Vogeli,³ Christine Ritchie,⁴ 1. *McLean Hospital, McLean Hospital, Massachusetts, United States*, 2. *Heller School for Social Policy Management, Brandeis University, Waltham, Massachusetts, United States*, 3. *Mass General Brigham, Somerville, Massachusetts, United States*, 4. *Massachusetts General Hospital, Boston, Massachusetts, United States*,

The Care Ecosystem (CareEco) model is a telephone-based dementia care program providing standardized, personalized and scalable support and education for caregivers and persons living with dementia (PLWD), medication guidance, and promotion of proactive decision-making. It has demonstrated improvement in quality of life for PLWD and reduced unnecessary healthcare expenditures. We initiated a pragmatic, embedded randomized pilot trial of an adapted CareEco model for nurses who provide high-risk care management and are embedded in primary care practices within a large healthcare system. Outcomes include feasibility of collecting emergency department visits, usability and acceptability of the intervention by nurse care managers, caregiver strain, behavioral symptoms of dementia and healthcare expenditures. Challenges of implementation include engaging key care management leaders, adaptation of the CareEco training modules for nurses, identification of primary caregivers, training and reinforcing knowledge and skills of the nurses, embedding clinical assessments into care manager workflows and integration with the EMR.

Session 2160 (Paper)

Trends and Issues of Older Adults Living With HIV/AIDS

MEDIATING ROLE OF LONELINESS ON STIGMA AND DEPRESSIVE SYMPTOMS AMONG OLDER PERSONS LIVING WITH HIV

Moka Yoo-Jeong, *Northeastern University, Brookline, Massachusetts, United States*

Studies have shown associations among stigma, loneliness, and depressive symptoms in older persons living with HIV (OPLWH) but research assessing the mediating pathway among these variables is lacking. As such, the aims of this study were to assess the association between stigma and depressive symptoms and to test the mediating effects of loneliness. A sample of 146 OPLWH (50 years of age and

older) recruited from an outpatient HIV clinic in Atlanta, GA, completed a cross-sectional survey. Mediation analysis, guided by Baron and Kenny's (1986) criteria, was conducted using Stata v14.2 to assess the direct and indirect effects of loneliness on the association between stigma and depressive symptoms while controlling for covariates (self-rated health [0=poor to fair, 1=good to excellent]; past unstable housing [0=No, 1=Yes]; and HIV disclosure status [0=to none, 1=to someone]). Loneliness mediated the association between stigma and depressive symptoms ($\beta=0.79$, $SE=0.23$, $p < .001$). The model reflected a very good fit ($\chi^2=0.09$, $p=.765$; $CFI=1.00$, $TLI=1.09$, $RMSEA < 0.001$) and explained 27% of the variance in loneliness and 33% of the variance in depressive symptoms. Stigma predicted higher loneliness, which in turn predicted more depressive symptoms. Findings suggest that addressing depressive symptoms in OPLWH may require multifaceted interventions targeting psychosocial and interpersonal factors including stigma and loneliness.

OVERWEIGHT, OBESITY, AND NEUROPSYCHOLOGICAL PERFORMANCE: RESULTS FROM THE WOMEN'S INTERAGENCY HIV STUDY

Elizabeth Vasquez,¹ Mark Kuniholm,² Leah Rubin,³ Anjali Sharma,⁴ Kathleen Weber,⁵ Margaret A. Fischl,⁶ Michael Plankey,⁷ and Deborah Gustafson,⁸ 1. *University of Albany, University of Albany, New York, United States*, 2. *University at Albany (SUNY), Rensselaer, New York, United States*, 3. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*, 4. *Albert Einstein College of Medicine, Bronx, New York, United States*, 5. *Cook County Health, Chicago, Illinois, United States*, 6. *Sylvester comprehensive cancer center, Miami, Florida, United States*, 7. *Georgetown University, Washington, District of Columbia, United States*, 8. *SUNY Downstate Health Sciences University, Brooklyn, New York, United States*

Conflicting associations of body mass index (BMI) and waist circumference (WC) with neuropsychological performance (NP) are observed in the general population and among people living with HIV. We examined BMI and WC in middle-aged women living with HIV (WLWH) and without HIV (HIV-) in relation to 10-year trajectories of NP in the Women's Interagency HIV Study (WIHS). NP assessments occurred biennially from 2009-2019. Demographically-adjusted T-scores were calculated for six NP domains: learning, memory, executive function, processing speed, attention and working memory, and motor function. Multivariable linear models stratified by HIV serostatus examined whether baseline (2009) BMI and WC were associated with NP domains - 1) cross-sectionally and 2) longitudinally over 10 years. The sample included 432 WLWH and 367 HIV- women, >40 years old. Most women (73%) were overweight (BMI=25-29.9kg/m²) or obese (BMI=>30kg/m²). Among WLWH, 28% were overweight, 45% obese; among HIV- women, 26% were overweight; 56% obese. Cross-sectionally at baseline, WLWH who were overweight versus normal weight (BMI=18.5-24.9kg/m²), performed worse on executive function, processing speed, and motor function (all $p<0.05$). HIV- women who were overweight versus normal weight performed worse on memory, learning, executive function, processing speed and motor function (all $p<0.05$).

Baseline BMI and WC were not associated with worsening NP domains in this younger, primarily overweight and obese sample of WLWH or HIV- women (all $p>0.05$). Future follow-up of these women will enhance understanding of the age when total and/or central obesity may influence NP trajectories and health of the aging brain.

TRENDS IN ANTIRETROVIRAL REGIMEN COMPLEXITY AMONG MEDICARE BENEFICIARIES WITH HIV, 2014-2018

Sean Fleming,¹ and Linda Wastila,² 1. *University of Maryland Baltimore, University of Maryland Baltimore, Maryland, United States*, 2. *University of Maryland School of Pharmacy, Baltimore, Maryland, United States*

Little is known about antiretroviral therapy (ART) patterns among Medicare beneficiaries with Human Immunodeficiency Virus (HIV). ART has significant implications for spending in Medicare Part D as use of single-tablet regimens (STR) grows, generic availability remains low, and price increases for branded therapies consistently exceed inflation. The objective of this study is to detail patterns of STR utilization among Medicare beneficiaries with HIV. We conducted a retrospective trend analysis using a 5% sample of Medicare Chronic Conditions Data Warehouse, 2014-2018. We included each person-month that fee-for-service beneficiaries with HIV had Parts A, B, and D coverage. Trends in annual prevalence of STR overall, by ART class, and by age, sex, and race subgroups were estimated. The study included 9,509 beneficiaries who contributed 345,708 person-months to the analysis. The prevalence of STR increased from 21.8% (95%CI, 21.5-22.1) in 2014 to 44.6% (95%CI, 44.3-45.0) in 2018 ($p < 0.0001$), an increase of 104.6%. Integrase strand transfer inhibitors (INSTI) saw the largest increase in utilization between 2014 (4.4% [95%CI 4.2-4.5]) and 2018 (35.1% [95%CI 34.8-35.4]) ($p < 0.0001$), a 701.8% increase. All sociodemographic subgroups experienced similar growth in STR use between 2014 and 2018. STR and INSTI utilization increased significantly over the study period, suggesting increased ART spending under Part D. Although increasing availability of generic multi-tablet ART regimens (MTR) may offer cost-savings, further research is needed comparing generic MTR to branded STR with regards to patient preferences, adherence, healthcare resource utilization, and total costs in the growing population of Medicare beneficiaries with HIV.

VISION DIFFICULTY AND ENGAGEMENT IN CARE AMONG AGING MEN LIVING WITH HIV

Alison Abraham,¹ Weiqun Tong,² Valentina Stosor,³ Mackey R. Friedman,⁴ Roger Detels,⁵ and Michael Plankey,⁶ 1. *University of Colorado--Denver, Aurora, Colorado, United States*, 2. *Johns Hopkins University, Baltimore, Maryland, United States*, 3. *Northwestern University Feinberg School of Medicine, Chicago, Illinois, United States*, 4. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 5. *UCLA School of Public Health, Los Angeles, California, United States*, 6. *Georgetown University, Washington, District of Columbia, United States*

For aging adults living with HIV (AALH) who have complex medical care needs, vision impairment may be an added burden that may lead individuals to disengage from

their own medical care. We examined the relationships of self-reported vision difficulty with indicators of care engagement: 1) adherence to HIV antiretroviral therapy (ART; defined as taking $\geq 95\%$ of medications); 2) self-reported avoidance of medical care; 3) self-reported tendency to ask a doctor questions about care (> 2 questions at a medical visit). A modified version of the National Eye Institute vision function questionnaire was administered at three semi-annual visits (from October 2017 to April 2018) to assess difficulty performing vision-dependent tasks (no, a little, moderate to extreme difficulty). We included 1063 AALH participants (median age 60 years, 24% Black). Data were analyzed using repeated measures logistic regression with generalized estimating equations adjusted for fixed race, and at visit values for age, education level, depressive symptoms, alcohol use, and smoking status. Compared to no vision difficulty, those reporting moderate to extreme vision difficulty on at least one task (18%) had 1.95 times higher odds (95% CI: 1.36, 2.79) of having less than optimal ART adherence and 1.92 times higher odds [95% CI: 1.06, 3.47] of avoiding necessary medical care, but 1.6 times higher odds [95% CI: 0.93, 2.72] of asking more questions. These findings suggest that vision impairment plays a role in medical care engagement among older adults living with HIV, and may contribute to poorer management of HIV and chronic comorbidities.

Session 2165 (Symposium)

POLICY SERIES: UPDATE ON POLLING AND POLICY EFFORTS ON LONELINESS, TELEHEALTH, CAREGIVING, AND ADVANCE CARE PLANNING

Chair: Erica Solway

Discussant: Brian Lindberg

Older adults and their caregivers experienced dramatic changes in many aspects of their lives during the COVID-19 pandemic which resulted in important shifts in organizational and federal priorities and policies. To explore older adults' changing experiences and perspectives amidst the pandemic, the University of Michigan National Poll on Healthy Aging (NPHA), a recurring, nationally representative household survey, polled over 2,000 adults age 50-80 at multiple timepoints through January 2021 about their feelings of loneliness and use of telehealth. In June 2020, the NPHA also surveyed adults age 50-80 about advance care planning before and during the COVID-19 pandemic and asked family caregivers about their care challenges in the three months since the pandemic. This session will start with a presentation of results from these polls, first exploring change over time in loneliness and telehealth use and then focusing on experiences related to advance care planning and caregiving challenges. Next, presenters from diverse national coalitions and organizations, including the Coalition to End Social Isolation and Loneliness, the National Academy for State Health Policy, the National Alliance for Caregiving, and the Coalition to Transform Advanced Care will describe their organizations' efforts, including their work with research and advocacy partners, state and federal agencies, and the Biden administration to facilitate dialogue and advance activities and policies related to these timely topics.

FINDINGS ON LONELINESS, TELEHEALTH, AND ADVANCE CARE PLANNING FROM THE NATIONAL POLL ON HEALTHY AGING

Erica Solway,¹ Matthias Kirch,¹ Dianne Singer,¹ Jeffrey Kullgren,¹ Cheryl Lampkin,² Teresa Keenan,² Alison Bryant,² and Preeti Malani,³ 1. *University of Michigan, Ann Arbor, Michigan, United States*, 2. *AARP, Washington, District of Columbia, United States*, 3. *University of Michigan, Ann Arbor, Michigan, United States*

The University of Michigan National Poll on Healthy Aging (NPHA) taps into the perspectives of older adults to inform health care policy and practice using a nationally representative sample of more than 2,000 adults age 50-80. Questions about lack of companionship and feelings of loneliness were tracked over three time points; 34% expressed feelings of loneliness in October 2018, 41% in June 2020, and 37% in January 2021. The NPHA also found that use of telehealth increased from 4% in May 2019 to 30% in June 2020 to 43% in January 2021. Finally, the NPHA found that 37% have completed both medical durable power of attorney and advance directive with 7% completing at least one of these documents in the first three months of the COVID-19 pandemic. These poll results can be used to inform actions by coalitions and organizations to advance state and federal policy.

CAREGIVING CHALLENGES DURING THE COVID-19 PANDEMIC: FINDINGS FROM THE NATIONAL POLL ON HEALTHY AGING

Amanda Leggett,¹ Alicia Carmichael,² Natalie Leonard,² Jeannette Jackson,² Erica Solway,² Matthias Kirch,² Dianne Singer,² and Richard Gonzalez,² 1. *University of Michigan, Ypsilanti, Michigan, United States*, 2. *University of Michigan, Ann Arbor, Michigan, United States*

The COVID-19 pandemic posed new challenges for caregivers. This study examines the prevalence of pandemic care challenges (e.g., decreasing care to reduce virus spread, difficulty accessing medical care) and their associations with caregiver mental health and interpersonal well-being in a nationally representative sample of 311 caregivers who participated in the June 2020 National Poll on Healthy Aging. We consider seven care challenges and supports as key predictors of caregiver mental health (care-related stress, self-reported mental health, three depressive symptoms) and interpersonal well-being (lack of companionship, isolation) in bivariate tests and ordinary least squares regressions. Each care challenge/support was endorsed by between 13-23% of caregivers. Difficulty getting needed medical care was the most predictive challenge associated with increased caregiver stress, depressive symptoms, and worsened interpersonal well-being. All care challenges predicted an increase in caregiver stress. Effective caregiver tools and supports must consider changing policies and care needs, especially during a pandemic.

EFFORTS BY THE COALITION TO END SOCIAL ISOLATION AND LONELINESS

Andrew MacPherson, *Healthspieren, Washington, District of Columbia, United States*

Established in the Fall 2018 and based in Washington, D.C., the Coalition to End Social Isolation & Loneliness

brings together dozens of national organizations including consumer groups, community-based organizations, health plans, mental and behavioral health organizations, health care innovators, and many others to lead a multi-stakeholder dialogue to address the crisis of social isolation and loneliness in America. The Coalition focuses on three major areas to achieve this goal: Disseminating research findings, developing and advocating for federal and state legislative and regulatory policy interventions, and leading public awareness events in Washington, D.C. and across the nation. The COVID-19 pandemic has greatly accelerated efforts to engage Congress and the Executive Branch on a range of federal policy priorities, including leveraging and advancing social services and supports, supporting health care delivery to support those who are socially isolated and/or lonely, and advancing federally-funded research initiatives.

EFFORTS BY THE NATIONAL ACADEMY FOR STATE HEALTH POLICY

Wendy Fox-Grage, *NASHP, Washington, DC, District of Columbia, United States*

The National Academy for State Health Policy hosts both the RAISE Act Family Caregiving Resource and Dissemination Center and the Hub for State Strategies to Build and Support Palliative Care, with generous funding from The John A. Hartford Foundation. The value of supporting individuals with serious illness and complex conditions as well as their family caregivers through telehealth, care management, advance care planning, and other added family caregiver supports has been especially evident during the COVID-19 pandemic. Policymakers are now grappling with how to restructure hard-hit health care and long-term services and supports systems to better support these individuals and their family caregivers. The State Hub provides concrete resources for states working to implement and expand high-quality palliative care, and the RAISE Center is assisting the Family Caregiving Advisory Council with creating the country's first national Family Caregiver Strategy.

EFFORTS BY THE NATIONAL ALLIANCE FOR CAREGIVING

C. Grace Whiting, *National Alliance for Caregiving, Washington, District of Columbia, United States*

The National Alliance for Caregiving (NAC) conducts research, does policy analysis, develops national best-practice programs, and works to increase public awareness of family caregiving issues. In addition to national research and advocacy, NAC provides technical assistance to a national network of caregiving coalitions representing nearly 30 states. NAC recognizes that family caregivers provide important societal and financial contributions toward maintaining the well-being of those in their care. The need to support the nation's nearly 53 million family caregivers and sustain them as the backbone of our chronic and long-term care system is a central issue in national and state efforts to reform healthcare, especially in light of the challenges presented by the COVID-19 pandemic. This presentation will provide information on the current status of these national and state efforts.

Session 2166 (Symposium)

CAREGIVER STRESS: BIOMARKERS LINKED TO DISEASE RISK AND THE PSYCHOBIOLOGY OF STRESS REDUCTION

Chair: Janelle Beadle

Co-Chair: Felipe Jain

Caregivers to older adults with chronic diseases frequently experience chronic stress which can negatively affect caregivers' physical and mental health, and increase disease risk. This interdisciplinary symposium will highlight critical factors influencing caregiver stress, and the role of biomarkers in detecting caregiver disease risk. First, we will discuss the effects of stress and emotional experiences on risk for cardiovascular disease in caregivers of persons with dementia (PWD). In the first talk, Dr. Mausbach will examine relationships among perceived stress, blood glucose and risk of diabetes and cardiovascular disease in caregivers of PWD. Next, Dr. Losada-Baltar will discuss the degree to which caregivers' ambivalent feelings towards providing care are associated with inflammatory markers of cardiovascular risk. Following this, two talks will investigate critical links between stress and caregiver emotional well-being. Dr. Liu will report relationships among the stress-related hormone cortisol, sleep, and anxiety in the context of adult day services. Dr. Beadle will examine the degree to which caregivers' affiliative, empathetic interactions with others relate to their experience of stress through cortisol assessments and neuroimaging. The final talk by Dr. Jain will investigate the effects of a Mentalizing Imagery Therapy intervention for family PWD caregivers on stress, evidence for mindfulness as a causal mediator of stress reduction, and the relationship to brain networks associated with emotion regulation. Taken together, this symposium will identify relevant psychosocial and biological factors that contribute to caregiver stress, as well as discuss the psychobiology of amelioration of caregiver stress.

CAREGIVER STRESS AND EMPATHY: NEURAL AND HORMONAL CORRELATES

Shalmali Mirajkar,¹ David Warren,² and Janelle Beadle,³

1. *Saint Louis University, St. Louis, Missouri, United States,*

2. *Department of Neurological Sciences, University of Nebraska Medical Center, Omaha, Nebraska, United States,*

3. *University of Nebraska at Omaha, Omaha, Nebraska, United States*

Providing care to older adults with chronic conditions can be emotionally meaningful and stressful. The tend-and-befriend theory highlights the role of affiliation/empathy in stress reduction, but it has not been established whether this theory extends to caregivers for older adults. Addressing this gap, we assessed caregiver empathy and stress through behavioral, hormone, and neuroimaging measures. In Experiment 1, we compared 19 caregivers (Mage=67.1) to 24 non-caregivers (Mage=72.6), and found that caregivers with a greater reduction in cortisol to an empathic context showed greater prosocial behavior ($r=0.3$). In experiment 2 (N=32), we examined differences between caregivers and non-caregivers in whole brain resting-state functional connectivity (RSFC) with seed regions of interest (posterior cingulate cortex (PCC); amygdala), and covariation of RSFC

with empathy ($\alpha=0.05$). For emotional empathy, caregivers had stronger connectivity between the PCC seed, medial prefrontal cortex, and right supramarginal gyrus, and between the amygdala seed and the right middle frontal gyrus.

CAUSAL MEDIATION OF STRESS REDUCTION IN FAMILY DEMENTIA CAREGIVERS: A FOCUS ON MINDFULNESS

Liliana Ramirez Gomez, and Felipe Jain, *Massachusetts General Hospital, Harvard Medical School, Boston, Massachusetts, United States*

Although mindfulness therapies have demonstrated benefits for reducing stress and improving psychological symptoms in family dementia caregivers, the mechanisms underlying these salutary effects are unknown. We report a causal mediation pathway to improvement of stress symptoms in family dementia caregivers with Mentalizing Imagery Therapy (MIT), which employs mindfulness and guided imagery tools to reduce stress and improve understanding of self and others. In a randomized controlled trial of short-term 4-week MIT (N=24) versus a psychosocial support group (N=22), MIT demonstrated superior benefit for reducing perceived stress ($p=.006$). Increased trait mindfulness was a causal mediator of this effect ($p=.02$). Neuroimaging pre and post intervention found that increased mindfulness was associated with strengthened connectivity of the dorsolateral prefrontal cortex with an emotion regulation network ($p<.001$). The results are discussed in light of theories of cognitive control and may inform the design of future studies aimed at reducing family caregiver stress.

DEMENTIA FAMILY CAREGIVERS' AMBIVALENT FEELINGS AND CARDIOVASCULAR RISK: LONGITUDINAL CORRELATES

Rosa Romero-Moreno,¹ Carlos Vara-García,² Samara Barrera-Caballero,³ Javier Olazarán,⁴ Brent Mausbach,⁵ Roland von Känel,⁶ Ricardo Olmos,⁷ and Andrés Losada-Baltar,² 1. *Universidad Rey Juan Carlos de Madrid, Madrid, Madrid, Spain*, 2. *Universidad Rey Juan Carlos, Madrid, Madrid, Spain*, 3. *Rey Juan Carlos University, Alcorcón, Madrid, Madrid, Spain*, 4. *HGU Gregorio Marañón, Madrid, Madrid, Spain*, 5. *University of California San Diego, La Jolla, California, United States*, 6. *University Hospital Zurich, Zurich, Zurich, Switzerland*, 7. *Universidad Autónoma de Madrid, Madrid, Madrid, Spain*

Cross-sectional data show that caregivers' ambivalent feelings are associated with psychological distress. The association of ambivalent feelings with caregivers' cardiovascular risk has not been studied. For this purpose we analyzed preliminary data from the Spanish Longitudinal Caregiving Spanish Longitudinal Study (CUIDA-LONG). One-year follow-up data were available for 96 dementia family caregivers. The following variables were assessed: sociodemographics, body mass index (BMI), disruptive behaviors, ambivalence, depressive symptomatology and cardiovascular risk with the inflammatory biomarker C-reactive protein (CRP). A hierarchical regression model was tested. Sociodemographic variables and change over time in stressors, ambivalence and depression were entered as predictors of change in CRP. 27% of the variance in CRP was explained through the model. More time since being a caregiver, higher BMI and greater increase in ambivalence contributed significantly to an increase in CRP. Ambivalent feelings contribute significantly to

the cardiovascular risk of those who care for a relative with dementia.

AN INTENSIVE LONGITUDINAL STUDY OF THE ASSOCIATION OF STRESS WITH HYPERGLYCEMIA USING REAL-TIME DATA COLLECTION

Brent Mausbach, *University of California San Diego, La Jolla, California, United States*

Caregivers of persons with dementia (PWD) are at significantly elevated risk for cardiovascular disease (CVD)s. A higher risk for diabetes is one potential mechanism of morbidity in caregivers. Diabetes has been associated with dyslipidemia, hypertension, oxidative stress, increased low-grade inflammation, and endothelial dysfunction, which all place individuals at risk for CVD. Elevated blood glucose, even in the nondiabetic range, is a significant risk marker for the development of CVD. The current study examined the semi-continuous association between stress and glucose. Participants wore a continuous glucose monitor that measured blood glucose every 5 minutes for a period of 10 days ($n = 2,880$ /participant). Ecological Momentary Assessment (EMA) was used to measure stress, positive affect, negative affect, and dietary intake 3x/day over the 10-day period. Hierarchical linear models indicated significant within-person associations between stress and blood glucose levels ($t = 3.88$, $df = 3.92$, $p = .018$; $R^2 = 26.2\%$).

DAILY CORTISOL TOTAL OUTPUT MEDIATED SLEEP AND AFFECT AMONG DEMENTIA FAMILY CAREGIVERS

Yin Liu, Daniel Fleming, and Elizabeth Fauth, *Utah State University, Logan, Utah, United States*

Cortisol is a primary stress hormone associated with sleep. We examined daily cortisol as the potential mechanism linking prior night's sleep and daily mood among 173 dementia family caregivers (M (SD) age = 61.97 (10.66)) who used adult day services (ADS) at least two days a week. Caregivers self-reported sleep characteristics (bed and wake time, sleep quality, care receiver's night-time problems) and affect (anxiety, depressive symptoms) across eight consecutive ADS/non-ADS days. Salivary cortisol was collected five times each day. Multilevel mediation analysis suggested that daily cortisol total output (assessed as "area under the curve") mediated prior nights' total time in bed and daily anxiety, but only on high-stress (non-ADS) days. Mediation was non-significant on low-stress (ADS) days, and at the between-person level. ADS use is respite from a chronically stressful role. Reducing exposure to stress via respite may protect against harmful processes related to sleep, cortisol reactivity, and daily anxiety.

Session 2170 (Paper)

Ageism (BSS Paper)

AGE DISCRIMINATION DURING THE COVID-19 PANDEMIC: ASSOCIATIONS WITH DAILY WELL-BEING

Lydia Ong, Patrick Klaiber, Anita DeLongis, and Nancy Sin, *University of British Columbia, Vancouver, British Columbia, Canada*

During the COVID-19 pandemic, ageist attitudes have been pervasive in public discourse, interpersonal relationships, and medical decision-making. For example, older adults have been portrayed as vulnerable while younger adults have been portrayed as reckless. The current study examined age discrimination during COVID-19 and associations with daily affect and physical symptoms. Positive events and age were examined as moderators. From March to August 2020, 1493 participants aged 18-91 (mean=40) in the U.S. and Canada completed surveys for seven consecutive evenings about discrimination, positive events, affect, and physical symptoms. Multilevel models controlled for age, race, income, education, sample (university students vs. community), and country of residence. Results indicated that individuals who reported more age discrimination had higher negative affect ($b=36.44$, $SE=3.97$), lower positive affect ($b=-19.07$, $SE=4.10$), and increased physical symptoms ($b=3.85$, $SE=0.49$; $p<0.001$ for all), compared to those with fewer reports of age discrimination. Within-persons, days with age discrimination were associated with higher negative affect ($b=3.66$, $SE=1.36$, $p=0.008$), lower positive affect ($b=-2.60$, $SE=1.23$, $p=0.037$), and increased physical symptoms ($b=0.26$, $SE=0.11$, $p=0.02$), compared to days on which age discrimination was not reported. Positive events moderated the between-person association of age discrimination with physical symptoms such that individuals with more age discrimination and more frequent positive events reported fewer daily physical symptoms than those with more age discrimination and less frequent positive events. Age did not moderate the associations. Age discrimination was associated with poorer daily well-being during the COVID-19 pandemic and may have long-term impacts on intergenerational solidarity and attitudes toward aging.

IMPACT OF STRUCTURAL AGEISM ON GREATER VIOLENCE AGAINST OLDER PERSONS: A CROSS-NATIONAL STUDY OF 56 COUNTRIES

E-Shien Chang,¹ Joan Monin,² Daniel Zeltermann,² and Becca Levy,³ 1. *Weill Cornell Medicine, New York City, New York, United States*, 2. *Yale School of Public Health, New Haven, Connecticut, United States*, 3. *Yale University, Woodbridge, Connecticut, United States*

Violence directed against older persons is recognized as a global health problem. However, structural drivers for violence remain under-studied. This country-level ecological study aimed to examine a previously unexplored link between structural ageism and violence against older persons. Following extensive structural stigma literature, structural ageism consisted of two components: (1) discriminatory national policies related to older persons' economic, social, civil, and political rights, gathered from global databases including UN, WHO, and others; and (2) societal-level prejudicial social norms against older persons, measured by negative attitudes toward older persons by the World Values Survey. Two components were z scored and combined such that higher score indicated greater structural ageism. Prevalence rates of violence per 100,000 persons aged 70 and over in each country were drawn from the Global Burden of Diseases Study. Final analysis included 56 countries, representing 63% of the world's aging population aged 60 and over across all six WHO regions. As predicted, structural ageism was

significantly associated with the prevalence rates of violence in multivariate models ($\beta =205.7$, $SE=96.3$, $P=.03$), after adjusting for country-level sociodemographic and health covariates. Three sets of sensitivity analyses supported the robustness of our findings. That is, structural ageism did not predict other types of violence and other types of prejudice did not predict violence against older persons. Public health and population-based violence prevention policies may benefit from a targeted approach that tackles the harmful effects of structural ageism.

INTERGENERATIONAL CONTACT EXPERIENCES AND THEIR RELATION TO AGEISM AS A MULTIDIMENSIONAL CONSTRUCT

Tim Kuball, Georg Jahn, and Claas Pollmanns, *Chemnitz Technical University, Chemnitz, Sachsen, Germany*

Research on intergroup contact suggests that negative contact experiences affect cognitive representations such as stereotypes more strongly than positive contact experiences. To comprehensively examine the full effect of intergroup contact, the valence of the contact experience as well as the affective and cognitive dimensions of prejudice should be assessed. In ageism research, previous studies typically focused only on contact of positive valence and were limited to the perspectives of younger individuals on older adults. Primary objective of this study is to examine both positive and negative contact frequency and their relation to affective and cognitive dimensions of ageism from the perspectives of younger adults between the age of 18 and 25 (study 1) and older adults between the age of 60 and 92 (study 2). Consistent with previous research on intergroup contact, our results confirm that both types of contact were similarly predictive of affective facets of prejudice. However, only in study 2 that assessed older adults' agreement with contemporary stereotypes about young men and women, negative compared to positive contact frequency proved to be a stronger predictor of the cognitive dimension of ageism. Our findings emphasize the importance of focusing on all dimensions of prejudice and highlight the need to consider the perspectives of young and old in ageism research.

OLDER PEOPLE WITH DEMENTIA RUNNING A POP-UP RESTAURANT: HOW TO USE REALITY SHOWS TO REDUCE THE STIGMA OF DEMENTIA

Wenqian Xu, *Linköping University, Norrköping, Ostergötlands Lan, Sweden*

The present study focused on a Chinese reality show, *Forget Me Not Café*, which brought together five older people (aged 65 and older) living with dementia to run a pop-up restaurant and intended to reduce the stigma of dementia. The study aims to explore how the reality-show participants describe dementia in older people and how their views relate to the macrosocial context of dementia and older people. This study performed a thematic discourse analysis on the written and spoken content about dementia in older people (or later life) presented in the reality show. Four discursive themes were identified including: (1) age is a risk factor for dementia; (2) early signs and symptoms of dementia in older people deserve attention; (3) putting pressure on family caregivers of people with dementia; (4) expectations to maintain social engagement and slow down the development of dementia. This

study also found that the views of the reality-show participants highlight the capability of older people with dementia to communicate effectively and live with the condition, their personal goals of sustaining a happy, meaningful and sociable life, as well as their actions to positively influence personal circumstances. The results of this study indicate that this reality show might help reduce the stigma of dementia and empower older people living with dementia, while it also tends to stress the responsibility for care on family carers and shift the responsibility of managing the dementia-related challenges to older people living with dementia.

THE SOCIAL EFFECTS OF AN INTERGENERATIONAL E-MAIL PAL PROGRAM

Kristi Lise,¹ Jillian Minahan Zucchetto,² and Karen Siedlecki,³
 1. *CUNY Queens College, New Rochelle, New York, United States*, 2. *Fordham University, United States*, 3. *Fordham University, Bronx, New York, United States*

Ageist attitudes and loneliness negatively impact both younger and older adults (e.g., Sun et al., 2019). This study utilized a randomized waitlist-control design to investigate the effects of a six-week intergenerational e-mail pen pal program on loneliness in younger and older adults and ageism in younger adults. Thirty-three younger adults (18-30 years) and 28 older adults (over age 65) completed an online survey assessing ageist attitudes, loneliness, well-being, and other individual differences. One week after completing a baseline survey, 17 email pen pal pairs began the six-week e-mail intervention. Participants repeated the survey one week after the completion of the intervention (which was eight weeks after the baseline for the control participants). Analyses showed that at baseline, younger adults ($M=2.41$, $SD=.76$) reported higher levels of loneliness compared to older adults ($M=1.65$, $SD=.77$), $t(59) = 3.85$, $p < .001$. Repeated measures ANOVAs showed that the intervention did not have a significant effect on ageism or loneliness in either younger or older adults. However, the effect size of the intervention for loneliness among older adults was moderate to large ($\eta^2 = .07$). Descriptive statistics indicated that older adults in both the intervention and control groups experienced an increase of loneliness during the post-test. However, the older adults in the intervention group experienced less of an increase compared to older adults in the control group. This suggests that the intervention may have buffered the increase in loneliness that older adults may experience during the winter months and during the onset of the COVID-19 pandemic.

Session 2175 (Symposium)

AGING STRONG: PROMOTING RESILIENCE THROUGH OPTIMISM, PURPOSE, AND SOCIAL CONNECTIONS

Chair: Ellen Wicker

Co-Chair: James Schaeffer

Resilience is defined as the ability to adapt and cope with circumstances in a way that empowers one to emerge stronger, thrive, and incorporate lessons learned. Resilience as a trait can be learned and modified and have a significant impact on healthy aging. UnitedHealthcare (UHC) and AARP Services, Inc. (ASI) are committed to the health and well-being of participants in UHC's Medicare Supplement

insurance plans, recognizing that health and wellness need to be promoted on a holistic level to ensure successful aging. In this effort, an initiative titled Aging Strong 2020 was developed to promote health, well-being, and increase resilience by focusing on the key individual pillars of enhanced purpose in life, social connectedness, and optimism. To accomplish this goal, a series of eight interventions over three years were created and delivered, with a focus on the key pillars in order to improve clinical and psychological health outcomes and participants' satisfaction with health care. This symposium will specifically discuss efforts related to the Aging Strong 2020 program. First, we will describe the prevalence and outcomes of the pillars in a large national survey. Next, key challenges and successes in recruitment and retention for the various interventions will be highlighted, followed by overall findings from the eight interventions targeting the pillars. Finally, qualitative findings on participant experience as a result of participation will be discussed. Results from these initiatives demonstrate that interventions designed to improve well-being among older adults contribute to the holistic model of health.

RESILIENCE, PURPOSE IN LIFE, LONELINESS, AND ASSOCIATED MEDICAL COSTS IN OLDER ADULTS

Timothy Barnes,¹ Rifky Tkatch,² Gandhi Bhattarai,³
 Sandra Kraemer,⁴ James Schaeffer,¹ and Charlotte Yeh,⁵
 1. *UnitedHealth Group, Minnetonka, Minnesota, United States*, 2. *UnitedHealth Group, Oak Park, Michigan, United States*, 3. *OptumLabs, Minnetonka, Minnesota, United States*, 4. *UnitedHealthcare, Minnetonka, Minnesota, United States*, 5. *AARP Services, Inc., Washington, District of Columbia, United States*

Resilience, purpose in life (PIL), and loneliness have been linked, and used to characterize the health and well-being of older adults. Studies demonstrate that higher resilience, PIL, and minimal loneliness are associated with better late-life outcomes. However, research on how these constructs negatively impact medical costs is limited. Using survey and claims data from a large sample of older adults age 65+ ($N=4,496$), resilience, PIL, and loneliness were examined to determine associations with medical costs. Among study participants, 11% exhibited low resilience, 19% severe loneliness, and 35% low PIL. Low resilience was associated with 24% higher medical costs compared to participants with high resilience, severe loneliness with 20% higher costs compared to participants with no loneliness, and low PIL marginally associated with 12% higher costs compared to participants with high PIL. Interventions targeting resilience, PIL, and loneliness could be beneficial to promoting successful aging and lowering medical costs.

RECRUITING OLDER ADULTS IN A MEDICARE SUPPLEMENT POPULATION FOR WELLNESS INTERVENTION PILOT STUDIES

Rachel Ungar,¹ Catherine Zaidel,² Rifky Tkatch,³ Lizi Wu,¹
 Laurie Albright,⁴ Michael McGinn,² and Charlotte Yeh,⁵
 1. *UnitedHealth Group, Minnetonka, Minnesota, United States*, 2. *OptumLabs, Minnetonka, Minnesota, United States*, 3. *UnitedHealth Group, Oak Park, Michigan, United States*, 4. *UnitedHealth Group, Minneapolis, Minnesota,*

United States, 5. AARP Services, Inc., Washington, District of Columbia, United States

Older adults are often underrepresented in the health promotion literature, in part due to challenges in recruiting older adults for such studies. Aging Strong 2020 was specifically designed to address the health needs of older adults. A subset of adults aged 65 and older with an AARP Medicare Supplement plan insured by UnitedHealthcare were recruited for participation in one of eight interventions. Recruitment lists for each program were drawn from a pool previously screened for loneliness, purpose in life, optimism, and resilience, administered by an interactive voice response (IVR) telephone survey. Recruitment efforts were multifaceted and included emails, direct mailers, and phone calls. Incentives ranging from \$25-\$100 for completing surveys did not correspond with higher recruitment rates. Overall, recruitment phone calls reached 28,058 (32%) individuals on the recruitment lists; a total of 1,766 participated, demonstrating that targeted efforts to recruit older adults for research opportunities can be successful.

IMPROVING RESILIENCE, OPTIMISM, PURPOSE, AND LONELINESS AMONG OLDER ADULTS

Rifky Tkatch,¹ Lizi Wu,² Laurie Albright,³ Rachel Ungar,² Catherine Zaidel,⁴ Yan Cheng,² James Schaeffer,² and Charlotte Yeh,⁵ 1. *UnitedHealth Group, Oak Park, Michigan, United States*, 2. *UnitedHealth Group, Minnetonka, Minnesota, United States*, 3. *UnitedHealth Group, Minneapolis, Minnesota, United States*, 4. *OptumLabs, Minnetonka, Minnesota, United States*, 5. *AARP Services, Inc., Washington, District of Columbia, United States*

Aging Strong 2020 was developed to promote health and well-being and increase resilience by focusing on the pillars of enhanced purpose in life, social connectedness, and optimism. A series of eight interventions over three years tested the feasibility of enhancing these pillars. Interventions included: 1) An expressive writing program, 2) Animatronic pets, 3) A telephonic reminiscent program, 4) An online self-compassion mindfulness program, 5) A technology-based behavior change tool, 6) An online and workbook tool for purpose, 7) An online happiness program, and 8) A peer-to-peer support program. Each program demonstrated efficacy dependent on the pillar targeted and the population sampled. Overall, some improvement was found among participants in resilience (47%), purpose (49%), optimism (44%), and loneliness (48%). Further, participant satisfaction improved in each program with Net Promoter Scores increasing between 7-19 points. Results demonstrate that Aging Strong 2020 was successful, contributing to a holistic model of healthy aging.

OLDER ADULTS' EXPERIENCES PARTICIPATING IN AGING STRONG 2020 PROGRAMS

Janella Hudson,¹ Rachel Ungar,² Laurie Albright,³ James Schaeffer,² and Ellen Wicker,⁴ 1. *Optum/United Healthcare, Tampa, Florida, United States*, 2. *UnitedHealth Group, Minnetonka, Minnesota, United States*, 3. *UnitedHealth Group, Minneapolis, Minnesota, United States*, 4. *AARP Services, Inc., Washington, District of Columbia, United States*

User satisfaction assessments are integral to demonstrating intervention efficacy. Towards that end, older participants across the Aging Strong 2020 suite of offerings participated in semi-structured interviews (n = 248) to provide feedback about their experiences in the program and resulting satisfaction. Overall, most participants were satisfied with the Aging Strong 2020 interventions and reported gaining new skills, tools, or coping strategies. Participants endorsed program features that facilitated social interaction, community building, and social support. Program content specifically adapted for older adults and appropriate life stage concerns and/or areas of interest were considered especially helpful. Results demonstrate that the current test and learn model offers an opportunity for participant feedback to refine and improve future iterations of project offerings. Participant feedback led to key improvements in subsequent versions of the Aging Strong 2020 programs and their contributions to successful aging among older adults.

Session 2180 (Paper)

Alzheimer's Disease I (HS Paper)

IMPROVING USEFULNESS OF COGNITIVE DECLINE POPULATION MEASURES IN PREDICTING FUTURE DEMENTIA BURDEN

Benjamin Olivari,¹ Christopher Taylor,¹ and Lisa McGuire,² 1. *Centers for Disease Control and Prevention (CDC), Atlanta, Georgia, United States*, 2. *CDC, Atlanta, Georgia, United States*

Alzheimer's disease and related dementias begin with mild early symptoms of memory loss, progressing to more severe cognitive and functional impairment. Reports of worsening memory and subjective cognitive decline (SCD) are often the earliest possible signs of dementia onset. The trajectory of certain types of dementia may require early detection of worsening memory in the disease progression for successful interventions. However, the predictive value of subjective measures of cognitive decline is limited; the majority of those who report subjective symptoms do not progress to diagnosed cognitive impairment or dementia. These two realities create a significant challenge in confronting the growing dementia crisis. Population-level data can be beneficial in tracking trends in SCD. Data from the Behavioral Risk Factor Surveillance System (BRFSS) core questions related to chronic diseases and from the SCD optional module from survey years 2015-2019 were aggregated across the participating 50 states, D.C., and Puerto Rico for this analysis. Among 181,097 U.S. respondents aged ≥ 45 years, 11.3% (95% CI=10.9-11.6) reported SCD; among 20,424 with SCD symptoms, 39.4% (37.6-40.6) reported functional difficulties associated with SCD symptoms and 33.9% (32.4-35.5) needed assistance with day-to-day activities resulting from symptoms. Studies suggest persons experiencing SCD symptoms and associated functional difficulties are at increased risk for dementia compared with those with SCD without functional difficulties. Combining responses about SCD with associated functional difficulties, anxiety, and other measures might help to better inform the future burden of more severe cognitive impairment than SCD status alone.

MENTAL DISORDERS FORECAST ALZHEIMER'S DISEASE AND RELATED DEMENTIAS IN 1.7 MILLION NEW ZEALANDERS

Leah Richmond-Rakerd,¹ Stephanie D'Souza,² and Barry Milne,² 1. *University of Michigan, Ann Arbor, Michigan, United States*, 2. *University of Auckland, Auckland, Auckland, New Zealand*

Neurodegenerative conditions, including Alzheimer's disease and related dementias (ADRD), have an outsized impact on disability and loss of independence in older adults. As such, there is a growing need to identify modifiable risk factors for ADRD at the population level. We conducted a nationwide administrative-register study to investigate mental disorders as a potential preventable risk factor for later-life ADRD. Data were drawn from the New Zealand Integrated Data Infrastructure, a collection of whole-of-population administrative data sources linked at the individual level by a common spine. We identified all individuals born in New Zealand between 1928-1967 and followed them for three decades (N = 1,711,386; observation period = 1988-2018; age at baseline = 21-60 years). Diagnoses of mental disorders were ascertained from public-hospital records. Diagnoses of ADRD were ascertained from public-hospital records, mortality records, and pharmaceutical records. Individuals with a mental disorder were at elevated risk for developing Alzheimer's disease and related dementias relative to those without a mental disorder. This prospective association was evident in both men and women, across age, and after accounting for pre-existing physical diseases. If associations are causal, ameliorating mental disorders could extend population healthspan and reduce the societal burden of neurodegenerative diseases.

PREVALENCE AND IMPACT OF COMORBID CANCER AND DEMENTIA ON HEALTH OUTCOMES IN OLDER ADULTS: A LONGITUDINAL STUDY

Jyotsana Parajuli,¹ Diane Berish,² Ying-Ling Jao,² Yo-Jen Liao,³ and Lee Ann Johnson,⁴ 1. *University of North Carolina at Charlotte, Charlotte, North Carolina, United States*, 2. *Pennsylvania State University, University Park, Pennsylvania, United States*, 3. *Penn State University, University Park, Pennsylvania, United States*, 4. *University of Virginia, University of Virginia, Virginia, United States*

Dementia and cancer are two common chronic conditions in older adults. However, there are few studies examining the prevalence of comorbid cancer and dementia and the longitudinal impact of these comorbid conditions on health outcomes. This study investigated the prevalence and longitudinal impact on health outcomes in older adults with comorbid cancer and dementia. This is a secondary analysis, using data from the 2010 and 2016 waves of the Health and Retirement Study (HRS). The health outcomes of the study included nursing home stay, hospital stay, home care use, activities of daily living (ADL) limitations, instrumental activities of daily living (IADL), self-rated health status, mortality, and the out-of-pocket medical expenditure in older adults with cancer and dementia. Data were analyzed using descriptive statistics, logistic regression, and linear regression analyses. The results revealed that the prevalence of comorbid cancer and dementia ranged from 2.6% to 2.8% over the 6-year period. Older adults with comorbid cancer and dementia

demonstrated higher likelihood of nursing home stay, ADL and IADL limitations, and mortality; but a decreased likelihood of homecare use and hospital stay compared to older adults with cancer only or dementia only (some outcomes were not significant for dementia only group). Findings point out the risk of increased functional decline and mortality in older adults with comorbid cancer and dementia. Future research is needed to explore the contributing factors of the risk and identify interventions to promote physical function and reduce mortality for this population.

SAFETY CONSIDERATIONS OF ADAPTIVE HORSEBACK RIDING PROGRAM FOR ADULTS WITH DEMENTIA AND THEIR FAMILIES

Alicia Oestreich, and Beth Fields, *University of Wisconsin-Madison, Madison, Wisconsin, United States*

Human-animal interactions, including equine-assisted services, are becoming increasingly popular to enhance the quality of life of adults with dementia and their families. However, there is a lack of knowledge on safety considerations when serving this population. The purpose of this qualitative descriptive study was to explore the safety perspectives of key stakeholders involved in an adaptive horseback riding program for adults with dementia and their families. Ten, 30-minute semi-structured interviews and two, 60-minute focus groups were conducted with horseback riding program instructors and staff, dementia specialists, and adults with dementia and their families. Thematic analysis of data were guided by the Professional Association of Therapeutic Horsemanship International's Core Safety Standards and completed using NVivo 12. Stakeholders described two central themes to consider when offering equine-assisted services at therapeutic horseback riding centers to adults with dementia and their families 1) dementia and horse training parameters, and 2) enrollment procedures. Stakeholders recommended that training should encompass "how to interact and communicate in a positive way with the adult with dementia... redirect if a behavior comes up", and horses should be specially selected to "tolerate standing in a ramp during a difficult mount". Stakeholders also shared that enrollment in the program should include learning the adult's health and prior horse experience, precautions and contraindications, horseback riding readiness, and availability of and support from family. Information gleaned from this study may help researchers, instructors, and staff develop policies that demonstrate optimal safety practices when delivering equine-assisted services to adults with dementia and their families.

VALIDITY OF THE CHINESE VERSION OF THE PERSON-ENVIRONMENT APATHY RATING (PEAR-C) FOR PERSONS WITH DEMENTIA

Ying-Ling Jao,¹ Ying-Yu Chao,² Yo-Jen Liao,³ Diane Berish,¹ An-Yun Yeh,⁴ and Shang-Ti Chen,⁵ 1. *Pennsylvania State University, University Park, Pennsylvania, United States*, 2. *Rutgers University, Newark, New Jersey, United States*, 3. *Penn State University, University Park, Pennsylvania, United States*, 4. *Hunter College of CUNY, New York, New York, United States*, 5. *National Dong-Hwa University, Shoufeng, Hualien, Taiwan (Republic of China)*

Apathy is a prevalent neurobehavioral symptom in dementia. Despite that environmental stimulation plays a key role in apathy, it is often overlooked in assessment. The Person-Environment Apathy Rating (PEAR) scale is currently the only validated apathy scale for persons with dementia that addresses environmental stimulation and is only available in English. This project translated the PEAR scale into Mandarin Chinese and evaluated its content validity. The PEAR scale includes two subscales: PEAR-Environment and PEAR-Apathy. Each subscale includes six items. The PEAR scale translation and validation were conducted through a four-step process. First, the PEAR scale was translated from English into Chinese by two bilingual PhD-prepared researchers. Second, the two Chinese versions of PEAR (PEAR-C) were back-translated into English by another two bilingual PhD-prepared researchers. Third, three content experts reviewed the two translated scales and reconciled a final PEAR-C scale. Finally, these three experts individually rated the PEAR-C and evaluated its content validity item-by-item in two aspects: 1) content equivalence: appropriateness to use this scale in Chinese cultural setting, and 2) semantic equivalence: the scale remains the same meaning after translation. The content validity index (CVI) was calculated to sum the ratings across experts. The CVI of content equivalence for all items was 1.0 for both subscales. The CVI of semantic equivalence was 0.98 for the PEAR-Environment and 0.97 for the PEAR-Apathy. The PEAR-C shows substantial content validity. Its reliability and construct validity need further evaluation. This scale is promising to assess apathy for individuals with dementia in the Chinese-speaking community.

Session 2190 (Symposium)

CAREGIVING THROUGH TURBULENT TIMES: FINDINGS FROM THE MIT AGE LAB'S LONGITUDINAL STUDY OF FAMILY CAREGIVERS

Chair: Julie Miller

Discussant: Julie Miller

Nearly one in five Americans is an unpaid family caregiver, and the need for family caregivers is projected to grow over the next several decades in the face of longer lifespans (AARP 2020). Yet the increasing centrality of family caregivers for providing care to an aging population highlights two knowledge gaps: first, the degree and experience of burden and stress caregivers manage around balancing care with other family and work responsibilities; and second, a lack of knowledge about the caregiver journey and the microtasks of care, including how caregivers leverage – or not – different tools, technologies and resources to support the care they provide. To develop a deeper understanding of these questions and others, the MIT AgeLab has built a research panel of over 1200 caregivers providing care to another adult family member. This symposium will present findings from the MIT AgeLab Caregiver Panel, including: 1) an examination of the extent to which family caregivers identify as such and how they feel about their roles; 2) how family caregivers experienced the COVID-19 pandemic both personally and around the care they provide; 3) caregivers' use of and attitudes toward technology to support the care they provide; and 4) what caregivers identify as their key unmet needs. The session will include a facilitated discussion around the

intersection of COVID-19 with caregivers' technology use, experience of caregiving, and future needs, as well as to identify additional research questions and directions for future research with the MIT AgeLab Caregiver Panel.

CAREGIVERS' LANGUAGE AND EMOTIONS AROUND CARE

Lisa D'Ambrosio, *Massachusetts Institute of Technology, Cambridge, Massachusetts, United States*

Caregiving encompasses a range of roles and activities, but not all people providing care identify as "caregivers." Understanding the vocabulary and emotions that caregivers have should first, contribute to an understanding of caregiving and caregivers per se, and second, aid in communicating with them more effectively. Analysis of survey data from members of the MIT AgeLab Caregiver Panel shows variance in self-identification as caregivers and in language and emotions around caregiving, reflecting diversity in the care experience, but consensus around the core concept of a caregiver. This presentation will report on how caregivers' relationships, gender and care tasks affect their language and identify a caregiver experience-identity gap: a space between what caregivers do and what they report. We highlight how an understanding of caregivers' experiences of what they do – as opposed to a catalog of tasks they do – may be more important for understanding their experience of strain.

TECHNOLOGIES AND SERVICES TO SUPPORT CARE: CAREGIVERS' EXPERIENCES AND PERSPECTIVES

Chaiwoo Lee, *Massachusetts Institute of Technology, Cambridge, Massachusetts, United States*

Technologies developed to make life easier for the general population – including smart home products, internet-enabled services, communication platforms, and health management systems – also have the potential to assist individuals who provide care to loved ones. While caregivers may be eager users of technology to support their responsibilities, some technologies remain untapped resources. An in-depth survey conducted with the MIT AgeLab Caregiver Panel around attitudes toward and use of technology for themselves and for caregiving showed that while caregivers use a wide range of technologies for themselves, their use for caregiving is limited. However, while caregivers did not universally use technologies or services to support the care they provided, those who did so generally reported positive feelings about their use. This presentation will report on technology experiences – including perceived usefulness, ease of use and integration, impacts, and overall satisfaction – among caregivers of various characteristics and conditions.

CAREGIVING THROUGH THE PANDEMIC: EXPLORING THE IMPACTS OF COVID-19 ON CAREGIVERS AND THEIR CAREGIVING EXPERIENCES

Alexa Balmuth, *MIT AgeLab, Cambridge, Massachusetts, United States*

In the midst of the COVID-19 pandemic, many caregivers have been tasked with a unique role; not only to keep themselves safe and healthy, but also to protect and find new ways to aid their care recipients, many of whom are older adults at relatively high risk for severe complications from COVID-19.

These challenging circumstances have driven caregivers to quickly adapt as they continue to manage their personal lives and caregiving responsibilities. Utilizing three waves of survey data from the MIT AgeLab Caregiver Panel, this presentation will examine the attitudes, experiences and worries of family caregivers at several time points along the course of the COVID-19 pandemic, as well as caregivers' preparations and coping behaviors along the way. Differences between caregiving situations will also be discussed.

Session 2195 (Paper)

Chronic Disease Management (HS Paper)

ENERGY DECLINE MAY PREDICT MILD PARKINSONIAN SIGNS IN COMMUNITY-DWELLING OLDER ADULTS

Rebecca Ehrenkranz,¹ Qu Tian,² Andrea Rosso,³ Nancy W. Glynn,⁴ Lana Chahine,³ James Hengenius,³ Xiaonan Zhu,³ and Caterina Rosano,³ 1. *University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania, United States*, 2. *National Institute on Aging, Baltimore, Maryland, United States*, 3. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 4. *University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania, United States*

Mild Parkinsonian Signs (MPS) are common in older adults without overt neurological disease. MPS are often progressive and predict disability and dementia, yet little is known about predictors for MPS. Low self-reported energy is associated with mobility impairment, which is a hallmark of MPS. Yet whether self-reported energy relates to MPS is unknown. We explored the association of changes in self-reported energy with MPS in 293 participants (aged 83 ± 2.8 years, 58% women, 61% White) free of dementia and Parkinson's Disease in the Health, Aging and Body Composition Study. Self-reported energy was assessed on a 0-10 scale annually between Year 2 and Year 10 (mean follow-up: 8 years) and its slope was estimated via linear mixed effects models. MPS were evaluated at Year 10 based on the Unified Parkinson Disease Rating Scale motor component. On average, self-reported energy declined 0.06 points per year. In a linear regression model adjusted for age, fatigue, and comorbidities, those with MPS had steeper SEL decline (β [Standard Error] = -0.358 [0.119]) in the prior eight years than those without MPS. Thus, declining self-reported energy may be a risk factor for MPS. Self-reported energy is easily evaluated in routine clinic visits, and may be a modifiable risk factor that can be targeted to reduce the incidence of MPS.

HEALTHY LIFESTYLE AND SOCIAL NETWORK PROLONG DISABILITY-FREE SURVIVAL IN OLDER ADULTS WITH DIABETES

Ying Shang,¹ Wei Wu,² Abigail Dove,¹ Jie Guo,¹ Anna-Karin Welmer,³ Debora Rizzuto,¹ Laura Fratiglioni,³ and Weili Xu,¹ 1. *Karolinska Institutet, Solna, Stockholms Lan, Sweden*, 2. *Hubei University of Chinese Medicine, Hubei University of Chinese Medicine, Hubei, China (People's Republic)*, 3. *Karolinska Institutet 17175, Stockholms Lan, Sweden*

Aim: We aimed to estimate the extent to which diabetes shortens disability-free survival, and identify which factors may prolong disability-free survival in older adults with diabetes. **Methods:** A total of 2,216 disability-free participants aged ≥ 60 were followed up to 15 years. Diabetes was ascertained through antidiabetic drug use, medical records, or HbA1c $\geq 6.5\%$. Disability-free survival was defined as the survival until the occurrence of disability. Data on behaviours (healthy vs. unhealthy), leisure activities (active vs. inactive), and social network (moderate-to-rich vs. poor) were collected at baseline. A favourable (vs. unfavourable) lifestyle profile was defined as the presence of at least one of healthy behaviours, active engagement in leisure activities, and/or moderate-to-rich social network. Data were analysed with Cox regression and Laplace regression. **Results:** During the follow-up, 1,345 (60.7%) participants developed disability/death. Diabetes was related to the outcome (HR 1.29, 95% CI 1.06–1.57), and shortened 2.15 (1.02–3.27) years of median disability-free survival. Additionally, disability-free survival (95% CI) was shortened by 3.29 (1.21–5.36), 3.92 (2.08–5.76) and 1.66 (0.06–3.28) years for participants with diabetes plus unhealthy behaviours, inactive leisure activities, or poor social network, respectively (reference: no diabetes plus healthy behaviours, leisure activities, or moderate-to-rich social network). Among participants with diabetes, a favourable profile led to a non-significant HR of 1.19 (0.93–1.56) for disability/death and prolonged disability-free survival by 3.26 (2.33–4.18) years than those with unfavourable profile. **Conclusions:** Healthy lifestyle and/or moderate-to-rich social network attenuates the risk of diabetes on disability/death and prolongs disability-free survival in people with diabetes by 3 years.

IMPLEMENTATION OF A SHARED DECISION-MAKING TOOL FOR OSTEOARTHRITIS TREATMENT TO REDUCE DECISIONAL CONFLICT

Yashika Watkins,¹ Rose Gonzalez,² Charla Johnson,³ and Ravneet Kaur,⁴ 1. *Chicago State University, Cliffside Park, New Jersey, United States*, 2. *Movement is Life, Lake Ridge, Virginia, United States*, 3. *Franciscan Missionaries of Our Lady Health System, Baton Rouge, Louisiana, United States*, 4. *University of Illinois at Chicago, Crown Point, Indiana, United States*

Shared decision making is a key component of patient centered care where clinical evidence and the patient's preference and values are considered. Physical activity and weight loss are often recommendations in the treatment plan, especially in mild to moderate stage of osteoarthritis (OA). Movement is Life (MIL) created an innovative SDM tool to provide a framework for patient-centered discussions. The tool leverages an underlying Markov Model and represents the likely pain, activity levels, and lost productivity at three future time points. By comparing the patient's likely progression depending on treatment choices compared to doing nothing, the patient has an illustration of future state. A pilot of N=108 women, ages 45-64, with chronic knee pain for at least three months and at least one co-morbidity (obesity, hypertension, diabetes) were randomized to a control (n=54) or intervention (n=54) arm of the study at eight centers across the United States. Results showed the demographic profiles were similar between the groups. At one-month, n=47 control and n=50

intervention patients returned for evaluation. Self-reported level of physical activity increased in the intervention group (56% vs 34%, $p = 0.0229$). Qualitative feedback from the intervention group indicated high satisfaction with use of the tool. Both groups reported a high likeliness to recommend the provider to a friend or family member. Inclusion of the SDM tool added an average of one minute to the patient counseling time over the control group. The quasi script provides a consistent communication pathway and may reduce disparities by addressing unconscious bias.

MULTIPLE CHRONIC CONDITION COMBINATIONS, AFFECT, AND MEMORY AMONG BLACK AND WHITE OLDER ADULTS

Aaron Ogletree,¹ Steph Cooke,² and Benjamin Katz,²

1. *National Institute on Minority Health and Health Disparities, Washington, District of Columbia, United States*, 2. *Virginia Tech, Blacksburg, Virginia, United States*

Research demonstrates the adverse effects of coexisting multiple chronic conditions (MCCs) on older adults' health and wellbeing. While most research relies on total counts of chronic conditions, little work explores how specific MCC combinations may have compounding effects on depression and memory. Furthermore, no published research explores differences in the prevalence and correlates of MCC combinations between Black and White older adults. The current study assesses within- and between-group heterogeneity in the prevalence and correlates of MCC combinations to advance health equity research. We utilize a sample of 16,757 Black and White older adults drawn from the 2014 wave of the Health and Retirement Study. Respondents were categorized into one of 32 MCC combination groups. Depressive symptoms and self-rated memory were calculated separately for Black and White respondents across each of the 32 groups. Chi-square tests, t-tests, and ANCOVAs were used to compare differences. Black and White respondents differed significantly in the prevalence of 14 out of 32 MCC combinations. Within-group differences were found such that 45% of Black respondents experiencing only Lung Disease met criteria for clinical depression; this rate is similar to Black respondents experiencing Diabetes + Heart Condition + Hypertension + Lung Disease (44.5%). Between-group differences revealed that Black respondents experiencing Arthritis + Diabetes + Hypertension had worse self-rated memory than White counterparts ($MB = 3.24$, $MW = 3.13$; two sample $t[1139] = -2.04$, $p < .05$; Cohen's $d = 0.13$). Additional findings are presented, and theoretical and practical implications for this work are discussed.

PREDICTING SYMPTOM SEVERITIES IN MIDDLE-AGED AND OLDER ADULTS WITH ARTHRITIS AND MULTIMORBIDITY

Wenhui Zhang, *Emory University, Atlanta, Georgia, United States*

Introduction: Uncertainties increase with disease guideline-driven decision-making for older adults as their numbers of chronic conditions and functional limitations increase. A national study found that people with arthritis plus \geq one other chronic condition have reported significantly higher social participation restriction, serious psychological distress, and work limitation than those with \geq two

non-arthritis chronic conditions. However, how arthritis comorbidities contribute to the symptoms such as pain, fatigue, sleep, depression, anxiety, and cognitive abilities that chronically impair people's daily functioning remain unexplored. **Purpose:** To explore how arthritis comorbidities predict the symptom severities of pain interference, fatigue, sleep disturbance, depression, anxiety, and cognitive abilities among community-dwelling middle-aged and older adults. **Method:** 140 community people aged over 50 with arthritis and multimorbidity were recruited. Stepwise regressions predicted the PROMIS symptoms of pain interference, fatigue, sleep disturbance, depression, anxiety, and cognitive abilities with arthritis type and 18 comorbidities measured by the Functional Comorbidity Index checklist after controlling for demographics. **Results:** Obesity, chronic obstructive pulmonary disease, diabetes, and income significantly predicted pain interference (adjusted $R^2=35\%$). Marital status, obesity, and peripheral vascular disease significantly predicted fatigue (adjusted $R^2=17\%$). Depression diagnosis and income adequacy significantly predicted depressive symptoms (adjusted $R^2=23\%$). Depression, income adequacy, and anxiety diagnosis significantly predicted anxiety (adjusted $R^2=23\%$). Age significantly predicted cognitive abilities (adjusted $R^2=12\%$). **Discussion:** Comorbidities and socio-demographics, especially income, impact symptom experiences of people aging with arthritis and multimorbidity. Future studies should explore the pathogenesis among arthritis, comorbidities, and symptoms for tailored intervention while disclosing health disparities associated with the arthritis multimorbidity.

Session 2200 (Paper)

Cognitive Impairment and Decline

CANNABIS USE AND SUBJECTIVE COGNITIVE DECLINE AMONG MIDDLE-AGED AND OLDER ADULTS

Maritza Dowling, *George Washington University - School of Nursing, Washington, District of Columbia, United States*

Cannabis is the most commonly-used drug in the US, with older adults being the fastest-growing group of users. National surveys among 50+ adults found poorer executive function among current or past cannabis users, but better performance with daily users. However, there is little evidence linking levels of cannabis use and subjective cognitive decline (SCD) among middle-age and older adults. This study sought to examine the association between levels of cannabis use in the past 30 days and SCD during the past 12 months using Behavioral Risk Factor Surveillance System (BRFSS) data (2016-2019) from 45+ individuals while controlling for demographics, chronic conditions, exercise, general and mental health. Logit models with SCD as outcome were estimated using complex survey weights. Multiple group analyses examined differences across age groups: 45-64 vs. 65+. Levels of cannabis use in the past 30 days were categorized as: no use, 1-4 days, 5-20 days; and 21-30 days. Adjusted results indicated that those who reported no cannabis use were from 35% to 47% less likely to report SCD compared to cannabis users at all levels: 1-4 days ($OR=0.65$, $95\%CI=0.46, 0.92$); 5-20 days ($OR=0.53$, $95\%CI=0.36, 0.78$); 21-30 days

(OR=.61, 95%CI=0.45,0.83). In multi-group analyses, levels of cannabis use effects on SCD remained statistically significant in the 45-64 age group, but not in the 65+ group. Further research targeting SCD is needed to design interventions particularly for middle-age cannabis users whose health has been compromised by disease or age-related vulnerabilities and are at greater risk for adverse cognitive outcomes from cannabis use.

CLINICAL RECOMMENDATIONS FOR REDUCING THE RISK OF COGNITIVE DECLINE

G. Adriana Perez,¹ Kelly O'Brien,² Marwan Sabbagh,³ and Michelle Bruno,⁴ 1. *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania, United States*, 2. *UsAgainstAlzheimer's, Chicago, Illinois, United States*, 3. *Cleveland Clinic Nevada, Las Vegas, Nevada, United States*, 4. *Avalere Health, Washington, District of Columbia, United States*

As much as 40% of dementia cases can be attributed to modifiable risk factors (Livingston et al., 2020). Much of that risk-reduction can be accomplished by changing behavior in midlife. In light of the emerging evidence that dementia may be preventable, UsAgainstAlzheimer's convened a workgroup of national experts to develop new recommendations that primary care clinicians and general neurologists can use to initiate primary prevention conversations with their patients about cognitive decline. Few resources address steps that clinicians can take in their routine care to help patients reduce risk. Some relevant resources provide excellent guidance but tend to be more focused on early detection or slowing disease progression rather than primary prevention. The Risk Reduction Workgroup (RRWG) was convened to help address the need for clinicians to know how to discuss cognitive decline with their patients. The workgroup aligned on 11 recommendations for primary care clinicians and general neurologists. In addition the RRWG provide considerations for implementing the recommendations in clinical practice. The recommendations are mindful of social determinants of health, account for cultural differences, and are designed for general accessibility. This effort is part of a broader initiative by UsAgainstAlzheimer's to address risk-reduction for cognitive decline and early interventions. Under the guidance of a multidisciplinary Provider Leadership Group consisting of representatives from some of the nation's largest health provider serving organizations, three independent workgroups are developing guidance and tools to assist providers in their clinical practice and improve health outcomes for patients at-risk for Alzheimer's and related dementias.

PATIENT COGNITIVE IMPAIRMENT ASSOCIATED WITH GREATER CARE INTENSITY DURING MEDICARE HOME HEALTH CARE

Julia Burgdorf,¹ and Kathy Bowles,² 1. *Center for Home Care Policy & Research, New York, New York, United States*, 2. *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania, United States*

Medicare beneficiaries with cognitive impairment are more likely to access home health care than those without such impairment, and an estimated 1 in 3 Medicare home health patients has diagnosed dementia. However, recent

changes to the Medicare home health payment system do not adjust for patients' cognitive impairment. To the extent that cognitive impairment prompts higher intensity care, this could create a financial disincentive for providers serving this patient population. We draw on a nationally representative sample of 1,214 (weighted n=5,856,333) community-living Medicare beneficiaries who received home health care between 2011-2016. We measure care intensity by the number and type of visits received during an index home health care episode. We model care intensity as a function of patient cognitive impairment during the episode, measured via clinician reports in standardized patient assessment data. In propensity score adjusted, multivariable models holding all covariates at their means, home health patients with identified cognitive impairment received a significantly greater number of visits. During the index home health episode, cognitively impaired patients received an additional 2.82 total visits (95% CI: 1.32-4.31; p<0.001), 1.39 nursing visits (95% CI: 0.49-2.29; p=0.003), 0.72 physical therapy visits (95% CI: 0.06-1.39; p=0.03), and 0.60 occupational therapy visits (95% CI: 0.15-1.05; p=0.01). Findings suggest that recent changes to Medicare home health care reimbursement do not reflect the more intensive care needs of patients with cognitive impairment, and may threaten access to care for these individuals.

RISK FACTORS FOR COGNITIVE DECLINE IN OLDER ADULTS IN PUERTO RICO: ASSESSING BIAS FROM SAMPLE ATTRITION

Brian Downer,¹ Caitlin Pope,² Tyler Bell,³ Sadaf Milani,¹ Ross Anel,⁴ and Michael Crowe,⁵ 1. *University of Texas Medical Branch, Galveston, Texas, United States*, 2. *University of Kentucky, Lexington, Kentucky, United States*, 3. *University of California San Diego, La Jolla, California, United States*, 4. *University of South Florida, Tampa, Florida, United States*, 5. *University of Alabama at Birmingham, Birmingham, Alabama, United States*

Many risk factors for cognitive decline are associated with mortality and are common among older adults who cannot complete a survey interview. Our objective was to compare analyses of risk factors for cognitive decline among older adults in Puerto Rico with and without accounting for sample attrition. Data came from the Puerto Rican Elderly: Health Conditions Study. Our sample included 3,437 participants interviewed in 2002/03. Cognitive function was measured using the Mini-Mental Caban (MMC). The outcome was the change in MMC score between 2002/03 and 2006/07. Logistic regression was used to estimate inverse probability weights for being interviewed in 2006/07 (n=3,028) and completing the MMC at follow-up (n=2,601). Linear regression models were used to assess the association between stroke, hypertension, diabetes, smoking status, and cognitive decline with and without the IPWs. In the unweighted analysis, stroke was associated with a significantly greater decline in cognition (b=-0.62, standard error [SE]=0.30, p=0.04). Hypertension (b=-0.02, SE=0.12, p=0.84), diabetes (b=-0.22, SE=0.13, p=0.10) and being a current (b=0.05, SE=0.22, p=0.84) or former smoker (b=0.05, SE=0.14, 0.74) were not associated with cognitive decline in the unweighted analysis. The results were similar when including the IPW for mortality (stroke b=-0.63; hypertension b=-0.03; diabetes: b=-0.20; current

smoker: $b=0.08$; former smoker: $b=0.07$) and having completed the MMC at follow-up (stroke $b=-0.58$; hypertension $b=-0.03$; diabetes: $b=-0.20$; current smoker: $b=0.03$; former smoker: $b=0.09$). These findings indicate that stroke is a risk factor for cognitive decline among older Puerto Rican adults even after accounting for selective attrition.

THE UTILITY OF THE WHO INTRINSIC CAPACITY SCREENING TOOL TO IDENTIFY PHYSICAL AND MENTAL FUNCTION DECLINES

Lina Ma, Yaxin Zhang, Pan Liu, and Yun Li, *Xuanwu Hospital, Capital Medical University, National Research Center for Geriatric Medicine, Beijing, Beijing, China (People's Republic)*

Background: The disease concept is increasingly being replaced by a functional approach to address the healthcare needs of the older people. WHO proposed the Integrated Care for Older People (ICOPE) screening tool to identify older people with priority conditions associated with declines in intrinsic capacity (IC). Very few evidence on the clinical utility of the ICOPE tool is available. **Objectives:** To determine if the tool can identify adults with poor physical and mental function. **Method:** 376 participants aged 50–97 years were included. IC was assessed with the WHO ICOPE screening tool, covering the following five domains: cognitive decline, limited mobility, malnutrition, sensory loss, and depressive symptoms. We assessed the activities of daily living, the Fried frailty phenotype, FRAIL scale, SARC-F scale, MMSE, GDS, social frailty, and quality of life. Peak expiratory flow, bones mineral density, body composition were obtained. **Results:** 69.1% of the participants showed declines in IC. Participants with declines in IC were older, had more chronic diseases, worse general health, worse physical function as indicated by lower Barthel index, walk speed, grip strength, and physical fatigue, worse mental function indicated by lower MMSE scores, higher GDS scores, more mental fatigue, and worse social function. After adjusting for age, IC was positively correlated with walking speed, resilience score, and MMSE score and negatively correlated with frailty, SARC-F score, IADL score, GDS score, and physical and mental fatigue. **Conclusion:** The WHO ICOPE screening tool is useful to identify adults with poor physical and mental function in Chinese older adults.

Session 2205 (Symposium)

COVID VACCINE ROLLOUT FOR OLDER PEOPLE: EAST MEETS WEST

Chair: Nengliang Yao

Co-Chair: Tom Cornwell

Discussant: Cheryl Camillo

Older adults should be one of the first groups to receive COVID-19 vaccines, because the risk of dying from COVID-19 increases with age. However, it takes time to distribute the vaccines to different countries, and the challenges in administering vaccines may differ by health system characteristics and local culture. This international symposium will discuss the vaccine rollout issues in eight countries (Israel, Japan, South Korea, China, France, United Kingdom, Canada, and United States). We will use an interview and dialog format, instead of presentations. We will cover extensive topics including: Availability - What vaccines? Access, Acceptance,

Caregivers – How are providers responding/handling caregivers wanting to be vaccinated? Cost/Financing Issues, Distribution Logistics/Transport/Safety, Lessons Learned, Mutations/Variants, Partnerships needed to vaccinate homebound patients (community partners; home health agencies, etc.), Who can/should provide vaccination? The situation with COVID-19 is still very fluid. Countries are at different stages of vaccinating older people. The chair didn't ask the speakers to write an abstract now, instead, the speakers will collect more information during the next few months and plan to have a prep meeting one month before the Annual Meeting.

COVID VACCINE ROLLOUT FOR OLDER ADULTS IN JAPAN

Tadashi Wada, *Irahara Primary Care Hospital, Chiba, Chiba, Japan*

It has just started in Japan. We will provide detailed information later. The symposium has experts from 8 countries. We will use an interview and dialog format, instead of presentations.

COVID VACCINE ROLLOUT FOR OLDER ADULTS IN SOUTH KOREA

Chan Mi Park, *Asan Medical Center, Songpa-gu, Seoul-t'ukpyolsi, Republic of Korea*

It has just started in South Korea. We will provide detailed information later. The symposium has experts from 8 countries. We will use an interview and dialog format, instead of presentations.

COVID VACCINE ROLLOUT FOR OLDER ADULTS IN ISRAEL

Naim Mahroum, *Sabar Health, Even Yehuda, Tel Aviv, Israel*

The COVID vaccine rollout in Israel has prioritized older adults. It led to a substantial decline in the incidence of COVID-19 in older adults. The new variants are threats to the current achievements. We will provide detailed information later. The symposium has experts from 8 countries. We will use an interview and dialog format, instead of presentations.

COVID VACCINE ROLLOUT FOR OLDER ADULTS IN FRANCE

Matthieu De Stampa, *Assistance Publique - Hôpitaux de Paris, Paris, Ile-de-France, France*

Only about three million people in France have so far received at least one dose of a Covid-19 vaccine. Those aged over 75 are offered either Pfizer or Moderna vaccines in a vaccination center. Older people with pre-existing conditions can now get AstraZeneca's Covid-19 vaccine. We will provide detailed information later. The symposium has experts from 8 countries. We will use an interview and dialog format, instead of presentations (please refer to the program overview).

COVID VACCINE ROLLOUT FOR OLDER ADULTS IN THE UNITED KINGDOM

Huajie Jin, *King's College London, London, England, United Kingdom*

As of early March, at least 22 million adults had received one dose of a Covid vaccine in the UK, with 1.2 million of

those fully vaccinated with two shots. Anybody aged 56 and over can book an appointment to get the Covid-19 vaccine. We will provide detailed information later. The symposium has experts from 8 countries. We will use an interview and dialog format, instead of presentations.

Session 2210 (Symposium)

DISCRIMINATION, STRESS, AND HEALTH ACROSS THE LIFE COURSE

Chair: Roland Thorpe, Jr.

Discussant: Carl V. Hill

There is a paucity of research that seeks to understand why race disparities in health across the life course remain elusive. Two such explanations that have been garnering attention is stress and discrimination. This symposium contains papers seeking to address the impact of discrimination or stress on African American health or health disparities across the life course. Brown and colleagues examine the differential effects of chronic stress exposure by means of latent class analysis on mental and physical health in the HRS. Analysis revealed four subgroups, each demonstrated a typological response pattern with the most pronounced health consequences for high stress exposure, appraisal and few or no coping mechanisms. This suggests an alternative approach to examining the stress-health link by using a combined person- and variable-centered approach. Thomas Tobin and colleagues evaluate the life course processes through which early life racial discrimination (ELRD) and racial centrality shape adult allostatic load (AL) among older Blacks in the Nashville Stress and Health Study. Findings indicate that racial centrality is protective against adult high AL for those who experienced racial discrimination as children or adolescents. Cobb and colleagues examine how multiple attributed reasons for everyday discrimination relates to all-cause mortality risk among older Blacks in HRS. The authors report the 3 or more attributed reasons for everyday discrimination is a particularly salient risk factor for mortality in later life. This collection of papers provides insights into how discrimination or stress impacts African American health or health disparities in middle to late life.

STRESS IS A LATENT CONSTRUCT: EXPLORING THE DIFFERENTIAL EXPERIENCE OF STRESS AMONG BLACK OLDER ADULTS

Lauren Brown,¹ Catherine Garcia,² Alexis Reeves,³ John Pamplin,⁴ and Uchechi Mitchell,⁵ 1. *San Diego State University School of Public Health, San Diego State University School of Public Health, California, United States*, 2. *University of Nebraska - Lincoln, Lincoln, Nebraska, United States*, 3. *University of Michigan, Ann Arbor, Michigan, United States*, 4. *NYU Center for Urban Science and Progress, Brooklyn, New York, United States*, 5. *University of Illinois Chicago, School of Public Health, Chicago, Illinois, United States*

While evidence highlights the detrimental health consequences of stress exposure for Black Americans, the impact of stress exposure on health varies by the stressor, individual appraisal and coping mechanisms examined. In this study, we aim to explore the differential effects of chronic stress exposure by means of latent class analysis on mental and

physical health. Data come from 800 Black older adults ages 52+ from the 2006 Health and Retirement Study. A set of items that include stress exposure, appraisal and coping were used to assess chronic stress burden on anxiety, depressive symptoms and chronic conditions to identify stress and health clusters. Analysis revealed four subgroups, each demonstrated a typological response pattern with the most pronounced health consequences for high stress exposure, appraisal and few or no coping mechanisms. Results show an alternative approach to examining the stress-health link by using a combined person- and variable-centered approach.

EARLY-LIFE RACIAL DISCRIMINATION, RACIAL CENTRALITY, AND ADULT ALLOSTATIC LOAD AMONG AFRICAN AMERICAN OLDER ADULTS

Courtney Thomas Tobin,¹ Angela Gutierrez,² and Roland Thorpe, Jr.,³ 1. *Fielding School of Public Health, University of California Los Angeles, Fielding School of Public Health UCLA, California, United States*, 2. *Edward R. Roybal Institute on Aging, Los Angeles, California, United States*, 3. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

This study evaluated the life course processes through which early life racial discrimination (ELRD) and racial centrality (i.e., the importance of Black identity to one's sense of self) interact to shape allostatic load (AL) among African American (AA) adults aged 50+ in the Nashville Stress and Health Study (N=260). Adolescent ELRD was associated with greater racial centrality in adulthood and conferred 35% greater risk of high adult AL; greater centrality was also linked to high adult AL. Centrality accounts for 24% of the association between ELRD and AL. ELRD and centrality interact to shape adult AL, such that racial centrality is protective against high AL for adults who experienced racial discrimination as children or adolescents. Findings highlight the multiple pathways through which race-related stressors and psychosocial resources interact to shape physiological dysregulation in later life and underscore the health significance of racial identity for older AAs.

NUMBER OF ATTRIBUTED REASONS FOR EVERYDAY DISCRIMINATION AND MORTALITY AMONG OLDER BLACKS

Ryon Cobb, *University of Georgia, Athens, Georgia, United States*

To date, little is known about the significance of the number of attributions for everyday discrimination on all-cause mortality risk among older Blacks. Data are from a subsample of older Black respondents in the Health and Retirement Study (HRS), a nationally representative panel study of adults above the age of 50 in the 2006/2008 HRS waves, respondents completed a battery of questions on experience with psychosocial stressors, which included the number of attributed reasons for everyday discrimination. Vital status was obtained from the National Death Index and reports from key household informants (spanning 2006–2016). Cox proportional hazard models were used to estimate the risk of mortality. During the 10-year observation period, 450 deaths occurred. A higher number of attributed reasons for everyday discrimination was associated with a higher likelihood of death after adjusting for demographic

characteristics and remained significant after further adjustments for other psychosocial, health, behavioral, and economic covariates.

Session 2215 (Paper)

Education and Training in Topics on Aging

DEPLOYING IMPLEMENTATION STRATEGIES TO FACILITATE PROFESSIONALS' USE OF THE HOME CARE FRAILTY SCALE

Lisa Juckett,¹ Haley Oliver,¹ Leah Bunck,² Crystal Kurzen,² Andrea Devier,² and Fannisha Page,² 1. *The Ohio State University, Columbus, Ohio, United States*, 2. *LifeCare Alliance, Columbus, Ohio, United States*

Home- and community-based service (HCBS) organizations play an instrumental role in maximizing the independence of older adults, ages 60 and over. HCBS clients typically have multiple health complications, placing them at great risk of frailty—a complex condition associated with health decline and institutionalization. However, despite their frequent contact with older adults, HCBS professionals are not required to assess the frailty levels of their clients, creating a missed opportunity to monitor the needs of this at-risk population. The purpose of this quality improvement study was to test a package of five implementation strategies designed to support HCBS professionals' use of the evidence-based Home Care Frailty Scale (i.e., Frailty Scale) with all new clients at one large HCBS organization. Implementation strategies included (a) selecting one professional to serve as the organization's Frailty Scale "champion," (b) holding three training sessions with 25 HCBS professionals, (c) modifying client charts to allow professionals to document Frailty Scale results, (d) pilot testing the Frailty Scale with a small group of clients, and (e) completing monthly chart audits to monitor rates of Frailty Scale implementation. During the first three months of Frailty Scale use, HCBS professionals administered the Frailty Scale to 414 out of 467 eligible clients (88.6%). For Month 1, 87.4% of eligible clients were administered the Frailty Scale, followed by 90.8% in Month 2, and 85.6% in Month 3. This quality improvement study suggests that a multifaceted package of implementation strategies can support professionals' use of an evidence-based frailty instrument in the HCBS setting.

LESSONS ON LEARNING IN LATER LIFE WITH THE MIT AGELAB 85+ LIFESTYLE LEADERS

Taylor Patskanick,¹ Julie Miller,² Lucas Yoquinto,² Lisa D'Ambrosio,³ and Joseph Coughlin,² 1. *MIT, Somerville, Massachusetts, United States*, 2. *MIT, Cambridge, Massachusetts, United States*, 3. *Massachusetts Institute of Technology, Cambridge, Massachusetts, United States*

Previous research has established the role of lifelong learning in promoting psychological wellbeing and active aging. Population aging necessitates an understanding of the unique opportunities and challenges around formal and informal learning in later life. This paper will share findings from a mixed methods study with the MIT AgeLab 85+ Lifestyle Leaders, a panel comprised of octogenarians and nonagenarians from across the United States. Drawing on

an online survey and virtual focus groups with 29 Lifestyle Leaders from January 2021, findings suggest the Lifestyle Leaders most often learned new things from talking with others (46%) and reading print (54%) or online (54%) sources. The majority were familiar with attending in-person lectures or classes (89.7%) and were now using videoconferencing to do these (78.6%). A majority (56.7%) had or are currently participating in a lifelong learning program. Most consider themselves lifelong learners and described this around remaining curious and engaged with life, choices around what one learns, and greater enjoyment of learning. In the survey, a plurality of Lifestyle Leaders indicated the top two challenges affecting their ability to learn were sensory burdens (e.g., hearing loss, declining eyesight) (35%) and their energy level (32.4%); focus group data revealed that recall also is a barrier. Focus group data further highlighted generational experiences around early life learning and career paths, specifically how gender roles, diagnoses of learning disabilities, and evolving digital technology have affected these and changed over the course of their lifetimes.

RESOLVING DILEMMAS IN ICT-ENHANCED INTERVENTIONS: A CROSS-PLATFORM-MEDIATED STRATEGY

Dara KY Leung,¹ Frankie HC Wong,² Gloria HY Wong,² and Terry YS Lum,² 1. *The University of Hong Kong, Hong Kong, Hong Kong*, 2. *The University of Hong Kong, Hong Kong, Hong Kong*

Face-to-face interventions in social care settings are severely disrupted under COVID-19. Previous studies support Information and communication technology (ICT) enhanced intervention as an effective alternative. While difficulties older adults experienced in using ICT were examined extensively, there are fewer discussions on how innate medium characteristics of the delivery mode influence therapeutic interactions. This study explored these embedded challenges in ICT-enhanced psychosocial interventions and possible solutions. We conducted on-site observations and focus groups with 12 participants from two teleconferencing-aided intervention groups for chronic pain with exercise and psychotherapy elements. Observation notes and transcriptions of focus groups recordings were analyzed using thematic analysis. We identified three overarching themes: empowerment, dilemmas, and cross-platform mediated strategy. ICT empowered participants by promoting autonomy and self-management, yet two dilemmas that stemmed from technological affordances undermined the quality of communication. A screen-camera dilemma occurred when participants tried to observe instructions from interventionists while demonstrating their posture in front of the camera for guidance. The blurring boundary between therapy and home settings presented another dilemma. Although teleconferencing increased flexibility and comfort in participation, interruptions from the background environment and intersections of family living spaces disrupted audio-visual communication and jeopardized the sense of security. As a solution, interventionists adopted a cross-platform mediated strategy to bypass the dilemmas. They communicated and delivered supplementary materials through different media, including printed materials and video streamings. Interventionists could consider the unique structural features

in different media and the potential impact of participants' sociodemographic factors, especially those associated with digital literacy.

RETURN MIGRATION AS AN ASSET MAXIMIZATION STRATEGY IN RETIREMENT

Mara Sheftel, *Penn State University, Brooklyn, New York, United States*

Mexican immigrants make up an increasing proportion of the US population 65 and older. Estimating outcomes for this population is complicated by return migration. Due to data limitations, theoretical frameworks and empirical evidence fail to provide clear indication of the economic selection mechanism of return migration, especially at older ages making it difficult to estimate economic determinants of return. Here two waves of data from the US based Health and Retirement Study and the Mexican Health and Aging Study are combined to create a novel dataset that enables a comparison of assets at older ages for those who stay in the US, those who return before age 50 and those who return at 50 and older. Unadjusted results show no difference in total net wealth at older ages between the three groups, with higher business assets among returnees and higher concentration of wealth in home equity among stayers. With evidence of higher inequality among stayers, lower median wealth in Mexico, and asset advantages operating through citizenship, older age return can be interpreted as a means to acquire a higher standard of living in retirement for non-citizen immigrants. Comparing assets between 2000 and 2012 reveal the vulnerability of stayers during the US housing crisis. These findings are novel because they point to return migration as a retirement strategy and expose a source of vulnerability among those Mexican immigrants who remain in the US into older ages.

USING DOCUMENTARY SHORT FILM FOR HEALTH IMPACT: AN EXAMPLE FOR SUPPORTING FAMILY CAREGIVERS

Janice Bell,¹ and Jessica Zitter,² *1. University of California, Davis, Sacramento, California, United States, 2. Highland Hospital, Oakland, California, United States*

Storytelling through film is a powerful tool with potential to improve understanding, spark discussion, shape perceptions of health and illness, and influence related behavior. We developed a film discussion guide for the documentary short film *Caregiver: A Love Story*. The 24-minute film follows the experience of a man who leaves his job to become the primary caregiver of his 59 year-old wife, who opts out of non-beneficial chemotherapy, choosing instead to remain at home with hospice support. The 2-hour program was facilitated by an experienced social worker and offered on five different days/times using Zoom video (n=60 total attendees; 9-15/ session). At each session, we showed the film, discussed self-care and caregiver resources, and fielded a survey to assess satisfaction, format acceptability and session impact (response rates 67-100%/session). Attendees liked the session format (90%); found the film relevant to their situations (80%); intended to look for new professional resources (79%); were motivated to do something different (71%); learned something new (64%); and intended to ask for more help from family or friends (64%). Many commented that they preferred the video meeting format over

in-person meetings. The film viewing and discussion format is acceptable and accessible to family caregivers who may otherwise not be able to attend given competing demands. This format also has potential to improve support access to resources. Extensions to this work are planned to tailor the film discussion guide for health care providers and students working with family caregivers across inpatient, outpatient and hospice settings.

Session 2220 (Symposium)

EFFECTS OF AGING ATTITUDES ON DEVELOPMENT IN OLD AGE

Chair: Maria Clara P de Paula Couto

Co-Chair: Klaus Rothermund

This session will focus on aging attitudes and their effects on different aspects of development in old age (e.g., preparation, age stereotypes, age discrimination, and well-being). Cultural differences and how they shape individual aging are also explored. The first two presentations focus on cross-cultural differences in preparation for old-age. Nikitin et al. examine financial preparation and how expectations about support from the state influence it. People's beliefs about the utility and the risk of aging preparation and their role in preparatory activities is investigated by Kim-Knauss et al. Tsang et al. explore age differences in pursuing autonomy and independence during the COVID-19 pandemic and the role of perceived social obligation. Cultural differences in the accuracy between perceived retrospective changes in well-being and actual changes is explored by Park et al. The last presentation (de Paula Couto et al.) focuses on country- and age-related differences in personal experiences of age discrimination in different life domains. Taken together, findings suggest that attitudes toward, and preparation for aging, are not static. Situational contexts and personal assessments of the contexts can shape such attitudes and behavior.

PERSONAL EXPERIENCES OF AGE DISCRIMINATION IN DIFFERENT LIFE DOMAINS: DETERMINANTS AND CONSEQUENCES

Maria Clara P de Paula Couto,¹ Jana Nikitin,² Sylvie Graf,³ and Klaus Rothermund,¹ *1. Friedrich-Schiller University Jena, Jena, Thuringen, Germany, 2. University of Vienna, Vienna, Wien, Austria, 3. University of Bern, Bern, Bern, Switzerland*

Age discrimination is pervasive in society which bears far-reaching consequences for individuals in terms of decreased psychological and physical health. Age discrimination can be experienced in different life-domains and perceived as a social (others' experiences) or as a personal phenomenon (own experiences). Our first goal was to examine country- and age-related differences in personal experiences of age discrimination in distinct life domains, reported by 2,817 participants aged 40 to 90 years from the US, China, Germany, the Czech Republic, and Taiwan. As another goal, we investigated the impact of age discrimination on life satisfaction. Personal age discrimination was domain-specific, with more experiences reported in the family, work, and personality domains. Personal age discrimination increased with age and was higher in China and Taiwan. Age discrimination negatively predicted life satisfaction. This negative effect was

more pronounced if age discrimination was experienced in domains with high subjective importance.

COUNTRY DIFFERENCES IN FINANCIAL PREPARATION: WHAT DO PEOPLE EXPECT FROM THE STATE?

Jana Nikitin,¹ Maria Clara P de Paula Couto,² Sylvie Graf,³ and Klaus Rothermund,² 1. *University of Vienna, Vienna, Wien, Austria*, 2. *Friedrich-Schiller University Jena, Jena, Thuringen, Germany*, 3. *University of Bern, Bern, Bern, Switzerland*

A considerable gap between one's pension and living expenses in old age exists in almost all developed countries, making savings and financial preparation for old age inevitable. Nevertheless, financial preparation for old age substantially differs across countries. Using the data from the AAF project, we investigated what motivates people in different countries (USA, Germany, Czech Republic, Hong Kong, and Taiwan) to financially prepare for old age. Financial preparation was the highest in the USA, followed by Germany and the Czech Republic. The lowest levels of financial preparation were found in Hong Kong and Taiwan. These differences were explained by age-related expectations on a "paternalistic" role of the state: Greater endorsement of the idea that the state should provide financial support to older citizens led to less preparation. These findings are in line with the idea that individuals' beliefs and expectations regarding the role of institutions shape personal actions.

ACTION-RELATED THOUGHTS AND BELIEFS REGULATE THE EFFECT OF AGE STEREOTYPES ON AGING PREPARATION

Yaeji Kim-Knauss,¹ Frieder Lang,² Helene Fung,³ and Dwight Tse,⁴ 1. *Institute of Psychogerontology, University of Erlangen-Nuremberg, Nuremberg, Bayern, Germany*, 2. *Institute of psychogerontology, University of Erlangen-Nuremberg, Nuremberg, Bayern, Germany*, 3. *The Chinese University of Hong Kong, Shatin, N.T., Hong Kong, Hong Kong*, 4. *School of Psychological Sciences and Health, University of Strathclyde, Glasgow, Scotland, United Kingdom*

Thinking about old age stereotypically affects one's engagement in age-related behaviors and developmental regulation. We hypothesized that positive or negative aging stereotype (AS) would be associated with more or less aging preparation, while action-related thoughts and beliefs might exert influence thereon. We used the AAF online-study dataset consisting of 591 German, 348 Chinese, and 139 American adults (aged 18–93 and 55% female). Using a count measure of 15-preparatory-activities, we first explored the role of AS measured by a bipolar scale and how perceived utility and risk of aging preparation differentiate this association. Findings revealed that perceiving more utility buffered the impact of negative AS, which suggests that one's action-related thoughts are more proximal and self-relevant predictor of aging preparation. Besides, Chinese and Americans were more susceptible to the presence of AS than Germans, implying that cultural background or societal conditions might also shape one's belief system and thereby regulate behaviors.

OLDER ADULTS PURSUE MORE AUTONOMY DURING PANDEMIC: AN EXPLANATION BY SOCIAL OBLIGATION

Hiu Ling Vivian Tsang,¹ Chunyan Mai,² and Helene Fung,³ 1. *Hong Kong Metropolitan University, The Chinese University of Hong Kong, Hong Kong*, 2. *The Chinese University of Hong Kong, Hong Kong, Hong Kong*, 3. *The Chinese University of Hong Kong, Shatin, N.T., Hong Kong, Hong Kong*

Older adults are considered more vulnerable under the COVID-19 pandemic. Nevertheless, the pandemic also highlights the social obligation of all individuals, young and old. We investigated whether older adults pursued more autonomy during the pandemic than did middle-aged adults, and the moderating effect of perceived social obligation. One hundred and twenty-three Hong Kong citizens (62 females, Mage=60.59±13.28 years old) participated in this study in 2018 (before pandemic) and 2020 (during pandemic). Comparing these two waves, the results showed a larger increase of perceived importance of independence and autonomy among older adults than among middle-aged adults. Moreover, the age difference became stronger with a higher increase in expectation on social obligation, suggesting that the pandemic might make older adults feel more socially obligated to be independent and autonomous, so as not to be a burden on others. Future ageism-related studies should take the social obligation of older adults into consideration.

RETROSPECTIVE PERCEPTIONS OF CHANGES IN WELL-BEING: THE IMPACT OF AGE, CULTURE, AND AGING ATTITUDES ON ACCURACY

Jeongsoo Park,¹ Allura Lothary,² and Thomas Hess,³ 1. *Ajou University, Suwon-si, Kyonggi-do, Republic of Korea*, 2. *University of Illinois Urbana-Champaign, Urbana, Illinois, United States*, 3. *North Carolina State University, Raleigh, North Carolina, United States*

Aging attitudes have important consequences on functioning in later-life. A critical question concerns whether such attitudes may bias perceptions of one's own aging, with potentially negative effects on important outcomes. Using data from adults aged 30 – 85 in the US (n=315), Hong Kong (n=317), and Germany (n=623), we examined the impact of age and aging attitudes on accuracy of perceptions of change in well-being over five years in different domains of functioning. Across contexts, comparisons revealed good correspondence between retrospective reports and actual change. However, older adults and those with negative attitudes retrospectively reported less positive change over this period. Accuracy of perceived change was affected by aging attitudes, with positive attitudes being associated with greater accuracy across most domains, although culture moderated these effects. The results highlight the complex relationship between culture and perceptions of well-being, as well as the potentially insidious effects of attitudes on their accuracy.

Session 2225 (Symposium)

ENHANCE: THE CENTER FOR ENHANCING NEUROCOGNITIVE HEALTH, ABILITIES, NETWORKS, & COMMUNITY ENGAGEMENT

Chair: Sara Czaja

Co-Chair: Walter Boot

Discussant: Michelle Bourgeois

Approximately 9 % of those aged 65 and over have a cognitive impairment due to a variety of causes including Alzheimer's disease and other forms of dementia, Mild Cognitive Impairment (MCI), Parkinson's disease, traumatic brain injury (TBI), and stroke. Few technology solutions have been directed towards supporting older adults with cognitive impairments and the literature regarding the efficacy of these solutions is sparse. In this symposium, we describe our new Center called ENHANCE (Enhancing Neurocognitive Health, Abilities, Networks, and Community Engagement), which is focused on developing technology support for aging adults with a cognitive impairment due to MCI, TBI, and Stroke. Sara Czaja will provide an overview of the conceptual framework, goals, and structure of ENHANCE, and describe the STRUMM project, that focuses on the design and evaluation of an innovative intelligent adaptive software package aimed at providing cognitive and social support to aging adults with cognitive impairments. Wendy Rogers will discuss the ENACT project, a longitudinal needs assessment focusing on understanding the needs, challenges, and support preferences of our target population and informal caregivers. Neil Charness will describe the AUGMENT development project, which is concerned with developing an instructional support tool for mobility activities, such as wayfinding, locating, and using transportation services. Finally, Walter Boot will discuss the DREAM development project, which is focused on developing a technology-based cognitive aid to support prospective memory activities. Michelle Bourgeois will serve as the discussant for the symposium and highlight the unique opportunities and challenges associated with ENHANCE.

STRUMM: AN INTELLIGENT, ADAPTIVE SOFTWARE PACKAGE FOR OLDER ADULTS WITH A COGNITIVE IMPAIRMENT

Sara Czaja,¹ Marco Ceruso,² Walter Boot,³ Neil Charness,³ and Wendy Rogers,⁴ 1. *Weill Cornell Medicine/Center on Aging and Behavioral Research, New York, New York, United States*, 2. *Weill Cornell Med, New York, New York, United States*, 3. *Florida State University, Tallahassee, Florida, United States*, 4. *University of Illinois Urbana-Champaign, Champaign, Illinois, United States*

Many older adults have a cognitive impairment (CI), which negatively impacts on their quality of life and threatens their independence. In this presentation, we provide an overview of the conceptual framework, structure, and processes of our multi-site Center, ENHANCE, which is focused on developing technology support for aging adults with a CI. ENHANCE has two cross-site research projects, two cross-site development projects, training, and dissemination components. A core battery of measures is collected across all projects. We also discuss the Supportive Technology Resources through Usability & Machine-learning Methods (STRUMM) research project, which focuses on an innovative intelligent adaptive software package aimed at providing cognitive and social support, and support for resource access to aging adults with a CI. STRUMM is designed to meet the user's varying cognitive needs. Finally, we present preliminary data regarding the perceived usability and value of STRUMM from our clinical partners and potential user groups.

EVERYDAY NEEDS ASSESSMENT FOR COGNITIVE TASKS: CHALLENGES FOR PERSONS WITH COGNITIVE IMPAIRMENT

Wendy Rogers,¹ Raksha Mudar,² Maurita Harris,³ Elizabeth Lydon,¹ Widya Ramadhani,¹ Sara Czaja,⁴ Walter Boot,⁵ and Neil Charness,⁵ 1. *University of Illinois Urbana-Champaign, Champaign, Illinois, United States*, 2. *University of Illinois-Urbana Champaign, Champaign, Illinois, United States*, 3. *University of Illinois at Urbana Champaign, Champaign, Illinois, United States*, 4. *Weill Cornell Medicine/Center on Aging and Behavioral Research, New York, New York, United States*, 5. *Florida State University, Tallahassee, Florida, United States*

ENACT (Everyday Needs Assessment for Cognitive Tasks) is an exploration and discovery project to gather information on challenges in daily and community living experienced by individuals aging with compromised cognition due to mild cognitive impairment, traumatic brain injury, or post-stroke. We are exploring their challenges through a longitudinal needs assessment study involving interviews with older adults with cognitive impairment and their care partners. We will describe the study development process wherein we interviewed subject matter experts, including persons with professional (neurology, rehabilitation, gerontology) or personal experience with individuals who have cognitive impairment. Based on their collective insights, we selected the following categories of activities for the ENACT in-depth interviews: health, social engagement, transportation, domestic life, and leisure/recreation. The ENACT longitudinal data will provide insights to guide development of adaptive, context-sensitive technology-based supports for the AUGMENT, DREAM, and STRUMM projects described in this symposium, as well as other initiatives.

AUGMENT: NAVIGATION APPS INSTRUCTION FOR OLDER ADULTS WITH COGNITIVE IMPAIRMENT

Neil Charness,¹ Walter Boot,¹ Sara Czaja,² Wendy Rogers,³ Nicholas Gray,⁴ Dorota Kossowska-Kuhn,⁵ and Michael Pervratil,⁵ 1. *Florida State University, Tallahassee, Florida, United States*, 2. *Weill Cornell Medicine/Center on Aging and Behavioral Research, New York, New York, United States*, 3. *University of Illinois Urbana-Champaign, Champaign, Illinois, United States*, 4. *Psychology Department, Florida State University, Florida, United States*, 5. *Psychology Department, Tallahassee, Florida, United States*

Augmenting User Geocoordinates and Mobility by Enhanced Tutorials (AUGMENT) is a development project in the ENHANCE Rehabilitation Engineering Research Center aiming to promote community engagement for aging adults with cognitive impairment (CI) from stroke, traumatic brain injury, and mild cognitive impairment. AUGMENT aims include 1) providing proof of concept that a robust instructional package can support successful use of existing, complex navigation apps, Google maps and rideshare app Uber, by a diverse set of people with CI; and 2) providing proof of product by testing performance with and without instruction. We discuss the needs assessment phase and development of new tests to assess wayfinding abilities and reported difficulties with navigation, using a control sample of 384 community-dwelling older adults. We found that self-reported navigation difficulties are predicted (R-square = .28)

by gender, a spatial orientation test, self-reported memory ability, and severity of memory difficulty.

DEVELOPMENT OF THE DREAM SYSTEM: DIGITAL REMINDERS FOR EVERYDAY ACTIVITY MEMORY

Walter Boot,¹ Neil Charness,¹ Sara Czaja,² Wendy Rogers,³ Edie Sanders,¹ Robin Stuart,¹ and Ronald Andringa,¹

1. *Florida State University, Tallahassee, Florida, United States*,
2. *Weill Cornell Medicine/Center on Aging and Behavioral Research, New York, New York, United States*, 3. *University of Illinois Urbana-Champaign, Champaign, Illinois, United States*

Prospective memory, the ability to remember to execute an intention in the future, is crucial for the performance of many everyday tasks important for independent living. Prospective memory abilities decline with age, and older adults living with mild cognitive impairment (MCI), cognitive impairment due to traumatic brain injury (TBI), and cognitive impairment due to stroke are especially susceptible to prospective memory failures. The goal of the Digital Reminders for Everyday Activity Memory (DREAM) project is first to establish proof of concept for an adaptive cognitive aid to support the prospective memory of older adults with various cognitive impairments, and then establish proof of product in studies examining the use of a working prototype within the lab and within participants' homes. Data will be presented from initial work verifying product requirements through engagement with stakeholders, including subject matter experts, older adults with cognitive impairments, and their care partners.

Session 2230 (Symposium)

ESPO AND ACADEMY FOR GERONTOLOGY IN HIGHER EDUCATION SECTION SYMPOSIUM: A NEW NORMAL IN TEACHING? INCORPORATING UNCONVENTIONAL AND CREATIVE IDEAS INTO GERONTOLOGY CURRICULUM

Chair: Lauren Bouchard

Co-Chair: Yan-Jhu Su

Discussant: Marilyn Gugliucci

This symposium is intended to highlight novel, applied examples and classroom activities in gerontology curriculum. In accordance with the AGHE gerontological education competencies, these authors will provide insightful and fun connections to arts/humanities, popular culture, technology, and current events to inspire conversation, interest, self-reflection, and empathy in the classroom. The first author will discuss social media (e.g., TikTok) as a segue to difficult classroom conversations regarding negative stereotypes and ageism in society. Presenter two will discuss cross-field educational connections between music education and gerontology. Next, presenter three will put present a unique activity regarding technology, homeownership, and retirement with a competitive flair. Presenter four utilizes documentary to encourage empathy in nursing. Finally, presenter five will present a timely class debate regarding United States political office and ageism that is sure to create lively and relevant conversation.

DECODING TIKTOK: UTILIZING SOCIAL MEDIA FOR DIFFICULT CONVERSATIONS ABOUT AGEISM

Lauren Bouchard, *Concordia University Chicago, Chicago, Illinois, United States*

Understanding ageism is a key aspect of gerontological curriculum. Media examples (e.g., television and movies) can be effective tools, and yet gerontological educators should stay updated on new media trends to encourage student interest. This presentation will explore a new social media application (i.e., TikTok) to help students recognize and dismantle their own ageist beliefs. The presenter will describe and explain the classroom activity, instructions for finding and downloading content, as well as the social media application itself. In this activity, students brainstorm their preconceived notion of older adults to catalyze open discussion regarding societal beliefs. Next, a few video examples, with both positive and negative portrayals of older adults are presented for discussion. Students may also bring other examples for participation credit to this class. This symposium presentation will include an interview activity guide, additional breakout group instructions, and other tips for creating impactful class discussion on ageism.

INTERDISCIPLINARY EDUCATION MODEL IN THE STUDY OF AGING: EXAMPLE AND COURSE DESIGN

Yan-Jhu Su, *University of Massachusetts Boston, Boston, Massachusetts, United States*

Collaboration among various disciplines is essential to the gerontology curriculum because it is a new and comprehensive subject. This presentation will discuss the design of interdisciplinary courses to include practical applications in the study of aging. The presenter will share examples based on personal experience to illustrate how music and psychology may be applied to the study of aging. In addition, the presentation will include analysis of actual course designs to show how different fields can be integrated in the classroom setting. This symposium presentation intends to improve cross-discipline applications as well as help students contribute to and benefit from the study of aging.

ASSESSING KNOWLEDGE, ATTITUDES, AND BELIEFS OF NURSES ABOUT LGBTQ OLDER ADULTS USING A DOCUMENTARY VIDEO

Suzanne Dutton, *Sibley Memorial Hospital/Johns Hopkins, Washington, District of Columbia, United States*

Statistics reveal that lesbian, gay, bisexual, transgender, and queer (LGBTQ) older adults experience health disparities and barriers to accessing healthcare because of discrimination and fear of disclosing sexual orientation. Nurses receive limited education regarding care for LGBTQ older adults. This study exposed nurses to the documentary, *Gen Silent*, which details LGBTQ older adult experiences. The objective of the study was to increase participants' understanding of LGBTQ health disparities. A one-group pre-/post-test design was conducted to test the effect of the documentary on knowledge and attitudes about LGBTQ health. A total of 379 nurses participated in the study. A questionnaire including a 16-item standardized scale and an open-ended question asking how participants would change their practice was administered before and after the intervention. Findings revealed statistically significant increases in LGBTQ knowledge and inclusive attitudes. This research supports the use of a documentary as an educational method related to LGBTQ older adults.

AGE LIMITATIONS FOR PRESIDENTIAL CANDIDATES? EXPLORING STUDENT PERSPECTIVES USING CLASSROOM DEBATES

Jason Garbarino, *University of Vermont, Burlington, Vermont, United States*

Ahead of the 2020 Presidential Election, Donald Trump (age 73) and his primary opponent, Joseph Biden (age 76) received extensive criticism regarding the aptness of their candidacies based upon their current ages. While the United States Constitution requires candidates to have “attained the age of thirty-five years”, no age cap for presidential candidates exists. In response to timely public discussion, undergraduate interprofessional gerontology students worked in assigned groups to prepare to debate either in favor of, or in opposition to a constitutional amendment capping the age of presidential candidates. Following classroom debates, course faculty moderated in-depth conversation examining cogent arguments made throughout the debates. After attending this session, participants will understand the logistics of planning in-class debates, moderating post-debate student discussions, and evaluation methods of student debate performance and on a corresponding reflective writing assignment. Student and faculty takeaways and prospective classroom debate ideas will be provided.

HOUSE HUNTERS, GERONTOLOGY STYLE: A UNIQUE CLASSROOM ACTIVITY FOR UNDERGRADUATES

Meghan McDarby, *Washington University, St. Louis, Missouri, United States*

Small group discussion activities that capitalize on students' interest in technology may generate enthusiasm for course content in gerontology. We describe a unique classroom activity that supports discussion about retirement issues in older adulthood by leveraging student dexterity in utilizing web applications. In this activity, students act as real estate agents for a retired older adult couple who is relocating to be closer to family. Students are presented with details about the couple, including demographic information (e.g., age, functional limitations, hobbies) and the couple's “wish list” for features and amenities of their future home. Then, students use these details to choose a home for the couple on Zillow and prepare a “pitch” of the home that is presented to the class and judged by the course instructor. Feedback from students suggests that this activity offers a “real world application to course material” and facilitates enthusiasm about course content.

Session 2235 (Symposium)

FACTORS AND FUNCTIONS ASSOCIATED WITH HEALTH AND WELL-BEING AMONG OLDER ADULTS: EVIDENCE FROM NHATS

Chair: Loretta Anderson

Co-Chair: Alexandra Wennberg

Discussant: Allison Gibson

The National Health and Aging Trends Study (NHATS) is a nationally representative sample of Medicare beneficiaries aged 65 and older. From 2011 through 2020, annual in-person interviews have collected data in many areas,

including health, environment, wellbeing, cognition, and function. With a decade of follow-up, including replenishment samples, NHATS is an ideal setting to investigate trends and trajectories of aging. Aging is heterogeneous and understanding the myriad of factors and functions that impact health and wellbeing is critical to developing interventions and care to promote health and wellbeing. Considering a multifactorial, wholistic approach to aging will provide a deeper understanding to create an impact. This symposium features pivotal research conducted using NHATS data, while highlighting overall strengths of the dataset for future research. The first presentation of this symposium investigates the factors that define cognitive profiles associated with dementia diagnosis over a period of five years. The second presentation investigates the role engagement in personally meaningful activities play in cognitive, emotional, functional, and health-related outcomes in older adults. The third presentation investigates the association between sleep medication use and fall risk among older adults with and without dementia. The session concludes with an investigation of end-of-life communication in persons with dementia and hearing impairment.

COGNITIVE DECLINE OVER A 5-YEAR PERIOD: THE NATIONAL HEALTH AND AGING TRENDS STUDY

Allison Gibson,¹ Sarah Holmes,² and Virginia Richardson,³
1. *University of Kentucky, University of Kentucky, Kentucky, United States*, 2. *University of Maryland School of Nursing, Baltimore, Maryland, United States*, 3. *The Ohio State University College of Social Work, Columbus, Ohio, United States*

The classification of Alzheimer's disease and related dementia (ADRD) is important for understanding the progression of cognitive decline. This longitudinal study used data from the National Health and Aging Trends Study (NHATS). A sample of 3,287 eligible Medicare beneficiaries were included in the study. Nine cognitive profiles were examined from Waves 1 to 5 (2011-2015). Discriminant factor analysis was used to identify factors that differentiated across the cognitive profiles. Results showed that 1,076 had some measure of “possible” or “probable” dementia over the 5 years. In Wave 1, there were 104 self-reported ADRD diagnoses, and in Wave 5, there were 327 self-reported ADRD diagnoses. Social participation was an important factor in those that impairment reversed from probable to possible ADRD. Findings support previous evidence that certain activities may slow or reverse cognitive decline and can inform future studies exploring the causality of dementia onset.

FAVORITE ACTIVITY AND IMPLICATIONS FOR COGNITION, MENTAL HEALTH, AND FUNCTION IN PERSONS WITH AND WITHOUT DEMENTIA

Natalie Regier,¹ Jeanine Parisi,² Nancy Perrin,³ and Laura Gitlin,⁴
1. *School of Nursing, Johns Hopkins School of Nursing, Maryland, United States*, 2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 3. *Johns Hopkins University School of Nursing, Baltimore, Maryland, United States*, 4. *Drexel University, College of Nursing and Health Professions, Drexel University, Pennsylvania, United States*

Little is known about the impact of engagement in personally meaningful activities for older adults. This study examines the impact of engagement in one's favorite activity on cognitive, emotional, functional, and health-related outcomes in older adults with and without dementia. Data were obtained from 1,397 persons living with dementia (PLWD) and 4,719 cognitively healthy persons (CHP) participating in wave 2 of the National Health and Aging Trends Study (NHATS). Sociodemographic characteristics were examined by cognitive status. A multivariate analysis of variance indicated that, for PLWD, engagement in favorite activity was associated with greater functional independence and decreased depression ($F(6,1201)=3.01, p<.01$, Wilks's $\Lambda=.985$, partial $\eta^2=.015$). For CHP, engagement in favorite activity was associated with greater functional independence, decreased depression and anxiety, and better performance on memory measures ($F(6,4107)=11.46, p<.001$, partial $\eta^2=.016$). Findings suggest that engagement in personally meaningful activities may have significant and distinct benefits for persons with and without dementia.

FALLS AMONG HIGH- AND LOW- FREQUENCY SLEEP MEDICATION USERS WITH AND WITHOUT DEMENTIA

Loretta Anderson,¹ and Alexandra Wennberg,² 1. *University of Maryland, Baltimore, School of Medicine, Reisterstown, Maryland, United States*, 2. *Karolinska Institutet, Stockholm, Stockholms Lan, Sweden*

Difficulty with sleep and falls are prevalent among older adults. Sleep medication use is associated with falls in older adults, but little is known about its impact in older adults with dementia. We used data from the 2011 National Health and Aging Trends Study to assess the association of low- versus high- frequency sleep medication use with falls in older adults with self-reported dementia. In our fully adjusted model, among those with dementia, high-frequency sleep medication users were more likely to fall than low-frequency sleep medication users (OR=3.86, 95% CI: 1.31, 11.37). Among those without dementia, high-frequency sleep medication users were more likely to fall than low-frequency sleep medication users (OR=1.40, 95% CI: 1.11, 1.77). Reducing sleep medication use in older adults with and without dementia may help reduce the risk of falls and fall-related outcomes in older adults.

HEARING LOSS AND NEUROPSYCHIATRIC SYMPTOMS IN PERSONS WITH DEMENTIA AT THE END OF LIFE

Carrie Nieman,¹ and Natalie Regier,² 1. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*, 2. *School of Nursing, Johns Hopkins School of Nursing, Maryland, United States*

Access to effective communication is critical to the conversations that occur at end-of-life and represents an unaddressed need within palliative care. These challenges may disproportionately affect persons with dementia (PWD). Hearing loss is one of the most common comorbidities among PWD and is independently associated with neuropsychiatric symptoms. However, relatively little is known about the potential impact of hearing loss on PWD at end-of-life. We examined last month of life (LML) data from 971 proxies of

deceased PWD from the National Health and Aging Trends Study (2011-2020). Hearing difficulty was associated with increased anxiety/sadness in PWD, $\chi^2(1)=4.596, p=.032$, such that 65.6% of persons with hearing difficulty reported anxiety/sadness in the LML. Binary logistic regression found that hearing difficulty was significantly associated with increased anxiety/sadness (OR=1.40, 95% C.I. 1.00 – 1.80, $p < 0.05$). Interventions that optimize communication for PWD may be a meaningful approach to improving the end-of-life experience.

Session 2240 (Symposium)

HEALTH DISPARITIES IN COVID-19: IMPLICATIONS FOR RESEARCH, POLICY, AND PRACTICE

Chair: Chivon Mingo

Co-Chair: Ronica Rooks

The rapid transmission of COVID-19 has resulted in more than 100 million confirmed cases in over 200 countries and continues to have wide-community spread. Consistently, it has been reported that older adults are at a greater risk for requiring hospitalization or dying from the virus compared to younger adults and children. In fact, compared to those age 18-29, age 65-74 are five times more likely to be hospitalized and 90 times more likely to experience death. The risk increases exponentially with age. Individuals 85 and older are 13 times more likely to require hospitalization and 630 times more likely to die from the disease. The physical health-age correlation has permeated the media and many discussions concerning the pandemic. However, fewer discussions have centered on the interaction of age and social variables that further exacerbate COVID-19 related burden or mortality such as race/ethnicity, socioeconomic status, and limited access to healthcare. Therefore, this symposium will bring direct attention to COVID-19 related health disparities that compromise public health, discuss implications on future research, policy, and practice, and discuss opportunities to reduce the burden and mitigate health inequities. The symposium presenters will specifically address the impact of social support during COVID-19, disparities in the effects of social distancing on health status, the economic impact on health, cognitive decline among low-income older adults navigating a global pandemic, and factors associated with higher rates of hospitalizations among racial/ethnic diverse older adults.

RACIAL AND AGE GROUP DISPARITIES IN THE EFFECT OF SOCIAL DISTANCING ON HEALTH STATUS

Karen Lincoln, *University of Southern California, Los Angeles, California, United States*

African Americans are dying from COVID-19 at younger ages than Whites. Social distancing (SD) prevents the spread of the virus, but because of work demands, transportation needs, and living arrangements SD may be difficult for many African Americans, many of whom are experiencing higher unemployment, poverty, food insufficiency, and social isolation. This study will determine if the health of African Americans and Whites are differentially impacted by SD measures. SD rules can increase or decrease health

disparities by: (a) directly impacting the symptoms and progression of chronic health conditions; (b) influencing availability of protective factors and exposure to risk factors; and (c) mitigating or exacerbating the effects of sources of disparities. These hypotheses will be tested using data from the Understanding America's COVID Study. Findings can advance understanding of how public health requirements can reduce or increase health disparities and identify protective factors to facilitate adherence to public health guidelines.

SOCIAL SUPPORT, COPING BEHAVIORS, AND RESILIENCE AMONG AFRICAN AMERICANS DURING COVID-19

Sung Park, *Princeton University*

Enduring structural inequalities in the United States by race have only become more apparent during COVID-19, as African Americans experienced significant health and economic challenges that far exceeded those observed among other racial and ethnic groups. Relying on multiple nationally representative surveys, this study examines the diversity of ways in which middle-aged and older African Americans' managed the stress and pressures associated with the pandemic. I summarize the inequities faced by African Americans before and during COVID-19, as well as trends in the utilization of social support, coping behaviors, and degree of resilience. Furthermore, this study investigates the relationship between social support and coping strategies to multiple health outcomes over time. When appropriate, comparisons to other racial and ethnic groups are made. This research underscores the importance of considering social relationships and modifiable coping behaviors when studying African American aging and well-being during times of crisis.

MEMORY PROBLEMS DURING COVID IN LOW-INCOME OLDER ADULTS

Faika Zanjani, *Virginia Commonwealth University, Richmond, Virginia, United States*

Prevention, with widespread lifestyle risk reduction at the community-level, is considered an effective method to decrease Alzheimer's disease (AD). Diverse low-income older adults in Virginia managing either diabetes/cardiovascular symptoms, were offered weekly lifestyle telephone-health coaching for 12-weeks, providing education, motivations, self-efficacy, and referral services for AD lifestyle risk. Participants provided positive anecdotal feedback and the need for continued health coaching during COVID-19. Thirty participants (predominantly African American/Black female) consented for continued health coaching during the pandemic with 47% reporting memory problems. Findings indicated poorer health status associated with reporting memory problems for poor physical health days, poor mental health days, total mental/physical health poor days, sad days, worried days, tired days, feelings of emptiness, feelings of rejection, feelings of failure, little interest/pleasure, and feeling down. This preliminary work creates the impetus for future large-scale AD prevention investigations to improve the lives of AD-risk, low-income, diverse older adults reporting memory problems.

THE DEVASTATING ECONOMIC IMPACT OF COVID-19 ON OLDER BLACK AND LATINX ADULTS:

IMPLICATIONS FOR HEALTH AND WELL-BEING
Marc Garcia,¹ and Amy Thierry,² *1. Syracuse University, Syracuse, New York, United States, 2. Xavier University of Louisiana, Xavier University of Louisiana, Louisiana, United States*

The ongoing COVID-19 pandemic and subsequent economic recession have wreaked havoc on the United States' economy and brought to the forefront stark racial and ethnic inequalities in our society. Older Black and Latinx adults are particularly hard hit by the pandemic as they have relatively lower levels of income and wealth to protect against crises. This study used data from the 2020 COVID-19 module of the Health and Retirement Study, to highlight how the COVID-19 pandemic has economically impacted older Black, U.S.-born Latinx and foreign-born Latinx adults. Results show the pandemic has economically devastated older Black and Latinx adults across a host of economic factors, with foreign-born Latinx experiencing greater economic hardships relative to other groups. Our findings document stark inequalities that are being exacerbated by the pandemic. We discuss the implications of the economic shocks of the pandemic for the health and well-being of older Black and Latinx adults.

Session 2245 (Symposium)

HEALTHY BRAIN AGING

Chair: Saul Villeda

SYSTEMIC MECHANISMS OF BRAIN REJUVENATION

Saul Villeda, *University of California San Francisco, San Francisco, California, United States*

Aging drives cellular and cognitive impairments in the adult brain. It is imperative to gain mechanistic insight into what drives aging phenotypes in the brain in order to maintain, and even restore, functional integrity in the elderly. We, and others, have shown that systemic manipulations - such as heterochronic parabiosis (in which a young and old circulatory system are joined) and administration of young blood or exercise induced blood factors - can reverse age-related impairments in regenerative, synaptic and inflammatory processes, as well as rescue cognitive faculties in the aged brain. These studies have revealed an age-dependent bi-directionality in the influence of the systemic environment indicating pro-youthful factors in young blood elicit rejuvenation while pro-aging factors in old blood drive aging. It has been proposed that introducing pro-youthful factors or mitigating the effect of pro-aging factors may provide effective strategies to rejuvenate aging phenotypes in the brain. Despite this potential, much is unknown as to the systemic and molecular mechanisms regulating pro-youthful and pro-aging effects of blood-borne factors. I will discuss work from my research group that begins to provide mechanistic insight into the systemic and molecular drivers promoting rejuvenation in the aging brain.

INSIGHTS INTO HIPPOCAMPAL BIOLOGY FROM YOUTH-ASSOCIATED PLASMA FACTORS

Joseph Castellano, *Icahn School of Medicine at Mount Sinai, New York, New York, United States*

FEMALE RESILIENCE IN BRAIN AGING

Dena Dubal, *University of California San Francisco, San Francisco, California, United States*

TARGETING ANTICIPATORY NEUROGENESIS TO MAINTAIN COGNITIVE RESERVE

Amar Sahay, *Massachusetts General Hospital, Harvard Medical School, Lexington, Massachusetts, United States*

Memory imprecision is a hallmark of age-related cognitive decline and mild-cognitive impairment (MCI) and is characterized by increased memory interference and decreased stability of memory representations. Evidence from humans, non-human primates and rodents demonstrate reduced hippocampal neurogenesis, excitation-inhibition imbalance and inflexible hippocampal remapping during age-related cognitive decline and MCI. Developing strategies to reverse cognitive decline during aging and Mild Cognitive Impairment necessitates an understanding of molecular, cellular, circuit and network mechanisms that support memory functions of the hippocampus. Over the last decade we have built a multifaceted program grounded in basic neuroscience that is aimed at improving memory in aging and MCI. We have demonstrated how we can Rejuvenate the aged hippocampus by selectively increasing neurogenesis and how we can Re-engineer connectivity of aged inhibitory microcircuits to improve memory precision in aging. Ongoing efforts include strategies to Repairing neurogenic niche fitness by targeting intercellular communication in the aging hippocampus. In today's talk I will present a fourth approach catalyzed by our discovery of the first transcriptional regulator of neural stem cell expansion in the adult hippocampus. We will present data in support of this claim and convey how this discovery may guide strategies to maintain cognitive reserve embodied in the pool of neural stem cells in the adult hippocampus.

Session 2250 (Symposium)**HOW TO PUBLISH: GUIDANCE FROM GSA'S JOURNAL EDITORS**

Chair: Suzanne Meeks

Each year the GSA publications team sponsors a symposium to assist authors who wish to publish in GSA's high impact and influential journals. The first part of the session will include five brief presentations from the editors of *The Gerontologist*, *Innovation and Aging*, and the *Journals of Gerontology Series A and B* plus GSA's managing editors. We will integrate practical tips with principles of publication ethics and scholarly integrity. The topics will be as follows: (1) Preparing your manuscript: strong and ethical scholarly writing for multidisciplinary audiences, (2) common problems that affect peer review, (3) addressing translational significance and fit to journal expectations, (4) transparency, documentation, and Open Science; and (5) working with Scholar One. Following these presentations, we will hold round table discussions with editors from the GSA journals portfolio. At these round tables, editors will answer questions related to the podium presentations and other questions specific to each journal. Intended audiences include emerging and international scholars, and authors interested in learning

more about best practices and tips for getting their scholarly work published.

PREPARING YOUR MANUSCRIPT: STRONG AND ETHICAL SCHOLARLY WRITING FOR MULTIDISCIPLINARY AUDIENCES

Suzanne Meeks, *University of Louisville, Louisville, Kentucky, United States*

This presentation will emphasize the importance of plain, good writing. Editors read 10 or more manuscripts per week with pressure to reject 80-90% of them. If the point and contribution are not clear in a quick scan of the paper, it will not be reviewed favorably. I will provide tips for writing that are commonly violated in submissions, provide references for additional writing support, cover expectations for language consistent with GSA's Reframing Aging initiative, and discuss some common publication ethics issues that arise during the review process, including author contributions and embedding your scholarship in the context of prior work.

COMMON PROBLEMS THAT IMPACT PEER REVIEW

Rozalyn Anderson, *University of Wisconsin-Madison, Madison, Wisconsin, United States*

This presentation will review the most common issues that affect how reviewers see a manuscript submission. These include clarity, use of figures, and attention to existing research, especially establishing the significance and novelty of the work, and how to frame a narrative. I will also address responding to peer review. The focus will be on the biological science perspective (*Journals of Gerontology Series A*), but these issues are relevant to all submissions to GSA journals.

DEFINING TRANSLATIONAL SIGNIFICANCE IN GERONTOLOGY

Steven Albert, *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

Innovation in Aging requires a statement from authors on translational significance. This requirement forces authors to consider the implications of their research for changing some component of aging. How does the research address a challenge posed by aging bodies, minds, relationships, or societies? The editorial board has developed criteria for assessing translational significance. Translational research must meet at least one of three criteria. It (i) must predict or explain a health or behavioral outcome, (ii) be advanced enough in deployment or development to assess these effects, and (iii) have a clear pathway to large-scale program delivery or change in clinical practice. The criteria rule out some kinds of submissions, such as scale development, single-case studies, or reviews of literature. We use these criteria to structure each article's required translational significance statement. Rethinking translation may help focus research across the full set of GSA journals.

TRANSPARENCY, DOCUMENTATION, AND OPEN SCIENCE

Derek Isaacowitz, *Northeastern University, Northeastern University, Massachusetts, United States*

Some GSA journals are especially interested in promoting transparency and open science practices, reflecting how some

subdisciplines in aging are moving toward open science practices faster than others. In this talk, I will consider the transparency and open science practices that seem most relevant to aging researchers, such as preregistration, open data, open materials and code, sample size justification and analytic tools for considering null effects. I will also discuss potential challenges to implementing these practices as well as reasons why it is important to do so despite these challenges. The focus will be on pragmatic suggestions for researchers planning and conducting studies now that they hope to publish later.

GSA MANAGING EDITORS' PERSPECTIVE ON SUBMISSION DOS AND DON'TS

Kathleen Jackson, and Karen Jung, *The Gerontological Society of America, Washington, District of Columbia, United States*

In this presentation, the managing editors of GSA's peer-reviewed journals will discuss how the editorial offices operate and their roles in the publishing process. The topics will include how to navigate the ScholarOne submission system, why it is important to read the Instructions to Authors, and how authors can work with the editorial offices to increase the visibility and impact of their published articles.

Session 2255 (Symposium)

LEVERAGING A POPULATION-BASED DYADIC DATA SET TO PROMOTE HEALTH EQUITY AMONG CHINESE AMERICANS

Chair: Xinqi Dong

Co-Chair: Dexia Kong

Recognizing the central role of family-oriented values in Chinese culture, developing a family-based understanding of health and wellbeing in Chinese Americans is imperative. By linking two unique population-based datasets (one on Chinese older adults, and another on their corresponding adult children caregivers), the purpose of this symposium is to present interactive analyses of dyad-level data to achieve an interpersonal understanding of health outcomes of Chinese older adults and their adult children within the family context. Data were obtained from 807 Chinese older adults-adult children dyads by merging data from two epidemiological studies, namely the Population Study of Chinese Elderly in Chicago (the PINE study) and the PIETY study of corresponding adult children caregivers of PINE participants. Specifically, this symposium presents findings from five interconnected research projects. Session 1 provides an overview of study design and sample characteristics of the dyadic dataset. Session 2 examines the relationship between adult children's endorsement of the filial piety value and older parents' mental health outcomes. Session 3 investigates the level of congruence between older parents' self-perceived mental health and adult children's evaluation of their parents' mental health. Session 4 investigates the extent to which depressive symptoms among older parents were associated with those of their adult children. Session 5 explores the relationship between older parents' physical function and adult children's perceived caregiving burden. Taken together, this symposium presents potential contributions of dyad-level analyses in advancing minority population health.

Study findings have the potential to inform the development of family-centered intervention strategies targeting Chinese Americans.

DYADIC DATA ON U.S. CHINESE OLDER ADULTS AND THEIR ADULT CHILDREN: STUDY DESIGN AND SAMPLE OVERVIEW

Dexia Kong,¹ and Xinqi Dong,² 1. *The Chinese University of Hong Kong, Hong Kong, Hong Kong*, 2. *Rutgers University, Rutgers Institute for Health, New Jersey, United States*

This paper aims to describe study design of the unique dyadic older Chinese American-adult children dataset, and present sample characteristics of the dyads. A total of 807 older parents were matched with their adult children (characteristics of matched versus not matched participants will be compared). On average, adult children were 48 years old, had 12 years of education, lived with 3 persons in household, had 2 children, and lived in U.S. for 17 years. Approximately 65% of the adult children sample were female, 82% married, 93% preferred to speak Chinese dialects, and over 97% foreign-born immigrants. On the other hand, older parents were 74 years old, had 7 years of education, lived with 3 persons in household, had 3 children, and lived in U.S. for 17 years on average. About 60% of the older parent sample were female, 73% married, over 99% foreign-born immigrants who preferred to speak Chinese dialects.

CHILDREN'S FILIAL PIETY AND PARENTS' DEPRESSIVE SYMPTOMS: FINDINGS FROM A DYADIC STUDY

Stephanie Bergren,¹ Qun Le,¹ and Xinqi Dong,² 1. *Rutgers University, New Brunswick, New Jersey, United States*, 2. *Rutgers University, Rutgers Institute for Health, New Jersey, United States*

Filial piety is an important Chinese cultural value that prescribes child behavior towards their parents, but little is known about its relationship to the parents' psychological wellbeing. This study utilizes dyad data from the PINE and PIETY Studies. Filial piety was measured by asking how much the participant thought children should 1) care; 2) respect; 3) greet; 4) please and make happy; 5) obey; and 6) provide financial support to their parents. Depressive symptoms were measured by Patient Health Questionnaire-9 with a cutoff of 5 indicating the presence of depressive symptoms. Logistic regressions were used to examine the associations controlling for both children's and parents' sociodemographic characteristics. Higher filial piety in happy (OR:0.80, (0.65-0.99)) or obey (OR:0.83, (0.68-1.00)) was associated with a lower likelihood of depressive symptoms among parents. Future research should explore the potential causal relationships between children's filial piety and parents' mental health.

PARENTS' SELF-REPORTED VERSUS CHILD EVALUATION OF PARENTS' MENTAL HEALTH OUTCOMES: IS THERE A DIFFERENCE

Xinqi Dong,¹ Yingxiao Hua,² Dexia Kong,³ and Qun Le,² 1. *Rutgers University, Rutgers Institute for Health, New Jersey, United States*, 2. *Rutgers University, New Brunswick, New Jersey, United States*, 3. *The Chinese University of Hong Kong, Hong Kong, Hong Kong*

Older Chinese-Americans are more likely to experience depressive symptoms compared to the general U.S. aging population. This paper aims to examine the level of congruence between parents' self-reported mental health and children's evaluation of their parents' mental health. Dyad-level understanding is particularly relevant considering the family-based medical decision-making preference in the Chinese-community. Older parents' depressive symptoms were measured by PHQ-9 with a cutoff of 5 indicating the presence of depressive symptoms. Adult children were asked whether their parents informed them of their depressive symptoms or if they suspected that their parents were depressed. Logistic regressions were conducted. Parents' self-reported depressive symptoms were associated with both adult children's awareness (OR:3.28 (2.00-5.39)) and suspicion (OR:3.10 (2.02-4.77)) of their parents' depressive symptoms. Results remained consistent among mother-child and father-child dyads. Study findings underscore the importance of incorporating adult children's perspective in mental health research in the Chinese community.

PROFILE OF PARENT-CHILD WELL-BEING IN IMMIGRANT FAMILIES

Mengting Li,¹ Qun Le,² and XinQi Dong,³ 1. *Rutgers, The State University of New Jersey, New Brunswick, New Jersey,*

United States, 2. *Rutgers University, New Brunswick, New Jersey, United States,* 3. *Rutgers University, Rutgers Institute for Health, New Jersey, United States*

Earlier caregiving research focused on psychological well-being of either caregivers or care recipients, while less is known about the caregiving pattern with optimal outcome for both caregivers and care recipients. Data were from the PINE and PIETY studies, with 804 parent-child dyads. Depressive symptoms were measured by PHQ-9 with a cutoff of 5 distinguishing happy or depressed. Parent-child dyads were divided into four groups: happy-parent-happy-child (HPHC, n=572, 71.1%), depressed-parent-happy-child (DPHC, n=139, 17.3%), happy-parent-depressed-child (HPDC, n=65, 8.1%), and depressed-parent-depressed-child (DPDC, n=28, 3.5%). Multinomial logistic regression was used to compare the sociodemographic differences among the groups. Compared to the HPHC group, the DPHC group had older parents, more mother-child dyads and lower-income children, the HPDC group had more female children. However, there was no significant difference between the HPHC and the DPDC group. Future research could explore the predictors of parent-child well-being to inform intervention strategies.

THE ASSOCIATION BETWEEN PARENTS' PHYSICAL FUNCTION AND ADULT CHILDREN'S CAREGIVING BURDEN

Stephanie Bergren,¹ Qun Le,¹ Dexia Kong,² and XinQi Dong,³ 1. *Rutgers University, New Brunswick, New Jersey, United States*, 2. *The Chinese University of Hong Kong, Hong Kong, Hong Kong*, 3. *Rutgers University, Rutgers Institute for Health, New Jersey, United States*

Using data from 544 older parents-adult children Chinese American dyads, this study aims to understand the association between older parents' physical function and their adult children's perceived caregiving burden. Parents' physical function was assessed by the Katz Index of Activities of Daily Living (ADL) and the Lawton Instrumental ADL (IADL), with higher scores indicating more functional limitations. Adult children's caregiving burden was assessed in five dimensions, including time dependence, developmental, physical, social, and emotion burden. Logistic regression was used to examine the association. More ADL limitations were associated with a higher likelihood of developmental burden (OR:1.14 (1.06-1.23)) and physical burden (OR:1.14 (1.06-1.23)) burden. More IADL limitations was associated with a higher likelihood of time dependence burden (OR:1.08 (1.03-1.12)), developmental burden (OR:1.06 (1.03-1.09)), and physical burden (OR:1.08 (1.04-1.12)). Parents' physical function was not related to children's social and emotional burdens. Practice and research implications will be discussed.

Session 2260 (Symposium)

MAJOR DISASTERS' IMPACTS ON LONG-TERM CARE SETTINGS, VULNERABLE OLDER ADULTS, AND CARE PROVIDERS

Chair: Leah Haverhals

Co-Chair: Katie Cherry

The COVID-19 pandemic has disproportionately negatively affected older adults, and has specifically devastated older adults who are minorities and those who reside in long-term care (LTC) facilities. For professionals working in LTC facilities, major stressors and challenges due to the pandemic must be navigated, sometimes in parallel with the effect that major disasters like hurricanes can have on LTC facilities. This symposium will focus on the impact major disasters, including the COVID-19 pandemic and Hurricane Irma, had on LTC settings and those who live and work there, as well as older adults who are minorities and their communities. First, Dr. Roma Hanks will present findings from a study of community members and leaders in a majority African-American community in the United States (US) about their experiences with and challenges faced related to the pandemic. Second, Dr. Lisa Brown will share experiences and perceptions of mental health clinicians from across the US who worked in LTC settings before and during the pandemic. Third, Dr. Ella Cohn-Schwartz will describe how the pandemic impacted Holocaust survivors ages 75+ in Israel compared to older adults who did not experience the Holocaust. Fourth, Dr. Lindsay Peterson will present findings from interviews with nursing home and assisted living community representatives in the US regarding vulnerabilities LTC facilities experienced

related to Hurricane Irma in 2017. As a whole, these presenters will provide insights into experiences of older adults, care providers, LTC facilities, and communities as they navigated challenges associated with the COVID-19 pandemic and a major hurricane.

JUST ANOTHER STORM: CONCEPTUALIZING OLDER ADULTS' PERCEPTIONS OF THE COVID-19 PANDEMIC

Roma Hanks,¹ Christopher Freed,¹ Shoon Lio,² and Martha Arrieta,¹ 1. *University of South Alabama, Mobile, Alabama, United States*, 2. *Spring Hill College, Mobile, Alabama, United States*

Older adults of color who experience health disparities are especially vulnerable to health and economic adversity related to COVID-19. This study focuses on nine zip codes wherein 70.2% of residents are of African-American descent and an estimated 31.5% of residents live in poverty. To understand the lived experience of the COVID-19 pandemic, perceived challenges of COVID-19, and the dissemination of information related to COVID-19, we collected interview and focus group data in Spring 2020 from fifteen community members, leaders, or advocates. Analyses reveal that older individuals approach the COVID-19 pandemic with familiar disaster mitigation strategies. Other persons perceive the pandemic as another community challenge that African-Americans must confront. Older adults report generational differences in perceptions of the risk of COVID-19 and compliance with health guidelines. Overall, analyses reveal a deeply cultural context for intergenerational responses associated with COVID-19 and a sense of agency among older community leaders as health advocates.

PERCEPTIONS OF MENTAL HEALTH CLINICIANS WORKING IN LONG-TERM CARE FACILITIES DURING THE COVID-19 PANDEMIC

Roma Hanks,¹ Lisa Brown,² Rachel Ward,³ Savannah Rose,³ and Lisa Lind,⁴ 1. *University of South Alabama, Mobile, Alabama, United States*, 2. *Palo Alto University, Moss Beach, California, United States*, 3. *Palo Alto University, Palo Alto, California, United States*, 4. *Deer Oaks Behavioral Health, San Antonio, Texas, United States*

During the COVID-19 pandemic, mental health clinicians were initially not considered essential workers, and most were prevented from entering long-term care (LTC) facilities. This study investigated the perceptions and experiences of licensed clinicians who were providing services in LTC settings before and during the pandemic. Respondents included 126 clinicians from 31 states who completed a 90-item survey to assess the impact of COVID-19. Visitor restrictions were perceived to have had a negative effect on patients' emotional, behavioral, and cognitive status. The pandemic adversely impacted clinicians financially, personally, and emotionally, with more than half (67%) reporting that they experienced burnout. This study found that the COVID-19 pandemic adversely impacted clinicians working in LTC settings, their patients' wellbeing, and the delivery of mental health services. Understanding the impact that the COVID-19 pandemic has had on LTC patients and clinicians alike has implications for the provision of services during future pandemics.

MENTAL HEALTH OF HOLOCAUST SURVIVORS AND OTHER OLDER ADULTS DURING THE COVID-19 PANDEMIC IN ISRAEL

Ella Cohn-Schwartz, Yaacov Bachner, and Sara Carmel, *Ben-Gurion University, Beer-Sheva, HaDarom, Israel*

Holocaust survivors could be especially vulnerable to the negative effects of the COVID-19 pandemic due to their early life traumas. Thus, the current study examines the effects of the pandemic on the mental health of Holocaust survivors in Israel, compared to adults who did not experience the Holocaust. We collected quantitative data from 305 adults aged 75+ (38% Holocaust survivors) in Israel during the COVID-19 pandemic. The results indicate that Holocaust survivors were worried to a greater extent from COVID-19 and reported greater depression which became worse during the pandemic. On the other hand, despite these differences, the two groups were similar in their will to live. In conclusion, Holocaust survivors seem to be more vulnerable to the COVID-19 pandemic, strengthening the vulnerability hypothesis, while also showing resilience in their will to live. Policy makers and practitioners should pay special attention to this particularly vulnerable population during these difficult times.

DISASTER VULNERABILITY IN LONG-TERM CARE: THE IMPORTANCE OF SOCIAL AND ORGANIZATIONAL CONNECTIONS

Lindsay Peterson,¹ Debra Dobbs,² Joseph June,³ David Dosa,⁴ and Kathryn Hyer,⁵ 1. *University of South Florida, Bradenton, Florida, United States*, 2. *University of South Florida, School of Aging Studies, University of South Florida, Florida, United States*, 3. *University of South Florida, Tampa, Florida, United States*, 4. *Brown University, Providence, Rhode Island, United States*, 5. *University of South Florida, University of South Florida, Florida, United States*

The risks to older adults in nursing homes (NHs) and assisted living communities (ALCs) exposed to disasters are evident in prior research. However, little research has been conducted to understand the factors related to facilities' vulnerability. This research examined NH and ALC experiences during Hurricane Irma in 2017. Qualitative interviews were conducted with representatives of facilities (N=100), transcripts were analyzed using Atlas.ti version 8. Team members met to reach consensus on codes and major themes and subthemes, which they analyzed using a conceptual model designed to identify factors related to the disaster vulnerability in long-term care (LTC). We found physical factors (e.g. location, physical characteristics) are important, but physical strength is not enough. Multiple social/organizational factors are critical. Results indicate managing a major disaster and protecting LTC residents involve social and organizational connections across a range of groups from staff and family members to emergency managers and neighborhood associations.

Session 2265 (Paper)

Mobility, Disability, and Social Contexts

FORMAL AND INFORMAL CARE USE OVER THE COURSE OF COGNITIVE DETERIORATION AMONG ADULTS WITH A DISABILITY

HwaJung Choi,¹ Kenneth Langa,¹ Edward Norton,¹ Tsai-Chin Choi,¹ and Cathleen Connell,² 1. *University of*

Michigan, Ann Arbor, Michigan, United States, 2. *University of Michigan School of Public Health, Ann Arbor, Michigan, United States*

The dynamics between formal and informal care among persons with a disability may substantially differ over the course of their cognitive decline.

Based on a nationally representative study of older adults, the analysis sample included 3,685 individuals who had at least one activity of daily living (ADL) limitation. We estimated probabilities of using formal care and informal care in the years before and over the course of dementia after controlling for sociodemographic factors, survey mode, and proxy interview status.

The adjusted probability of receiving care from an informal helper increased before the onset of dementia: 36% in 4 years prior to the onset (T=-4); 46% at T=-2. In contrast, the increase in the probability of using formal care was pronounced primarily at the onset of dementia; for example, the probability of overnight nursing home stay was 12% at T=-2 vs. 31% at T=0, which continued to increase over the subsequent years (39% at T=6). The probability of using nursing home care at the onset was significantly greater for women vs. men (Adjusted risk ratio (ARR)=1.21; p=0.010); non-Hispanic white vs. Hispanic (ARR=1.62; p=0.004); those with low vs. high wealth (ARR=1.60; p < 0.001); those without a spouse vs. with a spouse prior to the onset (ARR=1.39; p < 0.001); and those with all adult children living far vs. at least one coresident adult child prior to the onset (ARR=1.51; p= < 0.001).

Public policies and interventions aimed at providing for the needs of people with dementia should consider disparities in care use across racial/ethnic and socioeconomic groups.

GENDER DIFFERENCES IN AVOIDING LATER-LIFE DISABILITY: A LIFE COURSE PERSPECTIVE

Patricia Morton, *Wayne State University, Detroit, Michigan, United States*

Identifying the early origins of adult health has underscored how experiences in the earliest stages of life can have lasting consequences. Whereas most research on the early origins of adult health has linked childhood conditions to worse health in adulthood, this study considered whether childhood conditions are associated with healthy aging. Guided by the World Health Organization's emphasis on functional ability as a core component of healthy aging, the present study investigated the association between childhood social conditions and avoiding later-life limitations in basic and instrumental activities of daily living, referred to as disability-free status. This study also tested potential health-related and socioeconomic mediators and examined whether these life course antecedents of healthy aging vary by gender. Analyzing a sample of 9,376 adults over age 50 from the Health and Retirement Study over 10 years (2006-2016) revealed that childhood socioeconomic disadvantage reduced the odds of avoiding disability over time. For women, adult health lifestyles mediated this relationship whereas adult socioeconomic status (SES) mediated this relationship for men. Conditional indirect effects indicated that the mediational effects of body mass and education differed between men and women (i.e., moderated mediation). The direct effects of childhood and adult SES also varied by

gender. These results demonstrate that the life course antecedents, especially SES, of healthy aging are distinct for men and women. Interventions should prioritize reducing early-life exposure to socioeconomic disadvantage, especially for women. Given the gendered differences in the mediating effects, midlife interventions can be tailored for men and women.

OLDER AMERICANS WITH DISABILITY ARE VULNERABLE TO ECONOMIC AND FOOD INSECURITY DURING COVID-19

Shinae Choi,¹ Eun Ha Namkung,² and Deborah Carr,³

1. *The University of Alabama, Tuscaloosa, Alabama, United States*, 2. *Korea Institute for Health and Social Affairs, Sejong, Ch'ungch'ong-namdo, Republic of Korea*, 3. *Boston University, Boston, Massachusetts, United States*

This study investigated whether older Americans with physical disability were vulnerable to three types of economic insecurity (difficulty paying regular bills, difficulty paying medical bills, income loss) and two types of food insecurity (economic obstacles, logistical obstacles) during the early months of the COVID-19 pandemic. We evaluated the extent to which associations are moderated by three personal characteristics (age, sex, race/ethnicity) and two pandemic-specific risk factors (job loss, COVID-19 diagnosis). Data were from a random 25 percent subsample of the Health and Retirement Study participants who completed a COVID-19 module administered in 2020. Our analytic sample included 3,166 adults aged 51 and older. We estimated logistic regression models to document the odds of experiencing each hardship. Persons with three or more functional limitations reported significantly higher odds of both types of food insecurity, and difficulty paying regular and medical bills, relative to those with no limitations. After controlling for health conditions, effects were no longer significant for paying medical bills, and attenuated yet remained statistically significant for other outcomes. Patterns did not differ significantly on the basis of the moderator variables. Older adults with more functional limitations are vulnerable to economic and food insecurity during the pandemic, potentially exacerbating the physical and emotional health threats imposed by the pandemic. Our findings reveal an urgent need to promote policies and procedures to protect older adults with disability from economic and food insecurity. Supports for older adults with disability should focus on logistical as well as financial support for ensuring food security.

TOWARD A MULTIDIMENSIONAL UNDERSTANDING OF LATER LIFE DISABILITY: A LATENT PROFILE ANALYSIS

Natasha Peterson,¹ Jeongeun Lee,² and Eva Kahana,³

1. *Iowa State University, Iowa State University, Iowa, United States*, 2. *Iowa State University, Ames, Iowa, United States*, 3. *Case Western Reserve University, Cleveland, Ohio, United States*

Disability is difficult to define succinctly. Current literature on disability has primarily focused on physical functional limitations. However, relying on a single dimension or index cannot accurately represent disability as the experience of disability is nuanced and complex. To address these

gaps, this study aims to understand the multidimensional nature of disability among retired, community-dwelling older adults. Using a sample of 414 older adults between the ages of 72 and 106 years ($M=84.84$, $SD=4.56$), latent profile analysis was employed to identify classes based on five indicators of disability across three domains. The five indicators of disability included difficulties with activities of daily living (ADLs), cognitive impairment, physical impairment, sensory impairment, and participation restrictions. Three classes were found to represent the data best. The most favorable and highly functioning group comprised the highest number of participants ($n=242$, 59.5%). The next group, class 2 ($n=157$, 37.9%), was characterized by high physical impairment and ADL-difficulty. The smallest group, class 3 ($n=15$, 3.6%), had the highest ADL-difficulty and participation restrictions but drastically lower cognitive and sensory impairment. Multinomial logistic regression revealed that class membership was related to sociodemographic characteristics. Finally, class membership predicted several mental health outcomes such as depressive symptoms, positive affect, and life satisfaction in the expected direction. If supported by future work, these findings could inform practitioners in developing more specific interventions relevant to older adults based on their disability profiles. Understanding various combinations of disablement has potential implications for services and interventions to be tailored to individuals' distinct disability-related needs.

Session 2270 (Symposium)

NEW BRAIN AGING CENTER

Chair: Feng Lin

Co-Chair: Yeates Conwell

Discussant: Janine Simmons

Evidence indicates an association between emotional well-being (EWB) and underlying brain processes, and that those processes change with both normal and pathological brain aging. However, the nature of these associations, the mechanisms by which EWB and its component domains change with brain aging, and how those changes may be associated with common neuropathologies like Alzheimer's disease and related dementias (ADRD), are largely unexplored. The NIA-funded Network for Emotional Well-being and Brain Aging (NEW Brain Aging) has the goal of developing a nationwide community of investigators dedicated to research that identifies and tests mechanisms by which brain aging influences EWB and how EWB may impact risk for and progression of ADRD. Synthesizing human and animal literature, our premise is that relationships between EWB and ADRD are bidirectional – normal and pathological changes in aging brain influence EWB and EWB contributes to brain health and illness, such as ADRD. NEW Brain Aging will identify and coalesce resources for interested investigators and provide pilot funding opportunities to stimulate research and development of the field. Component presentations of this symposium will include (1) an overview by Dr. Robert Kaplan of the current state of research on EWB; (2) the role of animal studies (Kuan Hong Wang) and (3) human subjects research (Feng Vankee Lin) in EWB and aging; and (4) design of NEW Brain Aging and resources it will provide

(Yeates Conwell). Janine Simmons will explain NIA's vision for EWB research and lead open discussion.

EMOTIONAL WELL-BEING HUMAN STUDIES

Feng Lin, *Stanford University, California, United States*

Early evidence indicates an association between EWB and underlying brain processes, and that those processes change with both normal and pathological brain aging. However, the nature of these associations, the mechanisms by which EWB and its component domains change with brain aging, and how those changes may be associated with common neuropathologies in AD, are largely unexplored. We propose an appraisal-adaptation model in understanding relationships between EWB and AD. For human models, we encourage the use of well-established measures that directly assess eudaimonic and hedonic EWB, including abnormal scenarios (e.g., neuropsychiatric symptoms, anhedonia, loneliness, etc.), as well as older adults with exceptional cognition (i.e., superagers or supernormals). Dr. Lin will review premises associated with the appraisal-adaptation model in conducting human research on EWB, aging, and AD.

ACTIVITIES OF NEW BRAIN AGING

Yeates Conwell, *University of Rochester Medical Center, Rochester, New York, United States*

The Network for Emotional Well-being and Brain Aging (NEW Brain Aging) was funded by NIA with the goal of forming a national, transdisciplinary collaborative that includes investigators with research expertise in emotional well-being (EWB), Alzheimer's disease and related dementias (AD), human and animal neuroimaging, stress regulation, and computational/quantitative methods. Our objective is to stimulate mechanistic research identifying and testing mechanisms by which brain aging influences EWB and how EWB may impact risk for and progression of AD. This presentation will explain the structure and functions of the network that serve as a resource for investigators interested in EWB and aging research, and how to access them: a transdisciplinary community of scholars interested in brain, aging, and EWB research from both human and animal fields; webinars; workgroups to establish priorities for NEW Brain Aging activities; a resource repository; and pilot project funding opportunities to which network members can apply.

EMOTIONAL WELL-BEING ANIMAL MODELS

Kuan Wang, *University of Rochester, Rochester, New York, United States*

Clinical studies suggest an association between EWB and the risk or progression of AD. However, the mechanistic link and causal relationship between EWB and AD remain unknown, due to limited experimental access and control of the underlying human brain processes. Animal models offer genetic control of AD mutations and neural circuit analysis tools, but subjective feelings of EWB cannot be assessed through self-report. To study EWB across species, we adopt a theoretical framework that views emotions as central brain states that respond to exteroceptive or interoceptive stimuli and cause multiple cognitive, somatic and behavioral changes. Recent neuroanatomical and functional imaging studies have identified evolutionarily related brain circuits

in the encoding and regulation of central emotional states in animals. Dr. Wang will review progress in elucidating the functional activities of these circuits and discuss the challenges and opportunities to link these neural representations to EWB and AD related pathological progression.

OVERVIEW OF EWB AND AGING

Robert Kaplan, *Stanford University, Stanford University, California, United States*

The accumulation of scientific knowledge has been hampered by inconsistent usage of terms and categories. Ontology is the study of categories, their properties, and the relations between them. This presentation considers the definition and measurement of emotional well-being (EWB), a term that has been used inconsistently in research and clinical practice. The category contains eudaimonic and hedonic well-being that represent interrelated but conceptually distinct aspects of mental health. This presentation will review the definition and measurement of EWB and evidence for the validity of the construct. Evidence suggests EWB increases after age 50 and is important for maintenance of cognitive function in old age. Further, low in EWB may be a risk factor for incident AD, and is likely to impair cognitive functioning.

NIA PRIORITIES ON EMOTIONAL WELL-BEING

Janine Simmons, *NIA, Bethesda, Maryland, United States*

In 2021, NIH funded six high-priority research networks designed to develop resources to support and advance the study of emotional well-being (EWB) and its core components. These research networks aim to advance the field by facilitating transdisciplinary research in the social, behavioral, psychological, biological, and neurobiological sciences. The National Institute on Aging (NIA) co-sponsored the RFA, and provided funding for NEW Brain Aging, because of the central importance of EWB to health trajectories across the adult lifespan. In this presentation, Dr. Simmons, Chief of the Individual Behavioral Processes Branch within the NIA Division of Behavioral and Social Research (BSR), will discuss how EWB research fits within NIA priorities. She will then facilitate open discussion about NIA and BSR's vision for the EWB 'network of networks,' the synergy of NEW Brain Aging with other members of the larger network, and the opportunities these networks will provide for investigators interested in EWB.

Session 2275 (Symposium)

NOVEL STRATEGIES TO REACH AND ENGAGE OLDER VETERANS DURING COVID-19

Chair: Amanda Peebles

Discussant: Kim Van Orden

The COVID-19 pandemic and associated public health measures to prevent its spread have important implications for the health and wellbeing of older Veterans. Prior to the pandemic, social isolation was already recognized as a risk for older adults, contributing to increased risk of depression, physical inactivity, and mortality. Stay-at-home orders, social distancing, and transitions to new ways of delivering care have meant that many of the ways in which older Veterans connect with VA and others have changed. Older Veterans and Veterans with serious mental illness (SMI) are

especially vulnerable to experience negative impacts from social isolation and loneliness. This symposium will present on four novel and adapted strategies for engaging with older Veterans during the COVID-19 pandemic and beyond: 1) VA Connection Plans, a whole health intervention to promote social connections for older Veterans with and without SMI (Peeples); 2) telehealth adaptations to PEER, an in-person, peer-delivered exercise intervention for older Veterans with SMI (Muralidharan); 3) VA Compassionate Contact Corps, a VA Voluntary Service program to connect older Veterans with friendly volunteers via telephone (Sullivan); and 4) group telehealth interventions to foster social connection among older Veterans and their families (Weiskittle). Kim Van Orden, geropsychologist and director of the Hope Lab (Helping Older People Engage) at the University of Rochester Medical Center, will serve as discussant.

VA CONNECTION PLANS: A WHOLE HEALTH INTERVENTION TO PROMOTE SOCIAL CONNECTIONS FOR OLDER VETERANS

Amanda Peeples,¹ Samantha Hack,² and Anjana Muralidharan,³ 1. *VISN 5 MIRECC, Baltimore, Maryland, United States*, 2. *VA Maryland Health Care System, Baltimore, Maryland, United States*, 3. *Veterans Affairs Capitol Healthcare Network, Baltimore, Maryland, United States*

The Connection Plan intervention was created as a brief intervention to assist older adults experiencing social isolation during COVID-19. Based in Cognitive Behavioral Therapy (CBT), it is designed to help older adults create a "Connection Plan" to cope with distress related to social isolation. In 1-2 sessions, interventionists work with the older adult to create a Connection Plan with three parts: Mind (ways to change negative thoughts), Body (ways to change unpleasant body sensations), and Connections (ways to increase social engagement). Through soliciting feedback from key stakeholders (Veterans and VA clinicians), the Connection Plan intervention was adapted for the VA context. This paper will present this process of creating the VA Connection Plans manual, as well as associated efforts to disseminate the intervention to 900 VA staff and deliver it to 600 older Veterans with (age 50+) and without (age 65+) serious mental illness.

ENGAGING OLDER VETERANS WITH SERIOUS MENTAL ILLNESS IN PHYSICAL ACTIVITY: IN-PERSON, REMOTE, AND HYBRID MODELS

Anjana Muralidharan,¹ Sera Havrilla,² Alicia Lucksted,² Deborah Medoff,³ Karen Fortuna,⁴ and Amanda Peeples,² 1. *Veterans Affairs Capitol Healthcare Network, Baltimore, Maryland, United States*, 2. *VISN 5 MIRECC, Baltimore, Maryland, United States*, 3. *University of Maryland School of Medicine, Baltimore, Maryland, United States*, 4. *Dartmouth College, Lebanon, New Hampshire, United States*

Older adults with serious mental illness (SMI) have complex care needs across medical, psychiatric, cognitive, and social domains. This growing population exhibits high levels of medical comorbidity and sedentariness. Innovative interventions that promote holistic recovery for this group are needed, especially in the context of the COVID-19 pandemic. Peer Education on Exercise for Recovery (PEER) is a peer coaching intervention, delivered by VA Peer Specialists

(Veterans with lived experience of mental illness), to promote exercise and physical activity among older adults with SMI. This paper will present on three different models of PEER: fully in-person, fully remote, and a hybrid model with both in-person and remote elements. Preliminary data indicates that PEER is (1) engaging and well-liked, (2) associated with greater sustained increases in physical activity compared to an active control, and (3) can lead to sustained physical activity increases that are resilient to situational constraints such as physical distancing.

VA COMPASSIONATE CONTACT CORPS: A PHONE-BASED INTERVENTION FOR VETERANS INTERESTED IN SPEAKING WITH PEERS

Jennifer Sullivan,¹ Lisa Gualtieri,² Maura Campbell,³ Heather Davila,⁴ Jacquelyn Pendergast,⁵ and Prince Taylor,⁶ 1. *VA Providence Medical Center LTSS COIN and Brown University, Providence, Rhode Island, United States*, 2. *VA, Syracuse, New York, United States*, 3. *Department of Veterans Affairs, St. Lois, Missouri, United States*, 4. *Iowa City VA Healthcare System; University of Iowa Carver College of Medicine, Iowa City, Iowa, United States*, 5. *CHOIR, VA Boston healthcare System, Boston, Massachusetts, United States*, 6. *Department of Veterans Affairs, Washington, District of Columbia, United States*

The VA Voluntary Service has developed and implemented a new social prescription program called Compassionate Contact Corps which was created during the COVID-19 pandemic when in-home volunteers could no longer enter Veterans' homes. The program targets Veterans who are lonely, socially isolated or seeking additional social connection. Volunteers and Veterans are matched based on common interests. Trained volunteers provide support by making periodic phone calls. Program referrals are made from VA providers in several clinical programs (e.g. Home-based Primary Care). To date, CCC has been implemented in more than 80 sites in the VA, with 310 volunteers, 5,320 visits, and 4,757 hours spend with Veterans.

GROUP TELEHEALTH INTERVENTIONS FOSTERING SOCIAL CONNECTION AMONG OLDER VETERANS AND THEIR FAMILIES

Rachel Weiskittle,¹ and Michelle Mlinac,² 1. *University of Colorado Colorado Springs, Colorado Springs, Colorado, United States*, 2. *VA Boston Healthcare System, Boston, Massachusetts, United States*

During the early months of the COVID-19 pandemic, virtual and telephone visits rapidly replaced most in-person care within the Veterans Health Administration (VA) to reduce virus spread. To address the emerging mental health needs of older Veterans (e.g., isolation, loneliness), we developed an 8-week group treatment manual, deliverable over telephone or videoconference, to foster social connection and address pandemic anxieties. The manual was disseminated in March 2020 as a rapid response to emergent COVID-19 pandemic realities, during which many locations in the United States called for immediate self-quarantine measures for unknown durations. This talk will present the user-centered design of the manual, preliminary feasibility and acceptability findings from provider surveys, and introduce versions of the manual targeting specific populations (e.g., caregivers, Spanish speakers) currently in development or in pilot testing.

Session 2280 (Symposium)

ORAL HEALTH, COGNITIVE FUNCTION, AND MORTALITY: FINDINGS FROM NATIONAL SURVEYS

Chair: Bei Wu

Co-Chair: Susie Keeper

Discussant: Michele Saunders

Poor oral health, diabetes mellitus (DM), and cognitive impairment are common problems in older adults. Using national surveys, this symposium aims to present new findings regarding the impact of the co-occurrence of DM and poor oral health on cognitive function, cognitive decline, and mortality. This symposium will also cover the topic of dental care use among adult populations in the U.S. Using data from the Health and Retirement Study (HRS) (2006-2018), the first study shows that adults with both DM and edentulism had the worst cognitive function, followed by those with edentulism alone, and those with DM alone. Using the same HRS data, the second study found that co-occurrence of DM and edentulism had a higher risk of more rapid cognitive decline with advancing age than the presence of each condition alone. The third study used data from the 2006-2016 HRS linked with mortality files, and revealed that the risk of diabetes and edentulism on mortality may vary across racial/ethnic groups. Using the Behavioral Risk Factor Surveillance System survey (2002-2018), the fourth study examined disparities of dental service utilization among racial/ethnic groups (Whites, Hispanics, Blacks, Asians, American Indians or Alaska Natives, and Native Hawaiian or other Pacific Islanders). Age differences in dental services were also compared between older adults and other younger and middle-aged populations. This symposium highlights the role of oral health in improving cognitive health. Policies and programs are needed to increase dental care access, a critical way to help maintain good oral health.

DIABETES MELLITUS, EDENTULISM, AND TRAJECTORY OF COGNITIVE DECLINE AMONG OLDER ADULTS

Bei Wu,¹ Chenxin Tan,¹ Brenda Plassman,² Frank Sloan,² Mark Schwartz,³ Samrachana Adhikari,³ Angela Kamer,¹ and Huabin Luo,⁴ 1. *New York University, New York, New York, United States*, 2. *Duke University, Durham, North Carolina, United States*, 3. *New York University, NYC, New York, United States*, 4. *East Carolina University, Greenville, North Carolina, United States*

We examined the impact of diabetes mellitus (DM) and edentulism on the trajectory of cognitive decline, using the Health and Retirement Study. We analyzed self-reported DM and edentulism collected in 2006 and cognition data from 2006 and its follow up waves through 2018. Among 15,709 eligible participants age 50+ in 2006, 65.96% had neither DM nor edentulism (Group 1), 15.12% had DM alone (Group 2), 13.79% had edentulism alone (Group 3), and 5.12% had both conditions (Group 4). Results from linear mixed-effects models show that in comparison to Group 1, individuals in Group 4 had the lowest level of cognitive function, followed by those in Group 3 and Group 2. Group 4 had a modestly faster rate of cognitive decline ($p=0.052$). This study illustrates that co-occurrence of DM and edentulism has a higher

risk of more rapid cognitive decline with advancing age than the presence of each condition alone.

THE IMPACT OF DIABETES AND EDENTULISM ON ALL-CAUSE MORTALITY: RACIAL AND ETHNIC DISPARITIES

Chenxin Tan,¹ Huabin Luo,² Frank Sloan,³ Brenda Plassman,³ Samrachana Adhikari,⁴ Mark Schwartz,⁴ Xiang Qi,⁵ and Bei Wu,¹ 1. *New York University, New York, New York, United States*, 2. *East Carolina University, Greenville, North Carolina, United States*, 3. *Duke University, Durham, North Carolina, United States*, 4. *New York University, NYC, New York, United States*, 5. *Rory Meyers College of Nursing, New York, New York, United States*

This study examined the relationships between the concomitance of diabetes mellitus (DM) and edentulism and mortality among Black, Hispanic, and White older adults in the US. We used data from the 2006-2016 Health and Retirement Study with 2,108 Black, 1,331 Hispanic, and 11,544 White respondents aged 50+. Results of weighted Cox proportional hazards models showed that the concomitance of DM and edentulism was associated with a higher mortality risk for Blacks (Hazard Ratio [HR] = 1.58, $p < 0.01$), Hispanics (HR = 2.16, $p < 0.001$) and Whites (HR = 1.61, $p < 0.001$). Findings also indicated that DM was a risk factor for mortality across all racial/ethnic groups, but edentulism was a risk factor only for Whites (HR = 1.30, $p < 0.001$). This study revealed that the risk of DM and edentulism on mortality varied among racial/ethnic groups. Our study gives alternative explanations for the observed findings.

EFFECTS OF THE CO-OCCURRENCE OF DIABETES AND TOOTH LOSS ON COGNITIVE FUNCTION

Huabin Luo,¹ Chenxin Tan,² Brenda Plassman,³ Frank Sloan,³ Mark Schwartz,⁴ Samrachana Adhikari,⁴ Xiang Qi,⁵ and Bei Wu,² 1. *East Carolina University, Greenville, North Carolina, United States*, 2. *New York University, New York, New York, United States*, 3. *Duke University, Durham, North Carolina, United States*, 4. *New York University, NYC, New York, United States*, 5. *Rory Meyers College of nursing, New York, New York, United States*

Using data from the 2006, 2012, and 2018 waves of the Health and Retirement Study, we estimated effects of co-occurrence of diabetes mellitus (DM) and complete tooth loss (CTL), both self-reported, on cognitive function among 10,816 adults age 50+. Cognitive function was measured using a shortened version of the Telephone Interview for Cognitive Status. Results from the fixed effects linear regression model show that in comparison to those with neither condition, adults having both DM and CTL had the worst cognitive function ($b = 1.49$, $p < 0.001$), followed by having CTL alone ($b = 0.78$, $p < 0.001$), and having DM alone ($b = 0.42$, $p < 0.001$). Our study suggests that CTL is a stronger risk factor for lower cognitive function than DM, and the co-occurrence of DM and CTL poses additive risk. Further research is needed to investigate the pathway from DM and CTL to poor cognition.

DISPARITIES IN DENTAL SERVICE USE AMONG ADULT POPULATIONS IN THE UNITED STATES

Yan Yan Wu,¹ Wei Zhang,² and Bei Wu,³ 1. *University of Hawaii at Manoa, University of Hawaii at Manoa, Hawaii, United States*, 2. *University of Hawaii at Manoa, Honolulu, Hawaii, United States*, 3. *New York University, New York, New York, United States*

This paper aimed to examine disparities of dental service utilization for younger (20-49), middle-aged (50-64), and older adults (65+), among Whites, Hispanics, Blacks, Asians, American Indians or Alaska Natives (AIAN), and Native Hawaiian or other Pacific Islanders (NHOPI). Weighted logistic regression models were conducted to analyze nine waves of data (2002-2018) from the Behavioral Risk Factor Surveillance System. Results show that the all-wave average prevalence was 71% and racial/ethnic disparities increased with age. Black older adults had the lowest level of dental service utilization (65%), comparing to the two highest groups: White older adults (79%) and Asian older adults (76%). The younger adult populations had low prevalences with the lowest among Asians (65%). The AIAN and NHOPI all age groups tended to have average or below average prevalences. Health policy, federal funding, and community-based programs should address needs of dental service utilization for racial/ethnic minorities including Blacks, AIANs, and NHOPIs.

Session 2285 (Symposium)

PERCEIVED PHYSICAL FATIGABILITY: A PROGNOSTIC MARKER OF BIOLOGICAL, ORGAN SYSTEM, AND BRAIN AGING

Chair: Nancy W. Glynn

Co-Chair: Eleanor Simonsick

Discussant: Basil Eldadah

Characterizing perceived physical fatigability enables researchers to quantify an individual's susceptibility to experiencing fatigue in the context of a standardized physical task. This approach eliminates self-pacing, and is a less-biased, more sensitive means to measure the degree to which fatigue may limit activity. Our previous work with two validated measures of perceived fatigability, the Pittsburgh Fatigability Scale (PFS) and Borg Rating of Perceived Exertion (RPE) at the end of a standardized 5-minute treadmill walk, are prognostic indicators of phenotypic aging. This symposium will present new directions related to greater fatigability as a marker of biological aging, organ system health and functioning, as well as brain pathology and structure. Specifically, Mr. Katz will explore the relationship between leukocyte telomere length, a marker of biological aging, with PFS fatigability in participants from the Long Life Family Study. The other four papers use data from the Baltimore Longitudinal Study of Aging (BLSA) and RPE fatigability (RPE). Drs. Simonsick and Karikkineth investigate fatigability as an early marker of aging and disease related impacts on key organ systems, specifically diminished renal function as reflected in estimated Glomerular Filtration Rate and cardiovascular health evaluated as vascular stiffness. Ms. Liu and Dr. Schrack will share whether there are associations of perceived fatigability with brain health, specifically Alzheimer's disease-related pathology (PiB) and changes in

brain structure. Lastly, our Discussant, Dr. Eldadah, will critically review the presentations in the context of new directions in fatigability research.

ASSOCIATION OF LEUKOCYTE TELOMERE LENGTH WITH PERCEIVED PHYSICAL FATIGABILITY

Rain Katz,¹ Joseph Zmuda,² Joseph Lee,³ Lawrence Honig,⁴ Kaare Christensen,⁵ Mary Feitosa,⁶ Mary Wojczynski,⁷ and Nancy W. Glynn,⁸ 1. *University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania, United States*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 3. *Columbia University, New York, New York, United States*, 4. *Columbia University Irving Medical Center, New York, New York, United States*, 5. *Department of Public Health, University of Southern Denmark, Odense, Syddanmark, Denmark*, 6. *Washington University School of Medicine in St. Louis, St. Louis, Missouri, United States*, 7. *Washington University School of Medicine, Washington University School of Medicine, Missouri, United States*, 8. *University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania, United States*

Leukocyte telomere length (LTL) is a potential marker of biological aging, but its relationship to fatigability, a prognostic indicator of phenotypic aging (e.g., functional decline) is unknown. We hypothesized shorter LTL would predict greater perceived physical fatigability. Two generations of participants (N=1,997; 309 probands, 1,688 offspring) were from the Long Life Family Study (age=73.7±10.4, range 60-108, 54.4% women). LTL was assayed at baseline and 8.0±1.1 years later perceived physical fatigability was measured using the validated, self-administered 10-item Pittsburgh Fatigability Scale (PFS, 0-50, higher scores=greater fatigability). Prevalence of greater physical fatigability (PFS scores≥15) was 41.9%. Using multivariate linear regression, one kilobase pair shorter LTL predicted higher PFS Physical scores ($\beta=0.9$, $p=0.025$), adjusted for family relatedness, generation (indicator for age), field center, follow-up time, sex, and follow-up body mass index, physical activity, health conditions. LTL, a promising marker of future fatigability, may allow for early identification of those at-risk for deleterious aging.

FATIGABILITY: AN EARLY MARKER OF DIMINISHED RENAL FUNCTION?

Eleanor Simonsick,¹ Ann Moore,² Michelle Shardell,³ Pei-Lun Kuo,⁴ Ajoy Karikkineth,² and Luigi Ferrucci,² 1. *National Institute on Aging/NIH, Baltimore, Maryland, United States*, 2. *National Institute on Aging, Baltimore, Maryland, United States*, 3. *University of Maryland School of Medicine, Baltimore, Maryland, United States*, 4. *National Institute on Aging, National Institute on Aging, Maryland, United States*

Renal function declines markedly with age due to normal aging and/or disease processes and impacts multiple systems. Diminished renal function may manifest as low exercise tolerance and fatigue threshold. Using data on 951 well-functioning (usual gait speed >.67m/s and no difficulty walking ¼ mile) men and women (51%) aged 60-89 years in the Baltimore Longitudinal Study of Aging, we evaluated the cross-sectional association between perceived fatigability (Rating Perceived Exertion after 5-minute treadmill

walk at 1.5mph) categorized as 6-7, 8-9, 10-11 and 12+ and GFR using Cockcroft-Gault. For each fatigability increment, likelihood of suboptimal (GFR=75-89, 21%), diminished (GFR=60-74, 26%) and poor renal function (GFR=15-59, 30%) relative to GFR \geq 90 was respectively OR(95%CI) p-value 1.51(1.16-1.96).002, 1.38(1.04-1.83).027 and 1.68(1.22-2.31).002 adjusted for demographics, weight, height, smoking, exercise and anemia. Findings were similar for men and women. Perceived fatigability may facilitate identification of apparently well-functioning older adults on the precipice of suboptimal to poor renal function.

ASSOCIATION BETWEEN ARTERIAL STIFFNESS AND FATIGABILITY IN WELL-FUNCTIONING OLDER ADULTS

Ajoy Karikkineth,¹ Luigi Ferrucci,¹ and Eleanor Simonsick,²
1. *National Institute on Aging, Baltimore, Maryland, United States*, 2. *National Institute on Aging/NIH, Baltimore, Maryland, United States*

The association between vascular health measured by arterial stiffness and fatigability, a marker of future mobility decline, is unknown. We examined 1210 men (47.7%) and women from the Baltimore Longitudinal Study of Aging, mean age 66.6 \pm 13.9 years. Perceived fatigability was assessed after a 5-minute, treadmill walk using Borg rating (range 6-20). Arterial stiffness was determined by carotid femoral pulse wave velocity (PWV). In linear regression analyses fatigability and PWV were associated in men (Beta/P-value) (0.160/0.001) and women (0.136/0.008). Adjustment for mean arterial and pulse pressure attenuated the association in women (0.104/0.050) but not men (0.160/0.001). The association was significant among those with slower usual and rapid gait speeds, longer 400m walk time and slower repeated chair stands pace (all p<0.05). Arterial stiffness is associated with a greater proneness to fatigue especially in older adults exhibiting poorer mobility. The underlying mechanisms appear to differ between men and women.

ASSOCIATIONS BETWEEN PERCEIVED FATIGABILITY AND AMYLOID STATUS IN THE BALTIMORE LONGITUDINAL STUDY OF AGING

Fangyu Liu,¹ Ryan Dougherty,² Amal Wanigatunga,² Murat Bilgel,³ Yang An,⁴ Eleanor Simonsick,⁵ Susan Resnick,³ and Jennifer Schrack,² 1. *Johns Hopkins University, Baltimore, Maryland, United States*, 2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 3. *National Institute on Aging, Baltimore, Maryland, United States*, 4. *NIA, Baltimore, Maryland, United States*, 5. *National Institute on Aging/NIH, Baltimore, Maryland, United States*

Higher level of and greater longitudinal increase in perceived fatigability are linked to cognitive decline and lower brain volumes in older adults. However, it remains unclear whether perceived fatigability is associated with Alzheimer's disease-related brain pathology. In the BLSA, 163 participants without neurological disease or cognitive impairment (aged 74.7 \pm 8.4 years, 45% men) were assessed for perceived fatigability using rating of perceived exertion after a 5-minute (0.67 m/s) treadmill walk and A β burden using 11C-Pittsburgh compound B (PiB) positron emission

tomography. Forty-four participants were PiB+ based on a mean cortical distribution volume ratio (DVR) cut point of 1.066. After adjusting for demographics, body composition, comorbidities and ApoE-e4, higher perceived fatigability was not associated with PiB+ status (OR=0.84; 95% CI: 0.69, 1.05). Results suggest perceived fatigability may contribute to cognitive decline through pathways other than A β pathology. Future studies should target other mechanisms linking perceived fatigability and cognitive decline.

LONGITUDINAL ASSOCIATION BETWEEN PERCEIVED FATIGABILITY AND BRAIN VOLUMES IN COMMUNITY-DWELLING OLDER ADULTS

Jennifer Schrack,¹ Fangyu Liu,² Yang An,³ Amal Wanigatunga,¹ Alden Gross,¹ Eleanor Simonsick,⁴ Luigi Ferrucci,³ and Susan Resnick,³ 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 2. *Johns Hopkins University, Baltimore, Maryland, United States*, 3. *National Institute on Aging, Baltimore, Maryland, United States*, 4. *National Institute on Aging/NIH, Baltimore, Maryland, United States*

Perceived fatigability is linked to declining physical and cognitive performance, yet whether fatigability reflects early subclinical change in brain structure is unknown. Using mixed effects models, we assessed the longitudinal association of 3T MRI-derived brain volumes with perceived fatigability after a 5-min treadmill walk (0.67 m/s, 0% grade) using the Borg Rating of Perceived Exertion scale (range 6-20) in 802 BLSA participants (age 68.2 \pm 12.4 years, 45% men 66% White). In models adjusted for intracranial volume, demographics, chronic conditions, and CESD score, declining gray matter volumes in the frontal (β =-0.01) and temporal (β =-0.02) lobes, as well as the hippocampus (β =-0.25), precuneus (β =-0.10) and thalamus (β =-0.19) were associated with higher fatigability. Larger ventricular volumes were also associated with higher fatigability (β =0.02). Brain atrophy, particularly in gray matter and the hippocampal region, is longitudinally associated with increased fatigability in cognitively normal older adults, making it a potential marker of brain atrophy.

Session 2290 (Symposium)

PROSPECTIVE MONITORING OF NEWLY MARKETED DRUGS IN FRAIL OLDER ADULTS USING REAL-WORLD DATABASES

Chair: Dae Kim

Co-Chair: Elisabetta Patorno

In recent years several new drugs have been approved for treatment of heart failure and type 2 diabetes. Despite their life-prolonging benefits, uptake of new drugs is often slow among older patients with frailty due to under-representation of frail older adults in pivotal clinical trials and concerns for adverse events. To optimize pharmacotherapy, timely evaluation of the drug benefits and risks is urgently needed. We propose a novel drug monitoring framework that prospectively evaluates the effectiveness and safety of newly marketed drugs for frail and non-frail patients in real-world databases. This framework utilizes a validated claims-based frailty index (CFI) (range: 0-1; frail if \geq 0.20) to find early signals for effectiveness and safety of new drugs by updating

the analysis at regular intervals as new data become available. In this symposium, we present early results of this prospective monitoring framework for 2 new drug classes using Medicare claims data from the approval date until the end of 2017: 1) angiotensin receptor-neprilysin inhibitor (ARNI) (approved in July 2015) for heart failure with reduced ejection fraction (HFrEF) and 2) sodium-glucose cotransporter-2 inhibitors (SGLT2i) (approved in March 2013) for type 2 diabetes. We first show the uptake of ARNI and SGLT2i over time among the eligible Medicare beneficiaries by clinical characteristics, including frailty. Subsequently we present the results of sequential cohort analysis for the effectiveness and safety results of ARNI and SGLT2i. After these presentations, the panel will discuss the strengths, limitations, and challenges of implementing our monitoring framework in real-world databases.

MONITORING THE EFFECTIVENESS AND SAFETY OF ARNI VS. ANGIOTENSIN RECEPTOR BLOCKER BY FRAILTY STATUS

Dae Kim,¹ Elisabetta Patorno,² and Chandrasekar Gopalakrishnan,² 1. *Hebrew SeniorLife, Boston, Massachusetts, United States*, 2. *Brigham and Women's Hospital and Harvard Medical School, Boston, Massachusetts, United States*

Using Medicare data 2015-2017, we conducted 5 sequential 1-to-1 propensity score-matched analyses of ARNI initiators and angiotensin receptor blockers (ARB) initiators, mimicking the accrual of new data every 6 months. Primary effectiveness endpoint was a composite of heart failure hospitalization or all-cause mortality and primary safety endpoint was a composite of hospitalization or emergency department visits for hypotension, acute kidney injury, hyperkalemia, and angioedema. Among non-frail patients (n=5,014), the rates (per 100 person-years) for ARNI vs ARB were 12.7 and 9.2 (rate difference: 3.4, 95% CI: 0.8 to 6.1), respectively, for the effectiveness endpoint and 5.2 and 3.6 (rate difference: 1.5, 95% CI: -0.1 to 3.2), respectively, for the safety endpoint. Among frail patients (n=2,694), the corresponding rates were 19.8 and 21.6 (rate difference: -1.8, 95% CI: -7.0 to 3.4) for the effectiveness endpoint and 10.9 and 8.0 (rate difference: 2.9, 95% CI: -0.6 to 6.4) for the safety endpoint.

MONITORING THE COMPARATIVE SAFETY OF SGLT2I VS GLP-1 RA IN OLDER ADULTS WITH TYPE 2 DIABETES BY FRAILTY STATUS

Alexander Kutz,¹ Elisabetta Patorno,² Chandrasekar Gopalakrishnan,² and Dae Kim,³ 1. *Brigham and Women's Hospital, Harvard Medical School, Boston, Massachusetts, United States*, 2. *Brigham and Women's Hospital and Harvard Medical School, Boston, Massachusetts, United States*, 3. *Hebrew SeniorLife, Boston, Massachusetts, United States*

Using Medicare (4/2013-12/2017), we conducted 9 sequential analyses of patients with type 2 diabetes initiating SGLT2i vs. GLP1-RA mimicking the accrual of new data every 6 months to monitor SGLT2i safety with respect to diabetic ketoacidosis (DKA) since their U.S. approval. For each analysis, we estimated cumulative HRs (95% CIs) after 1:1 propensity score matching on >70 covariates comparing treatments within frail and non-frail patients. By analysis 1,

SGLT2i were associated with a higher DKA rate vs. GLP-1RA in both frail and non-frail patients, but results were highly imprecise due to few events. With the accrual of more DKA events, precision of the estimates continued to improve through analysis 9 [HR=2.95 (95% CI, 1.19-7.31)] in frail patients; [HR=1.77 (1.15, 2.75)] in non-frail patients], with sufficiently precise estimates by analysis 6 in frail patients [HR=2.80 (95% CI, 1.03, 7.61)] and by analysis 7 in non-frail patients [HR=1.62 (95% CI, 1.01, 2.57)].

MONITORING UTILIZATION TRENDS OF GLUCOSE-LOWERING DRUGS FOR TYPE 2 DIABETES IN OLDER ADULTS BY FRAILTY STATUS

Chandrasekar Gopalakrishnan,¹ Dae Kim,² Alexander Kutz,³ and Elisabetta Patorno,¹ 1. *Brigham and Women's Hospital and Harvard Medical School, Boston, Massachusetts, United States*, 2. *Hebrew SeniorLife, Boston, Massachusetts, United States*, 3. *Brigham and Women's Hospital, Harvard Medical School, Boston, Massachusetts, United States*

Using Medicare fee-for-service data from 2013-17, we identified a cohort of patients with type 2 diabetes (T2D) who initiated a glucose-lowering drug (mean [SD] age, 74.8 (6.9) years). Amongst frail patients (CFI \geq 0.20), metformin use remained stable from 29.1% to 29.4%, whereas sulfonylureas (25.8% to 22.1%) and insulin (21.2% to 19.0%) use declined. Amongst non-frail patients (CFI <0.20), metformin (35.3% to 33.1%) and sulfonylurea (26.2% to 22.2%) use decreased whereas insulin (11.7% to 10.6%) use remained stable. DPP-4i and glitazones use remained stable whereas the use of newer agents such as SGLT-2i and GLP-1 RA increased steadily over the study period in both frail and non-frail patients, though their use remains low (<8%). In conclusion, sulfonylureas and insulin accounted for about one-third of initiated glucose-lowering medications and were more frequently used by frail patients, though their use declined steadily over time with the availability of newer agents.

TRENDS OF ARNI AND OTHER HEART FAILURE MEDICATION USE IN OLDER ADULTS

Yu-Chien Lee,¹ Elisabetta Patorno,² Chandrasekar Gopalakrishnan,² and Dae Kim,³ 1. *Linkou Chang-Gung Memorial Hospital, Department of Family Medicine, Linkou Chang-Gung Memorial Hospital, Taoyuan, Taiwan (Republic of China)*, 2. *Brigham and Women's Hospital and Harvard Medical School, Boston, Massachusetts, United States*, 3. *Hebrew SeniorLife, Boston, Massachusetts, United States*

In 2015-2017, we identified 276,679 to 315,788 Medicare beneficiaries with HFrEF (mean age 76.6-76.7 years, 75.0-76.2% male, 82.0-83.4% Whites, and 44.8-50.9% frail). Since its approval in July 2015, ARNI use increased from 0.3% to 5.7%. ARNI uptake was lower in patients with older age (6.6% for 65-74 years vs 3.4% for \geq 85 years), non-Hispanic race (7.3% for Hispanic vs 5.6-6.6% for other race), no dual eligibility (6.4% for dual eligibility vs 5.5% for no dual eligibility), frailty (5.1% for frailty vs 6.1% for non-frailty) and dementia (3.8% for dementia vs 6.1% for no dementia). Frail patients were less likely than non-frail patients to receive disease-modifying treatments, such as angiotensin-converting enzyme inhibitors (32.4% vs 38.9%), angiotensin

receptor blockers (14.5% vs 17.5%), aldosterone antagonists (20.8% vs 23.4%), and beta-blockers (65.1% vs 68.3%), but more likely to receive symptomatic treatment with loop diuretics (56.4% vs 48.0%).

Session 2295 (Symposium)

RECRUITMENT, ENROLLMENT, AND RETENTION: CREATIVE TECHNIQUES TO OVERCOME OBSTACLES

Chair: Justine Sefcik

Discussant: Darina Petrovsky

The process of recruiting, enrolling, and retaining older adults in research studies has been challenging, even prior to the COVID-19 pandemic. This symposium presents research conducted and lessons learned on recruiting, enrolling, and retaining older adults, including those with cognitive impairment. Insights are provided on what techniques are most beneficial for improving rates of research participation, spanning time prior to and during the pandemic. The first presentation reports on qualitative perspectives of persons living with dementia and their caregivers as to what helped them decide to enroll into a clinical trial together. The second presentation speaks to how variations in incentive payment allocations played a role in consent decisions of patients with amnesic mild cognitive impairment and their study partners. The third presentation discusses the effectiveness of an adapted framework and strategies to increase the recruitment and retention of older Latinos with Alzheimer's Disease and Related Dementias (ADRD) into a clinical trial. The fourth presentation shares techniques for recruiting older adults for a survey study during the pandemic. The fifth presentation defines challenges during a longitudinal study when the pandemic and other natural disasters occurred and strategies for success. Taken together, these presentations will inform researchers on techniques that could be used to improve recruitment, enrollment, and retention of older adults in clinical research.

DYADS' PERCEPTIONS: RECRUITING PERSONS LIVING WITH DEMENTIA AND CAREGIVERS IN A CLINICAL TRIAL

Justine Sefcik,¹ Darina Petrovsky,² Glenna Brewster,³ Junxin Li,⁴ Nalaka Gooneratne,⁵ Nancy Hodgson,⁶ and Miranda McPhillips,⁷ 1. *Drexel University, College of Nursing and Health Professions, Philadelphia, Pennsylvania, United States*, 2. *Rutgers University, Philadelphia, Pennsylvania, United States*, 3. *Nell Hodgson Woodruff School of Nursing Emory University, Atlanta, Georgia, United States*, 4. *Johns Hopkins University, Baltimore, Maryland, United States*, 5. *University of Pennsylvania School of Medicine, Philadelphia, Pennsylvania, United States*, 6. *University of Pennsylvania, School of Nursing, Philadelphia, Pennsylvania, United States*, 7. *University of Pennsylvania, University of Pennsylvania, Pennsylvania, United States*

Recruiting persons living with dementia (PLWD) and their caregivers (dyads) into research is challenging and costly. The purpose of this study was to better understand factors that influence dyads decisions to enroll in a clinical trial. We used Ajzen's Theory of Planned Behavior (TPB) to develop a qualitative interview guide and analyze the data with

a directed content analysis. We conducted semi-structured telephone interviews with 12 PLWD and 9 caregivers who all enrolled in one clinical trial. Aligning with the TPB we found the following positively influenced enrollment: 1) wanting to learn, in-person meetings with knowledgeable staff, and the money always helps (attitudes toward joining); 2) to support another person (perceived norm); and 3) easy to participate (perceived behavioral control). Flexible scheduling and the study taking place in the home was comfortable and convenient for participants. Findings can inform future recruitment efforts and research studies.

VARIATIONS IN PAYMENT ALLOCATION TO PERSONS LIVING WITH COGNITIVE IMPAIRMENT AND STUDY PARTNERS

Miranda McPhillips,¹ Junxin Li,² Justine Sefcik,³ Darina Petrovsky,⁴ Glenna Brewster,⁵ Nancy Hodgson,⁶ and Nalaka Gooneratne,⁷ 1. *University of Pennsylvania, University of Pennsylvania, Pennsylvania, United States*, 2. *Johns Hopkins University, Baltimore, Maryland, United States*, 3. *Drexel University, College of Nursing and Health Professions, Philadelphia, Pennsylvania, United States*, 4. *Rutgers University, Philadelphia, Pennsylvania, United States*, 5. *Nell Hodgson Woodruff School of Nursing Emory University, Atlanta, Georgia, United States*, 6. *University of Pennsylvania, School of Nursing, Philadelphia, Pennsylvania, United States*, 7. *University of Pennsylvania School of Medicine, Philadelphia, Pennsylvania, United States*

There is a paucity of research focused on monetary incentives for recruiting dyads (participants with cognitive impairment and study partners) into research. Our objective was to evaluate if two different variations in allocating compensation among dyads changed consent rates in one clinical trial, Memories2. This trial is evaluating cognitive and functional outcomes of obstructive sleep apnea treatment in patients with amnesic mild cognitive impairment (aMCI). Prior to phone screening, participants were randomly assigned to one of two groups (1) \$200 to participant with aMCI or (2) \$100 to participant with aMCI and \$100 to study partner at consent visit. Allocating all the payment to the participant with aMCI yielded a 2.6% consent rate, while splitting the payment yielded at 1.7% consent rate. We will also discuss how demographic factors affected consent decision by group. This study provides insight into novel strategies that may enhance enrollment of dyads into clinical trials.

RECRUITMENT AND RETENTION FRAMEWORK FOR A TIMED-ACTIVITY INTERVENTION AMONG OLDER LATINOS WITH ADRD

G. Adriana Perez, *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania, United States*

Latino participation in ADRD research is essential to advance cognitive health equity. We present results of an adapted framework to increase recruitment and retention of older Latinos with ADRD and caregivers (CGs) in a timed-activity intervention. Framework factors include 3 structures with strategies informed by a Latino Community Advisory Board. For Characteristics of Study Processes, we included linguistically equivalent data collection procedures/measures, scheduled at times most convenient for participants/CGs.

Participants were called weekly for questions/guidance with procedures. Intervention sessions built-in additional time to embed Latino cultural values: familismo, personalismo, confianza and respeto. Study Team Infrastructure, included bilingual/bicultural members/students; and trusted community partners to assist with participant referrals. For Preferences and Beliefs Toward Research, we conducted a series of focus groups to understand beliefs about “memory health” and perceptions of ADRD risks. Strategies yielded effective results. We reached our recruitment goal; started a wait-list of interested participants; had zero (n=0) attrition.

RECRUITMENT OF OLDER ADULTS DURING THE COVID-19 PANDEMIC: UTILIZING TWO RECRUITMENT TECHNIQUES

Martha Coates,¹ Justine Sefcik,² Zachary Hathaway,³ and Rose Ann DiMaria-Ghalili,² 1. *Drexel University, Bryn Mawr, Pennsylvania, United States*, 2. *Drexel University, College of Nursing and Health Professions, Philadelphia, Pennsylvania, United States*, 3. *Drexel University, Philadelphia, Pennsylvania, United States*

The COVID-19 pandemic has limited in-person interactions and reduced access to research participants. To recruit older adults for a study on the impact of COVID-19 on physical, mental, and social wellbeing we utilized two recruitment techniques: 1) ResearchMatch, a free recruitment database, and 2) a convenience sample of residents in a retirement community. Messages were sent via ResearchMatch to 1,491 adults age 65 and over. In total, 228 individuals responded over 2 weeks; 194 responded in the first 24 hours. Eighty-four completed the online survey. For the retirement community, recruitment information was shared during a Zoom townhall meeting; 44 expressed interest and 30 completed the study (half over the phone with a research assistant). We will discuss differences between the older adults recruited by each strategy (e.g., the ResearchMatch group was highly educated; more staff needed to interview retirement community participants). Overall, these were effective recruitment techniques during challenging times.

IMPLEMENTING PHYSICAL ACTIVITY STUDIES DURING COVID-19 AND WINTER STORMS: LESSONS LEARNED

Annalisa Na,¹ Calliope Murphy,² Tony Chao,³ Charles Morrison,² Karen Chapman,² Ronald Lindsey,² and Mary Hastings,⁴ 1. *Drexel University, College of Nursing and Health Professions, Drexel University College of Nursing and Health Professions, Pennsylvania, United States*, 2. *University of Texas Medical Branch at Galveston, Galveston, Texas, United States*, 3. *University Of Texas Medical Branch, Galveston, Texas, United States*, 4. *Washington University School of Medicine in St. Louis, St. Louis, Missouri, United States*

Patient recruitment and retention are challenging for longitudinal studies. Stay-at-home restrictions for the Galveston and Houston regions in 2020 for COVID-19 and in 2021 for the Winter Storms shut down elective healthcare activities and created additional recruitment barriers during the implementation of a 12-month study examining the physical function of older adults receiving a total knee arthroplasty. This presentation describes recruitment and retention strategies

during natural disasters. Ten participants started the study during the pandemic and 6 remained through the winter storms (3 withdrew, 1 no showed). Physical activity monitors were distributed and collected through mail, patient reported outcomes were completed online or over the phone, clinician-initiated measures were only collected when clinics were open, and efforts were made to minimize staff burden and follow evolving hospital guidelines. Most importantly, regular communication and follow-up with participants, research team, and department personnel created a sense of community.

Session 2300 (Paper)

Social Determinants of Health I

ADULT CHILDREN'S EDUCATION AND OLDER MOTHERS' HEALTH: ARE OFFSPRING'S PROBLEMS MEDIATORS OR MODERATORS?

Robert Frase,¹ Shawn Bauldry,² J. Jill Suitor,² and Megan Gilligan,³ 1. *Purdue University, West Lafayette, Indiana, United States*, 2. *Purdue University, Purdue University, Indiana, United States*, 3. *Iowa State University, Iowa State University, Iowa, United States*

Despite the growing body of literature documenting positive effects of adult children's education on older mothers' health outcomes there is limited research exploring the mechanisms that underlie and influence this relationship. This lack of knowledge limits our understanding of how or under what conditions older mothers benefit from their offspring's resources. In this paper, we draw from theories of the life course, cumulative inequality, and the social foreground to explore how adult children's problems (physical and emotional, personal and financial, and deviant behaviors) mediate and moderate the effect of adult children's education on older mothers' self-rated health and depressive symptoms. To address this question we use data collected from 420 mothers aged 75-85 reporting on their 1,514 adult children, as part of the Within Family Differences Study. Theoretically, this project adds to existing scholarship on intergenerational support in later-life families by identifying the conditions under which adult children's resources improve parents' well-being. Preliminary findings reveal that less educated adult children experience more problems, which in turn, negatively impact mothers' health. Additionally, when adult children experience problems in their own lives, mothers receive less care and financial support from their offspring, even from those who are well-educated and would otherwise have been expected to have shared resources. The findings will have implications for practice by increasing health care providers' awareness that older parents may be at risk for unmet needs for care even when adult children have resources that would have been expected to serve as a safety net.

HEALTH AND SOCIAL DETERMINANTS ASSOCIATED WITH DELAY OF HEALTH CARE AMONG RURAL OLDER ADULTS

Autumn Decker, and Raven Weaver, *Washington State University, Pullman, Washington, United States*

Delaying healthcare has the capacity to increase morbidity and mortality, especially among individuals with chronic and

acute health conditions. Older adults in rural areas are more likely to have chronic health conditions and are more likely to delay care due to financial barriers than their urban counterparts. To further investigate these associations, we conducted descriptive, bivariate, and regression analyses using data from a needs assessment designed to identify health needs and service delivery gaps among an economically diverse eight-county region. A random sample of adults responded to the survey, with 1,226 respondents aged 60+ (mean age = 71). The majority of respondents were White, female, and had insurance coverage. Overall, 35% of respondents experienced a delay in healthcare. We used logistic regression to determine the associations of age, gender, number of health conditions, household income, distance from medical facility, and perceived quality of neighborhood with delay of healthcare. Individuals with younger age ($p = .017$), more chronic conditions ($p < .001$), lower income ($p < .001$), and lower perceived quality of neighborhood ($p = .008$) were more likely to experience a delay in healthcare. These findings highlight risk factors that were salient prior to the onset of the COVID-19 pandemic. However, the pandemic has contributed to an increasing trend of delaying healthcare and may have amplified existing challenges. Findings may inform efforts led by healthcare providers and policy makers to facilitate timely and preventive healthcare use. Future research is needed to investigate the compounding long-term health implications of delaying healthcare.

LIFE COURSE STRESSORS AND FUNCTIONAL LIMITATIONS IN LATER LIFE AMONG WHITE, BLACK, AND HISPANIC ADULTS

Madison Sauerteig,¹ Kenneth Ferraro,¹ and Shawn Bauldry,²
 1. *Purdue University, West Lafayette, Indiana, United States*, 2. *Purdue University, Purdue University, Indiana, United States*

Although striking racial and ethnic disparities in health are manifest during later life, they may be rooted in early-life exposures. Drawing from cumulative inequality theory, we investigate whether experiencing life course stressors increases the risk of later-life functional limitations and whether this relationship differs by race and ethnicity. This study utilizes longitudinal data from the Health and Retirement Study to test whether six indicators of child stressors and eleven indicators of adult stressors predict trajectories of the onset and severity of functional limitations in later life among a diverse sample of adults. We find that child and adult stressors are associated with earlier onset and greater severity of functional limitations during later life. Mediation analyses reveal the indirect influence of child stressors via adult stressors on onset and severity of functional limitations; however, the indirect effects are slightly stronger for Black and Hispanic adults than their White counterparts (i.e., moderated mediation). In sum, child stressors, in and of themselves, do not increase functional limitations among Black and Hispanic people but are associated with greater adult stress exposure, leading to more functional limitations in later life. Disparities in functional limitations are also partly due to lower education and less wealth among Black and Hispanic adults.

SOCIAL ENGAGEMENT AND DEPRESSIVE SYMPTOMS AMONG MIDDLE-AGED AND OLDER ADULTS IN INDIA

Kasturi Banerjee,¹ and Tamara Baker,² 1. *University of Kansas, Lawrence, Kansas, United States*, 2. *University of*

North Carolina, Chapel Hill School of Medicine, University of North Carolina at Chapel Hill (School of Medicine), North Carolina, United States

Social networks and family support are known to have benefits for many older adults globally, and India is no exception. However, the exact nature of the impact of these factors on depression in the Indian population remains largely unexplored. Considering the aging Indian population and changing socio-cultural landscape, it is important to identify the role of social engagement and neighborhood factors in the mental health needs of these older adults. To address this need, this study aimed to identify predictors of depressive symptoms among individuals aged 45+ years from four states in India. Data were taken from the Longitudinal Aging Study in India (LASI) pilot survey in 2010, focusing on the influence social activities, family factors and neighborhood satisfaction variables have on depressive symptomatology. A hierarchical multiple regression analysis was conducted and found that residing in a southern state (Karnataka and Kerala) ($\beta = .178$, $p < 0.05$); lower life satisfaction ($\beta = -.261$, $p < 0.05$); having more living children ($\beta = .110$, $p < 0.05$), less frequently or never visiting friends and relatives ($\beta = .079$, $p < 0.05$) and not liking the neighborhood ($\beta = .072$, $p < 0.05$) were predictors of depressive symptoms. These findings are consistent with limited extant literature on the importance of family and social engagement as predictors of depressive symptoms in this population. Future research should focus on qualitatively examining the interaction between depressive symptoms and social engagement within this population, thereby helping develop targeted interventions, measure outcomes and long term, community engagement-based prevention programs.

THE 2008 RECESSION AND BIOLOGICAL HEALTH: PSYCHOLOGICAL WELL-BEING AND SOCIAL DISADVANTAGE MODIFY VULNERABILITY

Julie Kirsch, *University of Wisconsin-Madison, University of Wisconsin-Madison, Wisconsin, United States*

Racial minorities and educationally disadvantaged experienced more housing loss, unemployment, and financial strain during the 2007-2009 Great Recession. These hardships may heighten stress and amplify persistent and growing health inequities, which were further worsened by the recent COVID-19 pandemic. It is therefore essential to identify factors that contribute to individual differences in vulnerability so that more effective interventions can be implemented, especially in older adult populations who may face unique economic hardships tied to age discrimination. According to the reserve capacity model, higher levels of psychosocial resources, including psychological well-being, can protect against the negative health outcomes related to heightened stress exposure. This study tested the intersections between recession hardship, pre-existing vulnerability defined as racial and educational disadvantage, and psychological well-being as predictors of biological indicators of chronic allostatic load. Chronic allostatic load was assessed with cardiovascular reactivity and recovery to acute mental stress and systemic inflammation (basal indicators of C-reactive protein and interleukin 6). Biological data came from a national sample of adults known as the Midlife in the US Study (MIDUS; age = 25-75, N=863) that completed assessments after the recession. Multiple regression models revealed

that more widespread recession hardship predicted greater biological dysregulation. Tests of three-way interactions revealed that the association between recession hardship and biological dysregulation was strongest among respondents with combined disadvantages of low educational status and low levels of psychological well-being. This study connected a major economic event to individual variation in health vulnerability and identified potential biological pathways to future disease outcomes.

Session 2305 (Symposium)

SOCIAL RELATIONSHIPS IN OLDER ADULTHOOD AND LINKS WITH PSYCHOLOGICAL AND PHYSICAL WELL-BEING

Chair: Emily Willroth

Discussant: Patrick Hill

Positive social relationships are fundamental to psychological and physical well-being across the lifespan. This symposium showcases rigorous daily-diary and longitudinal investigations that (a) examine change in social relationships and loneliness in older adulthood, and (b) investigate links between social relationships and psychological and physical well-being outcomes in older adulthood. First, we present results from a coordinated analysis of three longitudinal studies demonstrating that loneliness tends to increase across the second half of life (Talk 1). Second, we share converging evidence that suggests positive social relationships tend to decline with age. In turn, these longitudinal changes in loneliness and social relationships predict later physical health outcomes (Talk 2). Together, these findings suggest that positive social relationships tend to decrease and loneliness tends to increase with age, resulting in physical health costs. In the second half of the symposium, we turn to research on how positive social relationships may promote psychological well-being, and in turn, better physical health in older adulthood. Using daily diary data, we demonstrate that on days when older adults report more positive social interactions, they also report feeling more sense of purpose (Talk 3). Finally, we show that higher sense of purpose and more positive change in sense of purpose in midlife prospectively predicts better physical health in older adulthood (Talk 4). Together, the research presented in this symposium reveals normative declines in social relationships in late life, while also highlighting the potential health benefits of increasing positive social relationships in older adulthood.

ADVANCING THE STUDY OF LONELINESS AND HEALTH IN OLDER ADULTS THROUGH THE USE OF INTEGRATIVE DATA ANALYSIS

Anthony Ong,¹ Eileen Graham,² Kathryn Jackson,³ Emorie Beck,⁴ Jing Luo,² Olivia Atherton,² Emily Willroth,² and Daniel Mroczek,² 1. *Cornell University, Ithaca, New York, United States*, 2. *Northwestern University, Chicago, Illinois, United States*, 3. *Northwestern University, Chicago, Illinois, United States*, 4. *Northwestern University Feinberg School of Medicine, Chicago, Illinois, United States*

Recent work has shown the importance of studying loneliness and social isolation across adulthood for understanding healthy aging. This project explored loneliness trajectories across multiple independent samples. Using coordinated IDA, we estimated and meta-analyzed identical

multilevel growth models in loneliness using three samples (ELSA, SHARE, HRS). We found u-shaped change, suggesting that loneliness may decline from young adulthood to midlife, then increase after midlife. These trajectories were significant across all three datasets and not fully explained by demographics or depression. We found that divorce, widowhood, social isolation, and functional limitations were associated with higher overall loneliness. Additionally, divorce and functional limitations, and sex (being male) were associated with deeper dips in loneliness in midlife and steeper increases in old age. These findings suggest that loneliness increases across the second half of life and point to the need for evidence-based strategies for addressing social disparities in midlife and later adulthood.

EARLY TRAUMA AND LATER HEALTH: EXAMINING THE MEDIATION OF SOCIAL RELATIONSHIPS IN ADULTHOOD IN HRS

Yin Liu,¹ William Chopik,² Amanda Leggett,³ Jooyoung Kong,⁴ and Courtney Polenick,⁵ 1. *Utah State University, Logan, Utah, United States*, 2. *Michigan State University, East Lansing, Michigan, United States*, 3. *University of Michigan, Ypsilanti, Michigan, United States*, 4. *University of Wisconsin-Madison, Madison, Wisconsin, United States*, 5. *University of Michigan, Ann Arbor, Michigan, United States*

Early trauma is associated with compromised health and well-being in later life, but whether social functioning mediates the association is unclear. Participants in the Health and Retirement Study ($n = 15,946$) had baseline surveys in years 2006 and 2008 (T1), and were followed up twice (T2-3) every 4 years. Health outcomes included depressive symptoms, chronic health conditions, and subjective memory complaints. Social relationships were measured by contacts, relationship strains, and feelings of loneliness. Early trauma was measured by parental physical abuse and alcohol and drug problems in the family before the age of 16. Social contacts decreased over time, while relationship strains and loneliness increased especially for older adults with early trauma, which in turn mediated the associations between early trauma and poorer health in later life. The findings suggested that maintaining positive social relationships are beneficial for better health in late life, especially for individuals with early trauma exposures.

DAILY SOCIAL INTERACTIONS AS A ROUTE TO PURPOSEFUL DAYS IN OLDER ADULTHOOD

Gabrielle Pfund,¹ Mathias Allemand,² and Matthias Hofer,² 1. *Washington University in St. Louis, Saint Louis, Missouri, United States*, 2. *University of Zurich, Zurich, Zurich, Switzerland*

Sense of purpose predicts slower cognitive decline, reduced risk for health issues, and greater longevity (Pfund & Lewis, 2020). However, work is limited regarding how we can help older adults maintain purposefulness in daily life. The current study explored positive daily social interactions as a route to daily purposefulness in older adults, using a measurement burst design. Older adults completed surveys for five-day bursts spread six months apart (Mean age = 70.75, SD = 7.23; $n = 104$). Multilevel models demonstrated that on days when individuals reported more positive social interactions, they reported feeling more purposeful

($b = 0.39$, 95% CI [0.28, 0.51]) when accounting for health, employment, and relationship status. Employment status moderated this association, as daily social interactions were more strongly associated with daily purpose for unemployed/retired individuals ($b = -0.23$, 95% CI [-0.38, -0.08]). Positive social interactions thus may help older adults maintain purposefulness, particularly after retirement.

MAINTAINING SENSE OF PURPOSE IN MIDLIFE PREDICTS BETTER PHYSICAL HEALTH

Emily Willroth, and Daniel Mroczek, *Northwestern University, Chicago, Illinois, United States*

Having a sense of purpose in life is fundamental to psychological and physical well-being. Despite the myriad benefits of purpose, it may be difficult to hold onto purpose as people age and experience fewer future-oriented goals. The present research used reliable change indices to estimate change in sense of purpose during midlife in three diverse samples. On average, sense of purpose declined slightly with age in all three samples. Next, we used linear regression to examine associations between sense of purpose levels and sense of purpose change and later self-reported physical health outcomes. Consistent with our preregistered hypotheses, higher sense of purpose predicted better health in the two larger samples and more positive sense of purpose trajectories better health in all three samples. Together, these findings suggest that both having a sense of purpose and holding onto it may be important for physical health in middle to older adulthood.

Session 2310 (Symposium)

STRESS PROCESSES OVER 2 DECADES: FINDINGS FROM THE NATIONAL STUDY OF DAILY EXPERIENCES

Chair: David Almeida

Discussant: Daniel Mroczek

Daily experiences of stress and the associated sequelae of affective and physiological changes represent the multiple dimensions of a complex, time-dependent process of how stressors unfold in daily life. Daily diaries capture these time-sensitive processes as they occur under real world conditions. Longitudinal changes in stress processes can then be tracked using a measurement burst design: daily diaries repeated longitudinally. Using this design, the National Study of Daily Experiences (NSDE) has generated more than 35,000 days of data from a national sample of over 2,500 adults assessed repeatedly across 20 years of adulthood. The NSDE features details of more than 10,000 reports daily stress including exposure, appraisal and affective responses from adults ranging in age from 24 to 95 years. The current symposium leverages this unique and influential dataset to examine age differences and aging-related changes in daily stress processes with four presentations from the NSDE. First, Dr. Robert Stawski will discuss longitudinal change and age-related differences in exposure to multiple types of daily stressors. Next, Dr. Susan Charles will examine age differences and change in a key element of the stress process: negative affect. Third, Dr. Eric Cerino will describe longitudinal change in appraisals of daily stressors focusing on stressor control. Finally, Dr. David Almeida will examine changes in negative affect

reactivity to daily stressors across the 20 years of the NSDE. Dr. Dan Mroczek will discuss the picture these presentations provide of how aging and age-differences impact the daily stress process and future directions for understanding these trajectories.

AGE-RELATED CHANGE IN THE DAILY STRESSOR REACTIVITY ACROSS 20 YEARS OF ADULTHOOD

David Almeida,¹ Jacqueline Mogle,² and Jonathan Rush,³
1. *Pennsylvania State University, University Park, Pennsylvania, United States*, 2. *Penn State University, University Park, Pennsylvania, United States*, 3. *University of Victoria, Victoria, British Columbia, Canada*

Affective reactivity to everyday stressful events has been shown to be an important predictor of poor mental and physical health. The purpose of this study was to examine longitudinal changes in daily stress across 30 years of adulthood as a critical first step for understanding aging-related trends in daily stress. We used data from the National Study of Daily Experiences (NSDE) to calculate exposure and reactivity to daily stressors collected during telephone interviews over the course of 8 consecutive days. These daily assessment bursts were conducted in 1997, 2007, and 2018. Data were comprised of 33,931 daily interviews from 2,880 adults ages 25-74 at the first burst. Results indicated decreased stressor reactivity over time but this decrease was greater for younger adults. Discussion will focus on how examining change in daily stress processes is critical for illuminating stress and health.

AGE DIFFERENCES AND LONGITUDINAL CHANGE IN EXPOSURE TO DAILY STRESSORS: THREE WAVES OF DIARY DATA ACROSS 20 YEARS

Eric Cerino,¹ Robert Stawski,² and Jonathan Rush,³

1. *Northern Arizona University, Flagstaff, Arizona, United States*, 2. *Oregon State University, Corvallis, Oregon, United States*, 3. *University of Victoria, Victoria, British Columbia, Canada*

Exposure to daily stress is an important risk factor for healthy aging. We examined cross-sectional age-related differences and longitudinal aging-related change in stressor exposure across three waves of the National Study of Daily Experiences ($N=2,914$, $M=51.53$ years, $SD=13.55$, 56.35% Female) spanning 20 years. Exposure to six types of stressors (arguments, avoided arguments, work overloads, home overloads, network stressors, other) were obtained from telephone interviews over 8 consecutive days in waves conducted in ~1996, ~2008, and ~2017. Longitudinal analyses revealed declines in stressor exposure across 20 years ($p < .01$), driven by declines in arguments, work overloads, and network stressors specifically. Cross-sectional analyses indicated that older individuals reported stressors less frequently ($p < .01$), driven by decreases in arguments, avoided arguments, work overloads, and home overloads specifically. Rates of longitudinal decline did not depend on age at baseline. Results suggest that aging-related changes and baseline age differences inform daily stress trajectories in mid- and later-life.

CHANGE IN DAILY NEGATIVE AFFECT ACROSS 20 YEARS

Susan Charles,¹ Jennifer Piazza,² and Jonathan Rush,³

1. *University of California, Irvine, Irvine, California, United*

States, 2. California State University, Fullerton, California State University, Fullerton, California, United States, 3. University of Victoria, Victoria, British Columbia, Canada

The current study examined levels of daily NA among people (N=413) who participated in three waves of the National Study of Daily Experiences (~1996; ~2008; ~2017). At each wave, participants reported how often they had experienced six negative emotional experiences every day for eight consecutive days. Cross-sectional analyses at each time-point show age-related decreases in NA. Trajectories over time, however, were moderated by age (Est = .006, SE = .002, $p = .001$), revealing a curvilinear pattern. Among people who were 25-50 years-old at the first wave, daily NA decreased over time, with decreases more pronounced among the younger adults. For people at least 50 years-old at the start of the study, daily NA increased over time, with the slopes steepest for older adults. Findings indicate that cross-sectional and longitudinal age-related patterns in NA differ when examining data collected from 1996 to 2017.

CHARACTERIZING PERCEIVED CONTROL OVER DAILY STRESS: LONGITUDINAL CHANGES AND ASSOCIATIONS WITH AFFECT

Eric Cerino,¹ Jacqueline Mogle,² Robert Stawski,³ Jonathan Rush,⁴ and David Almeida,⁵ *1. Northern Arizona University, Flagstaff, Arizona, United States, 2. Penn State University, University Park, Pennsylvania, United States, 3. Oregon State University, Corvallis, Oregon, United States, 4. University of Victoria, Victoria, British Columbia, Canada, 5. Pennsylvania State University, University Park, Pennsylvania, United States*

Perceived control is an important psychosocial correlate of healthy aging. Using data from the National Study of Daily Experiences (N=1,047, M=55.82 years, SD=10.35, 57.27% Female), we examined cross-sectional age-related differences and longitudinal aging-related change in perceived control over daily stress across 10 years and explored the influence of stressor control on negative affect (NA) and positive affect (PA). Stressor control, NA, and PA were obtained from telephone interviews over 8 consecutive days in measurement bursts conducted in ~2008 and ~2017. Longitudinal analyses revealed significant declines in stressor control across 10 years ($p < .001$). Cross-sectional analyses revealed marginally lower stressor control among older individuals ($p < .10$). Within-person associations revealed lower NA and higher PA on days when stressor control was higher than usual ($ps < .001$). Results suggest that stressor control declines with age and holds promise as an important component of daily stress processes with relevance for health and well-being outcomes across the lifespan.

Session 2315 (Paper)

Successful Aging

DEVELOPMENT OF A COMPREHENSIVE CHINESE SUCCESSFUL AGING SCALE: INCORPORATING THE VIEWPOINTS OF OLDER ADULTS

Edwin K. H. Chung, and Dannii Yeung, *City University of Hong Kong, Hong Kong, Hong Kong*

Inspiring by Martinson and Berridge's (2015) systematic review, the current definition of successful aging (SA)

fails to acknowledge the laypeople's conceptualization of SA. Adopting a mixed-method approach, two studies were conducted with the aim of soliciting older adults' perceptions of SA and to develop a multidimensional instrument for assessing SA. Study 1 was a qualitative study and 27 community-dwelling older adults (Mage=68.07 years, SD=7.10, range=60-83; 56.3% females) were interviewed. Interview transcripts were analyzed, and seven themes were emerged. An initial item pool for the Successful Aging Scale (SAS) was then established based on these themes as well as those in the SA literature, such as acceptance and independence. Study 2 was a survey study which was conducted among 414 community-dwelling older adults (Mage=64.50 years, SD=4.01, range=60-82; 55.3% females) to identify optimal items for constitution of the SAS. Exploratory factor analysis revealed a 12-factor solution, accounting for 62% of the variance. The 12 factors are adequate health, perceived constraints, flexible attitudes toward life, acceptance of age-related change, life embracement, active engagement, harmonious family, supportive friendship, civic awareness, social contribution, living independently, and adaptive coping strategies. The 12 factors exhibit similar strength of associations with most of the well-being measures, but certain factors show stronger correlation with depressive symptoms and social relationship, suggesting the uniqueness of each factor. Overall, the SAS demonstrates promising psychometric properties. These findings disclose that the older adults' perceptions of SA could cover broader dimensions than those in Rowe and Kahn's model (1997).

I THINK I AGE GRACEFULLY: A FOCUS GROUP STUDY OF SUCCESSFUL AGING CONCEPTIONS AMONG OLDER WOMEN LIVING WITH HIV

Anna Rubtsova,¹ Tonya Taylor,² Gina Wingood,³ Igbo Ofotokun,⁴ Deborah Gustafson,² and Marcia Holstad,⁵ *1. Emory University Rollins School of Public Health, Emory University, Georgia, United States, 2. SUNY Downstate Health Sciences University, Brooklyn, New York, United States, 3. Columbia University Mailman School of Public Health, New York, New York, United States, 4. Emory University School of Medicine, Atlanta, Georgia, United States, 5. Emory University, Atlanta, Georgia, United States*

Our previous quantitative research found high prevalence of self-rated successful aging (SA) among older (age ≥ 50) women living with HIV (OWLH) enrolled in the Women's Interagency HIV Study (WIHS). However, little is known about how OWLH define SA. Most studies have examined SA among predominantly white men living with HIV. Therefore, the purpose of our qualitative study was to examine subjective understandings of SA among OWLH and, as a comparison group, older HIV-seronegative women at risk of HIV. Four focus group discussions (FGD) were conducted among 23 participants (12 OWLH, 11 HIV-seronegative). These women were recruited from WIHS participants previously enrolled in our quantitative study of SA, "From Surviving to Thriving" (FROST), at two WIHS sites - Atlanta and Brooklyn. At each site, we conducted two FGD - one with OWLH and one with older HIV-seronegative women in February-March of 2019. Participants were, on average, 56 years old (range, 51-70), 78% Black, and 60% with annual income \leq \$12,000. A team of coders conducted

thematic coding of fully transcribed FGD using MAXQDA software. Several themes emerged. Both OWLH and older HIV-seronegative women defined SA as “aging gracefully,” i.e. accepting and celebrating aging after having survived hardships of earlier life (e.g., HIV diagnosis, drug use). They also emphasized taking care of themselves (e.g., taking their meds) and spirituality in their definitions of SA. In contrast to HIV-seronegative participants, who prioritized sobriety as taking good care of themselves, OWLH emphasized taking care of their HIV (e.g., “staying on top of your numbers”).

LINKAGES BETWEEN INDIGENOUS CULTURAL GENERATIVITY AND SOBRIETY TO PROMOTE SUCCESSFUL AGING AMONG ALASKA NATIVES

Jordan Lewis, *Memory Keepers Medical Discovery Team/ University of Minnesota Medical School, Duluth campus, Duluth, Minnesota, United States*

This article builds on the People Awakening Project, which explored an Alaska Native understanding of the recovery process from alcohol use disorder and sobriety. The presentation will explore motivating and maintenance factors for sobriety among older AN adult participants (age 50+) from across Alaska. Ten life history narratives of Alaska Native older adults, representing Alutiiq, Athabascan, Tlingit, Yup'ik/Cup'ik Eskimos, from the PA sample were explored using thematic analysis. AN older adults are motivated to abstain from, or to quit drinking alcohol through spirituality, family influence, role socialization and others' role modeling, and a desire to engage in indigenous cultural generative activities with their family and community. A desire to pass on their accumulated wisdom to a younger generation through engagement and sharing of culturally grounded activities and values, or indigenous cultural generativity, is a central unifying motivational and maintenance factor for sobriety. The implications of this research indicates that family, role expectations and socialization, desire for community and culture engagement, and spirituality are central features to both Alaska Native Elders' understanding of sobriety, and more broadly, to their successful aging. Sobriety can put older Alaska Native adults on a pathway to successful aging, in positions to serve as role models for their family and community, where they are provided opportunities to engage in meaningful indigenous cultural generative acts.

PET OWNERSHIP AND LONGITUDINAL CHANGE IN PHYSICAL FUNCTION: EVIDENCE FROM THE BLSA

Erika Friedmann,¹ Nancy Gee,² Eleanor Simonsick,³ Erik Barr,⁴ Barbara Resnick,⁵ Emily Werthman,⁶ and Ikmat Adesanya,¹ *1. University of Maryland, Baltimore, Maryland, United States, 2. Virginia Commonwealth University, Richmond, Virginia, United States, 3. National Institute on Aging/NIH, Baltimore, Maryland, United States, 4. University of Maryland Baltimore, University of Maryland Baltimore, Maryland, United States, 5. University of Maryland School of Nursing, Baltimore, Maryland, United States, 6. University of Maryland, Baltimore, Baltimore, Maryland, United States*

Successful aging depends on avoiding disease and disability, maintaining high physical and cognitive function, and psychological adaptation. Research examining the

relationship of pet ownership (PO) or human-animal interaction (HAI) to human health supports contributions to these successful ag-ing-related outcomes at some point in the life-cycle, mostly in populations with diseases or disabilities. We examine the contributions of PO to maintaining physical capacity among generally healthy community-dwelling older participants in the Baltimore Longitudinal Study of Aging (BLSA). Participants' [N=637, mean age=68.3 years (SD=9.6), pet owners N=149] completed a standardized physical function test battery (among other measures) every 1-4 years and a ten-year PO history. Linear mixed, or generalized linear mixed, models with time varying PO were used to examine change in successful aging-related outcomes over up to 13 years [mean=7.5, (SD=3.6)] according to PO. Physical function declined across all domains examined, but was observed to be less severe with PO in overall physical performance ($p<0.001$), rapid gait speed ($p=0.041$), 400-meter walk time ($p<0.001$), and reported physical wellbeing ($p=0.032$). No differences were observed for grip strength ($p=0.56$), usual gait speed ($p=0.07$), and leisure time physical activity ($p=0.26$) after controlling for age. This study provides the first longitudinal evidence that PO may promote successful aging among community-dwelling healthy older adults by moderating age-related declines in physical functional status in late-life.

THE USE OF CONCEPT-MAPPING TO STRUCTURE THE CULTURAL ADAPTATION OF EDUCATIONAL CURRICULA FOR LATINO OLDER ADULTS

Lisette Piedra,¹ Melissa Howe,² Yadira Montoya,² and Molly Hofer,³ *1. University of Illinois at Urbana-Champaign, Urbana, Illinois, United States, 2. NORC at the University of Chicago, Chicago, Illinois, United States, 3. University of Illinois Extension, Chicago, Illinois, United States*

Culture, embedded in language and reflected in colloquial expressions, influences behaviors and cognitive constructs that affect health. To reach Latino older adults, health promotion efforts should include congruent cultural aspects—such as relevant metaphors, values, and proverbs—that will resonate with their cognitive constructs. However, this content should also be situated within a broader social context. For community-dwelling Latino older adults, this means considering their care systems and the multiple stakeholders within. In this paper presentation, we describe an innovative, interdisciplinary collaboration to culturally and linguistically adapt existing Illinois Extension curricula to meet the needs of Latino older adults and their families living in Cook County, which includes Chicago and its neighboring suburbs. We will demonstrate how concept-mapping (CM) studies can be used to structure the cultural adaptation of educational curriculum to a Latino audience. Specifically, we describe these CM studies, which asked how multiple stakeholders and Latino older adults living in the Chicagoland area defined positive aging provided empirically-grounded direction for our 11-member steering committee, composed of investigators, service leaders, and Latino older adults. We also will describe how the current project deepens relationships in the community that facilitate dissemination efforts to Latino older adults.

UNCOVERING PET ISSUES: A SURVEY OF PROFESSIONALS WORKING WITH OLDER ADULTS AND CARE PARTNERS

Jessica Bibbo,¹ Justin Johnson,¹ Jennifer Drost,² and Margaret Sanders,³ 1. *Benjamin Rose Institute on Aging, Cleveland, Ohio, United States*, 2. *Summa Health System, Akron, Ohio, United States*, 3. *Northeast Ohio Medical University, ROOTSTOWN, Ohio, United States*

Pets can play an important role in older adults' health behaviors and decisions. However, the degree to which these issues are encountered or addressed by professionals working with this population remains unknown. An interdisciplinary (e.g., healthcare, social services) sample of professionals (N=72, 93.05% female, Mage=48.82, SDage=12.57) completed an online survey focused on the pet ownership issues they have encountered while working with older adults, persons with dementia, and care partners. The professionals (n=66) estimated 42.86% of their clients had been pet owners, and 45.58% regularly asked their clients about pets. Issues raised to the professionals varied by type of client. Older adults most often brought up exercising the pet, routine veterinary care, and the financial aspect of ownership (all 37.50%). Persons with dementia most often discussed accessing pet care items (12.50%), exercising the pet (9.72%), and basic pet care (8.33%). Care partners brought up basic pet care (33.33%), planning for the pet due to their care recipients' housing transition (26.38%), and exercising the pet (25.00%). Professionals reported talking to clients about planning for the pet due to housing transition, concerns about falling, and concerns about the pet's behavior (all 31.94%). The professionals (n=69) were very favorable toward pet ownership in general (M=4.43, SD=0.78) (1=extremely unfavorable, 5=extremely favorable), less favorable about older adult pet ownership (M=4.15, SD=0.72, p=.002), and even less favorable about persons with dementia owning pets (M=3.51, SD=0.93, p<.001). The results provide evidence that pet ownership issues are likely encountered in geriatric service settings and may shape healthy aging.

Session 2320 (Symposium)

SUPPORT FROM A DISTANCE: HOW HOME CARE AGENCIES INFLUENCE PAID CAREGIVING IN THE HOME

Chair: Emily Franzosa

Discussant: Robyn Stone

Paid caregivers (e.g., home health aides, personal care attendants, and other direct care workers) who care for functionally impaired older adults in the home frequently report that while rewarding, their work is logistically, physically, and emotionally demanding. Unlike direct care workers in institutional settings, paid caregivers work with care recipients one-on-one in private settings and often have limited contact with or support from their employers. These factors contribute to high workforce turnover and may impact the quality of patient care. In this symposium, we explore ways that home care agency policies and practices influence the experience of giving and receiving care in the home. First, Bryant et al. describe the range of agency-based models and the impact of workplace design in creating supportive working environments. Next, Fabius et al. explore characteristics

of direct care agencies across Maryland, with implications for worker training and support. Reckrey et al. describe the differing perceptions of aides, caregivers and providers around the role agencies play in defining paid caregivers' roles, and how this may lead to conflict within the caregiving team. Finally, in the context of COVID-19, Franzosa et al. examine communication and coordination between Veterans Affairs-paid agencies and home health aides during the pandemic, while Tsui et al. present a case study of an agency's efforts to support paid caregivers through group support calls. Together, these studies highlight challenges in the structure, organization and perceptions of home care agencies, and identify potential avenues for agencies to support paid caregivers and their clients.

JOB DESIGN FOR HOME CARE WORK: PERSPECTIVES FROM EMPLOYERS AND HOME CARE AIDES

Natasha Bryant,¹ Robyn Stone,² and Alex Hennessy,¹

1. *LeadingAge LTSS Center @UMass Boston, Washington, District of Columbia, United States*, 2. *LeadingAge, Washington, District of Columbia, United States*

Home-based care is a rapidly growing sector becoming more important to individuals, families, providers, and payers. The ways in which agencies create the work environment for home care aides who are essentially in their clients' homes is not adequately documented and may be changing rapidly with labor market innovations. This qualitative study describes how different home care business models (e.g., non-profit VNAs, for-profit franchises, uber-style matching, worker-owned coops) address job design and the overall work environment for home care aides. Interviews with employers and focus groups with home care aides examine workplace practices, how work is organized and supported when the workforce is virtual and the workplace is a client's home, and the perceived attributes of a positive workplace environment across business models. This study fills significant knowledge gaps about home care workplace design and the role of agencies in creating a supportive environment.

CHARACTERISTICS, CHALLENGES, AND SUPPORT OF MARYLAND'S DIRECT CARE WORKERS: FINDINGS FROM A STATEWIDE AGENCY SURVEY

Chanee Fabius,¹ Deirdre Johnston,² and Jennifer Wolff,¹

1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 2. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*

Direct care workers (e.g., personal care aides) are paid health care professionals who provide hands on assistance with daily activities to persons with disabilities in home, community, and institutional settings. Many workers are employed by direct care agencies, but little is known or understood about the organizational attributes of these agencies. We describe results from a mixed mode (postal mail, electronic, and telephone) survey of n=1112 residential care agency administrators in Maryland to assess organizational (e.g., size, supplemental services) and direct care worker (e.g., training) characteristics. Preliminary findings indicate that half of direct care agencies' revenue comes from Medicaid and roughly 40% of clients are living with dementia. Administrators report challenges managing dementia-related behaviors (70%), communicating with persons living with

dementia (63%) and interacting with family caregivers (63%). Findings from this work will inform the development of an organizational level intervention that targets training and support of direct care workers.

WHOSE DECISION IS IT? PERSPECTIVES ON AGENCY INVOLVEMENT IN DETERMINING PAID CAREGIVERS' ROLES IN DEMENTIA CARE

Jennifer Reckrey,¹ Deborah Watman,² and Emma Tsui,³

1. *Icahn School of Medicine at Mount Sinai, Icahn School of Medicine at Mount Sinai, New York, United States,*

2. *Icahn School of Medicine at Mount Sinai, New York, New York, United States,*

3. *CUNY Graduate School of Public Health & Health Policy, CUNY Graduate School of Public Health & Health Policy, New York, United States*

Individuals living at home with dementia often rely on a team of caregivers and health care providers. Yet little is known about how the role of paid caregivers within this team is determined. We identified patients with moderate to severe dementia (n=9) and conducted individual interviews with their care teams (family caregiver, paid caregiver, physician) (n=27) to explore perspectives on paid caregiver roles. Participants disagreed on who determined the paid caregiver's role. Agencies were perceived to set limitations on the scope of care (particularly by physicians) but agency care plans were often seen as inadequate and failing to capture important nuances of care. Most family caregivers believed they should guide what paid caregivers did in the home, while most paid caregivers reported relying on their own experience and knowledge. Understanding and addressing these differing perceptions is critical to improving the quality of paid care in the home.

NAVIGATING COVID-19: COMMUNICATION AND COORDINATION BETWEEN HOME CARE AGENCIES AND AIDES CARING FOR OLDER VETERANS

Emily Franzosa,¹ Kimberly Judon,² Eve Gottesman,³

Tessa Runels,⁴ and Nicholas Koufacos,² 1. *Icahn School of Medicine at Mount Sinai, Icahn School of Medicine at Mount Sinai, New York, United States,* 2. *James J. Peters VA Medical Center, Bronx, New York, United States,* 3. *US Department of Veterans Affairs, Bronx, New York, United States,* 4. *West Haven VAMC, West Haven, Connecticut, United States*

Home health aides are essential members of the home care team, but often report limited communication with agency supervisors. To explore the impact of COVID-19 on these dynamics, we conducted semi-structured interviews with providers (n=9), contracted home health agencies (n=6), and aides caring for veterans (n=8) at an urban Veterans Affairs medical center. Data were analyzed through thematic analysis. Agencies relied on aides to observe and report on patients' conditions, including COVID-19 symptoms, but aides were not always aware of follow-up and wanted more information about their patients' health and COVID-19 status. Agencies also reported providing personal protective equipment (PPE) and infection prevention guidance to aides; however, some aides reported purchasing their own PPE and seeking out private COVID-19 testing. Supporting aides by providing needed training and protective resources, and engaging them more collaboratively in medical care, may help improve job satisfaction and quality of care.

RETHINKING EMPLOYER COMMUNICATION AND SUPPORT FOR HOME CARE AIDES: A CASE STUDY OF PANDEMIC GROUP SUPPORT CALLS

Emma Tsui, *CUNY Graduate School of Public Health & Health Policy, New York, New York, United States*

This case study explores an employer-initiated biweekly group support call for home care aides implemented by a large New York City-based home care agency during the COVID-19 pandemic. Specifically, we investigate how agency staff used information gathered through these calls to intervene into existing agency communication and support systems for aides. Our single-site case study analyzes detailed notes from almost 100 support calls that took place between April 2020 and March 2021, as well as interviews with agency staff from communications, human resources, nursing, and other departments that support aides. We compare and contrast new communication and support mechanisms advanced in conjunction with these calls with agency systems pre-pandemic. Our findings suggest that while calls were initially targeted toward providing emotional and operational support, staff also advocated for more systemic supports. We discuss the sustainability of these new efforts, as well as ongoing barriers and gaps.

Session 2325 (Paper)

Technology and COVID-19

I WOULD BE MORE AT A LOSS WITHOUT IT: TECHNOLOGY AS A TOOL FOR RESILIENCE FOR OLDER ADULTS DURING THE COVID-19 PANDEMIC

Rebecca Newmark,¹ Theresa Allison,² Alexander Smith,³ Carla Perissinotto,² and Ashwin Kotwal,⁴ 1. *University of California, San Francisco, Oakland, California, United States,* 2. *University of California San Francisco, San Francisco, California, United States,* 3. *UCSF, UCSF, California, United States,* 4. *University of California San Francisco, University of California San Francisco, California, United States*

COVID-19 associated shelter-in-place orders led to concerns about worsening social isolation and inadequate access to technology among older adults, yet little is known about technology use in this population during the pandemic. We examined older adults' experiences with technology during shelter-in-place in order to identify lessons learned for a post-pandemic world. We conducted semi-structured in-depth interviews with a purposive sample of 20 community-dwelling older adults in San Francisco. Two independent coders conducted concurrent data analysis using inductive and deductive approaches to identify salient themes. Participants were 78 years on average (range 64-99), 55% female, 25% Black, 75% lived alone, and 60% reported at least one ADL impairment. Technology emerged as core aspect of resilience, indicating whether older adults could navigate pandemic restrictions, with two primary themes identified. First, many participants reported discovery of new technologies to maintain or develop new connections, including Zoom-based community groups and telehealth services ("there's all kinds of virtual programs where you can exercise"). Second, older adults were resourceful in identifying community resources and enlisting family members to learn ("I had to ask one

of my granddaughters how to make the chat thing work”). Despite difficulty navigating passwords, software updates and other common obstacles, most participants expressed gratitude for technology and the connectivity made possible. Many indicated an intention to integrate new technology-based social interactions into everyday life even after restrictions ended. The COVID-19 pandemic has highlighted the role technology can play in fostering resilience among older adults in adapting to external stressors.

INFORMATION AND COMMUNICATION TECHNOLOGY CHANGES IN LONG-TERM CARE DUE TO COVID-19

Amy Schuster, and Shelia Cotten, *Clemson University, Clemson, South Carolina, United States*

Residents of long-term care (LTC) facilities (e.g., nursing homes, assisted living facilities) have historically been vulnerable to feelings of loneliness and social isolation. Due to the COVID-19 pandemic, LTC facilities were required to restrict public access in March 2020. LTC communities were not prepared for the residents’ increased socioemotional needs which arose because of the mandated facility lockdown. This study investigated ICT use in LTC facilities and how ICTs are being used by residents since the onset of the COVID19 pandemic. Seventy LTC administrators in South Carolina (12 nursing homes and 58 assisted living facilities) completed an online survey exploring ICT access and use in LTC facilities and whether access and use changed as a result of COVID-19. Administrators from fifty-three percent of LTC facilities reported purchasing ICTs for their residents to use for communicating with family members and telehealth since the onset of COVID-19. LTC administrators reported that using the ICTs helped residents to socialize more frequently and feel more socially connected to their family members, friends and/or other residents. Barriers to ICT use included staff not having time to assist residents with technology, broken technology, and residents not wanting to share technology. LTC facilities were not adequately prepared to support the socioemotional needs of their residents in the event of a federally mandated facility lockdown. Future research should investigate the ICTs available for residents’ use in a national sample of LTC facilities and how LTC administrators adapted the ICTs available as a result of their experiences with COVID-19.

OLDER ADULT TECHNOLOGY USE DURING A GLOBAL PANDEMIC: A STUDY OF MENTAL HEALTH, SOCIAL SUPPORTS, AND RESILIENCY

Geunhye Park, Erin Robinson, and Gashaye M. Tefera, *University of Missouri, Columbia, Missouri, United States*

Older adults have been disproportionately impacted by the COVID-19 pandemic, which has led many to isolate during this time. Technology enables people to remain connected, however little is known about how older adults have used technology and the impact it has had on their mental health and connectedness. This study was to explore how the COVID-19 pandemic has influenced older adult mental health and social connectedness, with a particular emphasis on how technology has played a role. One-on-one interviews (N=29) were conducted with adults aged 65+ (Mean age=71.5; 86% female) via phone/Zoom. Participants were asked open-ended questions about the impact social

distancing has had on their quality of life, health, and social connectedness as well as their technology use to remain connected. Findings highlight the mental health stressors experienced by older adults during the pandemic, as well as much resiliency and innovation. In speaking of the isolation and its effect on her mental health, one participant said, “I thought fighting cancer was bad, but this is worse.” Nearly all of the participants had used technology in some form to remain connected to others, which the most common being a smart phone to call, text, and video-interface. One participant commented, “You can’t beat an iPhone. How in the world could we ever live without an iPhone?” Many participants had learned a new technology during the pandemic, such as Zoom. Our findings raise the possibility that technology may be a good strategy for enhancing well-being of aging population amid the pandemic.

PREFERRED COMMUNICATION CHANNELS AMONG OLDER ADULTS DURING COVID-19

Cheryl Der Ananian,¹ Brad Doebbeling,² G. Mauricio Mejía,¹ Hallie Wine,¹ Michelle Houchins,¹ Frank Infurna,³ and Claire Pishko,¹ 1. *Arizona State University, Phoenix, Arizona, United States*, 2. *College of Health Solutions, Arizona State University, Phoenix, Arizona, United States*, 3. *Arizona State University, Tempe, Arizona, United States*

Social distancing measures put in place during the COVID-19 pandemic limited in-person interactions and may have increased the risk for social isolation and loneliness in older adults. Purpose: The purpose of this study was to understand the communication channels used by older adults (age 50+) during the COVID-19 pandemic to mitigate social isolation and loneliness. Methods: Older adults (n=22) who were selected from a longitudinal study, ‘Aging in the time of COVID,’ and who had self-reported they successfully avoided loneliness, participated in a semi-structured online interview. Participants were asked to describe the communication techniques and efforts they used to stay connected to family and friends during the pandemic. All interviews were recorded and transcribed verbatim. A thematic analysis approach was used to identify common approaches. Results: Participants were primarily female and white (100%) with a mean age of 64.7 years. Preliminary findings (n=5) suggest older adults relied heavily on technology to facilitate communication with family and friends including texting, phone calls, email, video calls or conferences (e.g., Zoom), WhatsApp and social media, primarily Facebook. In-person communication strategies, including one-on-one and small group gatherings following social distancing guidelines, were preferred, but used less often than technology-based approaches. Living close to friends and family, and previous experience with technology were facilitators. Competing work and family demands, distance, and technology challenges limited communication. Conclusions: While older adults may adopt technology at a lower pace, they relied on digital communication technology to maintain social connections during COVID.

USE AND DISUSE OF TECHNOLOGY AMONG PERSONS WITH MEMORY CONCERNS AND THEIR CAREGIVERS DURING THE COVID-19 PANDEMIC

Ashley Millenbah,¹ Elizabeth Albers,² Jude Mikal,² Jessica Finlay,³ Eric Jutkowitz,⁴ Lauren Mitchell,⁵ Brenna Horn,⁶ and Joseph Gaugler,² 1. *University of*

Minnesota, University of Minnesota, Minnesota, United States, 2. University of Minnesota, Minneapolis, Minnesota, United States, 3. University of Michigan, Ann Arbor, Michigan, United States, 4. Brown University, Brown University, Rhode Island, United States, 5. Emmanuel College, Boston, Massachusetts, United States, 6. University of Minnesota/ Families and Long-Term Care Projects, Minneapolis, Minnesota, United States

Social distancing and shelter-in-place orders designed to curb the spread of COVID-19 increased isolation among persons with memory concerns (PWMC) and increased the burden on individuals providing their care. Technology, such as smartphones or tablets, has demonstrated potential to improve the social connections and mental health of older adults; however, older adults historically have been reluctant to adopt new technology. We aimed to understand why some PWMC and their caregivers used new technology to adapt to lifestyle changes during the COVID-19 pandemic while others did not. In this study, we used data collected in 20 qualitative interviews from June to August, 2020 with PWMC and their family caregivers to assess changes in and barriers to technology use. Qualitative thematic analysis identified three themes which explained motivations for using new technology during a pandemic: 1) seeking relief from caregiver burden, 2) alleviating boredom, and 3) maintaining social connection. Results further revealed lingering barriers to PWMC and caregiver adoption of technologies, including: 1) PWMC dependence upon caregivers, 2) a lack of familiarity with technology, and 3) difficulties using technology. This in-depth investigation suggests that technology has the ability to provide caregivers relief from caregiving duties and provide PWMC with more independence during periods of pronounced isolation

Session 2330 (Symposium)

THE SILENT MAJORITY: AGING WITH HIV

Chair: Paul Nash

Discussant: Molly Perkins

Those over the age of 50 represent the majority of people living with HIV (PWH), most of the HIV research, prevention and service retention work is targeted at 'at-risk' communities under age 50. Given this diverse and growing population, intersections of age with HIV need to be prioritized. This focus would actively increase quality of care and life experience for older PWH and the growing numbers transitioning into old age. Using local, national, and international data, this symposium will highlight the unmet social needs of older PWH. Presentations will provide evidence of unmet need, decreased self-esteem, enhanced health burden, and the damaging nature of stigma. Given the impact of COVID-19 globally, the data will further demonstrate the need to support immunocompromised older PWH. Older PWH are a marginalized community and the effects of COVID-19 have been disproportionately severe. With the adverse health outcomes experienced because of COVID-19 and intersectional stigma, it is important to understand the support structures that are and are not in place for older PWH. Advance care directives make up an integral part of future planning, especially for those living with chronic health concerns, yet little

research has previously evidenced the steps taken by OPWH. Finally, using data from sub-Saharan Africa, emotional and instrumental social support sufficiency will be described to highlight the unmet needs of these older PWH. Our discussion will focus on the need for policies and programs to support this growing segment of the HIV population with increasingly diverse and unmet needs.

FAILING TO PLAN IS PLANNING TO FAIL: UTILIZATION OF ADVANCE CARE DIRECTIVES IN OLDER ADULTS LIVING WITH HIV

Paul Nash,¹ Annie Nguyen,² Anna Egbert,³ Mark Brennan-Ing,⁴ and Stephen Karpiak,⁵ 1. University of Southern California, Los Angeles, California, United States, 2. University of Southern California, Alhambra, California, United States, 3. Ronin Institute, Montclair, New Jersey, United States, 4. Brookdale Center for Healthy Aging Hunter College, CUNY, New York, New York, United States, 5. GMHC, National Resource Center on Aging and HIV, New York, New York, United States

Advance Care Planning (ACP) makes up an integral part of the care continuum, especially for those living with chronic conditions such as HIV. Little research exists to understand how intersections of race, gender, sexuality and gender identity combine to influence the choices made by older adults living with HIV regarding ACP. The Research on Older Adults with HIV (ROAH) 2 study collected data from across the US and investigated the incidence and range of ACP amongst those 50+ living with HIV. Correlational analysis indicated that being White was significantly related to having at least one directive (R=0.070, p=0.035) where being African American correlated negatively with several forms of ACP. Additionally, there were also significant relationships between being Transgender, being gay, and being a woman as to the engagement with ACP options. Further analysis explored the impact of finance, self-rated health and social support networks.

LIVING WITH HIV THROUGH THE COVID-19 PANDEMIC: IMPACTS ON OLDER ADULTS IN NEW YORK CITY

Annie Nguyen,¹ and Stephan Karpiak,² 1. University of Southern California, Alhambra, California, United States, 2. GHMC, New York, New York, United States

New York City was among the first to institute physical distancing and shutdowns to curb community spread of COVID-19. The pandemic has amplified issues related to isolation. We investigated the challenges created by the pandemic older adults living with HIV in NYC. 137 participants were recruited Sept-Nov 2020 from the oldest ASO in NYC, to complete surveys. Demographics: mean age=60.4; 58.3% men; 43.1% black/AA, 24.1% white; 48.9% gay, 30.7% straight; mean years living with HIV= 23.0, 92.6% reported undetectable viral loads. About one-third experienced hunger/food insecurity during the pandemic and 48.2% said they were not getting enough financial support from usual sources. Some (43.3%) reported skipping doses of HIV medications and 69.8% felt more isolated compared to before the pandemic. Those who lived alone (77.4% of total) were significantly more likely to report feeling depressed, follow

media coverage on COVID-19, skip HIV medications, and experience changes in sleep patterns.

PERCEPTIONS OF SOCIAL SUPPORT SUFFICIENCY AMONG OLDER ADULTS WITH HIV IN SUB-SAHARAN AFRICA

Mark Brennan-Ing,¹ Jennifer Kaufman,¹ Kristen Porter,² Catherine MacPhail,³ Janet Seeley,⁴ and Stephen Karpiak,⁵
 1. Brookdale Center for Healthy Aging Hunter College, CUNY, New York, New York, United States, 2. John W. McCormack Graduate School of Policy and Global Studies, Moultonborough, New Hampshire, United States, 3. School of Health & Society, University of Wollongong, Bulli, New South Wales, Australia, 4. London School of Hygiene and Tropical Medicine, London, England, United Kingdom, 5. GMHC, National Resource Center on Aging and HIV, New York, New York, United States

Globally, the greatest number of older people with HIV (OPWH) are in sub-Saharan Africa (3.7 million). This population will continue to expand with greater access to anti-retroviral therapy. Compared to OPWH in high income countries, these OPWH have constrained access to government and community-based services and largely rely on assistance from family, friends, and neighbors for their social support needs. We examined factors related to perceptions of instrumental and emotional support sufficiency (availability and adequacy) among OPWH age 50 and older in Uganda (n = 101) and South Africa (n = 108). Significant covariates of instrumental support sufficiency included not having an AIDS diagnosis, greater support from family, and less support from friends. Significant covariates of emotional support sufficiency were fewer depressive symptoms, greater support from family, and geographic location (Uganda). Explanation of these findings based on social network characteristics and implications for policy and program development will be discussed.

STIGMA IMPACTS HEALTH DISPARITIES AND INEQUITIES IN LGBTQ AND PEOPLE OF COLOR AGING WITH HIV

Anna Egbert,¹ Paul Nash,² Mark Brennan-Ing,³ and Stephen Karpiak,⁴
 1. Ronin Institute, Montclair, New Jersey, United States, 2. University of Southern California, Los Angeles, California, United States, 3. Brookdale Center for Healthy Aging Hunter College, CUNY, New York, New York, United States, 4. GMHC, National Resource Center on Aging and HIV, New York, New York, United States

The impact of stigmatizing attitudes and discriminatory behaviors on health disparities and inequities in non-heterosexual individuals, people of color (PoC), older adults, and persons living with HIV becomes increasingly recognized. This quartette of stigmatized characteristics elevates the risk of barriers to medical services, burden of disease and unfavorable health outcomes in LGBTQ-PoC aging with HIV. Using data from ROAH 2.0 study (N=723), we explored facets of stigma, barriers to medical services and health status in racial/ethnic minorities of older adults with HIV (OAH) living in California, New York, and Illinois. Stigma was evident in >50% of OAH who expressed reservation to self-disclose HIV status. Importantly, 20%-24%

of Asian, Black/African-American, Hispanic/Latinx and Multiracial vs. 7% White OAH withheld this information from at least one health care provider. Over 10% of OAH experienced prejudice/discrimination while accessing service. Non-disclosure and prejudice/discrimination were linked to lower self-rated health status, thus, evidencing stigma-related health burden.

Session 2335 (Symposium)

THE WISCONSIN LONGITUDINAL STUDY: NEW COGNITIVE, GENETIC, BIOLOGICAL, AND SOCIAL DATA AND A DIVERSIFYING SAMPLE

Chair: Michal Engelman

The Wisconsin Longitudinal Study (WLS) has followed a sample of one in three Wisconsin high school graduates from the class of 1957 for over 64 years, making it an excellent data source for researchers interested in linking early and midlife characteristics to a wide range of later-life outcomes. The WLS is unique among major studies of aging cohorts for its duration of follow up, the inclusion of siblings, and the combination of rich social and health information. This symposium will provide an overview of the WLS, describe recent data collection and linkages, and introduce ongoing efforts to diversify the educational and racial/ethnic composition of the study sample. WLS data cover nearly every aspect of the participants' lives from early life socioeconomic background, schooling, family, and work, to physical and mental health, social participation, civic engagement, well-being, and cognition. The study is linked to administrative data including Medicare records, Social Security records, mortality records, and resource data on primary and secondary schools attended by participants as well as characteristics of their employers, industries, and communities of residence. Recent data collection efforts have generated a wealth of new biological and cognitive information, including genetic data collected from saliva and blood samples, measures of the gut microbiome, and derived polygenic scores for educational attainment, cognitive performance, depression, and subjective well-being. The currently-fielding ILIAD effort is implementing rigorous AD diagnostic protocols to track the progression of dementia across cognitive phenotypes. The symposium will conclude with practical information on accessing and using the data.

THE WISCONSIN LONGITUDINAL STUDY: OVERVIEW, DATA LINKAGES, AND FUTURE PLANS

Michal Engelman, *University of Wisconsin-Madison, Madison, Wisconsin, United States*

The WLS is a study of Wisconsin high school class of 1957 graduates, with follow-ups in 1964, 1975, 1993, 2004, 2011, and 2020. The data reflect the life course of the graduates (and their siblings), initially covering education, switching to family, career, and social participation in midlife, and physical and mental health, cognitive status, caregiving, and social support as respondents age. The WLS is linked to multiple administrative data sources including: parent earnings from state tax records (1957-60) and Social Security earnings and benefits for respondents; 1940 Census

data; characteristics of high schools and colleges, employers, industries, and communities of residence; voting records from 2000-2018; Medicare claims; and the National Death Index. Efforts are underway to expand the racial/ethnic and educational composition of the WLS by supplementing the original sample with a new cohort of age-matched adults drawn from Wisconsin's Black, Hispanic, Asian-American, and Native American communities.

WLS-ILLAD: INITIAL LIFETIME'S IMPACT ON ADRD

Pamela Herd, *Georgetown University, Georgetown University, District of Columbia, United States*

Between 2021 and 2025, WLS will collect two new waves of data, which will capture detailed measures of cognitive change and dementia as the cohort reaches their early to mid 80s. In this session, I will provide an overview of the data that we're collecting, as well as opportunities to explore early and mid-life determinants of cognitive change and dementia onset in this unique study. Compared to existing studies, the WLS offers some novel opportunities. First, it will provide one of the only opportunities to study how early and midlife life conditions and experiences, on data gathered prospectively, can shape cognitive trajectories and dementia in later life. Second, its unique sibling design provides significant analytic advantages, improving causal inference. Third, the study includes a large group of rural participants, allowing for closer examinations of how rural conditions may shape risk and resilience against cognitive decline and dementia in later life.

WLS-ILLAD: NEW LONGITUDINAL RESOURCE FOR COGNITIVE AND DEMENTIA DATA

Sanjay Asthana,¹ Pamela Herd,² and Victoria Williams,³

1. *University of Wisconsin, Madison, Wisconsin, United States*, 2. *Georgetown University, Georgetown University, District of Columbia, United States*, 3. *Division of Geriatrics and Gerontology, UW-Madison, University of Wisconsin-Madison, Wisconsin, United States*

One of the distinctive strengths of WLS is the availability of Henmon-Nelson IQ scores on all participants while in high school, followed by prospective collection of data through cognitive batteries of varying size and sophistication. Launched in 1993, the initial longitudinal cognitive testing included 8 abstract reasoning items followed by the administration of larger cognitive batteries in 2004 and 2011 comprised of a 10-item word recall test, digit ordering task, phonemic and category fluency, as well as repeated and new items from the WAIS-R similarities task first administered in the 1993 survey. In 2018, with R01 funding from NIA, the scope of cognitive testing expanded significantly and includes administration of a phone-based cognitive screening measure, and a comprehensive in-person neuropsychological assessment for individuals identified at risk for dementia targeting a range of cognitive domains, including memory, language, attention, visuospatial abilities, and executive functioning.

BIOLOGICAL MEASURES IN THE WLS: GENETIC AND MICROBIOME DATA

Kamil Sicinski, *University of Wisconsin-Madison, Madison, Wisconsin, United States*

Ever since releasing genotype data in 2017, the WLS continually expands resources available to users interested in genetic research. Key advantages to the WLS data for genetics research include its sibling sample and nearly full life course longitudinal study design. In 2021, we now have state-of-the-art polygenic scores available in multiple domains, such as health, cognition, fertility, personality, risk behaviors and attitudes, and life satisfaction. The scores cover phenotypes spanning from adventurousness, through educational attainment, to age at which voice deepened. Additionally, the genotype data was re-imputed in 2021 to the superior Haplotype Reference Consortium reference panel and the WLS expects to obtain copy number variants data next year. In addition to genetic data, we have a set of novel microbiome data on a subset of participants that allows researchers to study relationships between environments and gut microbial composition.

HOW TO ACCESS AND USE DATA FROM THE WISCONSIN LONGITUDINAL STUDY

Carol Roan, *University of Wisconsin - Madison, Madison, Wisconsin, United States*

With over 27,000 analysis variables covering more than 60 years of participants' lives, the WLS data can be overwhelming to new users who are looking for the measures they need to answer their research questions. Core WLS survey data is free and easy to download from our website. As we add new types of measures and new waves of data, we refine our data sharing methods to balance our need to make the data easily available with the need to protect the confidentiality of participants. This presentation will teach users how to access to the data files they need for their research and how to use our online documentation of survey instruments and data files. Symposium attendees will also receive a USB drive with the publicly available data and complete documentation.

Session 2340 (Symposium)

TRANSITIONS TO LONG-TERM RESIDENTIAL CARE SETTINGS

Chair: Bram de Boer

Co-Chair: Hilde Verbeek

Discussant: Joseph Gaugler

During their life course, many older adults encounter a transition between care settings, for example, a permanent move into long-term residential care. This care transition is a complex and often fragmented process, which is associated with an increased risk of negative health outcomes, rehospitalisation, and even mortality. Therefore, care transitions should be avoided where possible and the process for necessary transitions should be optimised to ensure continuity of care. Transitional care is therefore a key research topic. The TRANS-SENIOR European Joint Doctorate (EJD) network builds capacity for tackling a major challenge facing European long-term care systems: the need to improve care for an increasing number of care-dependent older adults by avoiding unnecessary transitions and optimising necessary care transitions. During this symposium, four presenters from the Netherlands and Switzerland will present different aspects of transitions into long-term residential care. The

first speaker presents the results of a co-creation approach in developing an intervention aimed at preventing unnecessary care transitions. The second speaker presents an overview of interventions aiming to improve a transition from home to a nursing home, highlighting the clear mismatch between theory and practice. The third speaker presents the impact of the COVID-19 pandemic on transitions into long-term residential care using an ethnographic study in a long-term residential care facility in Switzerland. The final speaker discusses the results of a recent Delphi study on key factors influencing implementing innovations in transitional care. The discussant will relate previous findings on transitional care with a U.S. perspective.

DEVELOPING A REABLEMENT PROGRAM AIMED AT PREVENTING UNNECESSARY CARE TRANSITIONS AFTER GERIATRIC REHABILITATION

Ines Mouchaers,¹ Hilde Verbeek,¹ Gertrudis Kempen,¹ Jolanda van Haastregt,¹ Ellen Vlaeyen,² Geert Goderis,² and Silke Metzeltin,¹ 1. *Maastricht University, Maastricht, Limburg, Netherlands*, 2. *KU Leuven, Leuven, Vlaams-Brabant, Belgium*

Patients returning home after geriatric rehabilitation may encounter several challenges related to daily functioning, which only manifest after returned home due to the large difference in environment and amount of support provided in both settings. This study aimed to develop an intervention preventing transitional care. A co-creation design was used, including literature research, observations, interviews, and working groups including a variety of stakeholders (n=13), including care professionals, policymakers of the municipality, client representatives, and an expert in the field of geriatric rehabilitation. Results indicated four main causes for transitional care problems: lack of communication between patients and professionals, coordination and continuity of care, patients' limited self-management skills, and insufficient preparation. To solve these problems, an intervention was developed consisting of six intervention components aiming to increase self-management during meaningful daily activities, narrow the gap between the rehabilitation and home setting, and enhance communication and coordination.

A MISMATCH BETWEEN THEORY AND PRACTICE IN THE TRANSITION FROM HOME TO A NURSING HOME: A SCOPING REVIEW

Lindsay Groenvynck,¹ Amal Fakha,¹ Bram de Boer,¹ Jan Hamers,¹ Matheus van Achterberg,² Erik van Rossum,³ and Hilde Verbeek,¹ 1. *Maastricht University, Maastricht, Limburg, Netherlands*, 2. *KU Leuven, Leuven, Vlaams-Brabant, Belgium*, 3. *Zuyd University of Applied Sciences, Heerlen, Limburg, Netherlands*

The transition from home to a nursing home is a complex process, existing of three transition phases (pre-, mid- and post-transition). It is often fragmented, leading to negative outcomes for older persons and informal caregivers. To prevent these negative outcomes, knowledge of existing transitional care interventions is paramount. Therefore, a scoping review was performed, summarizing current interventions aiming to improve transitional care. The review identified 17 studies, describing eight multi- and five single-component interventions. From the multi-component interventions,

seven main components were identified: education, relationships/communication, improving emotional well-being, personalized care, continuity of care, support provision, and ad hoc counseling. This review identified a clear mismatch between theory on optimal transitional care and current transitional care interventions. All interventions focused on either a specific phase or target population throughout the transition process. This inhibits a continuous transition process in which a partnership between all stakeholders involved exists.

TRANSITION INTO LTRC DURING THE COVID-19 PANDEMIC: AN ETHNOGRAPHIC CASE STUDY

Megan Davies,¹ Franziska Zúñiga,¹ Hilde Verbeek,² and Sandra Staudacher-Preite,³ 1. *University of Basel, Basel, Basel-Stadt, Switzerland*, 2. *Maastricht University, Maastricht, Limburg, Netherlands*, 3. *Nursing Science, Department of Public Health, University of Basel/Basel, Basel-Stadt, Switzerland*

COVID-19 has affected long-term residential care (LTRC) disproportionately due to the high-risk population, lack of resources and insufficient preventative measures. Protective measures, including quarantine and strict visitation restrictions have made transitions into LTRC more challenging. Further insight is needed to understand how residents, relatives and staff have experienced this during the COVID-19 pandemic. During four months of fieldwork in a LTRC facility in Switzerland, a rapid ethnography consisting of interviews, observations, informal conversations and document analysis was conducted. This study included a total of 14 residents, 21 healthcare staff from varying departments and 7 relatives of residents. First results indicate that protective measures interfere with a resident's ability to find meaningful activities and interactions within LTRC as well as the possibility to maintain mobility. This and limited family contact following a move into LTRC prevents a smooth transition from home to LTRC and impacts overall resident quality of life.

IMPLEMENTATION OF TRANSITIONAL CARE INNOVATIONS: CONSIDERING THE ORGANIZATIONAL CONTEXT AND PROCESS IS KEY

Amal Fakha,¹ Bram de Boer,¹ Matheus van Achterberg,² Jan Hamers,¹ and Hilde Verbeek,¹ 1. *Maastricht University, Maastricht, Limburg, Netherlands*, 2. *KU Leuven, Leuven, Vlaams-Brabant, Belgium*

Many transitional care innovations (TCI) are implemented to improve long-term care services for older persons during the transition between various care settings. Nevertheless, multiple contextual factors (barriers; facilitators) influence the implementation of TCI at different levels such as but not limited to the organizational environment, outer setting, or innovation's characteristics. By conducting a modified Delphi study involving 29 international experts from 10 countries, eleven influencing factors were prioritized and agreed upon (with $\geq 85\%$ consensus level) as the most important for implementing TCI. These top factors were linked mostly to the organizational setting (e.g. resources, financing) or the implementation process (e.g. engaging key stakeholders). Moreover, the feasibility to address the majority of these factors with implementation strategies was rated as difficult. Our work concludes a compilation of major

factors to be aware of and aim to tackle when preparing to implement a new TCI in any long-term care setting.

Session 2345 (Symposium)

A TOOLKIT FOR ADVANCING AGE INCLUSIVITY IN HIGHER EDUCATION

Chair: Joann Montepare

Co-Chair: Kimberly Farah

The pioneering Age-Friendly University (AFU) initiative, endorsed by GSA's Academy for Gerontology in Higher Education (AGHE), calls for institutions of higher education to respond to shifting demographics and the needs of our aging populations through more age-friendly programs, practices, and partnerships. Over 70 institutions have joined the AFU global network and adopted the 10 AFU guiding principles. In support of the initiative, a GSA-AGHE-AFU workgroup was organized to develop strategies to help GSA members and their campuses explore how they can be more age-inclusive and create pathways to joining the AFU network. One outcome of the workgroup's efforts was the creation "Tools for Advancing Age Inclusivity in Higher Education", designed with support from AARP. In this symposium, workgroup members describe this suite of tools which can be used by faculty, students, administrators, and other campus leaders. Montepare will introduce the symposium with an overview of the AFU network and the workgroup's goals. Morrow-Howell and Schumacher will discuss tools for "Making the Case" with examples from efforts on their campuses. Porter and Bergman will describe tools for "Getting Started" and how campuses can begin to mobilize age-friendly efforts. Andreoletti and June will share tools for "Gaining Momentum" with tips for creating age-friendly campus connections and collaborations. Silverstein and Gugliucci will describe tools for "Assessing and Tracking Success" that can be used at any stage of the process for exploring a campus's age-friendliness. Information about joining the AFU network will be provided.

LEARN, ENGAGE, AND ACT TO ADVANCE AGE INCLUSIVITY IN HIGHER EDUCATION

Joann Montepare, *Lasell University, Newton, Massachusetts, United States*

Shifting age demographics are reshaping our social structures with far-reaching implications for higher education. Aging populations mean more older adults are looking to higher education to meet their professional needs and personal interests, and the longevity economy is calling for a trained workforce to provide services to support the health and functioning of individuals as they age. As well, there is a need to improve students' aging literacy, along with developing synergistic age-friendly campus-community partnerships to address aging issues. How can institutions explore, create, develop, and sustain more age-friendly programs, practices, and partnerships? This presentation will introduce the toolkit specially designed by the GSA-AGHE Workgroup for use by faculty, students, administrators, and other campus leaders, and will provide an overview of the Age-Friendly University (AFU) initiative and its 10 guiding principles for creating more age-inclusive campuses.

MAKING THE CASE FOR ADVANCING AGE INCLUSIVITY

Nancy Morrow-Howell,¹ and John Schumacher,²

1. Washington University in St. Louis, Saint Louis, Missouri, United States, 2. University of Maryland, Batlimore County, Baltimore, Maryland, United States

How do you present the most effective case for promoting age-inclusivity to your campus leadership? Educational institutions differ in their missions and resources; and these factors affect their readiness to becoming more age-inclusive. This presentation suggests that the best approaches are tailored to intentionally and robustly advance your institution's values, mission, and strategic plan as demonstrated through your proposed age-inclusivity initiative. We review the persuasive arguments for increasing the focus on age-inclusivity in higher education, including securing increasing external research and development funding, supporting employees and alums exploration of encore careers, attracting more students in light of demographic shifts, contributions to overall campus diversity, etc. Identifying the most compelling arguments for particular institutions, consistent with their missions, is connected to the various resources in the AFU toolkit. Finally, we show examples from a range of institutions who successfully made their cases for embracing age inclusivity and have not looked back.

GAINING MOMENTUM AROUND ADVANCING AGE INCLUSIVITY

Carrie Andreoletti,¹ and Andrea June,² *1. Central Connecticut State University, New Britain, Connecticut, United States,*

2. Central Connecticut State University, Central Connecticut State University, Connecticut, United States

Have you already experienced some success with age friendly initiatives at your institution but are wondering how you might broaden your reach? Fostering connections across disciplines and units on your campus as well as with organizations in your community is the key to gaining momentum and advancing age inclusivity. This presentation will discuss strategies for connecting and engaging faculty, staff, students, and community members in age friendly programs and practices. We will share examples and tips for supporting others to be more age inclusive in their teaching, research, and community engagement. We will share ideas from the AFU toolkit for creating learning groups, collaborative community events, and intergenerational exchange as well as our own experience which has demonstrated that many smaller efforts over time can go a long way toward building momentum and creating a more age inclusive campus.

WHERE TO START THE JOURNEY TO ADVANCE AGE INCLUSIVITY AT YOUR INSTITUTION

Michelle Porter,¹ and Elizabeth Bergman,² *1. University of Manitoba, Centre on Aging, Winnipeg, Manitoba, Canada, 2. Ithaca College Gerontology Institute, Ithaca, New York, United States*

Each institution's journey to becoming more age inclusive will depend on its unique characteristics, and be dependent on its strengths and existing gaps. A good place to start is to explore how to build connections and leverage existing initiatives, such as research programs, community connections and importantly the institution's strategic plan.

At this point, elements to consider include coalition building, identifying strengths and gaps, and reframing aging. Because ageism can be a hindrance in many ways, strategies to address ageism should be included. GSA initiatives and tools such as the Reframing Aging Initiative, Ageism First Aid and AARPs Disrupt Aging will be highlighted in our presentation. Examples of how several universities have charted their course to becoming more age-inclusive and age-friendly will be outlined.

ASSESSING AND TRACKING SUCCESS OF ADVANCING AGE INCLUSIVITY

Nina Silverstein,¹ and Marilyn Gugliucci,² 1. *University of Massachusetts Boston, Boston, Massachusetts, United States*, 2. *University of New England College of Osteopathic Medicine, Kennebunk, Maine, United States*

Assessment is an important component of advancing age inclusivity on your campus, and the AFU Principles are a useful guiding framework. Assessment helps move the campus from making a commitment to endorse the principles to actually taking stock of current campus practices and movement toward achieving the vision of an age-friendly institution of higher education. To establish a baseline of campus practices, assessment can be done before or after an institution joins the AFU Global Network. Evaluation also follows periodically to assess how well a campus is adhering to the AFU Principles once measurable goals are established and priorities are integrated within an institution's strategic plan. The toolkit contains examples from multiple campuses of mapping the principles, conducting an audit, doing a photovoice evaluation, holding listening tours, and using the newly developed AFU Inventory and Campus Climate Survey (ICCS).

Session 2350 (Symposium)

AGING WITH INTELLECTUAL AND DEVELOPMENTAL DISABILITIES: A CRITICAL EXAMINATION OF SUPPORTS FOR HEALTHY AGING

Chair: Lieke van Heumen

Co-Chair: Kelly Munly

Discussant: Patricia Heyn

The number of older adults with intellectual and developmental disabilities (IDD) in the U.S. is expected to double and potentially triple by 2030. Despite this demographic urgency, there continues to be a lack of research directly addressing aging of people with IDD. Individuals with IDD have on average twice as many health problems than others without IDD, experience earlier age-related declines in health and function than the general population and are more likely to develop secondary conditions as they age. The increase in the number of people aging with IDD and the challenges experienced by this population have demanded new directions for research, practice and policy that promote social justice and improve this population's health and well-being. This symposium brings together research that critically examines and calls for a "new normal" of supports for healthy aging provided to the population aging with IDD. The first presentation consists of a systematic review of healthy aging interventions for adults with IDD. The authors conclude that such interventions for adults with IDD remain scarce,

incipient and sporadic. The second presentation critically reviews an interprofessional education model aimed to address the complex and unique needs of older adults with IDD and dementia. The authors provide recommendations for the future development of interprofessional education in this field. In the third and final presentation the authors offer further transformation toward a new normal as they outline future directions for research on aging with IDD that is informed by positive psychology and disability studies theory.

POSITIVE PSYCHOLOGY AND DISABILITY STUDIES: DIRECTIONS FOR RESEARCH ON AGING WITH IDD

Lieke van Heumen,¹ and Tamar Heller,² 1. *University of Illinois at Chicago, Chicago, Illinois, United States*, 2. *University of Illinois at Chicago, Department of Disability and Human Development, University of Illinois at Chicago, Illinois, United States*

This presentation outlines future directions for research on aging with intellectual and developmental disabilities (IDD) informed by positive psychology and disability studies theory. Research on aging with IDD often focuses on losses in functioning that come with age and on ways to prevent such decline. When applying a positive psychology lens to the experience of aging with IDD the focus shifts to determinants of positive emotions and strength and on ways of increasing meaningfulness in life as one ages. A positive psychology lens also relies on the assumption that people can self-direct and organize their lives, which is essential for individuals aging with IDD who historically have lacked opportunities to exercise self-determination. Positive psychology as applied to disability aligns with disability studies perspectives that emphasize that different ways of being in the world can be 'sources of knowledge, satisfaction, creativity, and happiness' (Chivers, 2011 p.9).

ARE PERSONS WITH INTELLECTUAL AND DEVELOPMENTAL DISABILITIES BEING EMBRACED IN HEALTHY AGING INTERVENTIONS?

Flavia Santos,¹ Johanna Zurek,² and Matthew Janicki,³

1. *University College Dublin, Dublin, Dublin, Ireland*,

2. *Hochschule Doepfer, Cologne, Nordrhein-Westfalen, Germany*,

3. *University Of Illinois at Chicago, Chicago, Illinois, United States*

We carried out a systematic review of healthy ageing interventions for adults with IDD. Twenty-three prospective studies including 2,398 men and women [average age: 44.3 years old] were found worldwide. Among them were only five RCTs. The designs usually were within or between subjects involving small sample sizes (ranging from 8 to 379 participants), mostly non-randomised or without follow up. We identified four thematic areas: Physical activity - nutrition and health (n = 10); Health education and health exams (n = 6); Social inclusion and community participation (n = 3); and Multi-components (n = 4). Overall, studies found effective outcomes, such as loss of body weight and improvement in nutritional habits, despite a few negative findings. We conclude that healthy ageing initiatives for people with IDD continue to be scarce, incipient, and sporadic. More research should embrace health promotion in people with IDD as a programme practice and public policy.

DEVELOPING A NEW MODEL OF INTERPROFESSIONAL EDUCATION IN AGING AND IDD

Phillip Clark,¹ Faith Helm,¹ and Edward Ansello,²
 1. *University of Rhode Island, Kingston, Rhode Island, United States*, 2. *Virginia Commonwealth University, Richmond, Virginia, United States*

Health and social care providers are ill-equipped to address the complex needs of individuals growing older with IDD and their families when dementia is suspected or diagnosed. Addressing the growing need for professionals to acquire practical diagnostic, treatment, and management methods requires an interorganizational and interprofessional approach. A consortium of aging and IDD organizations developed a successful Project ECHO (Extension for Community Healthcare Outcomes) model to create a virtual community of practice connecting a hub team and participating spoke sites. This paper reviews reasons for the model's success, including: (1) curriculum providing practical solutions to complex problems, (2) integration of interprofessional team approach, (3) "all teach, all learn" model promoting sharing among participants, and (4) the inclusion of case studies engaging participants in developing solutions and strategies to improve the quality of life of clients and families. Implications of this model and recommendations for future professional educational programs are presented.

Session 2355 (Paper)

Alcohol, Substance Use, and Addictions

BRIEF ALCOHOL INTERVENTIONS WITH OLDER ADULTS: RESULTS OF A SYSTEMATIC REVIEW OF LITERATURE

Catherine Lemieux, and Gregory Purser, *Louisiana State University, Baton Rouge, Louisiana, United States*

Older persons are especially vulnerable to the negative effects of alcohol misuse. National reports show that the older-adult population is the least likely group to perceive a need for treatment and be screened for alcohol-related problems. Little research has examined the impact of brief interventions on different drinking outcomes in at-risk older adults. To address this gap, the current study sought to systematically review empirical literature examining the effectiveness of brief alcohol interventions (BAI) implemented with adults (≥ 50) engaged in at-risk drinking. The authors developed specific a priori inclusion criteria (e.g., alcohol-related outcome measures, randomized controlled trials, RCT) before beginning the search process. Key terms were entered into 9 databases to yield an initial pool of 5,909 articles, from which 5,572 were excluded. A total of 337 articles remained, from which an additional 89 were excluded. Next, the authors independently reviewed 248 full-text, empirical articles and subsequently excluded 237 that did not satisfy inclusion criteria. Thus, the current systematic review yielded 11 studies representing RCT or experimental designs that employed random assignment. Findings of the review indicated that 7 (63.6%) studies showed a positive effect, with only 1 showing no positive effect of the intervention. For the remaining 3 (27.2%), the positive effect of the intervention

was not conclusively determined due to study design issues. Overall findings suggest that BAI are effective in reducing alcohol consumption in the older-adult population. Additional evidence is needed to further knowledge consistent with recent initiatives (e.g., Age-Friendly Health Systems, 4Ms) that promote healthy aging.

CARE FACILITIES FOR OLDER PEOPLE WITH LONG-TERM SUBSTANCE USE: PROMISING PRACTICES FROM SWEDEN

Tove Harnett,¹ and Hakan Jonson,² 1. *Lund University, Lund, Skane Lan, Sweden*, 2. *Lund University, Lund University, Skane Lan, Sweden*

The stigma of alcohol and long-term substance use is well-known and may be even greater for older people. This is a presentation on "wet" eldercare facilities, i.e. care settings designed for older people with long-term substance use problems, where abstinence is abandoned for well-being. Wet eldercare facilities exist in several European countries and the Swedish ones have a hybrid formal organization: They target people over 50 years, but are regarded as nursing homes and residents lease their own flats inside the setting, which makes it correct to describe residents as tenants. Guided by symbolic interactionism, the aim is to analyze how residents in wet eldercare facilities manage to view these places in a positive light. Forty-two residents of four facilities were interviewed, revealing how the hybrid status of these places enabled residents to frame their situation as being "in the right place", but for different reasons. Some framed the place as a nursing home, others as an ordinary flat. Although wet eldercare facilities are undisputedly linked to stigma and the inability to become sober, the formal hybrid organization enabled residents to construct less stigmatized characterizations of the place and of themselves. The study suggests that it is an (often-neglected) gerontological responsibility to counter stigma and improve the sense of dignity for older people living in stigmatized settings. Based on promising practices in the Swedish system, the study therefore presents strategies that enable older people to ascribe positive characteristics to themselves and to the place where they live.

EXPLORING KNOWLEDGE, BELIEFS, AND ATTITUDES OF OLDER ADULTS ABOUT PRESCRIPTION OPIOIDS

Noell Rowan,¹ Tamatha Arms,² and Susan Glose,³
 1. *University of North Carolina Wilmington, Wilmington, North Carolina, United States*, 2. *UNC Wilmington, Wilmington, North Carolina, United States*, 3. *UNC Wilmington, UNC Wilmington, North Carolina, United States*

Over the past two decades, opioids have been considered important and acceptable in the treatment of pain for older adults, especially for chronic health conditions. Despite the fact that older adults are prescribed opioid medications at high rates, there is little research examining older adults' knowledge, beliefs, and attitudes about opioid medications. The purpose of this study was to explore the knowledge, beliefs, and attitudes surrounding prescription opioid medications of community living older adults in a southeast area of the United States. A cross-sectional, descriptive, anonymous survey design of participants aged 55 or over was used. Study participants (N=119) reported bias in their attitudes and

beliefs about the use and misuse of prescription opioid medications. Multiple regression analyses revealed that gender, age, work, marital status, and education level all had significant results in explaining variance in the statistical models. Even though study participants demonstrated high levels of education and understanding of the potential of addiction to opiates, there were a number of misconceptions revealed about prescription pain medications. This urges the necessity of increased awareness via further research, presentations, and creative discourse to assist in the understanding of precursors of addiction and ways to deal with pain that do not automatically rely on prescription opioid medicines. Implications include outreach to a larger and more diverse sample to address knowledge, beliefs, and attitudes surrounding prescription opioid medications of community living older adults.

THE MEANING OF AGE: IN A CONTEXT OF ELDERCARE AND SUBSTANCE USE

Tove Harnett,¹ and Hakan Jonson,² 1. *Lund University, Lund, Skane Lan, Sweden*, 2. *Lund University, Lund University, Skane Lan, Sweden*

Some people age with substance abuse and social problems and several countries provide members of this population with a type of arrangement referred to as “wet” eldercare facilities. These facilities provide care for people who are judged as unable to become sober, in some cases with a lower age-limit at 50 years. The aim of this study was to investigate the meaning of age for judging the fit between the person and the arrangement. The study was based on interviews with 42 residents, 10 case workers and 21 staff members at five facilities in Sweden. Respondents were asked about the relevance of age and if the facility should include younger people as well. Some staff argued that younger people should be excluded since they could not have the history of multiple failures in treatment that was a prerequisite for admission. Regarding the low age-limit, substance abuse was said to accelerate the process of ageing so that a person aged 50 could be considered 20 years older and in need of eldercare. Residents had a tendency to equate age with activity and argued that people below the age of 50 were active and energetic and the inclusion of younger people would lead to disturbance of the calm pace of the facilities. Given that facilities have been described as “end-stations”, it was puzzling that few respondents linked the question of admitting younger person to the matter of giving up ambitions to make the person sober.

Session 2360 (Paper)

Alzheimer's Disease and Other Dementias

FACILITY CHARACTERISTICS ASSOCIATED WITH INTENSITY OF CARE OF NURSING HOME RESIDENTS WITH ADVANCED DEMENTIA

Meghan Hendricksen,¹ Susan Mitchell,² Ruth Lopez,³ Kathleen Mazar,⁴ and Ellen McCarthy,⁵ 1. *Hinda and Arthur Marcus Institute for Aging Research, Boston, Massachusetts, United States*, 2. *Hinda and Arthur Marcus Institute for Aging Research, Roslindale, Massachusetts,*

United States, 3. *MGH Institute of Health Professions, Boston, Massachusetts, United States*, 4. *University of Massachusetts Medical School, Worcester, Massachusetts, United States*, 5. *Marcus Institute for Aging Research, Hebrew SeniorLife, Boston, Massachusetts, United States*

Profound variations in care intensity of nursing home (NH) residents with advanced dementia exist for NHs within and across hospital referral regions (HRRs). Little is known about how these levels of influence relate. Nationwide 2016-2017 Minimum DataSet was used to categorize NHs and HRRs into 4 levels of care intensity based on hospital transfer and tube-feeding rates among residents with advanced dementia: low intensity NH in low intensity HRR; high intensity NH in low intensity HRR; low intensity NH in high intensity HRR; and high intensity NH in high intensity HRR. We used multinomial logistic regression to identify NH characteristics associated with belonging to each of 4-levels of intensity as compared to low intensity NH in low intensity HRRs (reference). We found high intensity NHs in high intensity HRRs were more likely to be in an urbanized area, not have a dementia unit, have an NP/PA on staff, have a higher proportion of residents who were male, age <65, of Black race, and had pressure ulcers, and relatively fewer days on hospice. Whereas in low intensity HRRs, higher proportion of Black residents was the only characteristic associated with being a high intensity NH. These findings suggest potentially modifiable factors within high intensity HRRs that could be targeted to reduce burdensome care, including having a dementia unit, palliative care training for NP/PAs, or increased use of hospice care. This study underscores the critical need to better understand the role race plays in the intensity of care of NH residents with dementia.

RISK OF ALZHEIMER'S DISEASE AND RELATED DEMENTIA AMONG ADULTS WITH CONGENITAL AND ACQUIRED DISABILITIES

Elham Mahmoudi,¹ Paul Lin,² Neil Kamdar,² Anam Khan,³ and Mark Peterson,⁴ 1. *University of Michigan, Commerce Township, Michigan, United States*, 2. *University of Michigan, Ann Arbor, Michigan, United States*, 3. *University of Michigan School of Public Health, Ann Arbor, Michigan, United States*, 4. *University of Michigan, University of Michigan, Michigan, United States*

Objective: Adults with congenital (cerebral palsy or spina bifida (CP/SB)) or acquired disabilities (spinal cord injury (SCI) or multiple sclerosis (MS)) have higher incidence of age-related health conditions. There is a gap in the literature about the risk of dementia among adults living with these disabilities. This study aimed to examine time to incidence of Alzheimer's disease and related dementia (ADRD) among these disability cohorts. Method: Using national private payer claims data from 2007-2017, we identified adults (45+) with diagnosis of CP/SB (n=7,226), SCI (n=6,083), and MS (n=6,025). Adults without disability diagnosis were included as controls. Using age, sex, race/ethnicity, cardiometabolic, psychologic, and musculoskeletal chronic conditions, and socioeconomic variables, we propensity score matched persons with and without disabilities. Incidence of ADRD was compared at 4-years. Cox Regression was used to estimate adjusted hazard ratios (aHR) for incident early and late onset ADRD. Results: Incidence of early and late onset

ADRD were substantially higher among people with disabilities compared to their non-disabled counterparts. Adults with CP, SCI, and MS had higher risk for early [CP/SB: aHR=3.35 (95% CI: 2.18-5.14); SCI: aHR=1.93 (95% CI:1.06-3.51); and MS: aHR=4.49 (95% CI:2.62-7.69)] and late [CP: aHR=1.68 (95% CI:1.38-2.03); SCI: aHR: 1.77 (95% CI:1.55-2.02); and MS: aHR=1.26 (95% CI:1.04, 1.54)] onset ADRD. Conclusions: Risk of ADRD was higher among adults with CP/SB, SCI, and MS compared to their matched cohort without disability. Investment in early screening and use of therapeutic or rehabilitative services that may help preserving cognitive function among these patient cohorts is warranted.

SYSTEMS BARRIERS TO MEDICATION MANAGEMENT DURING HOSPITAL TO HOME TRANSITIONS OF OLDER ADULTS WITH DEMENTIA

Maningbe Keita-Fakeye,¹ Rhea Sharma,² Sylvan Greyson,³ Quincy Samus,⁴ Ayse Gurses,⁵ Sara Keller,⁶ and Alicia Arbaje,⁴ 1. *Johns Hopkins University, Parkville, Maryland, United States*, 2. *Virginia Commonwealth University, Virginia Commonwealth University, Virginia, United States*, 3. *Bayview Medical Center, Baltimore, Maryland, United States*, 4. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*, 5. *Johns Hopkins School of Medicine, Baltimore, Maryland, United States*, 6. *Johns Hopkins School of Medicine, Lutherville-Timonium, Maryland, United States*

The hospital-to-home transition is a high-risk period for medication errors and adverse events for older adults living with dementia. Researchers conducted a qualitative study using semi-structured interviews and participant solicited diaries. Caregivers of adults ages 55 and older were recruited to understand barriers to medication management during hospital to skilled home health care transitions. We used a human factors engineering approach to guide our understanding of systems level barriers. At least two researchers independently coded each transcript using content analysis and the ATLAS.ti software. We interviewed 23 caregivers and identified five barrier types stemming from systems breakdowns related to: (1) knowledge and information, (2) access to and use of resources and tools, (3) caregiver burden, (4) pandemic concerns, and (5) health limitations. Caregivers grappled with receiving overwhelming, insufficient, incorrect, or conflicting information, and had difficulty managing information from different sources. Latinx caregivers encountered language barriers that impeded role and task clarity. Caregivers expressed mistrust in health systems elements and inability to access resources. Caregivers were in need of additional caregiving assistance, financial aid, and tools to manage medications. Balancing multiple medications and responsibilities left caregivers burdened. The health limitations of the older adult and COVID-19 concerns related to reduced access to resources and ability to deliver and receive in person care complicated task management. Altogether these barriers reflect systems level breakdowns impeding task understanding, execution, and overall management. These findings will inform the development of interdisciplinary strategies to ensure safer care transitions.

THE COST-EFFECTIVENESS OF NON-DRUG INTERVENTIONS THAT REDUCE NURSING HOME ADMISSIONS FOR PEOPLE WITH DEMENTIA

Eric Jutkowitz,¹ Fernando Alarid-Escudero,² Peter Shewmaker,³ Joseph Gaugler,⁴ and Laura Pizzi,⁵ 1. *Brown University, Brown University, Rhode Island, United States*, 2. *Center for Reserach and Teaching in Economics, Aguascalientes, Aguascalientes, Mexico*, 3. *Brown Universtiy, Brown University, Rhode Island, United States*, 4. *University of Minnesota, Minneapolis, Minnesota, United States*, 5. *Health Outcomes, Policy, and Economics (HOPE) Program, Pscataway, New Jersey, United States*

Although people generally want to age in their community, individuals living with dementia are likely to move to a nursing home. In randomized trials, psychosocial interventions reduce the risk of people living with dementia transitioning to a nursing home, but the cost-effectiveness of these interventions is unknown. We used an evidence-based mathematical model to simulate a place of residence (community or nursing home) for people living with dementia. Our model also predicts time caregiving, health care costs, and quality of life. We modeled the reduction in nursing home rate (i.e., hazard ratio (HR) treatment effect) identified from two trials of non-drug interventions for people living with dementia and their caregiver. Using trial data, we account for the disease stage of when interventions are implemented. Specifically, we modeled MIND (HR: 0.63; 18-month effect), an in-home intervention for people with mild-moderate dementia, and the NYU Caregiver Intervention (HR: 0.53; 42-month effect), which is for people with moderate dementia. We evaluated each intervention's cost-effectiveness relative to usual care for the duration of the intervention from a societal perspective. The MIND and NYU Caregiver Intervention resulted in \$23,900, and \$6,600 costs savings relative to usual care, respectively. The model predicted an improvement in the quality of life for people living with dementia for both interventions. The largest cost saving was attributed to reductions in family nursing home spending. Medicare and Medicaid received modest cost savings but are likely to be tasked with paying for these interventions.

USE OF TANGIBLE, EDUCATIONAL, AND PSYCHOLOGICAL SUPPORTIVE SERVICES AMONG CHINESE AMERICAN DEMENTIA CAREGIVERS

Jinyu Liu,¹ Yifan Lou,² Ethan Siu Leung Cheung,² and Bei Wu,³ 1. *Columbia University, Columbia University, New York, United States*, 2. *Columbia University, New York, New York, United States*, 3. *New York University, New York, New York, United States*

Background and Objectives: Though many studies have examined the service utilization of dementia caregivers, there is limited empirical evidence from Asian Americans and the lack of incorporating community resources and sociocultural factors in this field. Guided by the Andersen's Behavioral Model of Health Services Use (ABM), we aimed to understand whether and how predisposing, enabling and need factors were associated with utilizing multiple types of services among Chinese Americans dementia caregivers. Research Design and Methods: We collected survey data

from 134 Chinese dementia caregivers in New York City. Logistic regression models were conducted to test the associations between predisposing, enabling and need factors and the likelihoods of using tangible (home health aide, adult daycare, respite care), educational (lectures and workshops), and psychological (peer support groups and psychological counseling) services. Results: Consistent with prior literature, caregiver's knowledge about services, caring tasks, length of care and burden and care recipient's physical and cognitive deteriorations, were significantly associated with higher possibilities of using multiple types of services among these Chinese American dementia caregivers. Three sociocultural factors, including residing in Chinatowns, availability of alternative family caregivers and diagnosis of cognitive deterioration, were also associated with higher likelihoods of using educational or psychological services. Discussion and Implications: The findings extended the existing literature on service utilization of caregivers by highlighting the importance of distinguishing types of services and the necessity of considering sociocultural factors in future research and practice.

Session 2365 (Symposium)

AN INTERDISCIPLINARY COLLABORATION TO IMPROVE HYPERTENSION MEDICATION ADHERENCE FOR OLDER ADULTS

Chair: Jeannie Lee

Co-Chair: Wendy Rogers

Hypertension is highly prevalent in older adults (74.5% in ≥ 60 years) with dire consequences, and adherence to hypertension medications is low (approximately 50%). With increased smartphone use among older adults (81% for 60-69 years, 62% for ≥ 70 years), technology innovations can improve medication adherence. This symposium highlights the efforts of an innovative interdisciplinary team of experts (clinical, cognitive aging, human factors, health technology) to develop and implement the Medication Education, Decision Support, Reminding, and Monitoring (MEDSR_eM) system to improve hypertension medication adherence for older adults. MEDSR_eM is a theory-based, integrated mobile application (app) and companion web portal that educates, supports missed dose decisions, reminds, monitors adherence, and incorporates blood pressure feedback. In this symposium, we describe the interdisciplinary development efforts. Insel et al. will present the theory-based intervention, technology translation, and advancement of the MEDSR_eM system. Lee et al. will describe the interdisciplinary team and describe the work by the decision support subteam that created the medication formulary and generated an algorithm to guide missed-dose decisions based on pharmacology of aging. Rogers et al. will discuss the education subteam's development of educational information about hypertension, medications, and adherence for the MEDSR_eM system. Mitzner et al. will illustrate the instructional support subteam's efforts to ensure older adults can interact with both the smartphone app and online portal. Lastly, Hale et al. will describe the user testing subteam's usability processes including the integration of blood pressure self-monitoring. These efforts will provide insights for other interdisciplinary teams developing technology interventions for older adults.

FOUNDATIONAL BASIS FOR THE DEVELOPMENT OF MEDSR_eM

Kathleen Insel,¹ Gilles Einstein,² Daniel Morrow,³ Jeannie Lee,¹ Wendy Rogers,³ and Tracy Mitzner,⁴

1. *University of Arizona, Tucson, Arizona, United States*, 2. *Furman University, Greenville, South Carolina, United States*, 3. *University of Illinois Urbana-Champaign, Champaign, Illinois, United States*, 4. *Georgia Institute of technology, Atlanta, Georgia, United States*

Discovering a composite of measures of executive function/working memory predicted everyday medication adherence among older adults, led to the development of a behavioral intervention, the Multifaceted Prospective Memory Intervention (MPMI) to improve hypertension medication adherence. The intervention resulted in a 35% improvement in adherence compared to an active education and attention control condition. However, adherence slowly declined over an additional five months of adherence monitoring without the presence of interventionists in the home. We proposed that the use of technology might help individuals maintain the prospective memory strategies, resulting in sustained adherence. An interdisciplinary team was formed to translate the behavioral intervention to technology, resulting in the first version of the MEDSR_eM system. In this presentation we describe the evolution of the project, from the components of the successful MPMI to the design and initial testing of MEDSR_eM. These efforts provide general insights about translating interventions into technology tools.

INTERDISCIPLINARY TEAM FOR MEDSR_eM-2 AND DECISION SUPPORT THROUGH PHARMACOLOGY OF AGING PRINCIPLES

Jeannie Lee,¹ Kathleen Insel,¹ J. Nicholas,² and Amani Albadawi,² 1. *University of Arizona, Tucson, Arizona, United States*, 2. *University of Arizona College of Pharmacy, Tucson, Arizona, United States*

The interdisciplinary team members with distinct and complementary expertise working collaboratively to advance MEDSR_eM to MEDSR_eM-2 will be introduced. The decision support functionality in MEDSR_eM-2 application (app) is to guide older users on making decisions about missed doses. MEDSR_eM-2 medication formulary was created to include safe hypertension medications for older adults. Pharmacology of aging, including Pharmacokinetic and Pharmacodynamic principles, along with published studies and expert peer reviews, were used to create an algorithm for safe window of time to take the missed medications. We will present the processes for developing the decision support algorithm for the MEDSR_eM-2 App and how this guide will be communicated to the users to inform their decision making about missed doses. Interdisciplinary collaboration including pharmacy, nursing, cognitive aging, and technology development that was crucial for designing and implementing decision support within the MEDSR_eM-2 app for older users will be shared.

DEVELOPING EDUCATIONAL MATERIALS TO SUPPORT OLDER ADULTS WITH HYPERTENSION MANAGEMENT

Wendy Rogers,¹ Qiong Nie,² Maurita Harris,² Stacy Al-Saleh,³ and Ysabel Beatrice Floresca,¹ 1. *University of Illinois Urbana-Champaign, Champaign, Illinois, United States*, 2. *University of Illinois at Urbana Champaign,*

Champaign, Illinois, United States, 3. University of Arizona, Tucson, Arizona, United States

A comprehensive approach to hypertension management requires medication adherence as well as more general health behavior changes. Our primary objective is to provide evidence-based and tailored education about hypertension, medications, and health self-management strategies with consideration for different stages of behavior change, health literacy, education, disease knowledge, and experience. To facilitate health behavior change, enable information seeking, and increase engagement, the educational materials provide different layers of information, including tips and information in the MEDSR_eM app, as well as more detailed educational content on the web portal. We will present examples of the materials in different formats to show how they are tailored to ease comprehension, support adherence, and influence behavior change. These educational materials will have broad utility outside of the MEDSR_eM system, and will also serve as the education-only comparison condition for the randomized controlled trial.

DEVELOPING INSTRUCTIONAL SUPPORT FOR MEDSR_eM-2 THROUGH HUMAN FACTORS DESIGN PRINCIPLES

Tracy Mitzner,¹ Maurita Harris,² Kenneth Blocker,³ and Mimi Trinh,⁴ 1. *Georgia Institute of technology, Atlanta, Georgia, United States, 2. University of Illinois at Urbana Champaign, Champaign, Illinois, United States, 3. University of Illinois at Urbana-Champaign, Champaign, Illinois, United States, 4. University of Illinois Urbana-Champaign, Champaign, Illinois, United States*

Appropriate instruction is critical for ensuring the MEDSR_eM-2 system (i.e., smartphone app, blood pressure monitor, online portal) will be easily and effectively used and will, therefore, be more likely to be adopted. We will present our iterative processes for developing instructional support for MEDSR_eM 2 using human factors design principles (e.g., task analyses, comparative analyses, expert evaluation of mock-ups with screen flows). The instructional supports include user manuals, videos, as well as instructions within the MEDSR_eM 2 app. We will also highlight design principles used to empower the user and the benefits of using an interdisciplinary approach (i.e., gerontology, cognitive psychology, educational psychology, design, community health) to develop instructional support for older adult users.

USABILITY EVALUATION METHODS USED TO ENSURE THE USABILITY OF THE MEDSR_eM-2 SYSTEM

Timothy Hale,¹ Carson Smith,² Mimi Trinh,² and Wendy Rogers,² 1. *University of Illinois Urbana-Champaign, University of Illinois Urbana-Champaign, Illinois, United States, 2. University of Illinois Urbana-Champaign, Champaign, Illinois, United States*

A key objective of the MEDSR_eM-2 study is to promote medication taking decisions and improve adherence to hypertensive medications for older adults. New functionalities include enhanced decision-support algorithms for missed medications, automated entry of blood pressure measurements, improved data visualizations, and an easy-to-use online web portal. In support of these enhancements, the User Testing subteam is tasked with providing ongoing evaluation and feedback on the usability of early design

concepts, prototypes, beta software, wireless blood pressure monitors, and instructional materials. The overall project comprises multiple working teams, whose efforts must be coordinated. We will describe the challenges of working with these interdisciplinary teams and the usability evaluation methods used to support the needs of each team in creating the enhanced MEDSR_eM-2 system that is easy-to-use and effective in helping older adults improve their hypertension medication adherence. These processes inform the research and design efforts of other technology interventions.

Session 2370 (Symposium)

BUILDING AND USING DATA RESOURCES FOR RESEARCH ON JOB CHARACTERISTICS, HEALTH, AND RETIREMENT

Chair: Amanda Sonnega

Discussant: Gwen Fisher

A growing literature seeks to understand the relationship between the experience of work and important later-life outcomes. Rich longitudinal measurement of both sides of this equation in datasets such as the Health and Retirement Study (HRS) have made this research possible. These data take the form of self-reported experiences of work (such as physical demands, job flexibility, job satisfaction etc.). Increasingly, researchers are looking to add potentially complementary information on the work environment available in the Occupational Information Network (O*NET) database through a linkage using occupation and industry codes in the survey data. The session talks will describe research conducted using O*NET linked with HRS data as well as ongoing work to create a new data resource that will allow other researchers to undertake research with O*NET-HRS linked data. Each presentation will include some discussion of both the value and limits of using the linkage to O*NET. Carpenter will provide a detailed description a new project linking the 2019 O*NET data to the HRS for public use. This presentation explains the types of variables that will be made available in the O*NET-HRS occupation project and will provide examples for how the measures can be used in longitudinal HRS studies. Using O*NET-HRS linked data, Carr will present on work examining the role of preretirement job complexity in alternative retirement paths and cognitive performance. Helppie-McFall will use the linked data to discuss the role of mismatch between demands of work and workers' ability to meet those demands in retirement decisions.

CREATING A PUBLIC DATA RESOURCE: THE HRS-O*NET LINKAGE

Rebekah Carpenter,¹ Dawn Carr,¹ Brooke Helppie-McFall,² and Julia Beckel,³ 1. *Florida State University, Tallahassee, Florida, United States, 2. University of Michigan, Ann Arbor, Michigan, United States, 3. Colorado State University, Fort Collins, Colorado, United States*

Few longitudinal studies provide detailed information about the characteristics of the jobs older workers engage in, limiting the ability to evaluate the potential consequences of extended working lives. In this session, we introduce a new project linking the 2019 O*NET taxonomy and corresponding data to the Health and Retirement Study for public use. We describe the procedures taken to develop an O*NET linkage to be released to HRS users in the form of a publicly

available data file, allowing aging researchers to evaluate detailed aspects of occupations in the 50+ population. We explain the types of variables that will be made available in the O*NET-HRS occupation project, and provide examples for how the measures can be used in longitudinal HRS studies.

USING O*NET LINKAGES TO ADVANCE RESEARCH: AN EXAMPLE EVALUATING COGNITIVE FUNCTION AND WORK TRANSITIONS

Dawn Carr, *Florida State University, Tallahassee, Florida, United States*

The type of work older adults engage in has potential to play a key role in shaping health and wellbeing. In this presentation, using data drawn from an O*NET crosswalk linked with the Health and Retirement Study, I show how different types of transitions out of the workforce shapes cognitive function differently for individuals retiring from different types of occupations. Based on a factor analysis of 36 job-related abilities, activities, and contexts, this paper shows that retirement has a more significant consequence for cognitive function for those who retire from jobs with low levels of cognitive complexity, but no significant consequences for those who retire from jobs with high levels of cognitive complexity. I discuss these results in the context of the ways in which O*NET classifications of jobs can provide critical insights into the potential influence of changing retirement trajectories on wellbeing in later life.

USING HRS-ONET LINKED DATA TO STUDY SUBJECTIVE AND OBJECTIVE MISMATCH BETWEEN WORK DEMANDS AND CAPACITY AT OLDER AGES

Brooke Helppie-McFall,¹ Amanda Sonnega,¹ and Gwen Fisher,² *1. University of Michigan, Ann Arbor, Michigan, United States, 2. Colorado State University, Fort Collins, Colorado, United States*

Mismatch between demands of work and workers' ability to meet those demands may play an important role in retirement decisions. This presentation extends earlier work using Health and Retirement Study data linked to O*NET to develop measures of discrepancy between individual's own reports of physical and mental abilities and 1) their perceptions of the physical and mental demands of their jobs and 2) O*NET ratings of the physical and mental demands of their jobs. In particular, we utilize newly available linked information using 2010 Census codes and 2019 O*NET ratings that reflect more current jobs. We then examine the impact of each type of mismatch (subjective and objective) on retirement timing. Overall, we find a stronger connection between subjective mismatch relative to objective mismatch. We discuss implications of this finding in terms of the value of the O*NET linkage and potential interventions aimed at extending working lives for positive aging.

Session 2375 (Paper)

Challenges of COVID-19 for Minority and Diverse Populations

ACTIVITY ENGAGEMENT PATTERNS AMONG OLDER CHINESE IMMIGRANTS

Fengyan Tang, and Mary Rauktis, *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

Activity engagement is a major component of well-being in later life. However, very few studies have focused on older immigrants who are often at risk for social isolation and psychological distress. We aim to map the pattern of activity engagement and examine its variations in relation to immigration-related factors and social aspects of neighborhoods in a representative sample of older Chinese immigrants. We used data from the Population Study of Chinese Elderly in Chicago (PINE), a population-based epidemiological study of US Chinese older adults that were conducted between 2011 and 2013 (N=3,157). Latent class analysis and multinomial regression analysis were conducted to identify activity engagement patterns and examine the associated factors. Four patterns of activity engagement were identified: restricted (15%), diverse (31%), informal social (32%), and community-based social (21%). Acculturation and family-oriented immigration differentiated the restricted from the diverse class membership. Positive attributes of social environment measured by social network size, positive social support, neighborhood cohesion, and sense of community were associated with the probabilities of class membership relative to the restricted class. Findings point to the importance of positive attributes of social environment in enhancing engagement with life among older Chinese immigrants. Efforts are needed to assist the vulnerable restricted group and recent older immigrants while meeting the demands of older immigrants who are less educated and less acculturated. Creating a supportive environment is important to provide information, access, and resources needed for activity engagement in the marginalized minority aging populations

AGING OF A MODEL MINORITY: A DIACHRONIC ANALYSIS OF TWO QUANTITATIVE RESEARCH STUDIES ON AGING OF JAPANESE IN NEW YORK

Itsuko Toyama,¹ and Taeko Nakashima,² *1. St. Andrew's University, Souraku-gun, Kyoto, Japan, 2. Nihon Fukushi University, Handa-city, Aichi, Japan*

This is a diachronic analysis of two quantitative research studies on the aging of Japanese and Japanese Americans living in Greater New York. How have older Japanese individuals, who once have been referred as "model minority," lived and aged in Greater New York? All the data in this paper are based on the first research study conducted in 2006 and the second in 2018 (Ethical approval reference number 6, 2018). This paper reveals both the social transitoriness and the cultural immutability of the Japanese elderly community in Greater New York. The following is a summary of the findings: (1) a growing Japanese American community with US citizenship, higher academic qualification, and better communication competency has been observed. (2) The allowable range of private expense to hire personal caregivers has been widened. (3) Not only the concerns and anxieties for later lives but also the plans and preparations for aging are much the same. (4) The elderly are provided with culturally specific care (with regard to language, food, and concept of care)—even allowed to live with other Japanese people—and the needs of caregivers who can understand Japanese culture are satiated. (5) Almost half of those in the community find it difficult to eliminate the possibility of returning to Japan, and some of them have already chosen to migrate back to Japan.

COVID-19 AND THE INTERSECTION OF RACE, ETHNICITY, AND SEXUAL MINORITY STATUS.

Robert Beringer,¹ Brian de Vries,² Gloria Gutman,³ Paneet Gill,⁴ and Helena Dault,⁵ 1. *University of Victoria, Victoria, British Columbia, Canada*, 2. *San Francisco State University, Palm Springs, California, United States*, 3. *Simon Fraser University, Vancouver, British Columbia, Canada*, 4. *Simon Fraser University, Surrey, British Columbia, Canada*, 5. *Victoria Hospice, Victoria, British Columbia, Canada*

The COVID-19 virus has caused millions of deaths and impaired physical and mental health and social disconnection for countless persons around the world; concomitantly, the pandemic has exposed and exacerbated the pervasive effects of racism and stigma experienced by Black, Indigenous, or People of Color (BIPOC) and other marginalized/stigmatized groups. This study adopts an intersectional perspective examining multiple marginalized identities (i.e., the combination of LGBTQ and BIPOC status) and COVID-19 pandemic health stressors. We report on data from an online survey (conducted between Aug 10 and Oct. 10, 2020) focusing on current experiences and future planning during the COVID-19 pandemic in Canada. LGBTQ respondents (n=415) indicated significantly higher levels of depression, loneliness, sadness, and isolation in comparison to heterosexuals (n=3916). Heterosexual white respondents (n=3446) reported significantly higher levels of acceptance in their community and reported greater happiness but also higher rates of feeling of isolation than heterosexual BIPOC heterosexuals (n=470) who reported significantly higher rates of feeling judged/shamed by others than the heterosexual white respondents. In contrast to our expectations, white LGBTQ respondents (n=366) reported significantly more depression, loneliness, anxiety, and sadness than their BIPOC LGBTQ peers (n=49). These findings are interpreted as reflecting a complex mix of the effects of marginalization (as experienced by LGBTQ persons in general), and privilege and relative deprivation (as experienced by heterosexual and LGBTQ white persons) along with resilience and the moderated expectations and experiences of BIPOC LGBTQ persons.

FACTORS RELATED TO COVID-19 VACCINE UPTAKE IN BLACK AMERICAN COMMUNITIES

Julene Johnson,¹ Orlando Harris,² Carl V. Hill,³ Peter Lichtenberg,⁴ Sahru Keiser,² Thi Tran,⁵ Tam Perry,⁴ and Elena Portacolone,⁶ 1. *University California San Francisco, San Francisco, California, United States*, 2. *University of California, San Francisco, San Francisco, California, United States*, 3. *Alzheimer's Association, Chicago, Illinois, United States*, 4. *Wayne State University, Detroit, Michigan, United States*, 5. *UCSF/ San Francisco, UCSF Institute of Health and Aging/ San Francisco, California, United States*, 6. *University of California, Berkeley, California, United States*

Black/African Americans represent 13% of the population, yet account for more than 24% of COVID-19 deaths. Emerging evidence indicates that Black Americans are receiving COVID-19 vaccines at lower rates than whites. However, there is minimal information about why vaccination rates are lower. To address this gap, we examined the effects of the COVID-19 pandemic among Black Americans, with an emphasis on understanding trust and vaccine uptake.

Data were collected between July and September 2020 using 8 virtual focus groups in Detroit, MI and San Francisco Bay Area, CA with 33 older Black Americans and 11 caregivers of older Black Americans with cognitive impairment. Inductive/deductive content analysis was used to identify themes. The first theme pointed to a sense of feeling abandoned by healthcare providers and the government at local and state levels, which exacerbated uncertainty and fear about the vaccine and in general. The second theme emphasized a sense of deep distrust towards healthcare providers and the government, especially during the pandemic. The third theme pointed to a reluctance in receiving the vaccine because of distrust of pharmaceutical companies and the government, as well as misinformation and the rapid speed of vaccine development. These findings suggest that underlying systemic issues need to be addressed immediately to accelerate vaccine uptake among older Black Americans. New initiatives are needed to foster trust and address abandonment by healthcare and government systems. In addition, public health campaigns with reliable information about the COVID-19 vaccine are needed.

MEETING NEEDS OF DIVERSE OLDER ADULTS AND CAREGIVERS DURING PUBLIC HEALTH EMERGENCIES: WHAT CAN WE LEARN FROM COVID-19?

Alycia Bayne,¹ Rachel Singer,¹ Candace Spradley,² Lauren Isaacs,³ Eva Jeffers,⁴ Benjamin Olivari,⁴ Kevin Matthews,⁵ and Alaina Whitton,⁶ 1. *NORC at the University of Chicago, Bethesda, Maryland, United States*, 2. *CDC Foundation, Atlanta, Georgia, United States*, 3. *NORC at the University of Chicago, Chicago, Illinois, United States*, 4. *Centers for Disease Control and Prevention (CDC), Atlanta, Georgia, United States*, 5. *NCCDPHP, Centers for Disease Control, Georgia, United States*, 6. *The CDC Foundation, Atlanta, Georgia, United States*

With support from the CDC Foundation and technical assistance from the Centers for Disease Control and Prevention, NORC at the University of Chicago conducted studies to examine the needs and concerns of older adults and unpaid caregivers during COVID-19, including their trusted sources of COVID-19 information and available public health interventions. Methods included a nationally representative survey of 1,030 adults aged 50+ years using computer-assisted telephone and web interviewing; online focus groups with older adults and caregivers in Spanish and English; a survey and interviews with stakeholder organizations; secondary analysis of U.S. caregiver surveys; analysis of public social media posts; and searches of peer-reviewed and grey literature in Spanish and English to identify interventions. Results suggest that needs and concerns differed among older adult subpopulations, including racial and ethnic minority populations, people with lower incomes, rural and tribal populations, people with limited English proficiency, and people with disabilities as well as caregivers. Older adults perceived news media, the internet, and healthcare providers as important resources for COVID-19 information, although trusted sources varied by race and ethnicity, urbanicity, and income. Findings suggested the need to increase awareness of existing public health interventions and resources to support older adults and caregivers during public health emergencies

like COVID-19. Strategies for tailoring communication for diverse older adults and caregivers include partnering with national organizations, leveraging community-level infrastructure, and disseminating information through trusted sources. Studying the needs of older adults and caregivers during COVID-19 can inform future public health emergency response priorities.

Session 2380 (Symposium)

COMMUNITY-ENGAGED RESEARCH WITH INDIGENOUS COMMUNITIES TO IMPROVE ELDER HEALTH AND WELL-BEING

Chair: Jordan Lewis

Much of the past research conducted with tribal communities was coined "helicopter research," because researchers would enter the community, gather data, and leave the community, never to inform communities how the data was used or published, creating mistrust. Community Based Participatory Research (CBPR) is a research approach conducted as an equal partnership between community members, organizational representatives, and researchers that serve as guidelines for researchers working collaboratively with communities. This symposium will offer a panel of presentations highlighting research studies with tribal communities that honor and respect tribal sovereignty in addressing health and wellbeing among their older adults. The panel presentations will consist of presentations on dementia caregiving, generativity and successful aging, social support and diabetes management, elder-centered research methods.

SOCIAL SUPPORT AND DIABETES MANAGEMENT AMONG OLDER AMERICAN INDIANS

R. Turner Goins,¹ Molly Grant,² Kathleen Conte,³ and Lisa Lefler,⁴ 1. *Western Carolina University, Western Carolina University, North Carolina, United States*, 2. *Phoenix Counseling and Crisis Center, Gastonia, North Carolina, United States*, 3. *DePaul University, Chicago, Illinois, United States*, 4. *Western Carolina University, Cullowhee, North Carolina, United States*

We examined social support among older American Indians in relation to their diabetes management. In-depth interviews were conducted with 28 participants aged ≥ 60 years who were members of a federally-recognized tribe. We examined professionally transcribed audio recordings with a systematic text analysis approach. Main sources of social support were family/friends, clinicians/formal services, community/culture, and spiritual/God. Most of the support was instrumental in nature, including food shopping, meal preparation, and medication management. Social support had both positive and negative influences diabetes management while there were some participants who lacked support. The four main social support types were present, including instrumental, emotional, informational, appraisal support. Value orientations among American Indian families command lateral-group relational behavior rather than autonomy and independence with extended social systems fostering interdependence. A deeper understanding is needed of how social relationships can be better leveraged to aid in the effective diabetes management among older American Indians.

ALASKA NATIVE ELDER-CENTERED RESEARCH METHODOLOGY

Rosellen Rosich,¹ Maria Crouch,² and Jordan Lewis,³ 1. *University of Alaska Anchorage, Anchorage, Alaska, United States*, 2. *Yale School of Medicine, Department of Psychiatry, East Haven, Connecticut, United States*, 3. *Memory Keepers Medical Discovery Team/University of Minnesota Medical School, Duluth campus, Duluth, Minnesota, United States*

Alaska Native (AN) Elders have historically been underrepresented in research. Innovative AN research posits that practice-based evidence is fundamental to culturally grounded, multifaceted methods. AN Elders is a cultural convention distinguishing Elders who continue to serve as an integral part of their family and community and recognized by their community as role models. Several studies will be discussed which employed Elders at every level of the research, ensuring cultural relevancy, outcomes, and dissemination activities. The findings lay the foundation for an Elder-centered research methodology that can be adapted and applied in other studies to encourage engagement of older adults. This methodology has potential to impact research for underrepresented groups and to rethink and reshape Western-centric practices. Findings from this research provides best practices for capacity building and sustainability, strategies for empowerment and prevention, and a framework for supporting the AN community in all phases of research.

CULTURAL CONTINUITY IN A RESERVATION NURSING HOME

Pamela Monaghan-Geernaert, *Northern State University, Aberdeen, South Dakota, United States*

Throughout our lifespan we experience the culture of our families and communities. Our cultural selves guide our understanding of health and illness. However the health care system often ignores our culture in the delivery of care. This can have devastating effects on individuals and particularly the elderly. This presentation reviews a case study of a tribally owned and operated nursing home. The emphasis on maintaining cultural activities, feasting on traditional foods, offering sacred practices led to high satisfaction of the health care experience by residents and staff. Creating this environment was difficult and barriers in culturally responsive care delivery will also be discussed.

COMMUNITY-BASED PARTICIPATORY RESEARCH ON DIET AND ACTIVITY WITH AN INDIGENOUS PUEBLO COMMUNITY

Karen Kopera-Frye, *New Mexico State University, Las Cruces, New Mexico, United States*

Tribal Critical Race Theory (Brayboy, 2005) supports the use of decolonizing methodologies such as Community-Based Participatory Research when collaborating with Indigenous communities. This paper highlights the underlying processes in working with a Pueblo community on an intergenerational health project. Indigenous participants included 16 Piro Pueblo individuals who collaborated on a project examining healthy diets and activity in their community. The project involved providing information on the importance of activity and healthy eating of traditional foods to promote healthy

living. Thematic analysis of open-ended questions exploring the role of culture in food and activity yielded important themes of gathering, resilience, history, honoring ancestors at mealtime, cultural ways, and activities such as dancing and drumming. The results suggest that projects addressing diet and activity collaborate to ensure cultural values, e.g., connectedness, cultural ways, e.g., gathering, dancing, and Indigenous knowledge are represented in the project and viewed through an Indigenous lens.

CPBR PROCESS IN URBAN SETTINGS AND THE UNIQUE CHALLENGES AND SUCCESSES

Steffi Kim, *University of Alaska Anchorage, Anchorage, Alaska, United States*

CBPR is a framework that allows for the collaboration of researchers and communities as co-partners and is a supported approach for Indigenous communities. The community engagement and co-partnership in this study allowed for the researcher's flexibility to be responsive to culturally appropriate practices and priorities of the communities and participants. CBPR principles, including the Elder Advisory Committee (EAC), were utilized in this urban-based project. Challenges presented in many ways, including the processes of a) entering communities, b) relationship building, c) time involvement, and d) recruitment. Successes represented the unique opportunity to enter communities at an interpersonal level, b) close community engagement, c) gathering information beneficial for the research team and the community, and d) extended community engagement. While challenges exist, this approach's benefits are far-reaching promoting trust, support, and interest in future research endeavors. The presenter will discuss strategies and processes helpful in engagement, recruitment, and data collection.

Session 2385 (Symposium)

CREATIVE ARTS-BASED APPROACHES TO IMPROVE THE WELL-BEING OF OLDER ADULTS

Chair: Darina Petrovsky

Discussant: Justine Sefcik

As older adults age they may face cognitive impairment, disruption in their sleep, and a decrease in mood and overall well-being. Given the negative consequences of the COVID-19 pandemic, they may experience a disruption in their access to health care services. Creative arts-based approaches have shown promise in improving the well-being of older adults and may be helpful in augmenting health care services. In this symposium, we will present research results of creative arts-based interventions aimed at improving the well-being of older adults, including those with dementia. We will also discuss ways to successfully engage with organizations that serve older adults using arts-based interventions. The first presentation will focus on the results from a feasibility randomized controlled trial examining the effects of a tailored music listening intervention on sleep outcomes in older adults living with dementia and their caregivers. The second presentation will report findings from the Mason Music & Memory Initiative aiming to improve mood and behavioral outcomes in persons living with dementia in nursing homes. The third presentation will focus on the preliminary results

of a pilot study that integrated the delivery of music therapy telehealth with remote social work support and service linkage for rural older adults from low-income areas. The fourth presentation will report findings from the capacity-building program for teaching artists, health/aging organizations, and arts organizations committed to strengthening Creative Aging efforts through research. Implications for future research and creative arts-based intervention development for older adults will be discussed.

TAILORED MUSIC LISTENING TO IMPROVE SLEEP IN OLDER ADULTS WITH DEMENTIA: A RANDOMIZED CLINICAL TRIAL

Darina Petrovsky,¹ Nalaka Gooneratne,² Joke Bradt,³ Miranda Varrasse McPhillips,⁴ Ime Etokebe,⁴ Laura Gitlin,⁵ and Nancy Hodgson,⁶ 1. *Rutgers University, Philadelphia, Pennsylvania, United States*, 2. *University of Pennsylvania School of Medicine, Philadelphia, Pennsylvania, United States*, 3. *Drexel University, Philadelphia, Pennsylvania, United States*, 4. *University of Pennsylvania, Philadelphia, Pennsylvania, United States*, 5. *Drexel University, College of Nursing and Health Professions, Drexel University, Pennsylvania, United States*, 6. *University of Pennsylvania, School of Nursing, Philadelphia, Pennsylvania, United States*

Sleep disturbances in persons living with dementia (PLWD) contribute to reduced well-being. Music has shown promise to improve sleep among older adults, but there is limited evidence of music interventions improving sleep specifically in PLWD. The purpose of this wait-list RCT was to examine the i) feasibility; ii) acceptability and iii) preliminary efficacy of tailored music listening intervention in community-dwelling PLWD and their caregivers (dyads). Thirty consented dyads out of 33 (91%) completed the RCT. Tailored music for sleep was feasible based on screening (26%), enrollment (89%), and recruitment (3 dyads/month) rates. The intervention was found acceptable, as evidenced by post-intervention interviews. Compared to controls, PLWD in the intervention group reported greater global sleep quality improvement post-intervention (PSQI mean change -0.08 vs -1.65; $p=0.06$). The results from this feasibility RCT have informed the development of a music mobile application that will be tested in a future clinical trial.

IMPLEMENTING A PERSONALIZED MUSIC INTERVENTION FOR PERSONS LIVING WITH DEMENTIA IN NURSING FACILITIES

Megumi Inoue,¹ Meng-Hao Li,² Emily Ihara,¹ Catherine Tompkins,¹ Christi Clark,³ and Shannon Layman,¹ 1. *George Mason University, Fairfax, Virginia, United States*, 2. *George Mason University, Arlington, Virginia, United States*, 3. *Harpeth Consultant Advisory Group, Franklin, Tennessee, United States*

The Mason Music & Memory Initiative (M3I) team has implemented a personalized music intervention in nursing facilities across Virginia aiming to improve behavioral and psychological symptoms of persons living with dementia. This person-centered intervention uses a unique music playlist comprising songs, artists, and preferred musical genres. The preliminary findings from a randomized controlled trial will be reported, the purpose of which was to examine the intervention impact on nursing home residents' mood and

behavior. Based on the findings from 16 facilities with 158 residents who have completed the study, both quantitative and qualitative data indicate the positive effects on residents, including improved sleep and mood, as well as reduced agitation. The challenges in implementing intervention research in nursing facilities during the COVID-19 pandemic and the principles of telehealth and virtual support for facilities that were used to address those challenges will also be discussed.

Session 2390 (Paper)

Disasters and Aging

CHALLENGES AND STRATEGIES TO MAINTAIN FIDELITY TO THE MIRROR-TCM INTERVENTION DURING THE COVID-19 PANDEMIC

Mary Naylor,¹ Karen Hirschman,¹ Brianna Morgan,¹ Molly McHugh,¹ Elizabeth Shaid,¹ Kathleen McCauley,¹ Christina Whitehouse,² and Mark Pauly,¹ 1. *University of Pennsylvania, Philadelphia, Pennsylvania, United States*, 2. *Villanova University, Villanova University, Pennsylvania, United States*

Randomized clinical trials (RCTs) have demonstrated that the multicomponent Transitional Care Model (TCM), an advanced practice registered nurse-led, team-based, care management strategy improves outcomes for older adults transitioning from hospital to home. However, healthcare systems' adoption of the model has been limited. A multi-system, replication RCT (MIRROR-TCM) enrolling older adults hospitalized with heart failure, chronic obstructive pulmonary disease or pneumonia began in February 2020 just as the outbreak of COVID-19 in the U.S. dramatically changed the healthcare and research landscape. The goal of this qualitative descriptive study is to explore the impact of COVID-19 on fidelity to the TCM intervention during this clinical trial. Using directed content analysis, recorded monthly meetings with health system leaders and staff were coded to identify challenges and strategies to maintaining fidelity to the intervention in the context of the pandemic. Analyses showed that COVID-19 impacted all 10 TCM components. The components with the most challenges were delivering services from hospital-to-home due to quarantining, restrictive facility policies, lack of personal protective equipment and limited telehealth availability; coordinating care due reduced availability of services, and screening at risk individuals because of fewer eligible patients. Strategies for addressing challenges included: exploring alternatives (e.g., increasing reliance on telehealth, expanding study eligibility), building and engaging networks (e.g., direct outreach to skilled nursing facility staff) and anticipating needs (e.g., preparing for shorter hospital stays). Findings highlight the importance of monitoring the contextual challenges to implementing an evidence-based intervention and actively engaging partners in identifying strategies to achieve fidelity.

CHANGES IN MODIFIABLE HEALTH BEHAVIORS DURING THE PANDEMIC AND EFFECTS ON MENTAL HEALTH: EVIDENCE FROM ENGLAND

Giorgio Di Gessa, and Paola Zaninotto, *University College London, London, England, United Kingdom*

COVID-19 mitigation efforts (including lockdowns and advice to stay at home as much as possible) are likely to have resulted in changes in health behaviours such as the amount of sleep, physical exercise, alcohol use, and eating. To date, little is known about how and to what extent these changes in health behaviours since the beginning of the pandemic are related to mental health. Using pre-pandemic data from Wave 9 (2018/19) and from two Covid-19 sub-studies (with data collection in June/July and November/December 2020) of the English Longitudinal Study of Ageing, we investigate how changes in health behaviour during the initial months of the pandemic are associated with subsequent mental health among older people. In our regression analyses, we considered depression and anxiety and controlled for pre-pandemic measures of mental health. Between March and June/July 2020, about a third of older people reported less physical activity; one in five less sleep; and one in ten eating less food and drinking more. Compared to respondents who did not change their behaviours, those who reported sleeping and eating both more and less, and who mentioned less physical activity were more likely to report depression and anxiety, even taking into account pre-pandemic mental health. An increase in drinking was also marginally associated with higher depression. Policymakers should encourage older people who have engaged in unhealthier behaviours to modify them to reduce the negative long-term effects on their mental health.

IMPACT OF COVID-19 MORTALITY ON U.S. LIFE EXPECTANCY BY SOCIOECONOMIC RANK OF COUNTY OF RESIDENCE

Denys Dukhovnov, and Magali Barbieri, *University of California, Berkeley, Berkeley, California, United States*

Mortality disparities due to COVID-19 pandemic in the US accentuated the gap in the targeted public health and education response among disadvantaged communities. We use county data from John Hopkins University of Medicine in conjunction with county socioeconomic decile rankings, and weekly national data from the Centers for Disease Control to uncover the impact of county-level socioeconomic deprivation on the spatio-temporal dynamic of COVID-19 mortality. We estimate that over the course of 2020, the pandemic reduced the life expectancy at birth by 1.33 years (95% CI 1.0-1.56), and by 0.84 years (95% CI 0.59-1.0) by age 85 across all county SES decile groups, relative to the previous year's projection. The highest losses occurred in counties at the ends of the deprivation spectrum, and least affecting those in its middle. Decomposition of the impact of the COVID-19 mortality by seasonal time periods of 2020 reveals that coastal urban and high-SES counties endured a heavy death toll in the initial stages of the pandemic, though managed to cut it by more than a half by the end of 2020. The least affluent, inland, and rural counties have experienced a dramatic and lasting increase in deaths toward the second half of the year. We find that preexisting socioeconomic disparities before COVID-19 remained in force during the pandemic, leaving populations at all ages residing in underserved communities at a greater risk. This both calls into question and further instructs the ongoing public health interventions enabling more effective and equitable infectious disease mitigation strategies.

IMPACT OF HURRICANE SANDY ON HOSPITAL ADMISSIONS 2 YEARS LATER

Laura Sands,¹ Pang Du,² Quyen Do,¹ Yunnan Xu,¹ and Rachel Pruchno,³ 1. *Virginia Tech, Blacksburg, Virginia, United States*, 2. *Virginia Tech, Virginia Tech, Virginia, United States*, 3. *Rowan University, Stratford, New Jersey, United States*

Disaster exposure is often followed by acute illness and injuries requiring hospital admission in the weeks after the disaster. It is not known whether disaster exposure is associated with hospitalization in the years after the disaster. We examined the extent to which disaster exposure is associated with hospitalization two years after Hurricane Sandy. The analyses fill a gap in our understanding of long-term physical health consequences of disaster exposure by identifying older adults at greatest risk for hospitalization two years after disaster exposure. Older adults (n=909) who participated in a longitudinal panel study provided data before and after Hurricane Sandy. These data were linked with Medicare inpatient files to assess the impact of Hurricane Sandy on hospital admissions after the post-hurricane interview. Those who reported experiencing a lot of fear and distress in the midst of Hurricane Sandy were at an increased risk of being hospitalized in the second or third years after the hurricane [Hazard Ratio=1.81 (1.15 – 2.85)]. Findings held after controlling for pre-hurricane demographics, social risks, chronic conditions, and decline in physical functioning after the hurricane. These findings are the first to show that disaster exposure increases risk for hospital admissions two years after a disaster, and that older adults' appraisal of their emotional distress during the disaster has prognostic significance that is not explained by known risks for hospital admissions. The findings suggest that interventions during the storm and after the storm, may reduce long-term health consequences of disaster exposure among older adults.

SOCIOCULTURAL FACTORS INFLUENCING THE MANAGEMENT OF MENINGITIS AMONG OLDER ADULTS IN KWARA STATE, NIGERIA

Kafayat Mahmoud,¹ Moshood Issah,² and Hameed Bakare,³ 1. *University of Kansas, Lawrence, Kansas, United States*, 2. *University of Ilorin, Ilorin, Kwara, Nigeria*, 3. *University of Ilorin, University of Ilorin, Kwara, Nigeria*

During epidemic and non-epidemic seasons, the Kwara North, Nigeria, has consistently reported high incidence rates for meningitis, a disease which mostly affects older members of the community. Limited studies have investigated the nexus between climate change-meningitis and socio-cultural factors influencing the management and control of meningitis among the older adults. This study explored the lived experiences of older individuals with meningitis and relationships with their caregivers in Kaiama Local Government area of Kwara state, Nigeria. 15 participants, 6 men and 9 women, aged 65+ years were purposively selected, and in-depth interviews were conducted. Results indicated that most of the older adults believed that the disease is caused by spiritual or supernatural forces (such as witchcrafts, demons, evil spirits among others), and the treatment and management, using orthodox medicine of it has been hampered by certain socio-cultural beliefs. Due to beliefs about contagion, older adults are mostly left on their own, with adult children occasionally

visiting their parents to provide care only to return to their own homes. Also, children visit with traditional healers who perform rites of purification and give older adults concoctions to use. The study concluded that meningitis is one of the leading causes of untimely death of some older adults in the study communities and it has been worsened by some socio-cultural practices. Based on this conclusion, the study recommended massive enlightenment of the general public about best practices in the treatment and management of the disease among the older members of the study communities.

Session 2395 (Symposium)

DIVERSITY, EQUITY, AND INCLUSION IN GERONTOLOGICAL RESEARCH MENTORING AND METHODOLOGIES

Chair: Ronica Rooks

Co-Chair: Chivon Mingo

Discussant: Chivon Mingo

With a rapid increase in our nation's diversity and in particular the diversity of the aging population, research focused on the well-being and quality of life for all older adults is imperative. Within GSA, The Minority Issue in Gerontology Advisory Panel is charged with providing support to the membership that ultimately will yield an increase in the quantity and quality of research related to minority aging issues. Therefore, understanding best practices for minority-focused gerontological research and gerontological education curriculum is warranted. The advancement of the field is predicated on the ability to have trained professionals with skills and competencies that effectively meet the needs of a diverse aging population. This symposium will include a presentation highlighting practical strategies for strengthening gerontology research by intentionally incorporating anti-racist methodological approaches. The second presentation will consist of recommendations on how to support, promote, and advance gerontology education in a manner that increases the diversity of those pursuing a research or an applied career in this area of study. Presenters will share an overview of the literature, findings from program implementation focus groups, and recommendations for tailoring strategies to fit your intended audience. This session will prove beneficial as we make strides to ensure that diversity, equity, and inclusion remain a core value and an inherent practice of all gerontology professionals.

THE GSA NIA R13 DIVERSITY MENTORING AND CAREER DEVELOPMENT WORKSHOP: WHAT DID WE LEARN AFTER 3 YEARS?

Patricia Heyn,¹ Patricia D'Antonio,² and Keith Whitfield,³

1. *University of Colorado Anschutz Medical Campus, Arvada, CO, Colorado, United States*, 2. *The Gerontological Society of America, Washington, District of Columbia, United States*, 3. *University of Nevada Las Vegas, Las Vegas, Nevada, United States*

The goal of the GSA NIA R13 Diversity Mentoring and Career Development Technical Assistance Workshop (GSA Diversity TAW) is to support, promote, and advance the training of diverse students in aging research. The program's main aim is to increase the number of early career scientists who are historically underrepresented in gerontological

research. Thus, from 2018 to 2020, more than 60 trainees and 16 faculty from diverse backgrounds participated in this unique gerontological training that included peer mentoring opportunities and engagements at the GSA Annual Meeting. The workshop curriculum included scientific presentations, networking, NIH grant preparation, career planning, and effective professional communication. Trainees and faculty were involved in the evaluation of the workshop, which included electronic surveys and focus groups that informed the design and curriculum of subsequent workshops. This paper will discuss the curricular design and objectives of the GSA Diversity TAW and present a summary of the trainees' feedback results about the program and the iterative changes made based on that data.

STRENGTHENING ANTI-RACIST GERONTOLOGY RESEARCH: DOES ONE SIZE FIT ALL?

Lyn Holley, *University of Nebraska at Omaha, Omaha, Nebraska, United States*

This paper is based on a scoping review and conceptual analysis of research literature about incorporating anti-racism into social science research practices. In his examination of how anti-racist research can effectively borrow key concepts such as "validation and "reliability" from traditional social science research, Dei concludes that these concepts must be reconsidered to address the main issues of anti-racism. (2005). A further critique of these concepts is that they do not account for differences among racism as it is applied to different minoritized groups. Public Health Nurses and other practitioners have long recognized the importance of understanding and taking these differences into account in their "culturally competent" practice. (Lipscomb, Culture Care) Although there is some literature about de-centering whiteness in research (e.g., <https://libguides.umn.edu/antiracism/>), little is available to guide research that acknowledges and addresses overlapping yet differing contours of racism as experienced by different "races", e.g., Black-Americans, Native American Indians".

Session 2400 (Paper)

Diversity, Racial Minorities, and Aging I

AGE-FRIENDLY AS TRANQUILO AMBIENTE: HOW SOCIO-CULTURAL PERSPECTIVES SHAPE OLDER LATINOS' LIVED ENVIRONMENT

Melanie Plasencia, *University of California, Berkeley, West Lebanon, New Hampshire, United States*

Researchers have increasingly considered the importance of age-friendly communities to improve the health and well-being of older adults. Studies have primarily focused on the built environment, such as community infrastructure, older adult behavior, and environmental expectations. Less attention, however, has been given to the role of cultural characteristics in shaping perceptions of age-friendly environments for Latinos. Using an ethnographic methodological approach, including participant observation in a Latino community near New York City and 72 semi-structured interviews, this study provides empirical insights

into how older Latinos characterize age-friendly communities. Latino older adults described their community as age-friendly using Tranquilo Ambiente (TA), which translates to a calm or peaceful environment. According to older adults, a TA possesses the following: 1) a sense of personal safety, including protection of their body, 2) ethnic, social connectedness, including networks with other Latinos and important social and cultural events; and 3) a comparative understanding of their communities treatment of seniors versus other geographical and spatial locations. While much has been written on the role of the built and social environment in developing and implementing age-friendly communities, more research on the cultural significance and understanding of place among marginalized older adults is necessary. TA and its characteristics demonstrate that cultivating an age-friendly setting requires adapting structures and services to promote Latino older adults' social and cultural support and engagement.

AGING OUT OF PLACE: FACTORS RELATED TO QUALITY OF LIFE AMONG OLDER REFUGEES IN THE UNITED STATES

Jonix Owino,¹ and Heather Fuller,² *1. North Dakota State University, Horace, North Dakota, United States, 2. North Dakota State university, Fargo, North Dakota, United States*

Refugees flee their home countries, migrating to countries such as the US for safety. The psychological distress they experience may compromise their adaptation and well-being. However, little is known about quality of life among aging refugees who migrate to the US as adults, and in particular whether quality of life varies among refugees by sociodemographic factors such as age, sex, country of origin, and length of residence. Moreover, limited research exists examining the role of social connectedness for aging refugees's quality of life. The current study explores sociodemographic and social connection factors associated with quality of life among aging refugees (N = 108; aged 50+). Refugees from Bhutan, Burundi, and Somalia were recruited from a Midwestern small city to complete an in-depth survey assessing social factors and well-being. Hierarchical regression analyses showed that females, older individuals, and African refugees reported lower quality of life, while length of residence was not associated with quality of life. When controlling for sociodemographic factors, greater social integration and lower loneliness were significantly associated with higher quality of life. There was also a significant interaction between loneliness and sex in predicting quality of life, indicating that greater loneliness was associated with reduced quality of life for women but not men. Study findings will be discussed in light of cultural variations within refugee groups and with the goal of highlighting ways to best support aging refugees' well-being and develop social programs that can effectively cater to issues of aging among refugees.

IMPACT OF A PHARMACIST-LED DIABETES MANAGEMENT INTERVENTION TO IMPROVE HEALTH EQUITY

Renae Smith-Ray,¹ Tanya Singh,¹ Evie Makris,² Jaime Horan,³ and Michael Taitel,¹ *1. Walgreen Co, Deerfield, Illinois, United States, 2. Walgreens Co.,*

Deerfield, Illinois, United States, 3. Walgreens, Deerfield, Illinois, United States

The COVID-19 pandemic and Black Lives Matter movement brought increased recognition to the need for health equity. Diabetes, the 7th leading cause of death, is one of many conditions where health inequities are evident. A higher percentage of Black (11.7%) and Hispanic (12.5%) U.S. adults are diagnosed with diabetes compared to non-Hispanic Whites (7.5%). To address this health inequity, a nationwide pharmacy chain implemented telephonic 'Advanced Care' (AC) outreach for patients with diabetes. During the AC call, pharmacists used motivational interviewing techniques to counsel patients on the importance of closing gaps in care and reducing barriers to medication adherence. Gaps included timely A1C testing, exams (eye, foot, kidney), immunizations (influenza, pneumonia, Hepatitis B), and recommendation of additional therapies for patients with multiple chronic conditions (ACE/ARB, statins). Medication fill gaps were compared between the Intervention period (8/1/20-1/31/21) and a pre-intervention period (2/1/20-7/31/20). The AC pilot occurred in 8 Chicago Walgreens locations that primarily serve Black and Hispanic patients. Eight control stores were matched on census block-level household income and race/ethnicity, patient volume, and insurance mix. A pre/post-test vs. control difference-in-difference (DID) analysis was conducted to compare on-time refill rates. Of the 1,009 older patients (age \geq 50) called, 59.9% were reached. The DID analysis showed that patients in pilot stores had improved pre-post on-time refill rates compared to controls ($p < 0.0001$). Diabetes self-management is key to reducing diabetes-related complications. Early findings from this pilot demonstrate that the Walgreens AC intervention improves medication adherence - an important step toward improving health equity.

INSTRUMENTAL ACTIVITIES OF DAILY LIVING DIFFICULTIES PREDICT COGNITIVE DECLINE IN OLDER PUERTO RICAN ADULTS

Caitlin Pope,¹ Tyler Bell,² Brian Downer,³ Sadaf Milani,³ Lauren Roach,¹ and Michael Crowe,⁴ 1. *University of Kentucky, Lexington, Kentucky, United States*, 2. *University of California San Diego, La Jolla, California, United States*, 3. *University of Texas Medical Branch, Galveston, Texas, United States*, 4. *University of Alabama at Birmingham, Birmingham, Alabama, United States*

Given the hypothesized bidirectional association between functional and cognitive decline, further characterization of the temporal association between the two is needed, especially in Latinx samples as they are the most rapidly growing demographic in the United States and at greater risk for Alzheimer's disease. This study assessed bidirectional associations between instrumental activities of daily living (IADL) difficulty and cognition in older Puerto Rican adults. Participants included 2,840 community-dwelling adults (60+ years) without cognitive impairment who completed baseline and a four-year follow-up in the Puerto Rican Elderly: Health Conditions (PREHCO) project. At each wave, cognition (using the Mini-Mental Cabán) and self-reported IADL difficulty (a sum score of 10 everyday tasks) were measured. Covariates included age, gender, education, comorbidities, and depressive symptoms. Bidirectional associations were

tested using a path model with concurrent and cross-lagged paths between cognition and IADL difficulty adjusting for covariates. Lower baseline cognition related to more baseline IADL difficulty ($B = -0.08$, $SE = 0.02$, $p < .001$). Cognitive decline at follow-up related to greater IADL difficulty at follow-up ($B = -0.06$, $SE = 0.02$, $p = .012$). Looking at cross-lagged associations, greater baseline IADL difficulty associated with more cognitive decline at follow-up ($B = -0.10$, $SE = 0.04$, $p = .012$). However, baseline cognition was not significantly associated with change in IADL difficulty at follow-up ($B = -0.003$, $SE = 0.02$, $p = .869$). Findings support the growing body of literature that IADL difficulties can predict future cognitive decline in samples of community-dwelling older adults. More research into both functional and cognitive decline in Latinx samples will provide a more generalizable view of aging.

POPULATION AGING AND MULTICULTURAL DIVERSITY IN THE UNITED STATES: IMPLICATIONS FOR OLDER CONSUMERS' NEEDS AND EXPECTATIONS

Julie Miller,¹ Taylor Patskanick,² Lisa D'Ambrosio,³ and Joseph Coughlin,¹ 1. *MIT, Cambridge, Massachusetts, United States*, 2. *MIT, Somerville, Massachusetts, United States*, 3. *Massachusetts Institute of Technology, Cambridge, Massachusetts, United States*

Looking ahead to 2030 and beyond, the United States will be both older and more multicultural than presently. To explore the impacts and characteristics of an increasingly diverse population beginning to age, the MIT AgeLab conducted online focus groups in August 2020 ($n = 92$) with ethnically diverse participants ages 40-69 on topics related to household composition, use of technology and digital engagement. Regarding household composition, Black and Latinx participants were more likely to report living with grandchild(ren), and Asian, Latinx, and White participants were more likely to report living with a parent(s) or parent(s)-in-law. Latinx participants often described ways in which caregiving for aging parents was a cultural value, but many participants who had raised children in the United States but who were not born in the United States themselves described cultural gaps in family attitudes that had sometimes widened across the generations. While all participants were using some technology, due to the coronavirus pandemic, digital tools were being used more widely than ever before. Racial/ethnic identity groups were more similar than different in terms of their responses to questions around consumer digital engagement. There were notable differences in overall trust in technology across racial/ethnic groups, with Asian participants reporting the highest average overall level of trust in technology and Multiracial participants reporting the lowest. Looking ahead, the intersection of aging and growing racial/ethnic diversity in the United States will yield a wider array of consumer needs and expectations.

Session 2405 (Symposium)

EFFECTS OF LONELINESS AND SOCIAL ISOLATION ON COGNITIVE HEALTH: LATEST PERSPECTIVES AND FUTURE DIRECTIONS

Chair: Ted Ng
Co-Chair: Kexin Yu
Discussant: James Lubben

Loneliness and social isolation as antecedents of cognitive decline have received substantial attention in recent research. This symposium addresses this year's conference theme of aging in the "new normal". The COVID-19 pandemic has highlighted the negative impacts of loneliness and social isolation on older adults' health and wellbeing. This symposium includes studies that shed light on the relationships between loneliness, social isolation and cognitive health using a multidisciplinary approach, and provide recommendations and future directions for advancing this research area. The first presentation examines cardiovascular biomarkers as potential mechanisms that mediate the longitudinal relationship between loneliness and cognitive decline with the HRS dataset. The second presentation examines several social isolation indicators and their effects on cognitive decline in a Canadian longitudinal study. Using the US ADRC longitudinal study of aging, the third study shows the effect of loneliness on cognitive health in older adults pre- and post-onset of the COVID-19 pandemic. The symposium concludes with a literature review of the different measures employed to operationalize the constructs of loneliness, isolation, which resulted in heterogeneous study findings on their influences on the risk of developing dementia. This review calls for consistent measures to produce comparable evidence on the health consequences of loneliness and isolation. In all, this symposium reports and reviews the latest evidence on the association between social isolation, loneliness and cognitive health amidst the ongoing COVID-19 pandemic. It also echoes the conference theme of transforming disruption to opportunities in aging health service and research.

BIOLOGICAL PATHWAYS UNDERLYING THE LONGITUDINAL ASSOCIATION BETWEEN LONELINESS AND COGNITIVE DECLINE

Kexin Yu,¹ and Ted Ng,² *1. USC, LA, California, United States, 2. ASU, Phoenix, Arizona, United States*

Loneliness has been recognized as a risk factor for cognitive decline (CD) in older adults. However, how loneliness "gets under the skin" to influence CD has been conceptually proposed but rarely empirically examined. The purpose of this study is to investigate whether cardiovascular and kidney biomarkers mediate the longitudinal association between loneliness and CD. We used the cross-lagged panel model (CLPM) to examine the hypothesized relationships with 2006, 2010 and 2014 waves of data from the Health and Retirement Study (HRS). Loneliness is measured with 3-item UCLA loneliness scale. Cognitive health was assessed using the total cognition score. Biomarkers considered including HbA1C, total cholesterol, HDL cholesterol, CRP, and Cystatin C. Among all five biomarkers examined, HbA1c significantly mediated the longitudinal association between loneliness and CD. The other biomarkers examined did not mediate the relationship between loneliness and CD. The study findings show loneliness might affect CD through elevating HbA1C levels.

A PUBLIC HEALTH ANALYSIS OF THE RELATIONSHIP BETWEEN LONELINESS, ISOLATION, AND DEMENTIA

Christina Victor, *Brunel University London, Uxbridge, England, United Kingdom*

Loneliness and isolation are now characterised as major public health problems largely because of reported associations with negative health outcomes including dementia. We adopt a public health perspective and review the relationship between loneliness/isolation and dementia focussing on how these concepts are defined, measured, and reported. We identified community based longitudinal studies which measured loneliness/isolation at baseline and dementia at follow up (minimum 12 months) published up to February 2021. We identified 12 papers for loneliness and 15 for isolation which demonstrated substantial heterogeneity in how exposure (loneliness/ isolation) and outcome (dementia) were measured and reported. For example, dementia was measured in 5 different ways: death, hospitalisation, clinical diagnosis, dementia screening tools or cognitive function. Evidence to support a relationship between loneliness/isolation and dementia is inconclusive largely because of this methodological heterogeneity. Using consistent exposure and outcome measures is a prerequisite for determining the health consequences of loneliness and isolation.

THE RELATIONSHIP BETWEEN LONELINESS AND THE COVID-19 PANDEMIC ON COGNITION AND WELL-BEING IN OLDER ADULTS

Elizabeth Rhodus,¹ Justin Barber,¹ Allison Gibson,² Shoshana Bardach,³ Kelly Parsons,¹ Julia Johnson,¹ and Gregory Jicha,¹ *1. University of Kentucky, Lexington, Kentucky, United States, 2. University of Kentucky, University of Kentucky, Kentucky, United States, 3. Dartmouth University, Dartmouth University, New Hampshire, United States*

Social distancing is necessary to limit the spread of Covid-19. However, many older adults are predisposed to isolation and loneliness despite calls to socially distance. The current study examined loneliness during Covid-19 in relation to cognition and wellbeing in older adults. Data were extracted from a U.S. ADRC longitudinal study of aging database. Cognition was assessed using the NACC UDS 3.0 battery. Measures of well-being include: Short Form Health Survey, Subjective Memory Assessment, and Geriatric Depression Scale. Measurement of loneliness was selected from the NIH ADRC Covid-19 questionnaire. Data were from 115 older adults with normal cognition or MCI with a visit ≤ 18 months before research stoppage in March 2020 and after resumption in late-June 2020. Cognition and wellbeing are compared before and after onset of pandemic. Isolation due to Covid-19 may have long-term implications. Results of this study will highlight the need for acute assessments and psychosocial interventions.

THE LONGITUDINAL ASSOCIATION BETWEEN SOCIAL ISOLATION AND COGNITIVE DECLINE AMONG CANADIAN OLDER ADULTS

Fereshteh Mehrabi,¹ and François Béland,² *1. School of Public Health (ESPUM), Université de Montréal, Montreal, Quebec, Canada, 2. Université de Montréal, Montreal, Quebec, Canada*

Social isolation is an emerging public health concern with an emphasis on its potential preventive impact on cognitive impairment. We hypothesize that change in social isolation is associated with cognitive decline over two years. Latent

growth models were used to test the hypothesis using data from the FRÉLE longitudinal study among 1643 Canadian community-dwelling older adults aged 65 years and over. We assessed social isolation using social participation, social networks, and support from various social ties. We found that less contact with friends and children, less social support from friends, children, and partner, and the absence of partner were significantly associated with cognitive decline. Higher baseline social participation was related to the lower rate of cognitive decline over time. Fewer contacts with grandchildren were associated with cognitive decline over time. Our study suggests that public health policies in age-friendly cities and intergenerational contacts may promote cognitive health in older adults.

Session 2410 (Symposium)

ESPO AND BUTLER-WILLIAMS SCIENTIFIC SYMPOSIUM: DISRUPTING HEALTH DISPARITIES AND TRANSFORMING CARE OF OLDER ADULTS

Chair: Patricia Jones

Co-Chair: Jamie Justice

Discussant: Roland Thorpe, Jr.

The NIA's Butler-Williams Scholars Program and GSA's ESPO Section are united in providing career development opportunities in a manner that promotes leadership, diversity, and inclusivity. Our emerging scholars are called to examine health inequity and overcome barriers by continuous and incremental improvements (disruption) or dramatic change (transformation) to improve health and access to care for our diverse aging population. Among the chief concerns of our aging population are disparities in health associated with race/ethnicity, experience, sociocultural and socioeconomic factors. GSA's early career professionals and 2020 alumni of the prestigious NIA Butler-Williams Scholars Program address these issues. Dr. Karen Moss will discuss new findings from a study of African American caregivers of persons living with dementia. Dr. Jasmine Travers will present on mitigating disparities in access to long-term services and supports among older adults. Dr. Maricruz Rivera-Hernandez, will present current work on aging and care delivery or health of Hispanic older adults, including impact of COVID19 in Hispanic groups. Dr. Marc Garcia will present on interaction of race/ethnicity, nativity, and gender with key social and economic factors on health, COVID19, and aging. Finally, Dr. Shana Stites will present on social challenges in advancing diagnosis and treatment of Alzheimer's disease dementia. The featured talks by rising stars deepen our understanding of the influence of health disparity so we can disrupt inequity and transform systems of care across our diverse aging populations.

EXPERIENCED FAMILY CAREGIVER PERSPECTIVES ON ADVANCE CARE PLANNING FOR AFRICAN AMERICANS LIVING WITH DEMENTIA

Karen Moss,¹ Kathy Wright,¹ Laurel Myers Hurst,¹ Abigail Grieff,¹ Karen Rose,¹ Todd Monroe,² and Celia Willis,¹ 1. *The Ohio State University, Columbus, Ohio, United States*, 2. *Ohio State University, Columbus, Ohio, United States*

Most existing advance care planning (ACP) programs do not meet the needs of lower socioeconomic status (SES)

African American (AA) older adults living with dementia. The perspectives of experienced family caregivers are integral to achieving appropriate ACP tailoring. The purpose of this study is to describe experienced family caregiver perceptions about needs and preferences for tailoring ACP for family caregivers of lower SES AA older adults living with dementia. This qualitative, descriptive, cross-sectional study is embedded within a larger community-based participatory study aimed at intervention development. Caregivers are completing up to two interviews. Preliminary data describes themes involving Caregiver Stress and suggestions for Service Improvements addressing grief and loss pre- and post-death. Caregiver findings and other stakeholder data from healthcare providers and community leaders will guide the design of a "new normal" enhanced, preference-consistent ACP intervention to improve end-of-life care during a global pandemic that is amplifying pre-existing healthcare disparities.

A PROFILE OF BLACK AND LATINX OLDER ADULTS RECEIVING CARE IN NURSING HOMES: 2011-2017

Jasmine Travers,¹ Andrew Dick,² Bei Wu,¹ David Grabowski,³ Mansi Agarwal,⁴ Gayani Perera,⁵ and Patricia Stone,⁶ 1. *New York University, New York, New York, United States*, 2. *Rand Corporation, Boston, Massachusetts, United States*, 3. *Harvard Medicaid School, Boston, Massachusetts, United States*, 4. *Division of Biostatistics, Washington University School of Medicine, St Louis, Missouri, United States*, 5. *Center for Health Policy Columbia University School of Nursing, New York, New York, United States*, 6. *Columbia University School of Nursing, New York, New York, United States*

Between the years 1999-2008, a substantial increase in nursing home use occurred among Black and Latinx older adults, while white older adults' use of nursing homes decreased. These disparate trends suggested potential racial and ethnic disparities in options for preferred long-term services and supports (LTSS) settings. Over the last decade, several initiatives have been put in place to support LTSS needs in the community. However, it is unclear whether Black and Latinx older adults are continuing to use nursing home services at disproportionate rates. We used LTCfocus data for 2011-2017 to explore current trends in nursing home use and access among Black and Latinx older adults in light of these current initiatives. Our findings reveal a continued rise in Black and Latinx older adults' use of nursing homes while white older adults' use continues to decline. More notably, there has been a decline in nursing homes servicing these minority groups.

THE IMPACT OF COVID-19 ACROSS NURSING HOMES THAT DISPROPORTIONALLY SERVE MINORITY RESIDENTS

Maricruz Rivera-Hernandez,¹ Amit Kumar,² Indrakshi Roy,² Amol Karmarkar,³ Kimberly Erler,⁴ James Rudolph,¹ and Julie Baldwin,² 1. *Brown University School of Public Health, Providence, Rhode Island, United States*, 2. *Northern Arizona University, Flagstaff, Arizona, United States*, 3. *Sheltering Arms Institute, Richmond, Virginia, United States*, 4. *MGH Institute of Health Professions, Boston, Massachusetts, United States*

The Coronavirus-2019 (COVID-19) pandemic has disproportionately affected communities of color and older adults in

the United States. Nursing homes (NHs) have reported over 130,000 COVID-19 deaths (or one-fourth of all US deaths) circa March 2021, a high share of the nation's total death count (CMS COVID-19 NH Data). These inequities partially driven by barriers to care, segregation and structural racism have resulted in the unequal impact of COVID-19 across NHs (Li et al., 2020). In this presentation, I will describe NHs that disproportionately care for minority residents and the effect of NH composition on COVID-19-related mortality and outcomes. In 2020, minority older adults were less likely to have access to high quality facilities. From June – August, NHs with a high proportion of minority residents reported higher COVID-19 mortality rates per 1000 residents. Equal access to high quality of care across the life-course among racial and ethnic groups is needed.

THE INTERSECTION OF RACE AND ETHNICITY, NATIVITY, AND SEX ON COGNITIVE TRAJECTORIES OF OLDER ADULTS IN THE UNITED STATES

Marc Garcia,¹ and Wassim Tarraf,² 1. *Syracuse University, Syracuse, New York, United States*, 2. *Institute of Gerontology & Department of Healthcare Sciences, Wayne State University, Detroit, Michigan, United States*

We used longitudinal data from the Health and Retirement Study (1998-2016) to estimate sex-specific age-graded changes in global cognition and memory among White, Black, and U.S.- and foreign-born Latino adults 51 years and older. Among males, racial/ethnic and nativity differences in cognitive function were mainly evident at younger ages, particularly for Blacks compared to Whites. We found no evidence to support male racial/ethnic or nativity differentials in trajectories of cognitive aging. For women, older Blacks and U.S.-Born Latinas, and to a lesser degree foreign-born Latinas, had lower cognitive function at younger ages. However, White women showed more pronounced cognitive aging in comparison to U.S.- and foreign-born Latinas. Results applied to both global and memory outcomes. Our findings support calls for nuanced considerations of racial/ethnic and nativity effects on cognitive aging and ADRDs. Continued monitoring of differential cognitive aging trends is warranted as the vascular and neurologic sequelae of COVID-19 manifests.

HOW BIOMARKER-BASED DIAGNOSIS AND TREATMENT AFFECT ALZHEIMER'S STIGMA: RESULTS OF A RANDOMIZED TRIAL

Shana Stites,¹ Jeanine Gill,¹ Emily Largent,¹ Kristin Harkins,¹ Abba Krieger,² and Jason Karlawish,¹ 1. *University of Pennsylvania, Philadelphia, Pennsylvania, United States*, 2. *Wharton School of Business, Philadelphia, Pennsylvania, United States*

Alzheimer's disease (AD) causes progressive disability and, ultimately, death. Currently no therapy can delay or slow cognitive and functional decline. This prognosis contributes to the general public's negative reactions—discrimination, pity, and social distance—toward individuals with AD and their families. But what if, using AD biomarker tests, diagnosis was made earlier and treatment was available? Stigma of AD might change. This project aimed to discover how diagnosis and treatment of AD before the onset of cognitive impairment would change public stigma, and how these

effects might differ in ethn racial populations. Comparisons of 12 experimental conditions (i.e., 2 (biomarker test result) x 2 (treatment availability) x 3 (cognitive impairment: none, mild, moderate)) are conducted in two independent samples of self-identified White (N=800) and Black (N=800) Americans. Findings anticipate the translation of the preclinical AD construct into care and will inform public policies and interventions to mitigate public stigma of AD.

Session 2415 (Symposium)

GENDER, FAMILY HISTORIES, AND LATE-LIFE ECONOMIC WELL-BEING

Chair: Deborah Carr

Co-Chair: Pamela Smock

Discussant: Teresa Ghilarducci

Text TK.

MARITAL HISTORIES AND LATE-LIFE ECONOMIC SECURITY: DO SOCIAL SECURITY BENEFITS RULES PERPETUATE DISPARITIES?

Deborah Carr, *Boston University, Boston, Massachusetts, United States*

Disparities in late-life economic security persist along the lines of gender, marital status, race, and educational attainment. We propose that these disparities are partly due to the fact that Social Security benefits are structured such that never-married, divorced, and cohabiting persons, those who were widowed prematurely, or were in a dual-earner couple face benefit penalties. Drawing on data from the Wisconsin Longitudinal Study (WLS), a study that has followed men and women from age 18 (in 1957) through age 72 (in 2011), we examine disparities in Social Security earnings and poverty risk on the basis of gender and marital histories. Our results reveal a large disadvantage for divorced and never-married persons (relative to their married counterparts), with women and those divorced two or more times experiencing the largest toll. We discuss the implications of our results for revamping Social Security to better meet the needs of 21st century families.

HOW MARITAL STATUS SHAPES GRANDPARENTING CHILDREN WITH DISABILITIES

Madonna Harrington Meyer, *Sociology, Syracuse, New York, United States*

How does marital status shape grandparent care work when grandchildren have disabilities? Based on 50 in-depth interviews with grandparents who provide various types of care for grandchildren with disabilities, we find that marital status shapes care work in three distinct ways: (1) Many who are married describe both grandparents working as a team to provide vital care; (2) Some who are married describe spouses, primarily grandfathers, who are either unable or unwilling to provide care; and (3) Many who are not married, primarily grandmothers, describe providing relatively high levels of care and support despite relatively low resources. While nearly all report a great deal of joy and satisfaction with their care work, those who are single, have greater care responsibilities, and fewer resources are more likely to report adverse social, emotional, physical, and financial impacts. More robust social policies could alleviate the impact of marital status on grandparent care work.

THE EFFECTS OF GENDER AND MARITAL STATUS ON ACCRUED DEBT IN RETIREMENT PLANNING

Karen Zurlo,¹ and Zibei Chen,² 1. *Rutgers University, Rutgers University, New Jersey, United States*, 2. *University of Southern Mississippi, Hattiesburg, Mississippi, United States*

The effects of gender and marital status on accrued debt in retirement planning becomes an urgent concern because unmarried women face greater financial challenges in retirement than their counterparts. This study used data from the National Financial Capability Study (NFCS), designed by FINRA. We identified debt that influences retirement planning among a sample of pre-retirees, aged 51 to 61 years, and consider the associations of gender, marital status, debt, and retirement planning. Our results indicated that mortgage debt and credit card debt were negatively associated with retirement planning for women. Having a retirement account is positively associated with retirement planning and it also mediates the relationship between credit card debt and retirement planning. We urge women and financial planning executives to take time during the pre-retirement years to assess their various forms of debt and determine how it affects retirement planning objectives given current marital status.

Session 2420 (Symposium)

JOSEPH T. FREEMAN AND EXCELLENCE IN REHABILITATION AWARD LECTURE

Chair: Elsa Strotmeyer

The Joseph T. Freeman Award lecture will feature an address by the 2021 Freeman Award recipient Pamela Cacchione, PhD, CRNP, BC, FGSA, FAAN, of the University of Pennsylvania. The Joseph T. Freeman Award is a lectureship in geriatrics awarded to a prominent clinician in the field of aging, both in research and practice. The award was established in 1977 through a bequest from a patient's estate as a tribute to Dr. Joseph T. Freeman. The Excellence in Rehabilitation of Aging Persons Award lecture will feature an address by the 2021 Excellence in Rehabilitation Award recipient Gregory Hicks, MPT, PhD of the University of Delaware. The Excellence in Rehabilitation of Aging Persons Award is designed to acknowledge outstanding contributions in the field of the rehabilitation of aging individuals.

EXCELLENCE IN REHABILITATION OF AGING PERSONS AWARD: DEVELOPING A FUNCTION-FOCUSED APPROACH TO PAIN MANAGEMENT FOR OLDER ADULTS WITH CHRONIC LOW BACK PAIN

Gregory Hicks, *University of Delaware, Newark, Delaware, United States*

The overarching goal of our research program is to improve physical function and participation in older adults with chronic musculoskeletal conditions, particularly low back pain (LBP). Despite the fact that LBP is a common problem for older adults and is associated with poor outcomes in this vulnerable age group, little research has focused on LBP in people over age 65. With minimal research available, clinicians do not have clear evidence-based guidance regarding management of older adults with LBP. This presentation will focus on our pathway towards developing

a focused treatment algorithm designed to prevent and address the pain-related disability found in older adults with LBP. Our work has largely focused on the identification of potentially modifiable "rehabilitation risk factors" that are associated with pain and functional limitations, as well as the development of interventions to address these risk factors. Specifically, we will discuss our findings relative to trunk muscle impairments and clinical hip impairments in the context of the older adult with low back pain.

JOSEPH T. FREEMAN AWARD: CREATING SYNERGY IN INTERDISCIPLINARY AGING RESEARCH AND PRACTICE

Pamela Cacchione, *University of Pennsylvania, University of Pennsylvania School of Nursing, Pennsylvania, United States*

Over 30 years of interdisciplinary practice stimulated many research questions. Early intervention research in sensory impairment, specifically vision and/or hearing impairment was heavily supported by interdisciplinary colleagues from Geriatric Medicine, Nursing, Occupational Therapy, Optometry and Audiology. Challenges and opportunities from this research created a growing interest in developing and designing technologies for older adults. Creating the need for partnerships with engineering. My expertise in aging and access to willing research participants made me an ideal research partner. Effectively expanding my focus beyond sensory impairment interventions to designing and testing robots with older adults. Currently we are testing low cost mobile robots in acute care and the community and are developing and testing a soft robot to assist persons out of a chair as well as turn and lift persons up in bed. The synergy of interdisciplinary practice and research is helping us innovate to improve the lives of older adults.

Session 2425 (Paper)

Long-Term Care II (SRPP Paper)

HOME CARE SERVICES FOR SENIORS: A TYPOLOGY OF INSTRUMENTS AND ADMINISTRATIVE BURDENS IN INDUSTRIALIZED COUNTRIES

Patrik Marier,¹ Daniel Dickson,¹ and Kyuho Lee,²

1. *Concordia University, Montreal, Quebec, Canada*,

2. *Daegu University, Daegu University, Kyongsang-bukto, Republic of Korea*

This contribution has two key objectives. First, inspired by earlier studies in comparative welfare state and in (social) gerontology, we develop a conceptualization of autonomy that is rooted in its social dimensions. This concept is then deployed to assess its policy considerations within the field of home care, both with regards to access and generosity in 21 industrialized countries. Second, this contribution performs a comparative assessment of the key factors resulting in a prioritization of the social dimensions of home care and social services in long term care. This study involves an-depth analysis of policy instruments deployed by public authorities to enhance the (social) autonomy of older adults, complemented with interviews with policy makers in diverse home care policy settings (Canada, France, South Korea, Sweden, and the United States). As such, this study features

an evaluation of the presence of social elements in the definition and supply of care needs across 21 countries. It leads to the construct of a social dimensions of autonomy index based upon these instruments and the budgetary prioritization of home care within long term care policies. Among core findings, one discovers broader access and more generous funding when home care responsibilities are firmly embedded at the local level.

NURSING HOME POST-ACUTE CARE SPECIALIZATION GROUPS AND FINANCIAL OUTCOMES

Xiao (Joyce) Wang,¹ Jeffrey Burr,² Robert Weech-Maldonado,³ Jennifer Hefele,⁴ and Kathrin Boerner,⁵ 1. *Brown University, Providence, Rhode Island, United States*, 2. *McCormack Graduate School, Boston, Massachusetts, United States*, 3. *University of Alabama at Birmingham, Birmingham, Alabama, United States*, 4. *Booz Allen Hamilton, McLean, Virginia, United States*, 5. *University of Massachusetts Boston, Boston, Massachusetts, United States*

Nursing homes (NHs) have increasingly specialized in post-acute care (PAC). However, it remains unclear as to why some NHs engage in more specialization than the others. Furthermore, the relationship between financial outcomes and PAC specialization has not been examined using more accurate financial indicators. This study developed a NH PAC specialization typology and examined financial outcomes (i.e. total revenue per inpatient day, operating margin) of different specialization groups. We employed NH-level panel data from 2011 through 2017 and focused on over 9,000 urban NHs per year. Multiple data sources were utilized like the Certification and Survey Provider Enhanced Reporting data; Medicare Cost Reports; and Brown University's LTCfocUS. We employed Latent Profile Analysis to develop distinct NH care specialization groups based on PAC staffing levels. This analysis revealed heterogeneous and clustered patterns of PAC staffing utilization and identified a four-group typology: "low specialization," "mixed specialization," "moderate PAC specialization," and "intensive PAC specialization." Using fixed-effects modeling, we then examined financial outcomes of the four PAC specialization groups. Although being in a group with higher level of commitment to PAC specialization was associated with higher revenues, it was not necessarily associated with higher operating margins. Further, in stratified analyses, for-profit and not-for-profit NHs showed different patterns in these associations. This suggested that although NHs compete for patients paid at higher reimbursement policies, increased costs may offset higher revenues as a result of specialization. Future studies should track financial outcome trajectories of NHs by care specialization groups in light of various payment innovations.

THE BENEFIT OF AUTONOMY AND CONTROL: A POSITIVE CHARACTERISTIC OF THE HOME HEALTH AIDE POSITION

Hayley Gleason,¹ and Edward Miller,² 1. *Colorado Department of Health Care Policy & Financing, Denver, Colorado, United States*, 2. *University of Massachusetts Boston, Boston, Massachusetts, United States*

Home Health Aides' (HHAs) are one of the fastest growing workforces in the country, yet the industry

struggles to recruit new aides into the field and retain current workers. This study explored HHAs' experiences with the level of autonomy and control granted to them within their day-to-day work. Findings from six focus groups with 37 HHAs showed that many aides select home care because of the control and independence the positions offer. Interacting one-on-one with clients and being able to self-structure their daily tasks were major benefits that drew HHAs to the field. Additionally, the HHAs highlighted the control they have over their schedule and the flexibility the position offers to enable them to accommodate other responsibilities, like childcare or other jobs. Being able to decline a client because of travel distance, the hours required, or not feeling that it is a "good fit" was also a welcomed aspect of the position. Despite complaints about the job, such as low pay, lack of benefits, and limited support, many of the HHAs admitted staying on in their positions because of the flexibility, autonomy, and control provided. Findings highlight the value that HHAs place on autonomy and control and the potential benefit that these job qualities have for promoting greater recruitment and retention of the home care workforce. Amplifying opportunities for these aspects of the job may thus entice new individuals to pursue a career as an HHA, as well as help to maintain those individuals currently in the position.

UNDERGIRDING CNAS IN LTC: THE EXPERIENCE OF COLLABORATIVE LN-CNA CAREGIVING PAIRS

Cynthia Beynon,¹ Katherine Supiano,² Elena Siegel,³ Linda Edelman,⁴ Connie Madden,⁵ and Sara Hart,⁶ 1. *Weber State University, Ogden, Utah, United States*, 2. *University of Utah, Salt Lake City, Utah, United States*, 3. *University of California, Davis, Sacramento, California, United States*, 4. *University of Utah College of Nursing, Salt Lake City, Utah, United States*, 5. *University of Utah, Salt Lake city, Utah, United States*, 6. *University of Utah, SALT LAKE CITY, Utah, United States*

This research explores support provided by licensed nurses (LNs) to certified nurse aide (CNA) coworkers in the nursing home (NH). Using purposive sampling, we interviewed 12 LN and 12 CNA participants individually and as part of an LN/CNA caregiving pair. Semi-structured interviews were recorded, transcribed verbatim, and coded for meaning using NVivo software. LN and CNA participants described anticipated and unanticipated holistic support for CNAs. We applied the term undergirding to this phenomenon, and we present descriptions and examples of undergirding in nine categories: listen and respond, show respect, help with resident care and answer call lights, protect the CNA, support physical needs, and provide emotional support. Undergirding promotes work success for the CNA and the LN, as the LN job includes oversight of CNA responsibilities. Most notably, participants report undergirding facilitates high-quality resident care. These findings may be helpful for educators and administrators, but perhaps are most important for policymakers. CNAs need additional support to decrease turnover, improve retention, and elevate NH residents' quality of care. The study design identified and explored optimal collaboration as it is possible in the current NH setting. It does not represent all LN/CNA caregiving pairs.

Session 2430 (Symposium)

MENTAL HEALTH AMONG INFORMAL CAREGIVERS OF OLDER ADULTS IN ASIA

Chair: Xiang Gao

Co-Chair: Kaipeng Wang

Discussant: Fei Sun

The purpose of this symposium is to highlight the mental health needs and factors associated with mental health among informal caregivers of older adults in Asia. The symposium consists of five papers. The first paper explores the perceived role, needs, and rewards of informal caregiving among caregivers of residents in independent long-term care facilities in South India. The second paper presents a systematic review and meta-analysis on the association between long-term care service use and informal caregiver burden, depression, and health status. The third paper examines the association between caregivers' characteristics and quality of life among informal caregivers of older adults with cognitive impairment in China. The fourth paper examines the association between coping strategies and caregiver burden and depression among Chinese caregivers of older adults with cognitive impairment. The last paper examines the association between cohort, meaning making, and depression among adult caregivers during the COVID-19 pandemic in Hong Kong. Taken together, these five papers underscore of the mental health needs and protective and risk factors of mental well-being among caregivers in Asia. Findings of those papers inform the development and adaptation of culturally sensitive interventions to improve mental health outcomes among informal caregivers in Asia. The discussant will comment on the strengths and limitations of these papers in terms of their contributions to the theory, research, and practice on mental health among informal caregivers in Asia.

INFORMAL CAREGIVING BETWEEN RESIDENTS IN LTC FACILITIES IN INDIA: DEMANDING OR REWARDING ROLE

Shantha Balaswamy, *The Ohio State University, Columbus, Ohio, United States*

Research on caring for older adult with health problems by Informal caregivers (IC) in the community in developing countries like India is increasing. However, IC in institutions is largely unacknowledged. This exploratory study examines the perceived role, demands, and rewards of informal caring for residents in independent LTC facilities in South India. A total of 187 residents were interviewed in Tamil and Kannada using structured and open-ended questions on demographics, health, mental health, residents' interactions, tasks performed and personal experiences. About 50% reported assisting other residents with ADLs, 30% helped with IADLs, and 75% provided emotional support. The caregivers' appraisals as residents and their relationship with care-recipient was both positive and negative. In addition to socialization, personal accomplishment, caregivers reported emotional exhaustion, stress, and burnout. Implications related to paid and unpaid labor policy in LTC and reducing IC stress are discussed.

LONG-TERM CARE SERVICE USE AND CAREGIVER BURDEN, DEPRESSION, AND HEALTH:

A SYSTEMATIC REVIEW AND META-ANALYSIS

Wayne Chong,¹ Cindy Ng,² and Ringo Ho,³ 1. *GeroPsych Consultants Pte Ltd, Singapore, Singapore*, 2. *GeroPsych Consultants Pte Ltd, Singapore, Singapore*, 3. *Nanyang Technological University, Singapore, Singapore, Singapore*

This study examined whether long-term care service use (LTCSU) is associated with informal caregivers' burden, depression, and health status. Eligible articles collected data directly from caregivers, written in English, and allowed for extraction or computation of effect sizes. MEDLINE, PsycINFO and ProQuest Dissertations & Theses Global databases were searched between September 2017 and January 2018. The risk of bias of individual studies was assessed regarding confounding, study power, and other biases. This unfunded study was registered with PROSPERO: CRD42018108827. Of the 419, 209 and 346 articles identified, 24, 14 and 15 articles that involved 12,530, 6,687 and 7,331 informal caregivers respectively, were eligible for analyses regarding the above associations. With unadjusted effect sizes, omnibus tests found statistically non-significant overall effect estimates in the association of LTCSU with caregiver burden, depression, and health status. Subgroup analyses, however, revealed that the above associations differed by service type, caregiver sex, and country, respectively.

ASSOCIATES OF PERCEIVED QUALITY OF LIFE IN CHINESE OLDER ADULTS LIVING WITH COGNITIVE IMPAIRMENT

Xiang Gao, *Huazhong University of Science and Technology, Wuhan, Hubei, China (People's Republic)*

This study examined perceived quality of life in Chinese older adults living with cognitive impairment in a group of urban Chinese older adults and explore its associations with caregivers' characteristics. Questionnaires were administered in person to 300 caregiver-care recipient dyads from three urban communities in mainland China in 2019. The 40-item Alzheimer's Disease-related Quality of Life tool asked caregiver respondents to indicate care recipients' life conditions. Higher levels of caregiving burden ($\beta = -0.19$, $p < 0.01$) and more depressive symptoms ($\beta = -0.19$, $p < 0.01$) amongst caregivers were significantly associated with lower quality of life of care recipients. The results suggested that reducing caregivers' burden and depressive symptoms are essential to promote quality of life of care recipients. Formal support from health professionals, service organizations, and communities are urgently called for to promote the wellbeing of Chinese families affected by cognitive impairment.

COPING AND CAREGIVER BURDEN AND DEPRESSION AMONG CHINESE CAREGIVERS OF OLDER ADULTS WITH COGNITIVE IMPAIRMENT

Kaipeng Wang,¹ and Xiang Gao,² 1. *University of Denver, Denver, Colorado, United States*, 2. *Huazhong University of Science and Technology, Wuhan, Hubei, China (People's Republic)*

Coping strategies are important factors that influence caregivers' mental health outcomes. The purpose of this study is to examine the association between coping strategies and

caregiver burden and depression among Chinese caregivers of older adults with cognitive impairment. Data came from structured interviews with 300 primary family caregiver-care recipient dyads in Wuhan, China. We used OLS to examine the association between coping strategies and caregiver burden and depression. More positive reframing and acceptance were associated with lower caregiver burden, whereas more self-distraction was associated with higher caregiver burden. More positive reframing was associated with lower caregiver depression, whereas higher self-distraction and religion were associated with higher caregiver depression. Findings of this study suggest that a psychosocial intervention package that emphasizes on enhancing positive reframing skills and affirming acceptance may be effective in reducing caregiver burden and depression among Chinese caregivers of older adults with cognitive impairment.

IMPACT OF COVID-19 ON MEANING MAKING OF DEMENTIA CAREGIVERS IN HONG KONG: FROM THE GENERATIONAL PERSPECTIVES

Vivian, W. Q. Lou,¹ and Reynold Leung,² *1. The University of Hong Kong, Hong Kong, Hong Kong, 2. The University of Hong Kong, Pokfulam, Hong Kong*

This study examined the impact of COVID-19 on meaning making among adult children dementia caregivers and the association with caregiver mental well-being. Adult caregivers (n=601) from two generations, 1946-1964 (Baby Boomers) and 1965-1980 (Generation X), were recruited in Hong Kong between October 2019 and June 2020. Participants were assessed on depressive symptoms (PHQ-9) and meaning making (Finding Meaning Through Caregiving Scale-FMTC). Generation X scored higher on sense of loss ($p = 0.04$) and lower on provisional meaning of FMTC ($p=0.017$). Moreover, an interaction effect ($p=0.003$) between generation and COVID-19 were found. During the pandemic, Generation X caregivers were more likely to suffer from higher losses, higher depressive symptoms (>23.2% moderate to severe) and lower provisional meaning ($p=0.03$) compared to their boomer counterparts. The level of meaning making is more important to Generation X caregivers, especially in COVID-19 situation. Government should consider generation-responsive services and education support in guiding service implementation.

Session 2435 (Paper)

Neighborhood Environments and Aging

NEIGHBORHOOD CHARACTERISTICS AND ACCELERATED AGING: EVIDENCE FROM THE HEALTH AND RETIREMENT STUDY

Haena Lee, Jennifer Ailshire, and Eileen Crimmins, *University of Southern California, Los Angeles, California, United States*

An individual's rate of aging directly impacts one's functioning, morbidity and mortality. Identifying factors related to accelerated or delayed aging may provide important information for potential areas of intervention. While race/ethnicity, socioeconomic status and behavior characteristics have been linked to biological aging, it is unclear whether

neighborhood characteristics are associated with one's rate of aging. We use a novel aging measure, Expanded Biological Age, from the 2016 Health and Retirement Study Venous Blood Study (HRS-VBS) to investigate whether individuals living with unfavorable neighborhood conditions are experiencing accelerated aging compared to those living in more favorable conditions. We constructed a summary measure of expanded biological age using 22 novel biomarkers in the HRS-VBS; we then regressed the summary measure on age and used the residuals as indicators of accelerated or delayed aging. We measured neighborhood physical disorder, presence of green space, and perceived social cohesion using the 2016 HRS Interviewer Observation data and Self-Administered Questionnaire. We find that individuals living with higher levels of neighborhood physical disorder appeared 1.05 years older biologically than the average for those of the same chronological age. Individuals living near green space including parks were 1.5 years younger biologically than expected based on their chronological age though this association was marginally significant. We did not find an association between neighborhood social cohesion and accelerated aging. This implies that living with severe neighborhood disorder, characterized by presence of disrepair, trash/litter, and abandoned structures, and living near green space, play an important role in who lives longer.

NEIGHBORHOOD COHESION AND THE MENTAL HEALTH OF MULTIMORBID OLDER ADULTS: CLSA PATH ANALYSIS THROUGH LONELINESS

Daniel R. Y. Gan, Andrew Wister, and John Best, *Simon Fraser University, Vancouver, British Columbia, Canada*

More older adults with multimorbidity are aging in place than ever before. Their mental health may be affected by housing and neighborhood factors. In this paper, we use structural equation modelling (SEM) to examine how the physical environment influences life satisfaction and depressive symptoms in two separate models. We included social environment (i.e., social support, social participation, walking) and loneliness as intermediate variables. Data were drawn from baseline and the first follow-up (after 3-4 years) of the Canadian Longitudinal Study on Aging (CLSA). Participants were N=14,301 adults aged ≥ 65 with ≥ 2 chronic illnesses. Good model fit were found after controlling for age, sex, education and baseline values (TFI=1.00; CFI=1.00; RMSEA<0.001; SRMR<0.001). The total effects of housing quality (Btotal=0.08,-0.07) and neighborhood cohesion (Btotal=0.03,-0.06) were weak but statistically significant in the expected direction. Together, the intermediate variables explained 21-31% of the total effects of housing quality and 67-100% of the total effects of neighborhood cohesion. Loneliness explains 27-29% of the total effects of physical environment on mental health, whereas walking explained a mere 0.4-0.9% of their total effects. Walking did not mediate between housing quality and mental health outcomes. Overall, the results support our path analysis framework: physical environment -> social environment -> loneliness -> mental health. Our model provided excellent explanations of the effects of neighborhood cohesion, especially on life satisfaction. If these associations reflect causal effects, community-based age-friendly interventions should focus on neighborhood cohesion and loneliness to promote

the well-being of older adults who are aging in place with multimorbidity.

NEIGHBORHOOD ENVIRONMENTS AND COGNITIVE DECLINE IN MIDDLE AND OLD AGE IN CHINA: GENDER AND AGE VARIATIONS

Ye Luo,¹ Xi Pan,² and Lingling Zhang,³ 1. *Clemson University, Central, South Carolina, United States*, 2. *Texas State University, San Marcos, Texas, United States*, 3. *University of Massachusetts Boston, Boston, Massachusetts, United States*

Older adults are more vulnerable to neighborhood physical and social conditions due to longer exposure, increased vulnerability, changing spatial use, and a greater reliance on access to community sources of integration. Previous research has demonstrated an association between neighborhood environments and cognitive function in older adults. However, most studies were cross-sectional, focused on western countries, and did not examine potential moderating factors. This study examined gender and age variations in the relationship between neighborhood environments and cognitive decline in middle and old age in a developing country that is experiencing rapid population aging and rising prevalence of Alzheimer's disease and related dementias. Using data from a nationally representative sample of adults aged 45 years and older from the three waves of China Health and Retirement Longitudinal Study (CHARLS 2011-2015), this study estimated multilevel growth curve models for the effects of neighborhood environments on cognitive decline separately for men and women and for those aged 45 to 64 and those aged 65 and above. It showed that the cross-sectional effect of outdoor facility and longitudinal effect of handicapped access were more significant for men, but the cross-sectional effect of community social participation and longitudinal effects of raining days, number of disasters, employment service, and community SES were more significant for women. The cross-sectional effect of infrastructure advantages and longitudinal effects of employment service and old age income support were more significant for adults aged 65 and over. These findings suggest that community-level interventions may be more beneficial for older women.

SOCIAL ISOLATION AND SUICIDAL IDEATION OF OLDER PEOPLE: THE BUFFERING EFFECTS OF NEIGHBORHOOD SOCIAL COHESION

Choi Bomi,¹ Hey Jung Jun,¹ and Susanna Joo,² 1. *Yonsei University, Seoul, Seoul-t'ukpyolsi, Republic of Korea*, 2. *Yonsei University, Seodaemun-gu, Seoul-t'ukpyolsi, Republic of Korea*

This study aimed to examine the buffering effect of neighborhood social cohesion on the association of social isolation and suicidal ideation among Korean older people. The sample was older adults who were 65 years old or older and participated in the Korea Health Survey 2017 collected by the Center for Disease and Prevention (N=67,835). Social isolation was measured with three indicators: living-alone, contact isolation (less than weekly contact with family, friends, or neighbors), and participation isolation (less than monthly social organization attendance). Neighborhood social cohesion was measured with two indicators: trust in neighbors

and the welfare budget ratio to represent social capital and social inclusion capabilities, respectively. Multilevel logistic regression analyses were performed to estimate the dynamic relationships between social isolation, neighborhood social cohesion, and suicidal ideation. Results of the main effect indicated that social isolation is a significant risk factor for suicidal ideation and neighborhood social cohesion works as a protective factor against suicidal ideation. Results of cross-level interactions showed that the welfare budget ratio moderated the association between participation isolation and suicidal ideation (OR=0.960, $p<.001$). The negative effect of participation isolation was reduced as the welfare budget ratio of the neighborhood increased. Neighborhood social cohesion indicators did not moderate the association between the remaining types of social isolation and suicidal ideation. The evidence from this study highlights the importance of social welfare expenditures when building suicide prevention interventions and age-friendly communities.

TWIN SIMILARITY FOR NEIGHBORHOOD, GEOGRAPHIC MOBILITY, AND HEALTH OUTCOMES IN LATE ADULTHOOD

Deborah Finkel,¹ Ida Karlsson,² Malin Ericsson,² Tom Russ,³ Anna Dahl Aslan,⁴ and Nancy L. Pedersen,² 1. *Indiana University Southeast, New Albany, Indiana, United States*, 2. *Karolinska Institutet, Stockholm, Stockholms Lan, Sweden*, 3. *University of Edinburgh, Edinburgh, Scotland, United Kingdom*, 4. *Hälsöögskolan Skövde, Skövde, Vstra Gotaland, Sweden*

Socioeconomic status (SES) is one of the most robust predictors of health. The source of SES-health associations is heavily debated; one approach is investigating neighborhood-level environmental characteristics. Challenges include selection effects and the possibility of reverse causation: people choose their neighborhoods. Longitudinal twin research can overcome these issues by assessing location choice over time as well as twin similarity; however, few existing twin studies have incorporated neighborhood-level data, and none of those focus on aging. Using longitudinal data from the Swedish Adoption/Twin Study of Aging, the current study examined the impact of location at various points in life. Location at birth and in 1993 were available for 972 participants. Birth years ranged from 1926 to 1948; mean age in 1993 was 54.55 (range = 35-67). Thirty-nine percent of the sample had moved to a different county between birth and midlife: individuals who moved had significantly higher parental SES and had achieved significantly higher education. Moreover, identical twin concordance for geographic mobility (77%) was significantly higher than fraternal twin concordance (65%), indicating a modest but significant genetic contribution. Geographic mobility did not impact identical twin similarity on a functional aging factor (corrected for age and education), but fraternal twins concordant for mobility were more similar than discordant twins, suggesting genetic contributions to mobility may also impact health. Ongoing retrieval of location information for twins born 1900-1925 and geocoding of location information available at 9 waves of data collection will allow for expanded investigation of the SES-health relationship at the neighborhood level.

Session 2440 (Symposium)

NEW FRONTIERS ON CELLULAR SENEESCENCE

Chair: Laura Niedernhofer

IDENTIFYING SENEESCENT CELLS THAT DRIVE AGING

Laura Niedernhofer, *University of Minnesota, Minneapolis, Minnesota, United States*

Cellular senescence is a potent tumor suppressor mechanism. However, the untoward effect is that the accumulation of senescent cells promotes loss of resilience, aging and age-related diseases. One approach to maintaining the benefits of senescence while preventing the negative consequences is senolytic therapies: drugs that do not prevent senescence, but selectively kill senescent cells. Since virtually any type of cell can become senescent, it is important to identify the lineages of senescent cells that are most potent at driving loss of tissue homeostasis and aging. This will enable honing development of senolytics. We used a genetic approach to drive increased genotoxic stress, a potent inducer of senescence, in a tissue specific manner. The impact of this targeted senescence on different organs and cell types will be discussed, identifying a lead target for senolytics.

SENOLYTICS REDUCE CORONAVIRUS-RELATED MORTALITY IN OLD MICE

Christina Camell, *Institute on the Biology of Aging and Metabolism, University of Minnesota, Province, Minnesota, United States*

The elderly and chronically ill are among groups at the highest risk for morbidity and mortality to several infections, including SARs-CoV-2. Cellular senescence contributes to inflammation, multiple chronic diseases, and age-related dysfunction, but effects on responses to viral infection are unclear. Old mice acutely infected with pathogens that included a SARS-CoV-2-related mouse β -coronavirus experienced increased senescence and inflammation with nearly 100% mortality. Targeting SCs using senolytic drugs before or after pathogen exposure significantly reduced mortality, cellular senescence, and inflammatory markers and increased antiviral antibodies. Thus, reducing the SC burden in diseased or aged individuals should enhance resilience and reduce mortality following viral infection, including SARS-CoV-2.

IMMUNE SURVEILLANCE OF SENEESCENT CELLS

Scott Lowe, *Memorial Sloan Kettering Cancer Center & Howard Hughes Medical Institute, New York, New York, United States*

Cellular senescence involves a stable cell cycle arrest and a secretory program that modulates the tissue environment. In cancer, senescence acts as a potent barrier to tumorigenesis and, though many cancers evade senescence during the course of tumor evolution, ionizing radiation and conventional chemotherapy can, to varying degrees, induce senescence in tumor cells leading to potent anticancer effects. Conversely, the aberrant accumulation of senescent cells can reduce regenerative capacity and lead to tissue decline, contributing to tissue pathologies associated with age or the debilitating side-effects of cancer therapy. Our laboratory

studies mechanisms of cellular senescence with the ultimate goal of developing strategies to modulate senescence for therapeutic benefit. We have focused on how senescent cells trigger immune surveillance to facilitate their own elimination or, when that fails, how synthetic immune cells (i.e. CAR T cells) can be directed to eliminate senescent cells. Recent advances in understanding senescent cell surveillance by the immune system will be discussed.

CELL SENEESCENCE AS A MEDIATOR OF AGE-DEPENDENT BRAIN INFLAMMATION

Marissa Schafer,¹ Xu Zhang,² Vesselina Pearsall,² and Nathan LeBrasseur,² *1. Physiology and Biomedical Engineering, Rochester, Minnesota, United States, 2. Mayo Clinic, Rochester, Minnesota, United States*

Cellular senescence and inflammation are interconnected causes and consequences of tissue aging. Here, we implemented orthogonal approaches to study their interaction in steady-state mature and aged mouse brain. Using single cell sequencing, we identified a putative senescent microglial population, which increased in abundance with age and was characterized by increased expression of p16 and chemotactic senescence associated secretory phenotype (SASP) factors. Using p16-INK-ATTAC transgenic mice to eliminate p16ink4a-positive senescent cells and mass cytometry, we show that p16ink4a-positive cell targeting reduced the abundance of activated inflammatory cells in the aged female brain. Age-dependent declines in executive cognitive function were improved following transgenic p16ink4a-positive cell targeting, and executive function robustly correlated with inflammatory brain cell composition in females. Collectively, our findings demonstrate fundamental differences in the age- and sex-dependent brain inflammatory landscape and implicate p16ink4a-positive senescent cell targeting as a therapeutic strategy to attenuate age-related inflammation and cognitive decline.

Session 2445 (Symposium)

NURSING HOMES AND COVID-19: STAFF EXPERIENCES

Chair: Verena Cimarolli

Co-Chair: Joann Reinhardt

Discussant: Sheryl Zimmerman

Nursing homes (NHs) faced an unprecedented crisis during the rapid spread of COVID-19. This pandemic has had a devastating impact on both NH residents and workers who are often on the frontlines providing hands-on care. These workers are vulnerable to the health risks of COVID-19 due to daily exposure to residents with COVID-19, residence in areas with high infection rates, and challenges specific to low-income workers (e.g. reliance on mass transportation). Research has highlighted the experiences of NH workers during the pandemic to learn how to better support them now and during future pandemics. This symposium will add to this research and present new findings from studies conducted in the United States to capture the unique experiences of NH employees. First, Bryant illustrates specific COVID-19-related challenges that NH frontline workers faced and how these workers' experiences compare to workers in other long-term services and support settings. Reinhardt reports

findings from a qualitative study examining the multi-level challenges experienced by nursing assistants during the pandemic. Cimarolli examines if quality of employer communication and workers' perceived COVID-19-related preparedness mitigate the impact of work-related stress on NH workers' decision to resign. Franzosa shares recommendations based on priorities identified by nursing assistants and administrators to build future resilience based on lessons learned. Finally, Simpson identifies factors associated with states' decisions to adopt COVID-19 testing mandates for workers in NHs. Dr. Zimmerman discusses study findings and their contributions for creating supportive NH work environments to ensure most optimal NH worker and resident quality of life.

CHALLENGES FACED BY NURSING HOME DIRECT CARE WORKERS DURING THE COVID-19 PANDEMIC: A COMPARISON ACROSS CARE SETTINGS

Natasha Bryant,¹ Verena Cimarolli,² and Robyn Stone,²
1. *LeadingAge LTSS Center @UMass Boston, Washington, District of Columbia, United States*, 2. *LeadingAge, Washington, District of Columbia, United States*

The COVID-19 pandemic has generated awareness of the value of the direct care workforce to provide care in settings serving those most at risk from the disease. However, few studies have gauged the impact of COVID-19 on this workforce and their pandemic-related challenges. The purpose of this study was to examine the challenges and stress experienced by direct care workers (N=1,414) and their perceptions of preparation and quality of employer communication during this health crisis. Nursing home (NH) workers reported separation from family members and understaffing as the top external and work-related challenges. They felt adequately prepared and gave their employers high marks for communicating with them during the pandemic. NH direct care workers were more likely to report increased workload and understaffing as a challenge compared to workers in home and community-based settings. They also experienced a significantly higher number of work-related challenges compared to workers in assisted living.

JOB RESIGNATION IN NURSING HOMES DURING COVID-19: THE ROLE OF EMPLOYER COMMUNICATION AND WORKER PREPAREDNESS

Verena Cimarolli,¹ Natasha Bryant,² Robyn Stone,¹ and Francesca Falzarano,³ 1. *LeadingAge, Washington, District of Columbia, United States*, 2. *LeadingAge LTSS Center @UMass Boston, Washington, District of Columbia, United States*, 3. *Weill Cornell Medicine, Douglaston, New York, United States*

Although research on factors mitigating the negative impact of strain/stress experienced by nursing home (NH) workers during the pandemic is emerging, there is no research on how COVID-19-related work stress and employer supports influence NH workers decision to resign. The purpose of this study was to investigate if high quality communication related to COVID-19 by the employer – a form of job support - can mitigate the impact of work stress on NH employees (N=1,730) decision to resign by optimizing employees' preparedness to care for residents with COVID-19. Guided by the Job-Demands-Control-Support Model and

employing path analyses, results indicate that higher stress was associated with greater likelihood of resigning, which operated through the paths of communication quality and preparedness. While higher stress was associated with less optimal quality of communication, good quality of communication was associated with more optimal preparedness which was associated with reduced likelihood of leaving one's job.

CHALLENGES REPORTED BY CERTIFIED NURSING ASSISTANTS DURING COVID-19: A QUALITATIVE STUDY

Joann Reinhardt,¹ Emily Franzosa,² Wingyun Mak,¹ and Orah Burack,¹ 1. *The New Jewish Home, New York, New York, United States*, 2. *Icahn School of Medicine at Mount Sinai, Icahn School of Medicine at Mount Sinai, New York, United States*

Certified nursing assistants (CNAs) who care for vulnerable nursing home residents faced unprecedented circumstances due to the COVID-19 pandemic. While staff and PPE shortages were ubiquitous and widely known, the focus of this qualitative work was to gain a broader understanding of the numerous challenges they faced. We conducted 10 remote focus groups with CNAs at 5 nursing homes (N=56) in downstate New York. Content analysis was conducted, and emerging themes identified. Results showed a myriad of emotional challenges including helplessness, fear and anxiety. Operational challenges focused on lack of COVID testing capacity, information, and consistent guidance and support, in addition to staff and equipment. Individual challenges included personal experience of COVID illness and that of colleagues, and balancing high concurrent demands of work and family. These results are discussed in the context of developing recommendations to promote future safety, skill refinement and enhanced resilience in the workforce moving forward.

IT WAS TRIAL BY FIRE: RECOMMENDATIONS FOR BUILDING A STRONGER NURSING HOME WORKFORCE AFTER COVID-19

Emily Franzosa,¹ Wingyun Mak,² Orah Burack,² Kenneth Boockvar,² and Joann Reinhardt,² 1. *Icahn School of Medicine at Mount Sinai, Icahn School of Medicine at Mount Sinai, New York, United States*, 2. *The New Jewish Home, New York, New York, United States*

The COVID-19 crisis showed the urgent need for a unified, well-supported nursing home workforce. The objective of this qualitative study was to examine the lived experience of certified nursing assistants (CNAs) and administrators during COVID-19 to identify best practices moving forward. Six administrator interviews and 10 remote focus groups with CNAs at 5 nursing homes (N=56) were examined through directed content analysis. Based on priorities identified by CNAs and administrators, the following practices may be most impactful: 1) ongoing and responsive staff training; 2) transparent, direct, and two-way communication channels; 3) prioritizing hiring permanent staff to avoid shortages and reliance on agency staff; 4) building collaborative staff-management relationships; 5) providing flexible job benefits; 6) providing staff-centered emotional support resources; and 7) appraising COVID-19 innovations. Our

results suggest that rather than returning to “business as usual,” nursing homes can draw on these lessons to build a more sustainable workforce and industry.

FACTORS ASSOCIATED WITH STATE MANDATE OF NURSING HOME STAFF TESTING DURING COVID-19

Elizabeth Simpson,¹ Edward Miller,² Molly Wylie,³ Lisa Beauregard,⁴ Pamela Nadash,¹ and Michael Gusmano,⁵
 1. *University of Massachusetts Boston, University of Massachusetts Boston, Massachusetts, United States,*
 2. *University of Massachusetts Boston, Boston, Massachusetts, United States,*
 3. *University of Massachusetts Boston, University of Massachusetts Boston, Massachusetts, United States,*
 4. *Executive Office of Elder Affairs, Executive Office of Elder Affairs, Massachusetts, United States,*
 5. *Rutgers University School of Public Health, Rutgers University School of Public Health, New Jersey, United States*

COVID-19 has presented challenges for nursing homes (NHs) and other congregate living settings which serve older adults at high risk for morbidity and death from the virus. This study identified factors associated with states’ adopting a mandate for regular staff testing for COVID-19 in NHs. Potential correlates included state government ideology and capacity, NH supply and demand, prevailing economic conditions, existing state policies, and NH characteristics. Findings indicate that percent for profit NHs is most strongly associated with adoption of a state staff testing mandate. Governing capacity (average legislative salary), percent population at risk for COVID-19, and existing public policy (percent Medicaid spending devoted to long-term services and supports (LTSS)) were also associated with the probability of adoption. Based on these results, states with more proprietary facilities and greater capacities for government action, investment in Medicaid LTSS, and at-risk populations were more likely to mandate regular staff testing in NHs.

Session 2450 (Symposium)

OBSERVING PERSONALITY IN EVERYDAY LIFE: HOW PERSONALITY INFLUENCES DAILY ACTIVITIES AND MOOD

Chair: Shiyang Zhang

Personality reflects the influence of older adults’ past experiences on their tendencies to engage in certain behaviors and generate emotions. An increasing number of studies have focused on the expression of personality in older adults’ everyday life. Specifically, personality features have been associated with daily activities, affect reactivity, and mood. This symposium draws on Ecological Momentary Assessments and longitudinal analysis to understand how personality is manifested in daily life, and how daily emotional experiences accumulate over time to influence physical health. Lee and colleagues examine how personality is associated with daily activities and find that extraversion is positively associated with activity diversity in two adult samples. Pasquini and colleagues consider the within-person fluctuations in personality traits and demonstrate the possibility of using daily behaviors and affect as markers of extraversion and neuroticism. Zhang and Fingerma assess how positive and negative moods concurrently change in reaction

to daily social contacts and confirm that narcissism moderates such associations. Finally, this symposium also focuses on the cumulative effect of daily emotions on physical health. Leger and colleagues address the long-term association between personality (e.g., neuroticism, conscientiousness) and physical health and identify the mediating role of negative reactivity to daily stressors. Collectively, the presentations provide an in-depth analysis of personality’s impact on concrete daily behaviors and emotions, as well as their profound long-term effect on physical health. Our discussion outlines future research directions and highlights how inter-individual differences, simultaneous life events, and social interactions intertwine to influence individuals’ behaviors that occur in natural settings.

SOCIAL ENCOUNTERS AND MOOD: THE MODERATING ROLE OF NARCISSISM

Shiyang Zhang, and Karen Fingerma, *The University of Texas at Austin, Austin, Texas, United States*

Social contacts may lead to more positive and less negative emotions in late life, yet we know little about how narcissism influences such associations, and whether contacts with close and not-close social partners impact mood differently. This study examined associations between social contacts, narcissism, and mood on the within- and between- person level. Older adults aged 65 + (N = 303) completed ecological momentary assessments in which they reported social contacts and mood every 3 hours for 5 to 6 days. Older adults had higher positive mood after contacting either close or not-close social partners, but only not-close social partners reduced negative mood. Multilevel models found positive associations between average social contacts number and positive mood among people scored lower on narcissism, and positive associations between social contacts and negative mood for those who scored higher on narcissism. Findings suggest the necessity of considering interpersonal differences in interventions targeting well-being.

WHO HAS ACTIVE LIFESTYLES? PERSONALITY AND ACTIVITY DIVERSITY IN ADULTHOOD

Soomi Lee,¹ Susan Charles,² Karen Fingerma,³ and David Almeida,⁴
 1. *University of South Florida, Tampa, Florida, United States,*
 2. *University of California, Irvine, Irvine, California, United States,*
 3. *The University of Texas at Austin, Austin, Texas, United States,*
 4. *Pennsylvania State University, University Park, Pennsylvania, United States*

Broad and even participation across daily activities (“activity diversity”) has been found to be associated with better health. Less is known about who has greater activity diversity. We examined whether personality traits are associated with activity diversity in two independent samples of adults. Data came from the Midlife in the United States Study II and Refresher (n=2623, Mage=54yrs) and Daily Experiences and Well-being in Late Life Study (n=308, Mage=74yrs) who responded to daily activity questions. We constructed activity diversity scores in each sample using Shannon’s entropy. We focused on three personality traits -- conscientiousness, extraversion, neuroticism -- often associated with health. Higher extraversion was associated with greater activity diversity, replicated across the two samples. The associations were independent of conscientiousness and neuroticism

(both were not significant), total activity time/frequency, age, gender, race, education, and self-rated health. Results suggest that future activity interventions may need to target those with lower extraversion.

CAN ECOLOGICAL MOMENTARY ASSESSMENTS BE USED AS DAILY MARKERS OF PERSONALITY TRAITS?

Giancarlo Pasquini,¹ Andreas Neubauer,² Nicholas Eaton,¹ Sean Clouston,³ Eileen Graham,⁴ Daniel Mroczek,⁴ and Stacey Scott,¹ 1. *Stony Brook University, Stony Brook, New York, United States*, 2. *Leibniz Institute for Research and Information in Education, Frankfurt, Mecklenburg-Vorpommern, Germany*, 3. *Renaissance School of Medicine, Stony Brook University, Renaissance School of Medicine, Stony Brook University, New York, United States*, 4. *Northwestern University, Chicago, Illinois, United States*

This study hypothesized that select ecological momentary assessment (EMA) survey items are sensitive to day-to-day fluctuations in personality traits Extraversion (E) and Neuroticism (N). As part of the Einstein Aging Study, 312 older adults (Mage=76.96 years, SD=4.85 years, range=70-90 years) completed up to 5 EMA surveys per day for 16 days and a Big Five trait personality measure. Parallel two-factor multilevel confirmatory factor analyses were conducted for E (Daily-E; Trait-E) and N (Daily-N; Trait-N). The E model showed good fit (CFI=.95; TLI=.94; RMSEA=.02) and a significant correlation of .20 between Daily-E and Trait-E factors. The N model showed poor fit (CFI=.68; TLI=.61; RMSEA=.06). Results suggest EMA items can be used as daily markers of Extraversion, yet results are unclear for Neuroticism due to poor model fit. Daily markers of Extraversion can be used to detect fluctuations in personality traits across days that may predict long-term personality change.

AFFECT REACTIVITY TO DAILY STRESSORS MEDIATES THE RELATIONSHIP BETWEEN PERSONALITY TRAITS AND PHYSICAL HEALTH

Kate Leger,¹ Nicholas Turiano,² William Bowling,¹ Jessica Burris,¹ and David Almeida,³ 1. *University of Kentucky, Lexington, Kentucky, United States*, 2. *West Virginia University, Morgantown, West Virginia, United States*, 3. *Pennsylvania State University, University Park, Pennsylvania, United States*

Researchers hypothesize that how people react to daily stressful events partly explains the personality-health relationship, yet no study has examined longitudinal associations between these factors. The current study examined the role of negative affect reactivity to daily stressors as a mediating pathway between personality and physical health outcomes using three waves of data spanning 20-years from a nationwide probability sample of 1,176 adults. Results indicate that Wave 1 neuroticism was associated with greater negative affect reactivity at Wave 2, which then predicted the development of chronic conditions and functional limitations at Wave 3. Higher conscientiousness was associated with less negative affect reactivity, which in turn predicted better physical health at Wave 3. Negative affect reactivity partially

mediated both personality traits and physical. These findings highlight the usefulness of using a daily stress framework for understanding how personality impacts health over time, which has important implications for disease prevention.

Session 2455 (Symposium)

ORAL HEALTH'S TRANSFORMATIVE IMPACT ON DIET AND SYSTEMIC HEALTH OUTCOMES

Chair: Michele Saunders

The 2020-25 Dietary Guidelines for Americans identified dental caries as a major diet-related chronic disease of public health concern and suggested in the section for adults over 60, "Good dental health is critical to overall health, as well as the ability to chew foods properly." Poor oral health can lead to chronic diseases and impede one's ability to chew fruits, vegetables, whole grains, and other nutrient-rich foods across the life span. Almost 90 percent of adults ages 20 to 64 years and 96 percent of those over 65 years of age have dental caries. The overall prevalence of complete tooth loss is 2.2 percent among adults ages 20 to 64 years and jumps to 17.3 percent for those over age 65. As a result of COVID-19, some seniors are not seeking regular oral health services, which increases the need for preventive oral health practices and consuming a healthy dietary pattern recommended in the new Dietary Guidelines. Recent research will underscore the importance of saliva and oral health in cancer patients on radiation and in other chronic diseases. Saliva has also been shown to reduce specific infections that are related to influenza and HIV. Participants in this session will gain understanding of factors linking poor oral health and nutrition practices to chronic diseases and guidance on critical preventive oral health practices to increase saliva flow and decrease dental caries through all stages of the life cycle. Promoting oral health is the responsibility of the interdisciplinary team overseeing older adults.

MINIMIZING COMPLICATIONS OF AGING THAT LEAD TO DRY MOUTH AND POOR ORAL HEALTH

Athena Papas, *Tufts University School of Dental Medicine, Boston, Massachusetts, United States*

Poor oral health causes severe pain and untreated infections to spread throughout the body. For older adults, the prevalence of root decay exceeds that of any other medical condition. Our research shows tooth loss and edentulousness were associated with increased mortality and inversely associated with BMI, waist circumference, blood pressure, and fasting blood glucose. Our Stop-it study found people who lost bone density had fewer teeth, problems chewing, and involuntary weight loss and frailty. 88% of the elderly take medications that cause loss of saliva. Sjögren's and radiation therapy for head and neck cancer patients heighten risk. Without saliva, patients have increased tooth decay, periodontal disease and fungal infections, salivary gland blockage, and problems swallowing and speaking. Dry mouth leads people to suck on candy that further increase caries. Substituting sugarfree gum for candy increases salivary flow and reduces dental caries. Brushing, flossing, and limiting sugar also lessen tooth decay.

NUTRITION, ORAL HEALTH, AND CHRONIC DISEASES INEXTRICABLY LINKED

Teresa Marshall, *University of Iowa, Iowa City, Iowa, United States*

The 2020-25 Dietary Guidelines identified dental caries as a diet-related chronic disease of major importance. Preventing dental caries and other oral infectious diseases is critical to maintaining an individual's capacity to chew food, consume nutrient-rich diets, and sustain optimal nutrition status. Pain and infection from dental caries complicates consumption of adequate amounts of fruits, vegetables, dairy, and lean protein recommended in the Dietary Guidelines. Nutrition and dietary intake can affect the development and integrity of oral cavity and progression of oral diseases. Increased snacking throughout the day in place of three-meals daily raises the risk of obesity and dental caries throughout the life cycle. Older adults who make routine oral health preventive practices, such as brushing, cleaning between teeth, drinking fluoridated water, and chewing sugarfree gum to increase saliva flow can reduce dental caries and oral infectious diseases. Professionals must also consider the impact of sugar-sweetened beverages and sugar intake.

RESEARCH CONFIRMS EFFECTIVENESS OF ORAL HEALTH PREVENTIVE PRACTICES

Michael Dodds, *Mars Wrigley, Chicago, Illinois, United States*

Lack of insurance or funds for dental services, lack of access to dental offices, fear of dentists, and avoidance of dental offices during COVID can lead to oral health problems in older adults. Brushing, flossing, and drinking fluoridated water can protect teeth when dentists are unavailable. Limiting intake frequency of carbohydrates and chewing sugarfree gum after eating add protection. A recent systematic review and meta-analysis confirmed the effectiveness of sugarfree gum in reducing caries, in children and adults who chewed sugarfree gum compared with those who did not chew. Chewing sugarfree gum significantly reduced caries increment, with a prevented fraction of 28 percent, roughly equivalent to the prevented fractions for fluoride toothpastes and supplements. A follow-up systematic review provides further evidence that chewing sugarfree gum reduces the numbers of *Streptococcus mutans* in the oral cavity. Finally, chewing sugarfree gum could alleviate symptoms of xerostomia and may reduce caries.

Session 2460 (Symposium)

PRESIDENTIAL SYMPOSIUM: FROM DISRUPTION TO TRANSFORMATION: CHALLENGING AND CHANGING THE NEW NORMAL

Chair: Deborah Waldrop

Co-Chair: Philip Rozario

Discussant: Emily Greenfield

While the refrain "We're all in this together" is meant to describe a sense of universality of our exposure and adaption to the Covid-19 pandemic life, the deeply rooted racial and economic injustices and ongoing health crises continue to expose the inequities experienced by many older adults. In this symposium, we focus on existing disparities and possibilities

for transformation. The first paper discusses systemic racism as a structural driver of practices and policies that influence poverty, poor housing and neighborhood conditions, worse health profiles, relationship loss and social isolation among older Black adults. The second paper illuminates the importance of health equity and collaboration between aging and healthcare systems to improve the well-being outcomes and address disparities of older adults from racial-ly/ethnically diverse backgrounds. The third paper illustrates how the privatization of Medicare has created bureaucratic complexities that increase cost and burdens for beneficiaries. The fourth paper presents the ways that the pandemic has exposed the challenges of a nonexistent Long Term Services and Support system; specifically, in refocusing our attention on the working conditions of in-home and residential workers, such as poor compensation, and high turnover and mounting demands on families. The fifth paper addresses the importance of collaboration between nursing homes and assisted living communities with governmental emergency operations in times of disasters and public health crises. Each paper addresses pressing issues that have created the "new normal" for older adults; together the presenters explore the disruptions and offer solutions for renewed transformation.

RACISM AND THE LIFE COURSE: SOCIAL AND HEALTH EQUITY FOR OLDER BLACK AMERICANS

Linda Chatters,¹ Harry Taylor,² and Robert Taylor,³

1. *University of Michigan, ANN ARBOR, Michigan, United States*, 2. *Center for the study of Aging and Human Development, Durham, North Carolina, United States*,

3. *University of Michigan, Ann Arbor, Michigan, United States*

Racism and the Life Course: Social and Health Equity for Older Black Americans examines the impacts of systemic racism on adult development and the aging trajectories of Black Americans. Using the life course perspective (e.g., socio-historical events, linked lives), we discuss systemic racism as a structural driver of practices and policies (e.g., racial residential segregation) that have shaped the social and health circumstances of older Black Americans. These life circumstances include high rates of poverty, poor housing and neighborhood conditions, worse health profiles, and relationship loss and social isolation—conditions that, for too many older Black adults, represent the 'normal' state of affairs. Creating a 'new normal' of social and health equity for older Black Americans requires recognizing and disrupting the operation of systemic racism in our policies and practices. Selected recommendations and actions for achieving health and social equity for older Black Americans are discussed.

MAKING MEDICARE COMPLICATED: THE CONSEQUENCES OF PRIVATIZATION

Pamela Herd, *Georgetown University, Georgetown University, District of Columbia, United States*

Starting with policy changes in the 1980s, Medicare has largely become privatized, with nearly 40 percent of beneficiaries enrolled in private Medicare Advantage plans and another 30 percent with private supplemental coverage, including for prescription drug coverage. As a result, Medicare has become laden with administrative burdens and barriers. Beneficiaries are faced with a confusing array of plans and coverage options when they enroll, and are

expected to choose a new plan every year. The choice they make has large implications for their health care costs, as well as their actual access to health care. While we typically think that targeted policies are burdensome and social insurance programs are accessible, Medicare contradicts this easy categorization. Instead, it demonstrates how private sector involvement in public programs can increase complexity and increase burdens for beneficiaries.

PROMOTING HEALTH EQUITY THROUGH PARTNERSHIPS

Karon Phillips, *Trust for America's Health, Trust for America's Health, District of Columbia, United States*

Funded by The John A. Hartford Foundation, Trust for America's Health's (TFAH) Healthy Aging initiative has supported states as they develop Age-Friendly Public Health Systems (AFPHS). The goal of this national initiative is to make healthy aging a core function of state and local public health departments. Through this initiative, TFAH is working directly with states as they work to improve the health of older adults, with a particular focus on health equity. Given the increased prevalence of health disparities, prioritizing health equity has become important for many organizations. Through new partnerships and collaboration with aging services providers and health care systems, public health departments have developed innovative ways to improve the health and well-being of older adults from racial/ethnically diverse backgrounds. Areas of collaboration between the public health and aging sectors include sharing data on older adult health and working together to address social isolation.

REIMAGINING LONG-TERM SERVICES AND SUPPORTS IN A POST-PANDEMIC WORLD

Robert Applebaum,¹ Katherine Abbott,¹ and Gretchen Alkema,² *1. Miami University, Oxford, Ohio, United States, 2. The SCAN Foundation, Long Beach, California, United States*

Prior to the global pandemic, the United States struggled to coordinate, deliver, and finance quality, person-centered long-term services and supports (LTSS) through the default primary payer, Medicaid. The pandemic highlights the challenges of not having a LTSS system. LTSS workers are underpaid, overworked, and turning over at alarming rates. Families face mounting pressures of caring for a growing number of loved ones, some with very complex care. Costs continue to climb, and quality indicators are not improving. While our approach to LTSS has improved, costs and quality challenges still dominate the landscape. We are at juncture when we need to reimagine the LTSS system, one that genuinely puts the care recipients and their caregivers at the heart of the system. The pandemic has provided some lessons about how to think differently about what long-term services can look like. Now is the time to embrace innovative opportunities building on this adversity.

THE DIFFERENCE LTC CORPORATE OWNERSHIP MAKES IN COLLABORATIONS WITH EMERGENCY OPERATION CENTERS DURING DISASTERS

Debra Dobbs,¹ Joseph June,² David Dosa,³ Lindsay Peterson,⁴ and Kathryn Hyer,⁵ *1. University of South Florida, School of Aging Studies, University of South*

Florida, Florida, United States, 2. University of South Florida, Tampa, Florida, United States, 3. Brown University, Providence, Rhode Island, United States, 4. University of South Florida, Bradenton, Florida, United States, 5. University of South Florida, University of South Florida, Florida, United States

Collaboration between nursing homes (NHs) and assisted living communities (ALCs) with state and local entities (e.g., emergency operation centers (EOCs)) is critical during a disaster. The corporate structure of NHs and ALCs can make a difference in their ability to collaborate with these entities during a disaster. This mixed-method study examines differences in satisfaction with collaboration with state and local entities during Hurricane Irma in Florida in 2017 between corporate-owned NHs (N=24), larger (25+ beds) ALCs (N=38) and smaller ALCs (N=30). We also explore collaboration in Florida NHs (N=35) and ALCs (N=123) specific to COVID19. Scaled 1-5 survey data results indicate that small ALCs are the least satisfied (M=2.90) with EOC collaboration, compared to NHs (M=3.04) and larger ALCs (M=3.33) during Irma. Smaller ALCs were more dissatisfied with COVID19 mandates compared to larger ALCs and NHs. Ways to improve collaboration during a disaster, especially for smaller ALCs, will be discussed.

Session 2465 (Paper)

Psychosocial Well-Being

ARE ALL DOMAINS OF LIFE SATISFACTION EQUAL? DIFFERENTIAL ASSOCIATIONS WITH HEALTH AND WELL-BEING IN OLDER ADULTS

Julia Nakamura,¹ Scott Delaney,² Ed Diener,³ Tyler VanderWeele,⁴ and Eric Kim,¹ *1. University of British Columbia, Vancouver, British Columbia, Canada, 2. Harvard T. H. Chan School of Public Health, Boston, Massachusetts, United States, 3. University of Virginia, Charlottesville, Virginia, United States, 4. Harvard T.H. Chan School of Public Health, Boston, Massachusetts, United States*

Growing evidence documents strong associations between overall life satisfaction and favorable health and well-being outcomes. However, because most previous studies have assessed satisfaction with one's life as a whole, we know little about whether specific domains of life satisfaction (e.g., satisfaction with income) might be driving better health and well-being outcomes. Data were from 13,752 participants in the Health and Retirement Study—a nationally representative cohort of US adults aged ≥ 50 . We evaluated if positive changes in seven domains of life satisfaction (between t0;2008/2010 and t1;2012/2014) were associated with 35 indicators of physical, behavioral, and psychosocial health and well-being (at t2;2016/2018). Satisfaction with family life and non-work activities showed the largest associations with subsequent psychological factors, followed by satisfaction with financial situation and income. Effect estimates were double in magnitude for certain domains of life satisfaction (e.g., the association between satisfaction with family life and purpose in life ($\beta=0.22$, 95% CI:0.16,0.27) was more than twice as large as the association between satisfaction with

housing and purpose in life ($\beta=0.09$, 95% CI:0.02,0.16). Further, some domains showed associations with physical health outcomes (e.g., participants with the highest satisfaction with health had a 21% decreased mortality risk (95% CI: 0.66,0.95)), health behaviors (e.g., higher satisfaction with income decreased risk of sleep problems by 11% (95% CI:0.80,0.99)), and social factors (e.g., loneliness (β : -0.16 to -0.42)). Individual domains of life satisfaction might be novel targets for interventions and policies seeking to enhance specific facets of health and well-being in our rapidly aging population.

ATTACHMENT, EMOTION, AND PHYSIOLOGICAL COREGULATION AMONG ELDERLY MOTHERS AND THEIR ADULT DAUGHTERS

Elizabeth Jain,¹ Gisela Labouvie-Vief,² and Mark Lumley,³
 1. Aurora University, Saint Charles, Illinois, United States,
 2. University of Geneva, University of Geneva, Geneva,
 Switzerland, 3. Wayne State University, Wayne State
 University, Michigan, United States

Examination of physiological coregulation among marital partners suggests a dynamic interplay between partner physiology. Further, attachment dimensions of anxiety and avoidance mediate this coregulation during conflict. This study examined the role of attachment and race in predicting physiological coregulation for mothers and their adult daughters during emotional discussions. A sample of 23 African American and 17 Caucasian mother-daughter pairs (aged 26 to 83) completed interview sessions and Relationships Questionnaires. Pairs engaged in discussions (neutral, conflict, happy), while monitoring heart rate. HR difference scores were computed between pairs (bps; 0 meant no difference). Multiple Regressions revealed attachment anxiety and avoidance predicted HR variation between pairs for the neutral and happy discussions, differently by racial group ($F(7,33)=3.297$, $p < 0.01$). For African American women, increased anxiety predicted increased HR variation during neutral and happy discussions, whereas for Caucasian women, increased avoidance predicted increased HR variation. However, during conflict anxiety singularly predicted increased HR covariation ($b = 5.03$, $p = 0.01$), for both groups. Low anxiety and low avoidance predicted physiological coregulation (lower HR variance between pairs). Increased anxious attachment predicted partner dysregulation (increased HR variation between pairs) across all 3 discussions, moderated by avoidance for the Caucasian women. Results suggest attachment plays a role in regulating physiology under emotional stress, and that there may be important cultural differences in this relationship. Further examination will explore the dynamic interplay between attachment and physiological coregulation across adulthood and later life.

LONGITUDINAL AND AGE-RELATED IMPLICATIONS OF PRIMARY AND SECONDARY CONTROL FOR HAPPINESS

Masahiro Toyama, *University of the Ozarks, Clarksville, Arkansas, United States*

While previous research addressed two distinct types of happiness, including hedonia and eudaimonia, the longitudinal associations of primary and secondary control with

these happiness constructs had not been fully studied. The present study aimed to contribute to the literature by examining these associations and their age differences. Using data from the second and third waves of the Midlife in the United States (MIDUS; $N = 4,963$, aged 28 to 84 at baseline), the present study conducted structural equation modeling analyses to examine whether primary and secondary control predicted residualized changes over around a decade in the latent constructs of hedonia and eudaimonia and whether there were age differences in these associations. The results indicate that while only primary control predicted change in eudaimonia overall, the associations of primary and secondary control with changes in hedonia and eudaimonia differed by age. Particularly, in comparing these effects for younger and older individuals, primary control predicted increases in eudaimonia only for younger individuals, whereas secondary control predicted decreases in hedonia for younger individuals but predicted increases in eudaimonia for older individuals. Considering these findings, the importance of primary and secondary control for happiness may vary between adults of different ages, which is possibly due to their life priorities that may change with age. The present study suggested potential directions of future research further examining the role of primary and secondary control for happiness and exploring potential interventions to promote happiness, for example, by modifying primary and/or secondary control for adults of different ages.

POSITIVE ASPECTS OF CAREGIVING IN INCIDENT AND LONG-TERM CAREGIVERS: ROLE OF SOCIAL ENGAGEMENT AND DISTRESS

Chelsea Liu,¹ Victoria Marino,² Virginia Howard,³
 William Haley,² and David Roth,⁴ 1. *Harvard School of
 Public Health, Allston, Massachusetts, United States,*
 2. *University of South Florida, Tampa, Florida, United
 States,* 3. *University of Alabama at Birmingham,
 Birmingham, Alabama, United States,* 4. *Johns Hopkins
 University, Baltimore, Maryland, United States*

Positive aspects of caregiving (PAC) are positive appraisals that caregivers report about their role such as feeling appreciated or important, and may increase with caregiver adaptation over time. We aimed to examine differences in PAC by caregiving duration and social engagement, controlling for measures of distress. A total of 283 African American or White caregivers from the Caregiving Transitions Study with a wide range of caregiving durations were included in our analysis. We used multivariable linear regressions to model total PAC score on years of caregiving and social engagement (social network, monthly social contact), adjusting for age, sex, race, marital status, relationship to care recipient, dementia status of care recipient and measures of distress (depressive symptoms, perceived stress, caregiving strain). Caregivers with higher social engagement reported significantly higher PAC while caregivers with longer duration of care reported marginally higher PAC in most analytic models. African American caregivers reported higher PAC compared to White caregivers. Dementia caregivers reported lower PAC than non-dementia caregivers in models that adjusted for demographic variables and social network size, but the association was attenuated with the addition of caregiving strain. In summary, higher social engagement

and longer care duration were associated with higher PAC after adjusting for demographic variables and measures of distress. Future studies should aim to understand how caregivers shift appraisal to positive aspects of their role and explore implementation of interventions targeting PAC in order to improve the caregiving experience.

THE EFFECTS OF STIGMA ON THE CAREGIVERS OF ELDERLY PATIENTS WITH PSYCHIATRIC ISSUES IN A CHINESE COMMUNITY

Joanne Siu Ping So,¹ and Kai Nin Joseph Chan,²

1. *University of Victoria, Canada*, 2. *Asia Pacific Career Development Association, 20850, Maryland, United States*

World Health Organization in 2017 indicates the proportion of persons over the age of 60 years will exponentially grow from 12% in 2015 to 22% in 2050. Advanced age is a common risk factor for multiple conditions, including psychosis, depression, and other mental illnesses linked to cognitive and neurologic disorders. The majority of the studies identify ethnicity and socioeconomic status as primary determinants of mental health care access. Recent studies show that up to 12% of elderly Chinese have had a history of mental problems. However, over 50% of Chinese with mental disorders have failed to obtain professional help. Lack of access to health care for mental disorders has been linked to multiple underlying socioeconomic and cultural factors. These Chinese Americans lack an in-depth understanding of their psychosis, and psychiatric conditions are often a minority in nature. This study will systematically review the existing situations relating the factors to the stigma on caregivers. The result shows that the leading cause of psychiatric disorders, physical and emotional components of the elderly population, needs to be incorporated in the care plan in nursing homes and hospitals. In North America, the constant perception of discrimination and the inherent feeling of isolation and stigma among families with elderly members remains challenging. This review could contribute to the policy reform, which can help design effective control strategies to manage gaps of most mental disorders that continue to disproportionately affect different ethnic groups across the U. S. and Canada.

Session 2470 (Paper)

Purpose in Life

MEANINGFUL ENGAGEMENT OF RESIDENTS WITH DEMENTIA IN ASSISTED LIVING: THE ROLE OF DIRECT CARE WORKERS

Jennifer Craft Morgan,¹ Joy Ciofi,² Candace Kemp,³ Andrea Hill,⁴ and Alexis Bender,⁵ 1. *Georgia State University, Georgia State University, Georgia, United States*, 2. *Georgia State University, Avondale Estates, Georgia, United States*, 3. *Gerontology Institute, Georgia State University, Atlanta, Georgia, United States*, 4. *Georgia State University, Atlanta, Georgia, United States*, 5. *Emory University, Atlanta, Georgia, United States*

Meaningful engagement has important implications for quality of care for persons living with dementia. Yet, little research has focused on direct care workers' (DCWs) role

in facilitating engagement opportunities for residents in assisted living. Using data from our ongoing NIA-funded study, "Meaningful Engagement and Quality of Life among Assisted Living Residents with Dementia," we describe DCW approaches to engaging residents and the factors that influence the use and successful application of these approaches. Focal residents (N=33) were followed at four diverse assisted living communities for one year. Data includes care partner interviews (N=100), including 28 DCWs and 1560 hours of field observation data. DCWs interviewed had between 2 months and 12 years' experience in their current position and were mostly African American and/or immigrant women of color. Findings suggest that DCW-resident interactions are key opportunities to engage residents in a meaningful way and can facilitate positive, trust-based relationships. This analysis elaborates on our previous work identifying four approaches: knowing the person, connecting with and meeting people where they are, being in the moment, and viewing all encounters as opportunities. We identified factors affecting opportunities for, and experiences with, meaningful engagement between residents and DCWs, including community staffing, consistent assignment, scheduling, DCW training and tenure, and community resources. We conclude with implications for practice emphasizing how elaboration of these approaches can inform the development of DCW training, opportunities for career advancement, and integration of approaches consistently into daily practice in an effort to support meaningful engagement of residents living with dementia.

PURPOSE IN LIFE: A RECONCEPTUALIZATION FOR VERY LATE LIFE

Keith Anderson,¹ Noelle Fields,¹ Jessica Cassidy,¹ and Lisa Peters-Beumer,² 1. *University of Texas at Arlington, Arlington, Texas, United States*, 2. *Concordia University Chicago, River Forest, Illinois, United States*

Across disciplines, we have long sought to understand the factors that contribute to purpose in life. Theorists have posited that having life goals, feeling productive, and remaining active are essential contributing elements to purpose in life (Crumbaugh & Maholick, 1969; Rowe & Kahn, 1997; Ryff, 1989). While these factors can undoubtedly contribute to purpose in life, they may not fully explain purpose in life for older adults in very late life (85 years old and older) who have long past and short future time horizons. In this presentation, we explore the concept of purpose in life for older adults in very late life and how current measures may not fully or accurately apply to this group. We examine the two most commonly used measures of purpose in life, the Purpose in Life Test (Crumbaugh & Maholick, 1964, 1969) and the Ryff Purpose Subscale (Ryff, 1989; Ryff & Keyes, 1995), and identify specific items that should be reconsidered for use with older adults in very late life. We then reconceptualize purpose in life for the oldest old based on several foundational theories, including Socioemotional Selectivity Theory, the Theory of Gerotranscendence, and Terror Management Theory. Stemming from this analysis, we posit that purpose in life in very life consists of three domains – the very long past, the very near future, and the transcendental post-mortem. Based upon this reconceptualization, we recommend the development of new measures of purpose of life in very late life that capture these three domains.

SENSE OF PURPOSE IN LIFE PROMOTES RESILIENCE TO MEMORY DEFICITS RELATED TO DEPRESSIVE SYMPTOMATOLOGY

Nathan Lewis,¹ and Patrick Hill,² 1. *University of Victoria, Victoria, British Columbia, Canada*, 2. *Washington University in St. Louis, St. Louis, Missouri, United States*

Individuals higher in depressive symptoms commonly present with neuropsychological deficits including poorer memory performance. Sense of purpose in life, a component of psychological well-being, has been shown to promote resilience to cognitive impairment in older adulthood, but it is unclear whether it may also protect against cognitive deficits associated with higher depressive symptoms. This study examined whether purpose in life moderated the effect of depressive symptoms on cognitive functioning in a large longitudinal study of 4599 American older adults (Mage = 74.33 years, range = 65–104 years, 56.84% female) across a 12-year follow-up period. Depressive symptomatology was assessed at each wave using the 8-item Center for Epidemiologic Studies Depression Scale. Multilevel models assessed the influence of depressive symptoms and the interaction with sense of purpose in life on changes in word recall and mental status. Higher depressive symptoms were associated with poorer recall at baseline, but not rate of change over time. A negative interaction was observed between sense of purpose in life and depressive symptoms such that individuals higher in purpose experienced a less negative impact of depressive symptoms on word recall. No significant interaction of sense of purpose and depressive symptoms was observed on mental status. Having a sense of purpose in life may help protect older adults from memory deficits associated with higher depressive symptoms. The present findings underscore the potential for sense of purpose to promote cognitive reserve in older adulthood, allowing individuals to maintain cognitive performance in the face of accruing neuropsychological challenges.

Session 2475 (Paper)

Social Connection and Research Challenges During the COVID-19 Pandemic

FEASIBILITY AND CONSIDERATIONS FOR REMOTE INTERVIEWING OF PERSONS LIVING WITH DEMENTIA: ADAPTATIONS FOR COVID-19

Jeanine Yonashiro-Cho,¹ Elizabeth Avent,² Laura Mosqueda,³ and Zachary Gassoumis,³ 1. *University of Southern California, Alhambra, California, United States*, 2. *University of Southern California, Los Angeles, California, United States*, 3. *Keck School of Medicine of USC, Alhambra, California, United States*

The continuing COVID-19 pandemic has necessitated changes to research protocols and approaches to mitigate health risks to both study participants and researchers. This is particularly true of studies exploring the biopsychosocial well-being and personal perspectives of older adults and those at elevated risk of COVID-19 complications. While videoconferencing platforms have enabled remote work and social activities, reliance on them may potentially exclude

some individuals (e.g., those without digital devices, access to high speed internet or proficiency with technology). Persons living with dementia (PLWD) may experience difficulties navigating videoconferencing systems and building rapport with interviewers, though the inclusion of PLWD in research is necessary to ensuring their equitable representation. This presentation disseminates promising practices and lessons learned from a longitudinal study conducting remote interviews on sensitive topics with PLWD and their care partners (CP). Findings are drawn from a case study of the Better Together Dementia Care Study, an 18-month longitudinal study of PLWD (N=8) and their CPs (N=13), which implemented remote interviewing in Summer 2020 to gather data on the quality-of-life, resilience, relationship quality, adverse childhood experiences, mistreatment, and health status of PLWD. Researchers were able to interview most enrolled PLWD (n=7) via videoconferencing. Paper surveys were mailed to phone-interviewed participants, enabling them to view questions and answer choices in concordance with verbal queries. Researchers also tested a protocol asking CPs to leave the room while PLWD answered questions on sensitive topics. Findings support the use of remote interviewing with PLWD and provide insights to guide replication of these approaches.

FEASIBILITY STUDY OF A TABLET-BASED INTERVENTION TO ENHANCE THE MEANING IN LIFE AMONG OLDER ADULTS

Seok In Nam, and Sangyoon Han, *Yonsei University, Seoul, Seoul-t'ukpyolsi, Republic of Korea*

Recommendations to improve older adults' health and well-being focus on enhancing meaning in life through social interaction. Research studies have suggested that a tablet-based intervention can create opportunities to enhance meaning in life, thus reducing social isolation and loneliness. The purpose of this study was to examine the feasibility of using a tablet-based intervention to enhance meaning in life among older adults. Senior Meaning in Life Enhancement (SMiLE) is a tablet-based application developed and implemented based on person-centered counseling, logotherapy, and Acceptance Commitment Therapy (ACT). Thirty-one participants (adults aged over 65 years) were randomized for intervention (n = 15) or waitlist control (n = 16). The intervention group received a tablet with our embedded app. Participants were invited to participate in the app-based 2-month program for 30-minutes each day with the tablet. We evaluated pre-and post-semi-structured interviews, meaning in life scales, and usability tests. Data were analyzed using thematic analyses, descriptive statistics, and Mann-Whitney and Wilcoxon tests. Findings confirmed that at two months after the intervention, there was a statistically significant difference in the gap between pre-and post-meaning in life scores between the two groups ($Z = -2.08, p < .05$). Furthermore, qualitative findings included positive changes in behavior, relationships, and usability. This pilot study suggests the feasibility of a tablet-based intervention in older adults and demonstrates its potential benefit for meaning in life. These findings are valuable to researchers, practitioners, and designers interested in technological interventions for older adults.

PARTICIPATORY RESEARCH WITH OLDER WORKERS IN A PANDEMIC: INNOVATIONS AND LESSONS LEARNED

Cal Halvorsen, Kelsey Werner, and Elizabeth McColloch,
Boston College, Chestnut Hill, Massachusetts, United States

In the spring of 2020, and as the implications of the COVID-19 pandemic became increasingly dire, in-person studies halted throughout the world. This included our planned study to examine the role of the Senior Community Service Employment Program (SCSEP)—the sole federal workforce training program for low-income older adults—in influencing participant financial, physical, and mental well-being. While our original plans were to hold a series of in-person workshops with SCSEP participants and case managers using a form of participatory research called community-based system dynamics (CBSD), we paused the launch of our study to determine the safest path forward. This presentation will describe how we responded as well as innovations and implications for future research with harder to reach populations. First, we met with the Massachusetts state SCSEP director to assess the feasibility of moving our sessions online with this particular population. After determining that virtual and telephone sessions would both be needed to increase accessibility, we identified virtual whiteboard software rigorous enough to utilize CBSD-specific activities, user-friendly enough for populations less familiar with virtual environments, and with security features that would be approved by our university, as well as discussed what types of activities to conduct on the telephone for such a visual research method. Our CBSD study was one of the first to utilize virtual and telephone formats in the history of this method, and our results indicate that it is possible—and sometimes beneficial—to move in-person participatory methods to these environments to increase inclusion and efficiency.

THE IMPACT OF THE CARING CALLERS PROGRAM ON SENIOR COMPANION VOLUNTEERS AND CLIENTS DURING THE COVID-19 PANDEMIC

Kathy Lee,¹ Noelle Fields,² Gretchen Feinhals,³ and Melanie Calhoun,³ 1. *University of Texas at Arlington, Coppell, Texas, United States*, 2. *University of Texas at Arlington, Arlington, Texas, United States*, 3. *The Senior Source, Dallas, Texas, United States*

Purpose of the Study: The purpose of this study was to examine the impact of the Caring Callers Program on older adults and volunteers. Our research team piloted this telephone reassurance program during the COVID-19 pandemic. In the Caring Callers Program, socially isolated older adults were paired with older adult volunteers from the Senior Companion Program (20 pairs). **Methods:** In the Caring Callers Program, Senior Companion volunteers provided the clients with emotional support through a weekly phone call over the 12 weeks period (May through July 2020). Prior to the intervention implementation, the volunteers received a two-hour group-based training through a teleconference platform. Program outcomes were measured through quantitative and qualitative approaches. **Results:** The clients (mean age=73.5) showed significantly increased overall self-rated health at post-test, compared to pre-test and they discussed social and emotional benefits. The clients

were very satisfied with the program and indicated that the program met their expectations. Our individual, in-depth interviews with the volunteers (mean age=73.2) also revealed that the volunteers were able to develop their skills that are helpful for their Senior Companion volunteer activities and experience mutual benefits by spending their time more purposefully. Overall, our participants shared that they wanted to continue participating in the Caring Callers Program. **Discussion:** We learned the importance of training not only for the volunteers but also for the clients, prior information on their pair, making sure of the volunteer-client fit, and benefits of using telephone particularly in this group of vulnerable older adults.

Session 2480 (Paper)

Social Determinants of Health II

BIRTH COHORT DIFFERENCES IN MULTIMORBIDITY BURDEN AMONG AGING U.S. ADULTS

Nicholas Bishop,¹ Steven Haas,² and Ana Quiñones,³

1. *Texas State University San Marcos, San Marcos, Texas, United States*, 2. *Penn State, University Park, Pennsylvania, United States*, 3. *Oregon Health & Science University, Portland, Oregon, United States*

Multimorbidity is the co-occurrence of two or more chronic health conditions and affects more than half of the US population aged 65 and older. Recent trends suggest increased risk of poor self-reported health, physical disability, cognitive impairment, and mortality among later born birth cohorts, yet we are unaware of work examining cohort trends in multimorbidity among aging US adults. Observations were drawn from the Health and Retirement Study (2000–2018) and included adults aged 51 and older across 7 birth cohorts (1923 and earlier, 1924–1930, 1931–1941, 1942–1947, 1948–1953, 1954–1959, and 1960–1965). Multimorbidity was measured as a count of 9 chronic conditions including heart disease, hypertension, stroke, diabetes, arthritis, lung disease, cancer (excluding skin cancer), depression, and cognitive impairment. General linear models adjusting for repeated measures and covariates including age, sex, race/ethnicity, and education were used to identify whether trends in multimorbidity varied across birth cohort. 31,923 adults contributed 153,940 total observations, grand mean age was 68.0 (SD=10.09), and mean multimorbidity was 2.19 (SD=1.49). In analyses adjusted for age and other covariates, adults born 1948–1953 reported .34 more chronic conditions (SE=.03, $p<.001$), adults born 1954–1959 reported .42 more chronic conditions (SE=.03, $p<.001$), and adults born 1960–1965 reported .55 more chronic conditions (SE=.03, $p<.001$), than those born 1931–1941, respectively. Our preliminary results confirm increasing multimorbidity among later birth cohorts of older Americans and should help guide policy to manage impending health declines among older Americans.

PERSONAL NETWORK BRIDGING POTENTIAL AMONG RURAL AND OLDER POPULATIONS

Adam Roth, Siyun Peng, and Brea Perry, *Indiana University, Bloomington, Indiana, United States*

Personal social networks play a fundamental role in the daily lives of older adults. Although many studies examine how life course factors and personal preferences shape network formation, fewer consider how the places in which older adults live present opportunities and obstacles to cultivate social relationships. In the present study, we explore how geographic context is associated with the ability to interact with non-overlapping social groups within one's personal network (i.e., network bridging). This unique network formation offers older adults access to diverse social stimuli, non-redundant information, and social autonomy. By analyzing data from the Person-to-Person Health Interview Survey (N=709), we found that a minority of respondents reported the ability to bridge social groups within their networks. Respondents residing in rural and semi-rural counties engaged in fewer non-overlapping social groups compared to those residing in urban counties. These findings suggest that the communities in which older adults live condition opportunities for accessing unique social resources. Identifying the link between geographic residence and personal network structure has important implications for how individuals navigate the uncertainty and elevated support needs of later life. Additional research adopting a social network perspective is needed to provide insight into geographic health disparities occurring among the older population.

RACE DIFFERENCES IN TRAJECTORIES OF HOPELESSNESS AMONG U.S. OLDER ADULTS: DO SOCIAL CONDITIONS MATTER?

Uchechi Mitchell,¹ Elena Graetz,² and Jing Wang,³

1. *University of Illinois Chicago, School of Public Health, Chicago, Illinois, United States*, 2. *University of Illinois Chicago, College of Liberal Arts and Science, University of Illinois, Chicago, Illinois, United States*, 3. *University of Illinois, Chicago, University of Illinois Chicago, Illinois, United States*

Despite being a risk factor for cardiovascular disease, suicidal ideation, and mortality among U.S. older adults, research on hopelessness and how it changes over time are lacking. Although hopelessness generally increases with age, levels of hopelessness may be influenced by race/ethnicity and social or economic factors. This study uses longitudinal data from 8,359 individuals from the Health and Retirement Study to examine race differences in trajectories of hopelessness from 2006 to 2018. We used linear mixed models to estimate trajectories of hopelessness for blacks, whites and Hispanics age 51 and older. The model was fit with a natural spline cubic function to model changes in time trends of hopelessness and the interaction between time and race. Models controlled for demographic characteristics, socioeconomic status, health status, and psychosocial factors that influence hopelessness. We found that older Hispanics have the highest levels of hopelessness, followed by non-Hispanic blacks and non-Hispanic whites. Trajectories of hopelessness were non-linear and differed by race. For older whites, hopelessness increased from 2006-2010 and then decreased until 2018. For older blacks, it decreased the entire time period but did so at a decreasing rate; and, for older Hispanics, hopelessness decreased from 2006-2012 and then increased thereafter. Our study shows that hopelessness generally decreased over time among older adults between 2006

and 2018 in race-specific ways, despite generally increasing with age. These findings suggest that race, age and period effects differentially influence trajectories of hopelessness. Factors contributing to these differences may be related to concurrent social and economic conditions.

TEMPORAL TRENDS IN THE PREVALENCE OF DEMENTIA IN SOUTH KOREA

Jung Hyun Kim,¹ and Anja Leist,² 1. *University of Luxembourg, University of Luxembourg, Diekirch, Luxembourg*, 2. *University of Luxembourg, Esch-sur-Alzette, Diekirch, Luxembourg*

Background. Secular decreases in the prevalence of cognitive impairment and dementia have been observed in several Western countries, however, few systematic investigations of temporal trends in dementia have been conducted in South Korea. Method. Data came from N=8,006 individuals (N=2,110 assessed twice) aged 65 years and older participating in the Korean Longitudinal Study of Aging 2008 and 2018. Dementia was indicated by a score ≤ 17 on the Korean Mini-Mental State Examination (K-MMSE). Dementia was regressed on the year of survey, adjusting for multiple demographic and socio-economic confounders, and, in additional models, also chronic diseases and lifestyle factors related to health, social, and religious activities. Results. Across waves, the share of individuals with low socio-economic status decreased. The prevalence of chronic diseases, including diabetes, heart diseases, stroke, and psychiatric diseases, increased over time. Alcohol consumption increased, whereas smoking rates, religious affiliation, and participation in religious activities decreased. Controlling for all covariates and compared to 2008, we observe decreases in dementia prevalence in 2018 by 52% (2018: OR 0.48, CI 0.42, 0.56). Women's MMSE scores were more than two times as likely as men's to indicate dementia (OR 2.59, CI 2.15, 3.14). Discussion. Decreases in dementia prevalence in Korea are partly attributable to improved socio-economic conditions and can be observed despite the increased prevalence of chronic conditions. However, secular trends were not fully explained by these and lifestyle factors. We discuss further individual-level and contextual-level mechanisms that may have contributed to these findings.

THE INTERACTION OF LIFE COURSE SOCIOECONOMIC STATUS AND LEISURE ACTIVITIES ON COGNITIVE PERFORMANCE IN OLD AGE

Rongjun Sun,¹ and Zhenmei Zhang,² 1. *Cleveland State University, Cleveland, Ohio, United States*, 2. *Michigan State University, Department of Sociology, Michigan, United States*

While the separate effects of socioeconomic status and engaging in leisure activities on cognition have been well documented, their interaction effect has rarely been examined. After examining life course socioeconomic status (SES) on cognitive impairment in old age, this paper is focused on exploring the interaction effects between life course SES and leisure activities. We use data from the Chinese Longitudinal Healthy Longevity Survey, which covers five waves of interviews of adults aged 65 or older between 2002 and 2014. Cognitive impairment is measured by the Chinese version

of Mini-Mental Status Examination. Two sets of variables are used to reflect an older person's life course SES in childhood and adulthood, respectively. Seven leisure activities are included in this analysis. We adopt the lagged independent variable approach and a Generalized Linear Mixed Model to examine the association between leisure activity and cognitive impairment over time. Results show that there is an independent impact of SES in both childhood and adulthood on cognitive decline in Chinese older population. Furthermore, as the focus of this study, there are substantial interactions between life course SES and engaging in leisure activities with a consistent pattern: those of higher life course SES enjoy extra benefits from engaging in leisure activities. The interactions between life course SES and leisure activities promise a competing approach accounting for cognitive health inequality among older adults.

Session 2485 (Paper)

Technology and Older Adults

DETERMINANTS OF INTENTION TO USE DIGITAL TECHNOLOGY FOR OLDER ADULTS BY ENVIRONMENTAL DIMENSIONS

Sangyoon Han, and Seok In Nam, *Yonsei University, Seoul, Seoul-t'ukpyolsi, Republic of Korea*

Due to the COVID-19 pandemic, it is common to hear news of older adults being socially isolated due to difficulties in purchasing or accessing online services and in interacting with family or friends through video calling apps. Despite an increasing ease of access to digital devices, such access far from universal. Thus, digital inequality has become a serious problem for older adults. To understand why digital inequality issues are so relevant for older adults, we must understand older adults' entire life contexts and the potential of digital technologies in their lives. With these understandings, the purpose of this study was to explore the technology acceptance process and identify key precursors to acceptance of digital technology using the Technology Acceptance Model (TAM) 3 as a framework. This study used data from the 2018 Digital Divide Survey of the Ministry of Science and ICT. A total of 1,662 older adults (aged 55+) were analyzed using structural equation modeling with bootstrap sampling. Model fit indices (CFI = .928; SRMR = .074; RMSEA = .044) suggested an acceptable fit. Results indicated that two environmental dimensions, personal environment (self-efficacy and value recognition) and social environment (social norms and social support systems), had a significant impact on the intention to use technology both directly and indirectly. Furthermore, perceived usefulness and perceived ease of use mediated between environmental domains and the intention. This study indicates that providing appropriate digital support for older adults is important to achieve greater digital inclusion.

DIGITAL DEVELOPMENTS IN SOCIETY THAT PERSONS 75 YEARS AND OLDER HAVE BEEN PART OF: A SCOPING REVIEW

Moonika Raja,¹ Jorunn Bjerkan,² Ingerd Kymre,¹ Kathleen Galvin,³ and Lisbeth Uhrenfeldt,¹ *1. Nord University, Nord University, Bodø, Nordland, Norway,*

2. Nord University, Nord University, Levanger, Nord-Trøndelag, Norway, 3. University of Brighton, University of Brighton, England, United Kingdom

The population in Europe is ageing and people are becoming more than ever dependent on digital technologies. The present study aims to map relevant evidence about digital developments in society involving people aged 75 and over in European countries. It focuses on their experiences and the main barriers to, and facilitators of, societal digital demands. Scoping reviews can be used when the purpose is to identify types of available evidence and clarify concepts, this process was guided by a framework proposed by Arksey and O'Malley. The studies included in the review covered digital technology, digital devices and telehealth, and the context covered participants' own home or surroundings. A comprehensive search was made on CINAHL, Embase, Pubmed/MEDLINE, Scopus and Open Grey. Out of 727 identified citations, 13 sources which met the inclusion criteria (9 original study articles, 2 theses, 1 letter about a product and 1 project report). The studies included varied in their focus, design and location. Older European citizens have experienced technology making life easier and the opposite. The outstanding facilitator found was that technology should be easy to use. Interestingly, both social support and lack of social support were found as facilitators of using new technology and difficulty in remembering the instructions was seen as an important barrier. As technology develops rapidly, there is a need for new and additional research among older European citizens. Future research should cover participants' access to the devices, social support and the technical solutions most relevant to older people today.

PRIVACY AND SMART SPEAKERS IN RESEARCH WITH OLDER ADULTS

Kelly Quinn,¹ Jessie Chin,² Smit Desai,³ Carrie O'Connell,⁴ David Marquez,⁵ and Naoko Muramatsu,⁶ *1. University of Illinois at Chicago, Chicago, Illinois, United States, 2. University of Illinois at Urbana-Champaign, University of Illinois at Urbana-Champaign, Illinois, United States, 3. University of Illinois, Urbana Champaign, Champaign, Illinois, United States, 4. University of Illinois at Chicago, University of Illinois at Chicago, Illinois, United States, 5. University of Illinois at Chicago & Rush University, University of Illinois at Chicago, Illinois, United States, 6. University of Illinois Chicago, Chicago, Illinois, United States*

Advances in artificial intelligence and computational linguistics have made smart speakers, such as Amazon AlexaTM and Google HomeTM, economical and widely available. For older adults particularly, devices with voice interfaces can help to overcome accessibility challenges that often accompany interaction with today's technologies. However, voice-activation also requires devices to be in a continuous state of ambient listening, which can create a significant privacy risk for the user, one that is often amplified as smart speakers are placed in highly personal home spaces to facilitate their utility. Deployment of these devices in research settings poses additional risk, as traces of data filter through research teams, app developers, and third-party services that support research efforts. This presentation addresses the privacy aspects of deploying Google Home MiniTM speakers in research that examined their

feasibility for enhancing physical activity among sedentary older adults. Interviews with participants were conducted in two studies: the first included a demonstration of the device and physical activity program (n=15); and the second included in-home use of devices and a physical activity program (n=15). Content analysis of study documentation, field notes, and interviews revealed specific areas that require additional attention when utilizing smart speakers in research, including the capture of identifying information, protocols for data handling, and requirements for informed consent. These findings are discussed in context with extant literature on individual privacy concerns and behaviors related to smart household devices. Results from this study can inform future research efforts incorporating smart speakers, to mitigate potential risks of privacy violation.

THE FINAL MILE: EVALUATING EHEALTH AND MHEALTH UTILIZATION AMONG OLDER ADULTS

Mary Krebs, *University of Massachusetts Boston, Warren, Maine, United States*

While health endures as a term to describe looking after oneself, looking after loved ones, and receiving care, the added component of electronic technology has emerged to affect all levels of health care delivery. Despite the prevalence of digital health and empirical evidence strongly supporting improved outcomes--the final mile--as it is sometimes called, is the sustained patient engagement with eHealth and mHealth we have yet to achieve. This research identifies a gap in the literature for understudied characteristics of digital health adoption, use affecting the aging population in the U.S., and contributes a deeper understanding of the key barriers to use of health-related technology. A mixed-methods research approach explores prevalent barriers to digital health utilization by older adults through a pre-post data collection strategy to empirically test an educational health-related intervention rooted in the Technology Acceptance Model. This validated analytic framework represents a decision 'core' as a user pathway for actual use. Evaluation of score data utilized a quantitative test of group means while thematic coding was employed for qualitative analysis. The results from this study are two-fold. The work strongly suggests specific barriers to adoption and use, confirming a distrust and reluctance to engage. However, additional evidence, both quantitative and qualitative illuminates substantive skills, positive perceptions, hopeful attitudes, as well as the rationale for use of available digital resources. Findings suggest future research would benefit from expanded use of the two-pronged approach to foster health-related technology engagement.

THE ROLE OF INTERSECTIONALITY IN ACCESS TO TECHNOLOGY AMONG OLDER ADULTS

Zainab Suntai,¹ and Susanny Beltran,² *1. University of Alabama, Tuscaloosa, Alabama, United States, 2. University of Central Florida, Orlando, Florida, United States*

In the era of COVID-19, technology has become a primary means of connecting with the world while maintaining physical distance, which is crucial for older adults who are at disproportionately high risk of infection and death. Throughout the pandemic, there has been increased emphasis on using telehealth to access medical and mental health care, and technology (e.g., apps, social media, video

calls) for social interactions/communication to mitigate loneliness/isolation. Thus, COVID-19 has increased the need for older adults to access technology, and widened disparities experienced by those with limited access. This study used data from the 2018 National Health and Aging Trends Study, an annual longitudinal panel survey of Medicare beneficiaries aged 65+ in the U.S, to explore the association between the interaction of race/ethnicity and sex, and access to both a working cell phone and laptop/computer. Chi-square tests and multivariable logistic regressions were conducted. The sample (N=2,442) was 83.7% white, 8.5% Black, and 7.8% Hispanic. After accounting for other explanatory variables, logistic regression analysis indicated significantly higher odds of not having both a working cell phone or computer/laptop among White women (OR=1.518, CI=.1.510-1.527), Black men (OR=.1.741, CI= 1.720-1.763), Black women (OR=2.567, CI= 2.545-2.589), Hispanic men (OR=1.036, CI=1.022-1.050), and Hispanic women (OR=2.265, CI=.2.243-2.287) compared to White men. Overall, Hispanic and Black women were the least likely to have access to technology compared to other groups. Addressing technological equity remains a need. Future research should consider how the provision of devices along with technological literacy programs can improve well-being among BIPOC women.

Session 2495 (Symposium)

THE IMPORTANCE OF PSYCHOSOCIAL FACTORS IN AGING: THE MINORITY AGING RESEARCH STUDY

Chair: Lisa Barnes

Co-Chair: Brittney Lange-Maia

Discussant: Carlos Mendes de Leon

Psychosocial factors can provide crucial insight into lived experiences that influence healthy aging. Though psychosocial factors are often used to explain health disparities seen between different racial/ethnic groups, within-group investigations can be particularly powerful for identifying culturally specific psychosocial factors that impact heterogeneity in aging among minority populations. The Minority Aging Research Study (MARS) is an ongoing, longitudinal epidemiologic cohort of 797 older African Americans from the Chicago, IL metropolitan area. Participants are on average 73.4 (standard deviation [SD]=6.6) years of age, 78.2% are women, and mean years of education is 14.8 (SD=3.7). At baseline, 75.3% of participants were without cognitive impairment, 20.8% had mild cognitive impairment, and 3.9% had mild dementia. Participants were recruited starting in 2004 and complete annual visits including a clinical evaluation, cognitive and motor testing, and assessment of risk factors related to Alzheimer's Disease risk, including those hypothesized to be associated with a higher burden of cognitive impairment among older African Americans. This symposium will discuss the longitudinal association between John Henryism and cognitive function and decline (McSorley), participation in social activities and risk of all-cause mortality (Lamar), and the predictive relationship between experiences of everyday discrimination and incident disability (Lange-Maia). Finally, we will examine multilevel correlates—including environmental, sociocultural, behavioral, and biological factors—related to perceived stress (Glover). Mendes de Leon will critically consider what appear to be

the most potent psychosocial factors for minority aging and possible implications of integrating these factors into interventions focused on promoting healthy aging among older African Americans.

DISCRIMINATION AND RISK OF INCIDENT DISABILITY IN OLDER AFRICAN AMERICANS

Brittney Lange-Maia,¹ Melissa Lamar,² Sue Leurgans,¹ Aron Buchman,³ and Lisa Barnes,¹ 1. *Rush University Medical Center, Chicago, Illinois, United States*, 2. *Rush Alzheimer's Disease Center, Rush University Medical Center, Rush Alzheimer's Disease Center, Illinois, United States*, 3. *Rush University, Chicago, Illinois, United States*

Discrimination is linked to poor health outcomes, but most studies examine young or midlife populations. We assessed associations between discrimination and disability in African Americans. The Detroit Areas Study Everyday Discrimination Scale quantified experiences of interpersonal mistreatment. Separate Cox-proportional hazards models tested the associations between baseline discrimination and incident mobility, activities of daily living (ADLs), and instrumental activities of daily living (IADLs) disability, adjusting for age, sex, education, BMI, smoking, depressive symptoms, and vascular diseases. At baseline, 441, 674, and 469, participants were initially free of mobility, ADL, and IADL disability, respectively, and 257, 185, and 269 new cases of mobility, ADL, and IADL disability were observed over approximately 8.5 years. Discrimination was associated with higher risk of ADL disability (hazard ratio: 1.03 per 1-point higher discrimination score, 95% confidence interval: 1.00-1.06) but no other disability type. Everyday discrimination is associated with risk of ADL disability.

JOHN HENRYISM AND COGNITIVE FUNCTION AND DECLINE

V. Eloesa McSorley,¹ Christopher Howard,² Bryan James,³ Raj Shah,⁴ Patricia Boyle,⁵ and Lisa Barnes,¹ 1. *Rush University Medical Center, Chicago, Illinois, United States*, 2. *The Utah State Hospital, Provo, Utah, United States*, 3. *Rush University, Chicago, Illinois, United States*, 4. *Rush, Rush University Medical Center, Illinois, United States*, 5. *Rush Alzheimer's Disease Center, Chicago, Illinois, United States*

Older Black adults in the US have higher prevalence and incidence of dementia and perform lower on cognitive tests than whites. Some of these differences have been attributed to facets of structural racism such as access to and quality of education and fewer socioeconomic resources. Here, we consider whether John Henryism (JH), a measure of self-perceived high-effort coping in the face of chronic environmental and psychosocial stressors, is associated with cognitive function and decline. JH has been associated with adverse cardiovascular health outcomes among African-Americans, especially those with fewer socioeconomic resources. Using data from MARS, we assessed whether JH, measured with an 8-item questionnaire (mean=16.9, sd=4.8, range: 4-27), was associated with level of cognitive function and rate of cognitive decline. We found one standard deviation increase in JH was associated with lower average cognitive function (β =-0.05,

95% CI: -0.09, -0.01). Higher JH was not associated with rate of cognitive decline.

SOCIAL ACTIVITY AND ALL-CAUSE MORTALITY IN OLDER BLACK ADULTS OF THE MINORITY AGING RESEARCH STUDY

Melissa Lamar,¹ Bryan James,² Ana Capuano,³ Robert Wilson,³ and Lisa Barnes,⁴ 1. *Rush Alzheimer's Disease Center, Rush University Medical Center, Rush Alzheimer's Disease Center, Illinois, United States*, 2. *Rush University, Chicago, Illinois, United States*, 3. *Rush, Chicago, Illinois, United States*, 4. *Rush University Medical Center, Chicago, Illinois, United States*

Negative social stressors (e.g., perceived loneliness and/or social isolation) predict mortality in older adults; less is known about the role of positive social activities. What research does exist focuses on White adults, leaving gaps in knowledge regarding specific activities that may decrease mortality risk in Black adults. We investigated whether self-reported late-life social activity, generally and by type, predicted mortality risk in 768 Black adults (age~73yrs; non-demented at baseline) participating in MARS. Over ~6.5 follow-up years, 25% of participants died (n=192; age-at-death~83yrs). In fully-adjusted Cox models including demographic, health, and relevant psychosocial covariates, mortality risk decreased by 32% (HR=0.68,95%CI=0.49,0.93) in those with higher compared to lower social activity generally, and with higher volunteer-, church- and group-related activities specifically. Engaging in social activity, especially altruistic or faith-based activities, reduces mortality risk in older Blacks regardless of overall health or social stressors pointing toward community-based approaches to increase longevity in this population.

CORRELATES OF PERCEIVED STRESS AMONG COMMUNITY-DWELLING OLDER AFRICAN AMERICANS WITHOUT DEMENTIA

Crystal Glover,¹ Ana Capuano,² Robert Wilson,² David Bennett,³ and Lisa Barnes,⁴ 1. *Rush University Medical Center, Chicago, Illinois, United States*, 2. *Rush, Chicago, Illinois, United States*, 3. *Rush University, Chicago, Illinois, United States*, 4. *Rush University Medical Center, Chicago, Illinois, United States*

The purpose of this study was to identify correlates of perceived stress among older African Americans without dementia. We grouped correlates into four levels – environmental, sociocultural, behavioral, and biological – guided by the National Institute on Aging's (NIA) Health Disparities Research Framework. We performed a cross-sectional data analysis with the Minority Aging Research Study using ordinal logistic regression analyses. Participants were 722 African Americans without dementia [mean age = 73.61 years (SD=6.33)]. Correlates from environmental (e.g., larger life space), sociocultural (e.g., larger social network size), behavioral (e.g., more purpose in life), and biological (e.g., higher global cognition) levels were associated with lower odds of having greater levels of perceived stress. Perceived stress was associated with correlates from every level. Future research is needed to examine how changes in these correlates may be related to perceived stress in older African Americans.

Session 2500 (Symposium)

THE IMPORTANCE OF SOCIAL SUPPORT NETWORKS ON MENTAL HEALTH STATUS OF CUSTODIAL GRANDPARENTS

Chair: Deborah Whitley
Co-Chair: Youjung Lee
Discussant: Yanfeng Xu

This symposium presents a collection of papers that examine the concept of social support and its effect on custodial grandparents' (CG) mental health state. Each paper explores a different perspective about grandparents' access to and/or use of social support networks and mental health outcomes; several papers view social support within the context of the COVID-19 pandemic. Nadorff and colleagues explore social support by middle-generation family members and its effects on grandparents' stress and depressive symptoms. Musil and colleagues report on psychosocial and social support predictors of self-appraised healthcare and financial security by CG during the Covid-19 pandemic. Whitley and Kelley describe current social networks relied upon by a preliminary sample of CG while managing the daily stresses and strains associated with COVID-19 and its restrictive mandates. The final two papers report the use of specialized technology and support services delivered to homebound CG during the COVID-19 pandemic. Lee and colleagues describe a telemental health model using Solution-Focused Brief Therapy to serve socially isolated grandparents experiencing mental health distress as during the pandemic. Mendoza and Park report on program challenges and outcomes of implementing a support service for grandparents living under COVID-19 restrictions. The highlights of the papers will be discussed by Yanfeng Xu and give attention to the ways scholars and practitioners can build upon these works to maximize the mental health outcomes of CG, while managing to live in socially restrictive and challenging environments.

LIVING WITH COVID-19: DESCRIPTIONS OF AFRICAN AMERICAN CUSTODIAL GRANDPARENTS MENTAL HEALTH STRESS AND SOCIAL SUPPORT NETWORKS: A PILOT STUDY

Deborah Whitley, and Susan Kelley, *Georgia State University, Atlanta, Georgia, United States*

Research suggests custodial grandparents (CG) with chronic health conditions, limited economic resources, and restricted social connections are at risk for adverse mental health outcomes. The growing uncertainty surrounding COVID-19 seems to accentuate these findings. This paper presents preliminary descriptions of mental stress by a small sample of CG ($n=26$) surveyed after the onset of COVID-19. They described the social groups comprising their networks, and the methods used to engage with them. A majority of the sample (96.2%) reported experiencing mental stress since the onset of the virus; based on Brief Symptom Inventory results, five CG scored in the clinical range for stress. Food access, fear of getting sick, and grandchildren's school requirements are leading sources of stress. Despite such challenges, CG report varying levels of social engagement with their support networks. The

reported descriptions give preliminary insight how CG can maximize their social networks to build/sustain positive mental health well-being.

CONNECTING GRANDPARENT CAREGIVERS THROUGH TELEMENTAL HEALTH DURING COVID-19

Youjung Lee,¹ Laura Bronstein,² and Kelley Cook,³
1. *Binghamton University, Department of Social Work, Binghamton, New York, United States*, 2. *Binghamton University, Binghamton University/Binghamton, New York, United States*, 3. *Community Research and action, Binghamton University/ Binghamton, New York, United States*

Since the COVID-19 outbreak, children and their caregivers throughout the world are experiencing unprecedented long-term social isolation. For too many, especially grandparent-headed families, underrepresented minorities, and those living in poverty, this precipitates and exacerbates mental health conditions including anxiety and depression. Despite these families' increased needs for mental health services during the pandemic, professionals often lack experience and expertise in telemental health, which is a safe and effective way to provide these services. In this symposium, we will present a telemental health model for working with grandparent-headed families that draws upon Solution-Focused Brief Therapy (SFBT), an evidence-based approach focusing on strengths. This SFBT-based telemental health training program prepares mental health professionals to implement this safe and innovative intervention, enabling them to effectively serve isolated and marginalized grandparent caregivers and their families when providing in-person services is not possible.

THE MODERATION OF MIDDLE-GENERATION SUPPORT ON THE RELATION OF STRESS AND DEPRESSION IN CORESIDENT GRANDPARENTS

Danielle Nadorff,¹ Melissa Barnett,² and Loriena Yancura,³
1. *Mississippi State University, Mississippi State, Mississippi, United States*, 2. *University of Arizona, Tucson, Arizona, United States*, 3. *University of Hawaii at Manoa, Honolulu, Hawaii, United States*

Consistent with Cohen & Wills' Buffering Hypothesis, social support has been found to moderate the relation between stress and depressive symptoms but has yet to be examined among coresident grandparents (CGPs), a population at risk of increased stress and depression. The current study sought to extend the model to this highly prevalent, vulnerable population. Participants were 180 grandparents across the USA living with their grandchildren. Measures included depression, stress, and satisfaction with support provided by the middle generation (MG) parent of the grandchild. After controlling for age, gender, income, and household type (skipped or multi-gen), MG support moderated the relation between perceived stress and depressive symptoms, accounting for 49% of variance. For CGPs least satisfied with support provided by the MG, the more stress, the higher their depressive symptoms. These findings indicate that improving relationships with grandchildren's parents is an important avenue for interventions focused on grandparent caregivers' mental health.

GRANDMOTHERS RAISING GRANDCHILDREN: PREDICTORS OF HEALTHCARE ACCESS AND FINANCIAL SECURITY DURING COVID-19

Carol Musil,¹ Alexandra Jeanblanc,² and Chris Burant,²
1. CWRU School of Nursing, Cleveland, Ohio, United States, 2. Case Western Reserve University, Cleveland, Ohio, United States

Grandmothers living with or raising grandchildren who had just completed the final data point of an NIH-funded, national, behavioral RCT were asked to complete an additional data collection point to capture the effects of the Covid-19 pandemic on their families' access to healthcare and financial security. In Spring 2020, 258 grandmothers completed measures of access to healthcare and financial security (3 and 4 item composite scales), family strain, family functioning, and psychosocial and demographic variables. Financial security (Adj. R2=.52) was explained by knowing other grandfamilies; better family functioning; and fewer financial worries, unmet service needs, and depressive symptoms. Access to healthcare (Adj. R2=.24) was explained by being married, employed and having fewer financial worries and unmet service needs. Findings that family functioning, knowing other grandfamilies and depressive symptoms contributed to financial security, and that marital and employment status affect access to healthcare show the importance of support.

IMPLEMENTING AN INTERVENTION PROGRAM DURING THE COVID-19 PANDEMIC: CHALLENGES AND SUCCESSES

Nancy Mendoza,¹ and Cherrie Park,² 1. *The Ohio State University, The Ohio State University, Ohio, United States*, 2. *The Ohio State University, Columbus, Ohio, United States*

During the COVID-19 pandemic, the implementation of intervention programs for grandfamilies are facing multiple challenges. In this paper, we will present some of the challenges and successes of introducing the GRANDcares Plus Project (GRANDc+) during the COVID-19 pandemic. As an intervention program, GRANDc+ has demonstrated positive outcomes for grandfamilies, such as increased satisfaction with life, knowledge of services, self-care practices, and supportive social networks. Due to the pandemic, the implementation of GRANDc+ has been met with many challenges including, training of facilitators, following CDC's COVID-19 guidelines/recommendations, and considering grandfamilies needs, concerns and safety. The pandemic has and continues to have detrimental effects on grandfamilies; this makes it more vital than ever to support grandfamilies through interventions like GRANDc+, despite what challenges we may face. Our presentation will provide insights into identifying, managing, and overcoming the challenges of implementing interventions during the COVID-19 pandemic.

Session 2505 (Symposium)

THE NEED FOR PERSON-CENTERED MEASURES FOR DEMENTIA RESEARCH AND CARE

Chair: Sam Fazio

Co-Chair: Sheryl Zimmerman

Discussant: Laura Gitlin

The importance of person-centered medical and psychosocial care has become widely recognized, but there is abundant evidence that care is not always person-centered. In 2018, the Alzheimer's Association published their evidence-informed Dementia Care Practice Recommendations, which address nine domains all grounded in a person-centered perspective. Following that work, the Association launched LINC-AD -- Leveraging an Interdisciplinary Consortium to Improve Care and Outcomes for Persons Living with Alzheimer's and Dementia. An early effort of LINC-AD, and the focus of this symposium, examined what measures are available to guide care and assess outcomes, and the extent to which they embrace person-centeredness. The results have been disappointing. This session will highlight the importance of person-centered measures in five domains of the Dementia Care Practice Recommendations, based on comprehensive reviews of literature. Each paper, presented by LINC-AD research advisors, will examine available measures and raise questions about gaps using a person-centered lens. Katie Maslow will describe frequently used measures and identify person-centered measures that could be added to studies of alternate procedures intended to increase detection and diagnosis. Drs. Mast and Molony will discuss a person-centered approach to item development and testing for assessment. Emilee Ertle will discuss the need to measure interpersonal and contextual factors associated with behavioral expressions. Drs. Prizer and Zimmerman will compare measures of dressing ability and their person-centered components. Dr. Calkins will examine the strengths and limitations of environmental assessment tools. As Discussant, Dr. Gitlin will integrate the findings from all five presentations, suggesting directions for the future.

ADDING PERSON-CENTERED MEASURES TO RESEARCH ON DETECTION AND DIAGNOSIS OF DEMENTIA

Katie Maslow, *Gerontological Society of America, Washington, District of Columbia, United States*

In the United States, numerous studies on detection and diagnosis of dementia show that large proportions of subjects refuse initial screening tests. Moreover, among those who accept the tests, score poorly, and are therefore referred for a diagnostic evaluation, large proportions do not follow up to get the evaluation. Available data on characteristics of subjects who refuse initial screening and follow-up evaluation suggest that incorporating procedures based on person-centered concepts and practices, such as procedures that acknowledge individuals' unique characteristics and attempt to involve, enable, and empower them, could lead to more effective detection and diagnosis. Based on results of an analysis of measures used in studies conducted in the U.S. and elsewhere, this presentation will describe frequently used measures and identify person-centered measures that could be added to studies of alternate procedures intended to increase detection and diagnosis.

PERSON-CENTERED ASSESSMENT: EVALUATING POSITIVE PSYCHOSOCIAL MEASURES IN DEMENTIA RESEARCH

Benjamin Mast,¹ and Sheila Molony,² 1. *University of Louisville, Louisville, Kentucky, United States*, 2. *Quinnipiac University, Hamden, Connecticut, United States*

Person-centered principles continue to redefine the nature of dementia care, but less attention has been given to integration of person-centered principles into clinical assessment and dementia research. As a result, identification of deficits and cognitive impairment tends to dominate clinical and research efforts, whereas strengths and positive characteristics need more research. This paper examines existing positive psychosocial measures of psychological wellbeing, hope, spirituality, resilience, social relationship, dignity, and at-homeness. Many of these measures demonstrate strong psychometric properties and have been identified as promising outcome measures for strengths-based studies and approaches to care. This paper will evaluate the extent to which these measures used a person-centered approach to item development and testing, and whether item content is consistent with person-centered principles. Future directions for instrument development require greater inclusion of people living with dementia and family caregivers.

PERSON-CENTERED ASSESSMENT OF BEHAVIOR CHANGES IN PEOPLE WITH DEMENTIA

Emilee Ertle,¹ Benjamin Mast,² Gail Mountain,³ Ann Kolanowski,⁴ Esme Moniz-Cook,⁵ and Margareta Halek,⁶ 1. *University of Louisville, Louisville, Kentucky, United States*, 2. *University of Louisville, Louisville, Kentucky, United States*, 3. *University of Bradford, West Yorkshire, England, United Kingdom*, 4. *Penn State, University Park, Pennsylvania, United States*, 5. *University of Hull, Hull, England, United Kingdom*, 6. *Witten/Herdecke University, Witten, Nordrhein-Westfalen, Germany*

Behavioral and psychological symptoms of dementia are increasingly being reconceptualized as expressions of distress and unmet needs. Measures that evaluate context are needed to increase our understanding of factors that influence these expressions. This review evaluated measures for two common behavioral states that are experienced as challenging for caregivers: apathy and resistance to care. A systematic literature search identified measures of apathy or resistance to care for people living with dementia. Eight measures of apathy and three measures of resistance to care were identified. Reliability and validity of these measures were evaluated using the COSMIN framework, as well as reported contextual factors within which the behavior occurs. The identified measures had fair to good reliability and validity in people living with dementia. However, available measures need to move beyond symptomatic constructs for this complex paradigm, and toward the varied interpersonal and contextual factors associated with behavioral expression.

MEASUREMENT FOR SOMETHING AS PERSONAL AS DRESSING IS NOT PERSONALIZED

Lindsay Prizer,¹ and Sheryl Zimmerman,² 1. *Emory University, Atlanta, Georgia, United States*, 2. *Cecil G. Sheps Center for Health Services Research, Chapel Hill, North Carolina, United States*

In 2018, the Alzheimer's Association set forth Dementia Care Practice Recommendations in nine domains, one being support for activities for daily living (e.g., dressing, toileting, eating/nutrition). For example, preservation of dressing independence is important for dignity, autonomy, and to decrease

caregiver burden. Measurement is necessary to guide care and assess outcomes related to dressing, but availability of related measures to assess processes, structures, and outcomes of care has not been examined; more so, the extent to which the related measures are person-centered is completely unexplored territory. This session will present a critical assessment of available measures grounded in the Donabedian Model. Of 21 identified measures, 4 assessed dressing alone, 16 included dressing as part of a larger scale, and 1 included dressing as a part of a scale to screen for dementia; none were person-centered. This session will suggest modifications to and need for new measures for person-centered dressing.

ENVIRONMENTAL ASSESSMENT TOOLS FOR SHARED RESIDENTIAL SETTINGS FOR INDIVIDUALS LIVING WITH DEMENTIA

Margaret Calkins,¹ Migette Kaup,² and Addie Abushousheh,³ 1. *IDEAS Institute, Cleveland Hts, Ohio, United States*, 2. *Kansas State University, Manhattan, Kansas, United States*, 3. *Center for Health Design, West Bend, Wisconsin, United States*

The overarching goal of conducting research in and on settings for individuals living with dementia is to be able to identify associations between features, or set(s) of features, and outcomes of interest. A major challenge to this goal is the disconnect between the rapidly changing arena of LTC design over the past 20 years toward more residential-styled settings and existing assessment tools, many of which were developed over 20 years ago, and which are based on and reflect more traditional models of care, service delivery and design. This session examines the strengths and limitations of both existing and emerging assessment tools from the US, Canada, UK and Australia. More recently developed tools are more directly focused on the values of person-centered care than older tools.

Session 2510 (Symposium)

VARIETY OF IDENTIFYING AND ASSESSING PREFERENCES OF EVERYDAY LIVING OF OLDER ADULTS

Chair: Martina Roes

Discussant: Kimberly Van Haitsma

Identifying preference of older adults supports person-centred care. The most sophisticated instrument is the preference for everyday living inventory (PELI). The PELI has been translated into German language and tested in different care settings. For people who experience difficulties communicating their preference the PELI has been combined with photographs. The voice of older immigrants could lead to an enhancement of the PELI as well other preference tools. Thus, our symposium title: Variety of identifying and assessing preferences of everyday living of older adults. Our symposium includes four presentations: Dr. Bergmann will present data from a preference study in three different care settings (long-term care, nursing homes, adult day care) in Germany. The results indicate that the importance of certain preferences distinguishes between the care settings. Dr. Vanessa Burshnic will present data from her content validity study of photographs used to supplement the Preferences for Everyday Living Inventory-Nursing Home (PELI-NH) from

the perspective of older adults. Content analysis revealed thematic codes describing participants' photograph preferences including image quality, context, subject diversity, and relevance to long-term care. Mike Rommerskirch-Manietta will present results from a review to identify Instruments which can be used to assess preferences for everyday living of older adults. Interestingly instruments either represent multiple or only one domain. The study from Viktoria Peters-Nehrenheim does focus on preferences of older immigrants. She will present results how older immigrants (first generation) define preferences and how they can be assessed. Prof. Van Haitsma will be our discussant.

TESTING A PREFERENCE TOOL IN DIFFERENT CARE SETTINGS IN GERMANY: DESCRIPTIVE RESULTS

Johannes Bergmann,¹ Tobias Stacke,¹ Mike Rommerskirch-Manietta,² Daniel Purwins,¹ Christina Manietta,¹ Armin Stroebel,³ and Martina Roes,⁴
 1. DZNE, Witten, Nordrhein-Westfalen, Germany, 2. DZNE, German Center for Neurodegenerative Diseases, Nordrhein-Westfalen, Germany, 3. Center for Clinical Studies, Erlangen, Bayern, Germany, 4. German Center for Neurodegenerative Diseases (DZNE), Witten, Nordrhein-Westfalen, Germany

Background: The tool "Preferences for Everyday Living Inventory" (PELI) for Nursing Homes (NH) was developed in the USA. In our project PELI-D, the PELI was translated from English into German and piloted in three care settings: Nursing Home (NH), Home Care (HC) and Adult Day Care (AD). Objective: The objective is to provide insights in preferences of importance of older adults in need of care in Germany. Methods: Data collection was carried out in 2019 on multiple measurement points: n=48 baseline (T0) and n=41 two-week follow-up (T1). Results: The results indicate that the importance of certain preferences distinguishes between the care settings: In NH preferences for body care and aspects of professional care are important. Additionally, in HC the aspects of social contact and eating/drinking are perceived as important. Comparing T0 and T1, importance of the item's daily routines, social contact and aspects of privacy seem to be reliable.

COGNITIVE INTERVIEWING TO EVALUATE THE CONTENT VALIDITY OF A PHOTO-SUPPORTED PREFERENCE ASSESSMENT

Vanessa Neal,¹ Kelly Knollman-Porter,² Rachel Topper,² Eleanor McConnell,³ Katherine Abbott,² and Kimberly Van Haitsma,⁴
 1. VA Office of Rural Health, Tampa, Florida, United States, 2. Miami University, Oxford, Ohio, United States, 3. Duke University School of Nursing, Durham, North Carolina, United States, 4. The Pennsylvania State University, University Park, Pennsylvania, United States

Photo-supported verbal assessments have shown to improve comprehension and expression of choices by older adults living with cognitive-communication challenges. The purpose of this study was to assess content validity (CV) of photographs used to supplement the Preferences for Everyday Living Inventory-Nursing Home (PELI-NH) from the perspective of older adults, using cognitive interviewing methods. Participants (N=21) were average age 75 (SD=5.67),

mostly male (62%) and white (90%), living in residential communities (86%), with no known cognitive or communication deficits. Interview data was used to iteratively assess and revise photographs. A total of 46 photographs demonstrated CV; 26 demonstrated CV after revisions; 3 did not demonstrate CV after revisions. Content analysis revealed thematic codes describing participants' photograph preferences including image quality, context, subject diversity, and relevance to long-term care. Discussion will include implications for clinicians and researchers on how to evaluate and improve CV of photo-supported verbal assessments.

INSTRUMENTS TO ASSESS PREFERENCES FOR EVERYDAY LIVING OF OLDER ADULTS WITH VARIOUS CARE NEEDS: AN EVIDENCE MAP

Mike Rommerskirch-Manietta,¹ Daniel Purwins,² Kimberly Van Haitsma,³ Katherine Abbott,⁴ and Martina Roes,⁵
 1. DZNE, German Center for Neurodegenerative Diseases, Nordrhein-Westfalen, Germany, 2. DZNE, Witten, Nordrhein-Westfalen, Germany, 3. The Pennsylvania State University, University Park, Pennsylvania, United States, 4. Miami University, Oxford, Ohio, United States, 5. German Center for Neurodegenerative Diseases (DZNE), Witten, Nordrhein-Westfalen, Germany

Background: Instruments to identify and assess preferences for everyday living are important tools for health professionals. For research purposes, they appear equally essential, for example, to develop new care approaches based on the preferences of the older adults. So far, it seemed unknown which instruments already exist to identify and assess preferences for everyday living. Method: We conducted an evidence map to identify instruments, to understand how preferences are assessed and which instruments are focusing everyday living. Results: We plotted our results in the form of a bubble plot. We identified instruments that map multiple domains (e. g. function and leisure activities) or only one topic (e. g. food, personal hygiene or brightness). Preferences are assessed using direct questions, frequencies, sorting, stimuli, or even scores. Our results show the variety of how preferences are defined and the range of instruments to assess preferences for everyday living of older adults.

PREFERENCES OF OLDER IMMIGRANTS IN NURSING CARE: A SCOPING REVIEW

Viktoria Peters-Nehrenheim,¹ Huerrem Tezcan-Guentekin,² and Martina Roes,³
 1. DZNE, German Center for Neurodegenerative Diseases, Nordrhein-Westfalen, Germany, 2. ASH, Berlin, Berlin, Germany, 3. German Center for Neurodegenerative Diseases (DZNE), Witten, Nordrhein-Westfalen, Germany

Background: Worldwide, our societies are characterized by an increasing diversity, greatly contributed by immigrants. When in need of care older immigrants face various barriers and serious challenges in terms of unmet preferences. To provide person-centered care, health care professionals need to consider the personal background of immigrants to identify and assess their individual preferences. Objective: To understand how preferences of older immigrants in nursing care are defined and how they can be assessed. Methods:

A scoping review will be conducted to identify and analyze preferences of older immigrants across health care settings. Preliminary results: The literature search revealed that older immigrants in need of care define their preferences in terms of expectations and priorities. Differences among immigrants are related to the age of the person at the time of immigration, on cultural differences and/or on how the concepts of preferences in the country of origin is understood.

Session 2515 (Paper)

Well-Being in Older Adults

COMPARING NIGHTTIME TO RUSH HOUR AVOIDANCE AS INITIAL DRIVING SELF-REGULATION BEHAVIORS

Jonathon Vivoda,¹ Lisa Molnar,² David Eby,² Carolyn DiGuseppi,³ Vanya Jones,⁴ Guohua Li,⁵ Thelma Mielenz,⁵ and David Strogatz,⁶ 1. *Miami University, Oxford, Ohio, United States*, 2. *University of Michigan Transportation Research Institute, Ann Arbor, Michigan, United States*, 3. *University of Colorado Denver, Aurora, Colorado, United States*, 4. *Johns Hopkins University, Baltimore, Maryland, United States*, 5. *Columbia University, New York, New York, United States*, 6. *Bassett Research Institute, Cooperstown, New York, United States*

Aging is associated with an increase in avoidance of challenging driving situations (e.g., driving at night, during rush hour, on freeways, and in unfamiliar areas). Such avoidance behavior may be due to driving self-regulation (SR), an intentional response to perceived declining abilities, or it may be due to other factors such as lifestyle changes or preferences. Most previous research has not studied SR as the reason for avoidance, and has treated avoidance behaviors interchangeably. In addition, previous research has not differentiated one's first SR behavior from those reported later in the process. This study included 1,557 participants from the AAA Longitudinal Research on Aging Drivers (LongROAD) to assess older adults' initial self-regulatory behavior by comparing the frequency of nighttime, rush hour, freeway, and unfamiliar area avoidance among those who reported only one SR behavior. Nighttime SR was most common (58.8%), followed by rush hour (25.5%), unfamiliar areas (11.0%), and freeways (4.8%). Binary logistic regression was used to assess how demographics, function, and self-reported driving variables were related to different odds of reporting nighttime vs. rush hour avoidance (the two most common) as one's initial SR behavior. Higher odds of reporting nighttime avoidance (compared to rush hour) as one's initial SR behavior were related to female gender, low income, impaired visual acuity, better self-reported ability to see during the day, worse self-reported ability to see at night, less comfort driving at night, and more comfort driving during rush hour, and in unfamiliar areas.

COMPARING YOUNG AND OLD ADULTS' NIGHT HAZARD DETECTION WITH DRIVING SIMULATION AND ON ROAD

Anne Dickerson, and Juliette Leonardo, *East Carolina University, Greenville, North Carolina, United States*

While there is validity of using driving simulation as a proxy for on-road performance, few studies have examined hazard detection at night. Night driving is a self-restricting practice with little evidence demonstrating the need with healthy older adults. This study's objective was to analyze night driving using eye-tracking technology examining differences between on-road/simulated drives and older/younger adults. A 2 (old, young) x 2 (simulator, on-road) repeated-measures design measured three roadway "hazards" of pedestrians looking at their cell phone while posed to cross the roadway. Pupil glances were recorded using outcome measures of total fixation duration, number of fixations, and time-to-first fixation for the pedestrians on-road and on a specifically designed scenario matching the on-road route. Thirty-three healthy, community-living drivers age 65+ years (N=16) and drivers age 20-40 years (N=17) completed both drives. Using non-parametric statistics, results demonstrated that night hazard detection was similar across driving conditions except for time-to-first fixation, which was faster on-road for both age groups ($p < .001$). At some hazard locations, there were significant differences between the two age groups, with older adults taking longer to initially see hazards. Results suggest, older adults detected hazards similarly to younger adults, especially during on-road performance, suggesting avoidance of night driving may not be necessary. Results also support using driving simulation as a proxy for on-road with night driving needing to be incorporated. Additionally, eye-tracking has the potential for research in hazard detection with emphasis on the time-to-first fixation outcomes when considering driving analysis.

FACTORS AFFECTING COGNITIVE DYSFUNCTION SCREENING FOR LATINX ADULTS WITH TYPE 2 DIABETES

Heather Cuevas,¹ Julie Zuñiga,¹ and Stephanie Morgan,² 1. *The University of Texas at Austin, The University of Texas at Austin/Austin, Texas, United States*, 2. *The University of Texas at Austin, Austin, Texas, United States*

Before development of overt type 2 diabetes (T2DM), changes in brain structure and activation patterns are found in insulin resistance, indicating many with T2DM may already have alterations in cognitive function. How best practices are met for screening for cognitive dysfunction, specifically Latinx adults with T2DM who are at higher risk, remains unclear. The purpose of this study was to examine aspects influencing screening Latinx adults with T2DM for cognitive problems by identifying patient-, clinician- and clinic- level factors. This was a mixed methods study which used semi-structured interviews with Latinx adults with T2DM (n=30; mean age: 68; 57% Mexican American); surveys and interviews with health care providers (n = 15); and inventories of four outpatient clinics to identify factors (e.g. time, clinic policies) influencing screening. Data were analyzed via thematic analysis (interviews) and descriptive statistics (surveys and inventories). For patients, screening was important, but inability to work related to a possible diagnosis of dementia was a concern. Providers and patients agreed other health issues (e.g. hyperglycemia) took precedence to screening. Providers (96.7%) were expected to screen but did not have support/time from clinics and relied on patients for initial prompts. Only one clinic reported

staff education on cognitive screening with an emphasis on potential cultural differences in test results and adequate resources related to dementia for Latinx adults. Clinics serving Latinx adults have a responsibility to deliver appropriate care. Leadership should consider innovative practices such creation, with patients, of educational materials for screening -a need highlighted by most participants.

Session 3000 (Symposium)

BENEFITS AND BARRIERS TO EMERGING TECHNOLOGIES TO PROMOTE HEALTH, WELL-BEING, AND INDEPENDENCE OF OLDER ADULTS

Chair: Walter Boot

Emerging technologies, such as voice assistant systems and artificial companion robots, hold a great deal of promise for improving the health, wellbeing, and independence of older adults. However, these solutions will likely be ineffective in the absence of research to understand barriers to the adoption and use of these technologies and without an exploration of the needs and preferences of older adults. This symposium focuses on both the potential of such technologies and factors that may affect their success. H. Spangler will present a detailed analysis of privacy concerns of older adults, with and without cognitive impairment, related to the use of Voice Assistant Systems (VAS). R. Nicholson will discuss the potential of a VAS app for promoting exercise among older adults and their caregivers to enhance mobility independence, with a focus on perceived benefits and dislikes about the app that may impact use. Finally, C. Berridge will present an exploration of perceptions of and attitudes toward artificial companion (AC) robots across the lifespan, before and after the start of the COVID-19 pandemic, including concerns about privacy. Together, these talks will highlight novel methods through which emerging technologies can support older adults and issues to consider if these methods are to produce meaningful change.

PRIVACY CONCERNS AMONG OLDER ADULTS USING VOICE ASSISTANT SYSTEMS

Hillary Spangler,¹ Tiffany Driesse,² Robert Roth,³ Xiaohui Liang,⁴ David Kotz,⁵ and John Batsis,⁶ 1. *UNC Hospitals, Chapel Hill, North Carolina, United States*, 2. *UNC School of Medicine, Chapel Hill, North Carolina, United States*, 3. *Dartmouth-Hitchcock, Lebanon, New Hampshire, United States*, 4. *University of Massachusetts Boston, Boston, Massachusetts, United States*, 5. *Dartmouth College, Hanover, New Hampshire, United States*, 6. *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States*

Voice Assistant Systems (VAS) are software platforms that complete various tasks using voice commands (e.g., Amazon Alexa), with increasing usage by older adults. It is unknown whether older adults have significant privacy concerns with VAS. 55 participants were evaluated from ambulatory practice sites for a study on VAS detection of early cognitive decline. The mean age was 73.3±5.6 years, 58% female, 93% white, and 53% had mild cognitive impairment. Privacy concerns were assessed via Likert-based surveys. Participants believed data was used with consent (71%) and stored properly (67%); however, 71% wanted new privacy regulations, 43%

were comfortable with daily activity monitoring, and 85% thought the data needs to be highly protected. Qualitative themes included “listening-in”, “tracking”, and unwanted sharing of information. Findings suggest that older adults do not have significant privacy concerns for VAS use, but requested additional regulations. Future research can compare VAS privacy concerns between age groups.

OLDER ADULT USER FEEDBACK ON DESIGN AND FUNCTIONALITY OF ENGAGE, A VOICE-ACTIVATED EXERCISE PROGRAM

Roscoe Nicholson,¹ Yadira Montoya,² Saira Shervani,³ Chelsea Smith,³ Louise Hawkey,² and Megan Huisingh-Scheetz,⁴ 1. *University of Chicago, Evanston, Illinois, United States*, 2. *NORC at the University of Chicago, Chicago, Illinois, United States*, 3. *University of Chicago, Chicago, Illinois, United States*, 4. *University of Chicago, Chicago, Illinois, United States*

The EngAGE Alexa app is a socially motivated exercise program targeting older adult-caregiver dyads to promote mobility independence. EngAGE provides exercise routines that older adults can perform in the home in conjunction with a messaging component to facilitate motivation from caregivers and a tracking component to monitor progress. This presentation will describe the qualitative results that have informed the app’s design and evaluation of its feasibility and functionality following a 14-week feasibility study in 10 dyads of older adult exercisers and their caregivers. The presentation will cover the perceived benefits of EngAGE’s older adult users (including “real world” clinically relevant improvements, the comprehensiveness of the exercises, and exercise knowledge gained), as well as likes and dislikes that contributed to our assessment of the app’s functionality. Finally, we will discuss how the feedback contributes to future directions in the development of the app’s features, supporting materials, design and content.

COMFORT AND DATA SHARING WITH ARTIFICIAL COMPANION ROBOTS AMONG AN ONLINE COHORT

Clara Berridge,¹ Yuanjin Zhou,¹ Julie Robillard,² Nora Mattek,³ Sarah Gothard,³ and Jeffrey Kaye,³ 1. *University of Washington, Seattle, Washington, United States*, 2. *University of British Columbia, Vancouver, British Columbia, Canada*, 3. *Oregon Health & Science University, Portland, Oregon, United States*

Results from a June 2020 survey on comfort with two forms of artificial companion (AC) robots in normal compared with pandemic times will be presented. 1,082 adults age 21-92 (mean 64) completed the online survey for a response rate of 45%. Significantly greater comfort is reported with small AC robots relative to larger human-shaped robots in both normal and pandemic times. In bivariate and adjusted models, younger age and male gender were most commonly associated with greater comfort with AC robots. Most participants (68.7%) did not think an AC robot would make them feel less lonely. About half (52.8 %) of the participants reported that they probably or definitely would want their facial expressions to be read, while a minority (15.0%) were at least somewhat comfortable with AC robots recording their conversations. The most common person participants wanted these data types shared with is themselves, a spouse/partner, and medical provider.

Session 3005 (Symposium)

BRIDGING AGE-FRIENDLY HEALTH SYSTEMS INTO THE COMMUNITY

Chair: Erin Emery-Tiburcio

Discussant: Rani Snyder

As the Age-Friendly Health Systems initiative is implemented across the country, building bridges into the community assures that older adults live safely, enjoy good health and stay involved in their communities. In this symposium, we present innovative approaches that bridge the Age-Friendly Health Systems initiative into the community. Each presentation explores how the 4Ms concepts are integrated into their programs and enhance community with older adults. CATCH-ON Connect provides free cellular-enabled tablets and individual training to older adults to help them do What Matters to them by using their tablets. Rush@Home is a home-based primary care program that addresses the 4Ms in the comfort of an older adult's home. Social Connections was co-designed with older adults to decrease loneliness by connecting older adults to each other. The Caregiver Initiative identifies and supports caregivers of older adults by meeting the 4Ms health needs of both caregiver and care recipient. Dementia Friendly Communities engage community stakeholders in a process to become educated, creating safe and respectful environments for individuals with dementia. By exploring these approaches, we can bridge the Age-Friendly Health Systems initiative into the community to support older adults outside the four walls of the health system.

CO-DESIGNING A SOCIAL CONNECTIONS PROGRAM WITH OLDER ADULTS

Erin Emery-Tiburcio,¹ Jasmine Chandy,² Padraic Stanley,² and Grisel Rodriguez-Morales,² 1. *Rush University, Chicago, Illinois, United States*, 2. *Rush University Medical Center, Chicago, Illinois, United States*

Loneliness presents a higher risk for mortality than smoking 15 cigarettes per day. COVID-19 has exacerbated loneliness for many older adults, without access to family, friends, and community. Friendly caller programs utilizing volunteers to talk with older adults who are lonely can be helpful, providing much-needed contact. However, few lasting connections have formed in these programs. To enhance our social connections program, we systematically engaged a group of older adults who struggle with social isolation to co-design a program to meet their needs. This group met virtually twice for two hours to (1) identify contributors to their isolation, generate ideas for ideal program components, and how best to connect older adults to each other; and (2) to refine the multi-component program created by staff based on the first discussion. Group process and themes will be presented, along with a discussion of key issues in program co-design with older adults.

CATCH-ON CONNECT: A PROGRAM TO INCREASE TECHNOLOGY ACCESS AMONG OLDER ADULTS DURING COVID-19

Erin Emery-Tiburcio,¹ Janis Sayer,² Robyn Golden,² Salvador Castaneda,² and Michelle Newman,² 1. *Rush University, Chicago, Illinois, United States*, 2. *Rush University Medical Center, Chicago, Illinois, United States*

During the COVID-19 pandemic, technology became an essential tool to maintain connections to social support, health professionals, and services. However, many older adults do not have access to technology or do not feel comfortable using it. CATCH-ON Connect provides cellular-enabled tablets and individual, personalized technical assistance to older adults. Adults age 65+ in project partner primary care clinics who do not have an internet-ready device or who lack digital literacy are eligible to participate. Older adults learn how to access their electronic health record portal, use pre-installed apps (e.g., Lyft, Zoom), and receive education about COVID-19 and the 4Ms. Of the 40 participants enrolled to date, 46% have never accessed the internet with a tablet or smartphone. Initial qualitative outcomes indicate high satisfaction and increased electronic socialization. Quantitative results of participant technology challenges, loneliness, and utilization of telehealth services will be discussed.

DEMENTIA-FRIENDLY AMERICA RECOGNITION: STRATEGIES FOR URBAN, AFRICAN AMERICAN COMMUNITIES

Tarisha Washington,¹ Susan Frick,¹ and Raj Shah,² 1. *Rush University Medical Center, Chicago, Illinois, United States*, 2. *Rush, Rush University Medical Center, Illinois, United States*

Dementia-Friendly America is a network of communities across the United States who have committed to a process to support people living with dementia and their caregivers. Through technical support from Dementia Friendly Illinois, CATCH-ON, a HRSA Geriatric Workforce Engagement Program, has identified key characteristics for the 17 communities in Illinois achieving national recognition and for communities that have engaged but not yet achieved national recognition. In addition to communities in rural regions, urban communities with a large number of African Americans residents have necessitated more grassroots engagement than other communities. Partnerships are vital for providing information and education about the movement and for supporting multi-sectoral engagement. This presentation highlights barriers and facilitators in diverse communities, particularly urban African American communities, becoming recognized by Dementia Friendly America.

THE CAREGIVER INITIATIVE: A MODEL FOR CAREGIVER HEALTH AND WELLNESS IN AGE-FRIENDLY HEALTH SYSTEMS

Ellen Carbonell,¹ Robyn Golden,¹ and Leslie Pelton,² 1. *Rush University Medical Center, Chicago, Illinois, United States*, 2. *Institute for Healthcare Improvement, Boston, Massachusetts, United States*

Health care systems have historically relied on family caregivers to provide long-term care for older adults, often including medically complex care for which they have no medical training. Yet there are few interventions in place to assist them within health care systems. The Rush Caregiver Initiative (Rush-CGI) provides system-level and caregiver interventions. Rush-CGI's system-level interventions focus on culture change, including modifying workflows, training, and electronic health record data. Rush-CGI caregiver interventions begin with assessment of needs and provision of resources for caregivers, offering interprofessional

family-based interventions. Interventions include a Teach-Back Clinic, Family Care Planning sessions, and Goals of Medical Care meetings, all held on an outpatient basis either in person or virtually. Outcomes include decreased caregiver depression and anxiety, and increased caregiving self-efficacy. This presentation will discuss creating system level change and providing customized caregiver interventions, including how the Rush-CGI can be modified to fit a variety of patient populations.

RUSH@HOME: HOME-BASED PRIMARY CARE FOCUSED ON UNDERSERVED COMMUNITIES AND HEALTH EQUITY

Robyn Golden, Alexander Rackman, Elizabeth Davis, Leticia Santana, and Walter Rosenberg, *Rush University Medical Center, Chicago, Illinois, United States*

Homebound patients are often medically complex and are among those in greatest need of care and services. This is especially true for those that reside in underserved communities, where they face the added risk stemming from scarce community resources. Often these patients are only able to access health care for emergencies, which is ineffective and high cost. Rush@Home is a home-based primary care program that exemplifies the Age-Friendly Health System mission with a focus on the 4Ms, incorporating navigation and social work. Patients reflect the West Side of Chicago, with 80% of patients identifying as Black and/or Latino. During the first two years, Rush@Home demonstrated better care at a lower cost with readmission rates decreased by 11.8%, hospitalizations by 17.5%, length of stay by 8.7%, ED visits by 17.9%, and missed appointments by 72%. This presentation will highlight outcomes and discuss key issues in home-based primary care.

Session 3010 (Symposium)

BRIDGING THE FAMILY CARE GAP

Chair: Joseph Gaugler

Discussant: Richard Schulz

This symposium aims to create a scientific and policy roadmap to offset the impending shortage of family caregivers available to assist older adults in the U.S. (i.e., the “family care gap”). Drawing on public health, cultural frameworks, family care science, and policy analysis, this symposium will orient future research, intervention development, dissemination and implementation, and policy innovation to more effectively address the family care gap. The selected presentations will include the need to apply and understand cultural adaptation and humility to support a rapidly diversifying older population (Drs. Nkimbeng and Parker). In addition, systematic review methodology will be applied to obtain insights as to what intervention models/strategies actually reduce caregiving time (Drs. Baker, Jutkowitz, and Gaugler). The next presentation will leverage the existing evidence base of translational efforts that aim to disseminate and implement dementia caregiver interventions into practice (Drs. Hodgson and Gitlin). The final presentation of our symposium will focus in-depth on a potential solution to the family care gap: more systematic approaches to identifying and assessing family caregivers in healthcare systems (Drs. Riffin and Wolff). Our discussant, Dr. Richard Schulz, will

bring his extensive and renowned experience in caregiving to summarize the public health and policy implications of the family care gap.

DIVERSE, CULTURALLY RICH APPROACHES TO FAMILY CARE IN THE UNITED STATES

Manka Nkimbeng,¹ and Lauren Parker,² *1. University of Minnesota, Minneapolis, Minnesota, United States, 2. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

Despite the projected rise in the diversity of caregivers and caregiving in the US, the health system is not prepared to accommodate this growth. Interventions and supports often are not adequately tailored to meet the cultural needs of older adults. Additionally, the limited interventions available for racial/ethnic minority populations frequently fail to capture and report culturally tailored perspectives. Therefore, the purpose of this presentation is to describe how culture influences caregiving in the US. Specifically, it will: (1) provide a contemporary definition of culture; (2) identify cultural domains that impact caregiving; (3) offer examples of how caregiving is influenced by different cultural/demographic backgrounds; (4) provide examples of culturally tailored caregiving programs, and (5) discuss how to approach cultural needs that may not be addressed by current interventions.

A SYSTEMATIC REVIEW OF INTERVENTIONS THAT REDUCE FAMILY CAREGIVING TIME

Zachary Baker,¹ Eric Jutkowitz,² and Joseph Gaugler,³ *1. University of Minnesota, University of Minnesota/Minneapolis, Minnesota, United States, 2. Brown University, Brown University, Rhode Island, United States, 3. University of Minnesota, Minneapolis, Minnesota, United States*

Due to multiple long-term sociodemographic and health trends contributing to the impending family care gap, there likely is no single policy or intervention that could increase the number of family caregivers in the U.S. to the levels required to fill such a gap. However, the amount of time that a family caregiver spends providing assistance is potentially mutable. Given the pressing concerns of the family care gap, identifying interventions or approaches that could reduce existing caregiving time is of considerable importance. This presentation provides the results of a systematic review of published research to identify the effects of interventions on the amount of time family caregivers spend on their caregiving tasks. Pharmaceutical approaches directed to care recipients, technology interventions, case management, multicomponent interventions, and care settings all appeared to reduce caregiving time. Improved operationalization, study design, and similar factors will help guide future intervention research to reduce caregiving time.

IMPLEMENTING AND SUSTAINING FAMILY CARE PROGRAMS IN REAL-WORLD SETTINGS: BARRIERS AND FACILITATORS

Nancy Hodgson, *University of Pennsylvania, School of Nursing, Philadelphia, Pennsylvania, United States*

This presentation will summarize the extant published studies on the translation of proven family care programs for dementia in different care settings. This review is the

first to our knowledge to examine the specific implementation efforts deployed in care settings for different family caregiver programs. In this review, we sought to answer three basic questions: (1) What theory base(s) or conceptual framework(s) guided the implementation of evidence-based family care programs?; (2) What implementation strategies were used to support translation into practice?; and (3) What were the identified drivers of and barriers to organizational change required for adoption of an evidence-based program? Understanding the frameworks and strategies deployed in translational studies published to date can help guide future translation efforts, inform the design of new family caregiver support programs that optimize their implementation potential, and ultimately help to minimize the “family care gap.”

IDENTIFYING, ASSESSING, AND SUPPORTING FAMILY CAREGIVERS IN HEALTH AND LONG-TERM CARE: PROGRESS AND OPPORTUNITIES

Catherine Riffin,¹ and Jennifer Wolff,² 1. *Weill Cornell Medicine, New York, New York, United States*, 2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

Family caregivers are a largely hidden but vital workforce within medical and long-term care settings. Family caregivers are actively involved throughout care delivery systems and provide crucial assistance to people with chronic conditions. Building on the person- and family-centered care approach and recent recommendations from national organizations, this presentation sets forth a roadmap for research, policy, and practice that outlines practical solutions and opportunities to address existing barriers to systematic assessment and support of family caregivers in clinical practice. With the impending family care gap and projections for a steep decline in the availability of family caregivers in the coming decades, it is more important than ever to prepare health care systems for this shift. If put into action, the recommendations of this presentation can help to bridge the care gap by promoting sustainable solutions and infrastructure to ensure that families are recognized and adequately supported in care delivery settings.

Session 3015 (Symposium)

DELIVERING PERSON-CENTERED CARE DURING A PANDEMIC: STAKEHOLDER PERSPECTIVES

Chair: Katherine Abbott

Discussant: Kirsten Corazzini

Person-centered care (PCC) is an approach to care that both nursing homes (NH) and assisted living (AL) communities strive to provide. PCC is a philosophy that recognizes knowing the person and honoring individual preferences. However, when COVID-19 emerged, the NH and AL environments were ground zero for infection spread and disproportionate numbers of deaths among residents. As a result, many practices changed dramatically in efforts to reduce the transmission of COVID-19 in these communities. The purpose of this symposium is to discuss several projects that can speak to the impact of the pandemic on stakeholder efforts to provide PCC. First, Dr. Roberts presents feedback from residents and family members on the challenges COVID-19 created for family involvement in care conferences. In the

second study, Dr. Behrens examines focus group data from direct-care nurses on their perceptions of delivering PCC related to risk of harm to staff and residents. The third study presents the voices of activities professionals who were implementing a PCC quality improvement project to communicate resident preferences, which illustrates both the importance of PCC during the pandemic, but also the challenges implementing during the pandemic. Fourth, the Kansas PEAK 2.0 program used provider feedback to direct and inform program responses through components such as consistent staffing. Finally, Dr. Zimmerman presents qualitative data from over 100 AL administrators, medical, and mental health care providers on their experiences pivoting during COVID-19. Our discussant will explore the implications of these studies in terms of the future of PCC in residential settings.

WE'RE STILL VERY MUCH IN LIMBO: PROVIDERS' PERSPECTIVES ON IMPLEMENTING A PERSON-CENTERED PROJECT

Miranda Corpora,¹ Megan Kelley,¹ Alex Heppner,² Kimberly Van Haitmsa,³ and Katherine Abbott,¹ 1. *Miami University, Oxford, Ohio, United States*, 2. *Scripps Gerontology Center, Oxford, Ohio, United States*, 3. *The Pennsylvania State University, University Park, Pennsylvania, United States*

Background: The Preferences for Everyday Living Inventory assists nursing home (NH) providers in assessing residents' preferences and can be used to make Preferences for Activity and Leisure (PAL) Cards, which are personalized 5x7 laminated cards that reflect a resident's recreation and leisure preferences. We sought to understand the barriers and facilitators to implementing PAL Cards in NH communities during COVID-19. Methods: NH providers from five states (n=29) were recruited to create PAL Cards in their communities. Monthly coaching calls with project champions assessed the implementation process. Calls were recorded, transcribed verbatim, checked for accuracy, and coded via thematic analysis. Results: Four themes emerged: Adapting to COVID, Preoccupied with COVID, Future Thinking, and PAL Cards Filling the Gaps. Conclusion: Some providers were successful adapting to COVID, while others struggled to implement a new program during the pandemic. Those that were successful expressed how PAL Cards helped promote person-centered care.

NURSING STAFF PERCEPTIONS OF RISK OUTCOMES IN DELIVERING PREFERENCE-BASED PERSON-CENTERED CARE

Liza Behrens,¹ Marie Boltz,² Ann Kolanowski,³ Mark Sciegaj,⁴ Katherine Abbott,⁵ Caroline Madrigal,⁶ and Kimberly Van Haitmsa,⁷ 1. *Ross and Carol Nese College of Nursing, Pennsylvania State University, University Park, Pennsylvania, United States*, 2. *Pennsylvania State University, University Park, Pennsylvania, United States*, 3. *Penn State, University Park, Pennsylvania, United States*, 4. *Penn State University, University Park, Pennsylvania, United States*, 5. *Miami University, Oxford, Ohio, United States*, 6. *Providence VA Medical Center, Providence VA Medical Center, Rhode Island, United States*, 7. *The Pennsylvania State University, University Park, Pennsylvania, United States*

Effective management of the perceived risks associated with delivering preference-based person-centered care (PBPC) is historically challenging for nursing home staff. Existing research lacks the granularity needed to guide clinicians who fear negative health and safety outcomes for residents. This study examined direct-care nursing staff perceptions of outcomes associated with delivering PBPC. Participants (N=27) worked in NHs experiencing 6-12 health citations, were mostly female (85%), and represented diverse ages, race, education, and collective work experience in NHs. Content analysis of verbatim transcripts from 12 focus groups identified an overarching theme of: “person-centered outcomes related to risk engagement”; and sub-themes of: harms to staff (e.g. fear, frustration, guilt); harms to residents (e.g. negative moods and behaviors, physical discomfort); and positive shared outcomes (e.g. building nurse-resident relationships, positive care environment). Implications for risk management that improves quality of care and life outcomes in a post-COVID era will be discussed.

RESIDENT AND FAMILY ENGAGEMENT IN CARE CONFERENCES: IMPORTANT PROCESSES AND SUPPORTING STRATEGIES

Tonya Roberts,¹ Elizabeth Cox,² Thuy Dan Tran,² and Hannah Tepsa,² 1. *University of Wisconsin - Madison, Madison, Wisconsin, United States*, 2. *University of Wisconsin, Madison, Wisconsin, United States*

Self-determination is a core value of person-centered care. Research has shown residents and families want to be involved in decisions about care. Care conferences are one existing structure where residents and families can engage in decision-making about care goals. However, there are few tools to support effective engagement. To inform future tool development, this study sought to understand what resident and family stakeholders value about engaging in care conferences. In virtual meetings, 16 stakeholders identified 3 key areas of engagement: being informed about health/well-being, influencing care goals, and advocating for needs. They indicated current approaches do not achieve these engagement goals, which is particularly problematic during COVID when families cannot engage in person. Stakeholders offered ideas for supporting engagement such as provision of data before the conference. The study has implications for individualizing care conferences and encouraging resident and family engagement in decision-making both during and beyond COVID.

COVID-19 AND PERSON-CENTERED CARE: LESSONS LEARNED THROUGH A STATEWIDE PROGRAM FOR NURSING HOMES

Laci Cornelison, and Migette Kaup, *Kansas State University, Manhattan, Kansas, United States*

Frail elders in nursing homes are the highest risk group for developing complications of COVID-19. This led to a response from CMS and state regulators that was heavily focused on protection and safety through segregation and infection control. The purpose of this study was to gather the narrative of this pandemic response and understand the impact on person-centered care and be able to address provider needs in real-time. This qualitative method focused on nursing home providers who are a part of PEAK 2.0, a Medicaid pay-for-performance program in Kansas.

Interviews with nursing home staff (n=168) revealed two critical themes of need; mandated responses disregarded elders' autonomy and self-determination in decision making, and infection control strategies required new approaches to facets of resident care that still maintained dignity. This data, along with COVID-19 guidance were then used to inform feasible resource development and education to maintain PCC practices during the pandemic.

COVID-19 PERSPECTIVES OF ASSISTED LIVING AND HEALTH CARE PROVIDERS IN SEVEN STATES

Sheryl Zimmerman,¹ Philip Sloane,² Johanna Hickey,³ Kali Thomas,⁴ Julia Thorp,³ Meredith Poole,³ Aisha Chaudhry,³ and Paula Carder,⁵ 1. *Cecil G. Sheps Center for Health Services Research, Chapel Hill, North Carolina, United States*, 2. *UNC Medical School, Sheps Center, Chapel Hill, North Carolina, United States*, 3. *University of North Carolina at Chapel Hill School, Chapel Hill, North Carolina, United States*, 4. *Brown University, Brown University/Providence, Rhode Island, United States*, 5. *OHSU-PSU School of Public Health, Portland, Oregon, United States*

Thirty percent of COVID-19 deaths in long-term care were in assisted living (AL), indicating challenges providing care. This project recruited AL administrators and medical and mental health care providers in a seven-state stratified random sample of 250 communities; it asked what was most challenging responding to COVID-19, what was successful, how to have better dealt with COVID-19, and how others could have helped. The most common challenge was addressing residents' psychosocial needs, explained as “No contact - no hugging. The seniors require touch. It's something we've always done, and we can't do; we're required not to do it.” Successes included infection prevention, and in hindsight, administrators discussed staffing. Related to external entities, one commented, “Come in the building and see what we're doing. Don't sit behind a freaking screen and act like you know what we're doing.” Providers stressed patient access to care and social isolation. Implications will be discussed.

Session 3020 (Symposium)

DISRUPTION TO TRANSFORMATION: AGING IN THE NEW NORMAL: A CHAT WITH NIA SENIOR LEADERSHIP

Chair: Melinda Kelley

Discussant: Melinda Kelley

The National Institute on Aging (NIA) at the National Institutes of Health, Department of Health and Human Services, is the federally designated lead agency on aging research and supports significant research on aging as a life-long process. In the last six years, NIA has experienced a tripling of its budget. Although much of this funding is targeted to Alzheimer's disease (AD) and AD-related dementias research, there has been an increase in funds allocated to non-AD research in keeping with the overall growth of NIH. This symposium will provide a forum for exploration of the implications of the budget increases for the general research community. NIA's senior staff will discuss research priorities and programs supported by the Institute. A question-and-answer session will follow these remarks on current funding and future priorities and research directions of NIA.

OVERVIEW OF NIA BUDGET

Richard Hodes, *National Institute on Aging, Bethesda, Maryland, United States*

Dr. Hodes will discuss budget and overall research priorities for the National Institute on Aging.

NIA DIVISION OF EXTRAMURAL ACTIVITIES

Kenneth Santora, *National Institute on Aging, Bethesda, Maryland, United States*

Dr. Santora will discuss the work of the NIA Division of Extramural Activities. Dr. Santora will also be available for small group discussion.

NIA OFFICE OF SPECIAL POPULATIONS

Patricia Jones, *National Institute on Aging, Bethesda, Maryland, United States*

Dr. Jones will discuss the work of the NIA Office of Special Populations. Dr. Jones will also be available for small group discussion.

NIA DIVISION OF BEHAVIORAL AND SOCIAL RESEARCH

Lisbeth Nielsen, *National Institute on Aging, Bethesda, Maryland, United States*

Dr. Nielsen will discuss research priorities for the Division of Behavioral and Social Research. Dr. Nielsen will also be available for small group discussion.

NIA DIVISION OF GERIATRICS AND CLINICAL GERONTOLOGY

Evan Hadley, *National Institute on Aging, Bethesda, Maryland, United States*

Dr. Hadley will discuss research priorities for the Division of Geriatrics and Clinical Gerontology. Dr. Hadley will also be available for small group discussion.

NIA DIVISION OF AGING BIOLOGY

Ronald Kohanski, *National Institute on Aging, Bethesda, Maryland, United States*

Dr. Kohanski will discuss research priorities for the Division of Aging Biology. Dr. Kohanski will also be available for small group discussion.

NIA DIVISION OF NEUROSCIENCE

Eliezer Masliah, *National Institute on Aging, Bethesda, Maryland, United States*

Dr. Masliah will discuss research priorities for the Division of Neuroscience. Dr. Masliah will also be available for small group discussion.

Session 3025 (Symposium)**RISING STAR EARLY-CAREER FACULTY AWARD LECTURE AND CYBER-PEDAGOGY PANEL DISCUSSION**

Chair: Kara Dassel

The Rising Star Early-Career Faculty Award lecture will feature an address by 2021 recipient Candace S. Brown, PhD, MA, MEd, of the University of North Carolina, Charlotte.

The Rising Star Early-Career Faculty Award acknowledges new faculty whose teaching and leadership stand out as influential and innovative. This event will also feature a panel discussion led by the AGHE Awards Review Panel titled, "Cyber-Pedagogy to the Rescue: Creating Effective Online Programming for Students and Trainees During the Pandemic."

CYBER-PEDAGOGY TO THE RESCUE: CREATING EFFECTIVE ONLINE PROGRAMMING FOR STUDENTS AND TRAINEES DURING THE PANDEMIC

Kara Dassel, *University of Utah, Salt Lake City, Utah, United States*

COVID-19 upended in-person educational programming in areas such as classroom instruction within academic institutions, engagement of adult learners, and training of direct care workers. In-person educational offerings were forced, as a result of health restrictions, to pivot into either asynchronous or synchronous web-based instruction. This panel discussion will discuss lessons-learned in cyber-pedagogy in three areas: 1) Faculty Consultation: Faculty who teach online regularly and have completed training in quality online educational practices are experts who were called upon to assist others with transitioning courses to an online format. This presentation outlines the ways in which certified online instructors, at one academic center, tutored and assisted faculty in the health sciences with online instruction. 2) Adult Learning: The rapid transition to online learning has implications for adult learners pertaining to accessibility, diverse learning and technology abilities, and course and peer engagement. This presentation will explore strategies that faculty can utilize to offer adult learners differentiated learning and engagement opportunities. This discussion will also highlight the nexus among these pedagogical strategies and the Age-Friendly University Global Network, providing guidance for how universities can connect online learning methods to the Age-Friendly University principles. 3) Workforce Training: The direct care workforce employed in community-based services and support programs and long-term care settings tend to receive little or no training in geriatric care. This presentation will discuss how educational trainings offered through a Geriatric Workforce Enhancement Program transitioned onto web-based platforms in order to accommodate these ongoing educational needs throughout the pandemic.

CREATING 'THIS IS IT' MOMENTS IN GERONTOLOGICAL EDUCATION

Candace Brown, *Duke University, Durham, North Carolina, United States*

We all have had "this is it" moments. And while many gerontologists will say they "fell" into the field, I solicit that educational paths are set before us and we have choice to which path that we take. Paths provide opportunities for discoveries about ourselves and in the case of gerontology, we have a breadth of choices. This is how I view teaching and why developing new courses in the field are a necessity. Change is constant; creating new paths for opportunities is optional. This lecture will provide how, as an educator, I accept my 'this is it' moments so I can effectively foster students to recognize their own 'this is it' moment(s) within gerontological education.

Session 3030 (Paper)

Diversity, Racial Minorities, and Aging II

BINGE DRINKING AND HEAVY DRINKING AMONG OLDER MILITARY VETERANS: APPLYING THE THEORY OF INTERSECTIONALITY

Zainab Suntai,¹ Justin McDaniel,² David Albright,¹ and Julianne Wallace,² 1. *University of Alabama, Tuscaloosa, Alabama, United States*, 2. *Southern Illinois University, Carbondale, Illinois, United States*

The post-service impact of military experiences include post-traumatic stress disorder, depression, substance misuse and several other adverse outcomes that persist well into older adulthood. As such, older military veterans are at risk of developing alcohol dependency and those with existing stressors from other identities are at the highest risk of engaging in binge drinking or heavy drinking. This study used the theory of intersectionality to examine alcohol misuse by veteran status and age, veteran status and race and veteran status and sex. Data were derived from the 2016, 2017 and 2018 Brief Risk Factor Surveillance System (BRFSS) from the Centers for Disease Control and Prevention (CDC). The BRFSS is an annual survey conducted over the phone in all 50 states and territories. Survey-weighted logistic regression models were used to examine alcohol misuse among adults aged 65+ by veteran status and the intersection between age, race, and sex. Results showed no interaction between veteran status and age, and no interaction between veteran status and sex. However, there was a significant interaction between veteran status and race, in that Black/Other race veterans were more likely to engage in both binge drinking and heavy drinking compared to White veterans, White nonveterans and nonveterans of the same race. Interventions geared towards this population should therefore engage culturally sensitive approaches that consider the historical and systemic factors that contribute to these disparities in rates of alcohol misuse among older military veterans.

DIAGNOSIS OF BEHAVIORAL SYMPTOMS OF DEMENTIA AND CNS-ACTIVE DRUG USE AMONG DIVERSE PERSONS LIVING WITH DEMENTIA

Johanna Thunell,¹ Geoffrey Joyce,¹ Dima Qato,¹ Jenny Guadamuz,² and Julie Zissimopoulos,¹ 1. *University of Southern California, Los Angeles, California, United States*, 2. *University of Southern California, University of Southern California, California, United States*

Approximately 90% of persons living with dementia (PLWD) experience behavioral and psychological symptoms of dementia (BPSD). Studies demonstrated high use of central nervous system (CNS) active drugs in nursing homes; one recent study documented high use among community-dwelling PLWD. Racial/ethnic disparities in BPSD diagnosis and CNS-active drug use, however, are unknown. We quantified disparities in BPSD diagnoses and CNS-active drug use using 100% Medicare Part A and B claims, 2017-2019, and Part D, 2018-2019. Beneficiaries were ages 65 and older in 2017, community-dwelling, and had a dementia diagnosis (n=801,597). We estimated models of CNS-active drug use to

quantify racial/ethnic differences adjusting for confounders. Among PLWD, 66% had a BPSD diagnosis and 65% were taking a CNS-acting drug. Asians/Pacific Islanders were less likely to have a BPSD diagnosis (55%) than other groups, particularly affective diagnoses (40%). Whites were most likely to have any diagnosis (67%). Blacks were most likely to have hyperactivity diagnoses (7%). Antidepressants were most commonly used drug class (44%). Thirteen percent used an antipsychotic. Models adjusted for age, sex, comorbid conditions, dual-eligibility and BPSD diagnoses, showed non-Whites were less likely to use any CNS-active drug than Whites, but Blacks and Hispanics were slightly more likely to use antipsychotics. We found racial/ethnic differences in BPSD diagnoses and CNS-active drug use. Whether these disparities are due to differences in BPSD symptoms, health-care access or care-seeking remains an important question. Further study of disparity in outcomes associated with use will inform risk and benefit of CNS-active drugs use among PLWD.

RACE AND ETHNIC GROUP DIFFERENCES IN SOCIAL ENGAGEMENT AMONG OLDER ADULTS

Lien Quach,¹ Uyen-Sa Nguyen,² Van Pham,³ and Jeffrey Burr,⁴ 1. *University of Massachusetts Boston, Newton, Massachusetts, United States*, 2. *University of North Texas Health Science Center (UNTHSC), School of Public Health (SPH), Fort Worth, Texas, United States*, 3. *Center for Promotion of Advancement of Society, Hanoi, Ha Noi, Vietnam*, 4. *McCormack Graduate School, Boston, Massachusetts, United States*

Social engagement is considered crucial for older adults' well-being, generating social capital, connecting them to information about healthy lifestyles, and providing coping strategies for addressing daily challenges. Little is known about race and ethnic disparities regarding social engagement. This study examines the relationship between race, Hispanic ethnicity, and social engagement among community-dwelling adults age 65 or older. Data are taken from the Health and Retirement Study (2014) (n=6,221). Race and ethnic status are measured as: non-Hispanic white, non-Hispanic black, non-Hispanic "Asians and other race," and Hispanic (any race). Social engagement includes frequency of contact with friends and family and participation in social activities (e.g. volunteering and attending religious services). Covariates included age, sex, education, number of co-morbidities, and alcohol consumption. Linear regression analyses were performed using SAS 9.4. The mean age was 74.6, and sixty percent of the sample was female. Race and ethnic distribution were 78.6% non-Hispanic white, 11.9% non-Hispanic black, 7.89% Hispanics, and 1.7% non-Hispanic "Asians and other race." The mean score for our social engagement index was 3.3 (range 0-6). Hispanic persons, Asian persons, and persons from other race groups had lower social engagement compared with non-Hispanic white persons [β :-0.29, p <.0001; β :-0.27, p =0.04 respectively), after adjusting for covariates. These race and ethnic group differences in social engagement likely contribute to well-documented health disparities in later life. Understanding racial and ethnic disparities in social engagement and the factors that create these differences can help identify appropriate social intervention

programs regarding improving the well-being of all older adults.

Session 3035 (Paper)

Elder Abuse and Neglect

EVALUATING A MULTIDISCIPLINARY TEAM APPROACH TO ELDER ABUSE

Carmen Morano,¹ and Erin Berical,² 1. *SUNY-Albany, Albany, New York, United States*, 2. *University at Albany, Albany, New York, United States*

This paper presents findings from a University and Community-based Agency collaboration to design and implement a preliminary evaluation of the Elder Abuse Multidisciplinary Team (E-MDT) Intervention. This intervention brings professionals from a variety of fields to investigate and respond to elder abuse. Data from 22 Interviews with staff along with anonymous survey data from E-MDT team members/staff (n=312) sought to establish team successes, challenges in implementation, and ongoing functioning. Themes that emerged in creating successful teams include: Establishing Buy-In and Trust of the team members, The Benefit of sharing experience and practical knowledge with other program sites; and Recognizing the Differences related to Onboarding and Sustaining New programs versus Sustaining Existing Programs. Themes related to responding during COVID revealed challenges such as Adapting to Technology and Inconsistent Access to the Internet. It was noted that remote meetings were easier to attend than face-to-face meetings. Data from the survey found the vast majority of respondents view the E-MDTs as having a positive impact on Clients (93%); while 93% of respondents indicated a positive impact on their Approach to Practice and the service area of their agency. Approximately 80% of the respondents indicated their multidisciplinary teams were Effective. Responses to 3-Open Ended questions included in the survey echoed similar themes from the interviews, as well as comments about their Professional Development and the complexity of responding to elder abuse. The paper will close with a discussion of the strategies used to facilitate the collaboration and complete the evaluation during the COVID-19 pandemic.

EVALUATING RISK OF NEGLECT AMONG OLDER ADULTS USING NSHAP ROUND 3 (2015-2016)

Melissa Howe,¹ Grey Pierce,² Selena Zhong,² Lissette Piedra,³ and Won Choi,² 1. *NORC at the University of Chicago, Chicago, Illinois, United States*, 2. *University of Chicago, Chicago, Illinois, United States*, 3. *University of Illinois at Urbana-Champaign, Urbana, Illinois, United States*

As functional health declines, dependency on others increases along with the risk of neglect and its harmful consequences. In this paper, we use data collected during 2015-16 (Round 3) of the National Social Life, Health, and Aging Project (NSHAP) to identify older adults at risk of neglect and to test the hypothesis that high neglect risk predicts poorer health. Specifically, we use NSHAP's functional health survey module and follow-up care receiving

“loop” to categorize respondents as having either “high” or “low” neglect risk. NSHAP's functional health module assesses respondents' difficulties with Activities of Daily Living (ADLs) and Instrumental Activities of Daily Living (IADLs). Because ADLs and IADLs are integral to the maintenance of physical health, hygiene, and well-being, the unrequited desire for help with such activities could signal neglect. Accordingly, we assign “high neglect risk” to respondents who report either that they: (a) want but are not getting help with an ADL or IADL; or (b) are getting help with an ADL or IADL, but from a helper who is not very reliable. Motivated by current research that documents higher rates of morbidity and mortality among neglected older adults, we examine associations between neglect risk and other key NSHAP measures, including indicators of physical health, mental health, cognition, social support, social strain, and field interviewer assessed respondent hygiene. Results suggest that this method of risk assessment can be useful in identifying vulnerable populations of older adults. Follow-up interviews are needed to further confirm its utility as a risk assessment tool.

INVESTIGATING ELDER ABUSE AND NEGLECT IN DIVERSE REFUGEE COMMUNITIES IN GREENSBORO, NC

S. Sudha,¹ and Narayan Khadka,² 1. *University of North Carolina Greensboro, Greensboro, North Carolina, United States*, 2. *Institute for Peace and Harmony, Albany, California, United States*

Elder abuse and neglect (EAN) comprises multiple dimensions, is experienced by about 10% of older adults in the U.S. in diverse communities, and is severely detrimental to older adults' (OA) health and wellbeing. However, documentation of EAN among refugee OA is greatly lacking as are services for these communities. Refugee OA are overall underserved members of marginalized communities. This paper reports on a community-engaged study to collect information and raise awareness of EAN among OA in 2 North Carolina refugee communities - Nepali-speaking Bhutanese and Congolese. Research partners included University researchers and community refugee-serving organizations. Surveys and focus group interviews were conducted. 17 Nepali-speaking Bhutanese and 13 Congolese filled out survey questions, including the Elder Abuse Suspicion Index. They participated in focus group discussions (FGDs), separately for men and women of each community. Survey results indicated EAN more among Congolese than Nepali-speaking Bhutanese. FGD results showed both communities prefer to depend on family members, and experience difficulties with language, transportation, and economic insecurity. No EAN was reported in the FGDs. In line with principles of community-engaged approaches, a capacity-building event to increase awareness of EAN was held, attended by 25 persons from the two communities. This study adds documentation on an under-researched area and marginalized communities. Action recommendations include disseminating culturally appropriate EAN information, strengthening English language and job skills and transportation options, encouraging cooperation across state, nonprofit, educational, and service organizations to address needs of older refugee adults.

OLDER ADULTS AND FAMILY DISCORD OR VIOLENCE DURING THE COVID-19 PANDEMIC: RESULTS OF A CANADA-WIDE SURVEY

Gloria Gutman,¹ Brian de Vries,² Robert Beringer,³ Paneet Gill,⁴ Helena Dault,⁵ and Mojgan Karbakhsh,¹

1. *Simon Fraser University, Vancouver, British Columbia, Canada*, 2. *San Francisco State University, Palm Springs, California, United States*, 3. *University of Victoria, Victoria, British Columbia, Canada*, 4. *Simon Fraser University, Surrey, British Columbia, Canada*, 5. *Victoria Hospice, Victoria, British Columbia, Canada*

Child abuse and intimate partner violence rates are known to increase during and in the aftermath of disasters. Research on elder abuse during disasters, including the current pandemic, is limited. As part of an online survey that explored older Canadians' current experiences and future care plans during the COVID-19 pandemic, we aimed to determine the prevalence, contributing factors and potential outcomes of frequent family discord involving physical violence (FFD/PV) as a proxy for elder abuse. The survey was conducted between Aug 10 and Oct 10, 2021. Respondents (n=4380) were recruited using social media, direct email, Facebook advertising and with the assistance of 85 local community, regional and national organizations. The sub-sample reporting FFD/PV (n=76, 1.8%) was compared with other survey respondents regarding socio-demographic characteristics, negative and positive emotions, difficulty accessing basic needs, food, health care and support. Respondents experiencing FFD/PV were found to be significantly younger and less educated and were more likely to be non-white and not working than other respondents. The subgroup sustaining FFD/PV reported significantly higher rates of feeling depressed, lonely, isolated, anxious, sad, and judged/shamed and felt less happy, relaxed and accepted in their community. They also reported higher rates of challenges in accessing basic material needs such as food, support, medical care, mental health treatment and experienced more changes in life routines. Although only a small percentage reported FFD/PV, our results highlight a disturbing pattern that merits serious attention of adult protection agencies, seniors' advocates and disaster response organizations.

PREDICTORS OF DEPRESSION IN HEALTHCARE PATIENTS AT RISK OF SELF-NEGLECT

Miriam Rose,¹ Farida Ejaz,¹ and Courtney Reynolds,²

1. *Benjamin Rose Institute on Aging, Cleveland, Ohio, United States*, 2. *Benjamin Rose Institute on Aging, Benjamin Rose Institute on Aging, Ohio, United States*

More than half of reports to Adult Protective Services agencies nationwide involve allegations of self-neglect. An intensive case management intervention for preventing self-neglect was evaluated in a longitudinal study conducted collaboratively by a large healthcare system, Adult Protective Services, and a gerontological research institute. Patients (444) who were older (60+ years) and/or disabled (18+ years) were randomly selected for participation from 19 primary-care clinics if they had risk factors for self-neglect, including depression, substance abuse, dementia, and/or impairment in activities of daily living. Average age was 68 years (SD=12.5), 68% were Hispanic, 68% had monthly income of less than \$1,361, and 67% were female. Clinics were randomized into

intervention and control groups. Intervention clinic patients received intensive case management services; control clinic patients received usual care, including social work services. Subjects were interviewed at baseline and four months later. The Stress Process Model guided a multiple regression analysis. Domains of background characteristics, primary and secondary stressors, and support (patients in intervention or control group) were entered in blocks to predict depression levels at post-test. While no significant differences were found in post-test depression levels between intervention and controls, the final model was statistically significant (adjusted R²=.452). Significant predictors of depression were: younger age (disabled adults), poorer self-rated physical and emotional health, greater loneliness, and less social support. Future analyses will examine effects of moderating variables on post-test depression levels. Practice implications of preliminary analyses include addressing disabled adults' mental health needs, especially if they are isolated and lack social support.

Session 3040 (Symposium)

EXPANDING THE SCOPE OF ADMINISTRATIVE HEALTH RECORDS THROUGH ADVANCED STATISTICAL METHODS

Chair: Igor Akushevich

Co-Chair: Carl V. Hill

Discussant: Konstantin Arbeev

The objective of the Symposium is to expand familiarity of the application of advanced methods of modern statistical modeling and data management, to administrative health data by combining methodological innovations with practical hands-on demonstrations. Topics will cover a range of methodological and substantive topics including: i) decomposition and partitioning approaches in analysis of disparities and time trends in AD/ADRD; ii) new artificial intelligence technologies that allow us to enrich electronic health record datasets with self-report scores in geriatrics; iii) using administrative data to model adherence to disease management and health-related behavior; iv) the use of longitudinal extension of the average attributable fraction to study health disparities and multimorbidity; and v) the geographic and racial disparities in total and remaining life expectancies after diagnoses of AD/ADRD and other chronic conditions. The increasing availability of large-scale datasets based on electronic health records and administrative claims records provide an unprecedented opportunity for obtaining nationally representative results based on individual-level measures that reflect the real care-related and epidemiological processes. This makes the reduction of barriers to entry to the use of such data of vital importance to the community of geriatrics and health researchers.

DECOMPOSITION OF DISPARITIES IN ALZHEIMER'S DISEASE AND RELATED DEMENTIA

Igor Akushevich, *Duke University, Durham, North Carolina, United States*

This study uses Medicare data to non-parametrically evaluate race- and place-of-residence-related disparities in AD/ADRD prevalence and incidence-based mortality, separate them out into the epidemiological causal components

including race-related disparities in incidence and survival, and finally explain these in terms of health-care-related factors using causal methods of group variable effects (propensity scores and the rank-and-replace method) and regression-based analyses (extended Fairlie's model and generalized Oaxaca-Blinder approach for censoring outcomes). Partitioning analysis showed that the incidence rate is the main predictor for temporal changes and racial disparities in AD/ADRD prevalence and mortality, though survival began to play a role after 2010. Arterial hypertension is the leading predictor responsible for racial disparities in AD/ADRD risks. This study demonstrated that Medicare data has sufficient statistical power and potential for studying disparities in AD/ADRD in three interacting directions: multi-ethnic structure of population, place of residence, and time period.

NEW AI TECHNOLOGIES TO ENRICH ELECTRONIC HEALTH RECORD DATA SETS WITH SELF-REPORT SCORES IN GERIATRICS

Ricardo Pietrobon, *SporeData, SporeData, North Carolina, United States*

Although electronic health record data present a rich data source for health service researchers, for the most part, they lack self-report information. Although recent CMS projects have provided hospitals with incentives to collect patient-reported outcomes for select procedures, the process often leads to a substantial percentage of missing data, also being expensive as it requires the assistance of research coordinators. In this presentation, we will cover Artificial Intelligence-based based technologies to reduce the burden of data collection, allowing for its expansion across clinics and conditions. The technology involves the use of algorithms to predict self-report scores based on widely available claims data. Following previous work predicting frailty scores from existing variables, we expand its use with scores related to quality of life, i.e. mental health and physical function, and cognition. Accuracy metrics are presented both in cross-validation as well as external samples.

USING ADMINISTRATIVE CLAIMS TO MODEL HEALTH-RELATED BEHAVIORS: MEASURES OF SCREENING AND MEDICATION ADHERENCE

Arseniy Yashkin, *Duke University, Morrisville, North Carolina, United States*

We demonstrate how administrative claims records can be used to model certain behavioral patterns and associated health effects. The inability of administrative claims, which are in essence a billing record, to account for differences in behavior is a major limitation of such data which usually requires an externally linked source to overcome. However, for certain diseases, for which well-defined and accepted guidelines on screening and medication use exist, the claims themselves can provide a way for modeling health-related behavior. A practical application to screening and medication adherence for type ii diabetes mellitus is presented. Diverse methods of the calculation of such indexes with their pros, cons and variation in identified effects are discussed and demonstrated using results based on administrative claims drawn from a 5% sample of Medicare beneficiaries.

DIFFERENCES IN THE RACIAL CONTRIBUTION OF DEMENTIA AND CHRONIC CONDITIONS TO HOSPITALIZATION, SNF ADMISSION

Heather Allore, *Yale School of Medicine, New Haven, Connecticut, United States*

We estimate the contribution for experiencing hospitalization, skilled nursing facility admission and mortality using a measure of attributable fraction that incorporates both the prevalence, incidence and risk called Longitudinal Extension of the Average Attributable Fraction (LE-AAF). We estimate the LE-AAF for Non-Hispanic whites and Non-Hispanic Blacks for dementia and 10 chronic conditions, for three outcomes. This approach analyses the temporal relationships among conditions to estimate their population-level average attributable fractions. Unlike standard measures of attributable fraction, the sum of the contribution of each condition based on the LE-AAF will not exceed 100 percent, enabling us to compute the contribution of pairs, triads or any combination of conditions. Furthermore, in studying multimorbidity, the LE-AAF has the desirable feature of being based on all combinations of the risk factors and covariates present in the data with final values for the individual LE-AAFs obtained by averaging across these observed combinations of predictors.

DISPARITIES IN DISEASE-SPECIFIC REMAINING LIFE EXPECTANCY AMONG MEDICARE BENEFICIARIES IN THE UNITED STATES

Julia Kravchenko,¹ and Bin Yu,² *1. Duke University, Durham, North Carolina, United States, 2. Duke University, Duke University/Durham, North Carolina, United States*

Racial and geographic disparities in life expectancy (LE) in the US are a persistent problem. We used 5% Medicare Claims for 2000-2017 to investigate the patterns of remaining LE (RLE) in the U.S. with the highest and the lowest LE. RLEs in race-/ethnicity specific populations aged 65+ were calculated in patients with specific diseases and in the total population using the area under the Kaplan-Meier estimator. The Cox model was used to investigate the effect of state-specific residence on total LE and RLE. Between-the-states differences in RLE were most pronounced for cerebrovascular disease, atherosclerotic heart disease, breast and prostate cancer. RLE was the lowest for lung cancer and sepsis, followed by Alzheimer's disease, dementia, pneumonia, and heart failure. RLE for myocardial infarction and cerebrovascular disease decreased over time, while for renal failure, diabetes, atherosclerotic heart disease, and cancers of breast and prostate RLE increased.

Session 3045 (Symposium)

EXPERIENCING THE COVID-19 PANDEMIC AT AGE 85 AND OVER: AN MIT AGELAB STUDY WITH THE 85+ LIFESTYLE LEADERS PANEL

Chair: Taylor Patskanick

Discussant: Lisa D'Ambrosio

The oldest of older adults remain at the highest risk of developing severe illness, requiring hospitalization, or dying if infected with COVID-19. As a result, the discourse about the COVID-19 pandemic has centered on short-term sacrifices to "protect" older adults. Yet much remains to be known

about the prolonged impact of the pandemic on the over-85 age demographic. This symposium shares findings from a longitudinal, mixed methods study with the MIT AgeLab's 85+ Lifestyle Leaders panel, a panel of octogenarians and nonagenarians convened since 2015. This symposium offers an update to a 2020 GSA session shared regarding the initial, cross-sectional work conducted in March 2020 with this panel. Findings will be drawn from a series of 85 interviews with 15 participants, 14 focus groups (\bar{x} participants=19.3), and three surveys (March 2020, N=28; August 2020, N=18; November 2020, N=16) conducted with the panel regarding the impact of the pandemic on this group over the past year. The first presentation covers the Lifestyle Leaders' adoption and use of technology throughout the pandemic, with a focus on telehealth. The second takes an in-depth look at the unique lived experiences of Lifestyle Leaders living in senior housing communities during the pandemic. The third explores the Lifestyle Leaders' perspectives on cultivating resilience and caring for their mental health while in a pandemic. Finally, the fourth presentation shares the Lifestyle Leaders' experiences with social isolation and loneliness during the pandemic, with a focus on how family relationships and engagement in intergenerational programming have changed.

PERSPECTIVES FROM THE 85+ LIFESTYLE LEADERS ON SOCIAL ISOLATION AND MULTIGENERATIONAL RELATIONSHIPS

Taylor Patskanick, MIT, Somerville, Massachusetts, United States

The oldest of older adults are especially impacted by many of the measures recommended to slow the spread of COVID-19. This presentation explores changes in Lifestyle Leaders' experiences with loneliness and their beliefs about the impact of COVID-19 on multigenerational relationships and intergenerational programming. For example, 55.6% strongly agreed or agreed with the statement, "The pandemic will have been more socially impactful on younger generations than older generations." Lifestyle Leaders remain interested (68%) in virtual or socially distanced intergenerational programming. Particular activities of interest included technology tutoring, pen pals, and outdoor or virtual socializing. Additionally, this presentation will highlight how the Lifestyle Leaders have been impacted by a loss in weak ties and the extent to which the pandemic has prompted them to take on new roles in their families, including "accepting" paid and unpaid caregiving and experiences living with children and grandchildren during the pandemic.

MENTAL HEALTH AND RESILIENCE AMONG THE 85+ LIFESTYLE LEADERS THROUGHOUT THE COVID-19 PANDEMIC

Julie Miller, MIT, Cambridge, Massachusetts, United States

Recent research suggests older adults may be uniquely able to cope and cultivate psychological resilience during the COVID-19 pandemic. This presentation will describe how the Lifestyle Leaders' overall mental health (including worries and experiences of social isolation and loneliness) and thoughts about the future have changed throughout the pandemic, as well as the ways in which they remained resilient throughout. For example, a survey in March 2020 indicated

that 68% of Lifestyle Leaders were very or extremely worried about COVID-19, compared to only 33% in November 2020. Interviews with Lifestyle Leaders revealed that the pandemic led many to engage in more focused thinking about their own mortality and, for some, presented or compounded challenges of older age (e.g., widowhood, downsizing, etc.). The presentation will also highlight ways in which Lifestyle Leaders' past experiences and current activities have contributed to their mental health and fortitude during the ongoing pandemic.

UNDERSTANDING TECHNOLOGY ADOPTION, TROUBLESHOOTING, AND TELEHEALTH AMONG THE LIFESTYLE LEADERS

John Rudnik, University of Michigan School of Information

The COVID-19 pandemic has prompted widespread adoption of and greater reliance on digital technologies across the generations. In interviews and focus groups, the Lifestyle Leaders reported increased use of teleconferencing services, especially for virtual programming, socializing, and telehealth. Approximately 61% of Lifestyle Leaders had attended between one and five virtual or phone-based healthcare appointments since March 2020. Beliefs about telehealth across interviews varied: appointments were convenient but lacked the "in-person feedback and understanding" of an in-person visit. Half of the Lifestyle Leaders (50%) agreed with the statement, "Telehealth is the future of personalized medicine." This presentation will also report on the Lifestyle Leaders' challenges associated with using technology during the pandemic. These included concerns about: having devices able to keep up with the demands of the pandemic; using technology-enabled grocery services; and troubleshooting technology. Many were concerned about their growing dependence on technology because of the pandemic.

LIFESTYLE LEADERS' EXPERIENCES IN SENIOR HOUSING DURING THE COVID-19 PANDEMIC

Kathryn Chan,¹ Taylor Patskanick,² and Julie Miller,³

1. Massachusetts Institute of Technology AgeLab, Cambridge, Massachusetts, United States, 2. MIT, Somerville, Massachusetts, United States, 3. MIT, Cambridge, Massachusetts, United States

Millions of older adults living in close communal contact in senior housing communities remain vulnerable during the COVID-19 pandemic. Approximately 30% of Lifestyle Leaders currently live in senior housing. This presentation will cover the unique challenges these participants have encountered, including experiences with and the impact of changing norms and pandemic-related policies within communities over time. In March 2020, 75% of Lifestyle Leaders rated the response of their senior housing community to COVID-19 as "Excellent" or "Very Good." In August 2020, they reported they believed they were less likely to contract COVID-19 living in senior housing compared to people not living in senior housing (80%). Interview data revealed Lifestyle Leaders in these environments held favorable views toward their communities. This presentation will further discuss how the Lifestyle Leaders who do not live in senior housing perceive senior living and how these perceptions have shifted during the pandemic.

Session 3050 (Paper)

Family Caregiving (BSS Paper)

CONTINUITY OF CAREGIVERS' ENSURING MEDICAL CARE AND CARE-TRANSITION PREPAREDNESS: A MEDIATION MODEL

Nosaiba Rayan-Gharra,¹ Orly Tonkikh,¹ and Nurit Gur-Yaish,² 1. *University of Haifa, Haifa, Hefa, Israel*, 2. *Oranim Academic College of Education, Haifa, HaZafon, Israel*

Studies show that informal support provided during hospitalization is essential for communicating with the healthcare team and explaining medical care. Less is known about factors explaining family caregivers' Ensuring and Explaining Medical Care (EEMC) during hospitalization and its impact on care-transition-preparedness of patients in terms of their understanding of the explanations and instructions for continued care. This study examined whether EEMC during the current hospitalization mediates the association between involvement of the caregiver in ensuring and explaining medical care prior the current hospitalization and patients' care-transition-preparedness for discharge. A prospective cohort study includes 456 internal-medicine-patients at a tertiary medical center in Israel, who were accompanied by an informal caregiver. Involvement in EEMC prior and during the hospitalization, covariates such as health literacy (HL) levels, demographic, health, and functional status were reported by the patients during the hospitalization; and care-transition-preparedness was reported by the patients in a week after discharge. After controlling for covariates, only high HL levels of patients and their caregivers were positively associated with EEMC during hospitalization and care-transition-preparedness ($P < 0.05$). Moreover, mediation analysis indicated significant direct ($B(\text{unstandardized}) = 1.69$; $p = 0.003$) and indirect effect (Mediated effect (ME) = 1.28; $CI = 0.81$ to 1.87) of prior involvement in EEMC on care-transition-preparedness through high EEMC during the current hospitalization, controlling for baseline characteristics of patients and their caregivers (total effect: $B = 2.95$; $p < 0.001$). These findings suggest that caregivers' experience and involvement prior the hospitalization may be an essential factor in improving EEMC during the current hospitalization, and in turn improve transition outcomes.

DOES PERSONAL GOAL PURSUIT ALLEVIATE FAMILY CAREGIVER STRESS?

Shelbie Turner,¹ and Karen Hooker,² 1. *Oregon State University, Oregon State University, Oregon, United States*, 2. *Oregon State University, Corvallis, Oregon, United States*

Family caregivers may experience reduced stress by maintaining their sense of self throughout their time in a caregiving role. Working towards personal goals is helpful for maintaining a sense of self, but pursuing one's own goals amidst caregiving responsibilities may be challenging. In this study, we analyze the processes by which caregivers pursue their own personal goals – and how those processes impact daily stress – in an effort to develop a deeper understanding of goal-pursuit as a potential caregiver stress-reducing strategy. We utilized daily data from spousal ($N = 256$ days)

and adult-child ($N = 400$ days) caregivers who participated in the PULSE (Personal Understandings of Life and Social Experiences) Project, a 100-day microlongitudinal study on goal pursuit amongst people 50 and older (Hooker et al., 2013). In daily surveys, caregivers reported progress made towards a personally-identified health and social goal, along with a 4-item measure of daily stress. We ran multi-level models to assess how daily goal progress was associated with same-day stress. Spousal caregivers' daily stress was lower on days when their health goal (Estimate = -1.07 , $SE = 0.20$, $p < .0001$) and social goal (Estimate = -0.97 , $SE = 0.15$, $p < .0001$) progress was higher. Similarly, adult-child caregivers' daily stress was lower on days when their health goal (Estimate = -0.67 , $SE = 0.19$, $p < .001$) and social goal (Estimate = -0.52 , $SE = 0.24$, $p = 0.03$) progress was higher. Results support the hypothesis that maintaining personally-meaningful goals can alleviate caregiver stress, and is a promising tool for caregiver health promotion.

ENHANCING ACTIVE ENGAGEMENT FOR DEMENTIA CAREGIVERS: A SYNTHESIS OF INTERVENTIONS

Jacqueline Eaton, *University of Utah, University of Utah, Utah, United States*

In a recent meta-analysis of interventions for dementia caregivers, psychoeducational interventions were found to be effective only if they required caregivers to apply knowledge and skills through active engagement. This emphasizes the importance of understanding which intervention components enhance application in order to improve caregiving interventions and the mechanisms by which they work. The purpose of this presentation is to identify and assess elements of active engagement within dementia caregiving interventions. Articles included in this review were published between 2009 and 2018 and identified as psychoeducational dementia caregiving interventions. Each intervention was assessed to describe: 1) how active engagement was defined, 2) the logistics for implementing the active engagement techniques, 3) and the process for evaluating active engagement components. Of 36 articles meeting inclusion criteria, 25 mentioned active engagement components of the intervention. Active components included discussion, problem-solving, practice, role-play, action plans, and homework. Only five articles provided partial descriptions of the active components, five mentioned assessing active engagement, and only one study examined the efficacy of an engagement technique. This demonstrates a significant gap in our understanding of interventions for dementia caregivers. Active engagement enhances outcomes, yet to our knowledge, the specific steps taken to engage caregivers actively and the mechanisms by which these work are unclear. This is a barrier to optimizing active engagement within intervention delivery. Clarifying processes and methods for testing mechanisms of action can further enhance caregiver engagement with interventions.

LONGITUDINAL EFFECTS OF STRESS AND COGNITIVE FUSION IN ANXIETY AND DEPRESSIVE SYMPTOMS OF FAMILY CAREGIVERS

Samara Barrera-Caballero,¹
Rosa Romero Moreno Carlos Vara-García,²
Javier Olazarán,³ María del Sequeiros Pedroso Chaparro,
⁴ Lucía Jiménez-Gonzalo,⁵ José Adrián Fernandes-Pires,⁵

and Andrés Losada-Baltar,² 1. *Rey Juan Carlos University, Alcorcón, Madrid, Madrid, Spain*, 2. *Universidad Rey Juan Carlos, Madrid, Madrid, Spain*, 3. *HGU Gregorio Marañón, Madrid, Madrid, Spain*, 4. *Universidad Autónoma de Madrid, Madrid, Madrid, Spain*, 5. *Rey Juan Carlos University, Alcorcón, Madrid, Spain*

Dementia caregiving has been commonly associated with negative psychological consequences in caregivers. Cognitive fusion, that is, the tendency for been overly influenced by cognition, has been linked to psychological distress in caregivers in cross-sectional studies. Female caregivers and those who are exposed to more stressors such as behavioral and psychological symptoms of dementia report higher levels of distress. However, longitudinal analysis of predictors of caregivers levels of distress are sparse, with no available study analyzing the longitudinal effect of cognitive fusion. The aim of this study is to analyze the longitudinal effect of cognitive fusion in depressive and anxiety symptoms of family dementia caregivers, after controlling for other relevant variables. Face to face interviews were conducted each year through a two-year period (three assessments) with 143 caregivers. Linear mixed models analysis were used to analyze the associations between time-varying values for cognitive fusion, frequency and reaction to care-recipient behavioral problems and depressive and anxiety symptoms, after controlling for caregivers' age and gender, daily hours and time caring, care-recipient functional capacity and caregivers' transitions (cessation of caregiving). Results suggest that increases in cognitive fusion and in reaction to behavioral problems, being a female caregiver and being younger, significantly predicted increases in anxiety symptoms over time. Also, increases in cognitive fusion and in reaction to behavioral problems, decreases in care-recipient's functional capacity and ending of the caregiving role significantly predicted increases in depressive symptoms. Psychological strategies aimed at reducing cognitive fusion and stress levels may be especially helpful for reducing caregivers' distress.

MET AND UNMET NEEDS OF COGNITIVELY IMPAIRED OLDER ADULTS AND BURDEN AND BENEFITS OF THEIR CAREGIVERS

Pildoo Sung,¹ Johan Suen,² Nawal Hashim,² Rahul Malhotra,² and Angelique Chan,² 1. *Duke-NUS Medical School, Singapore, Singapore*, 2. *Duke-NUS Medical School, Singapore, Singapore*

Previous studies typically assess caregiver needs when trying to interpret caregiver burden. We propose that both met and unmet needs of care recipients translate into different caregiving experiences with varying levels of benefits and burden combined. We use data on 263 caregivers of community-dwelling Singaporean older adults with cognitive impairment who participated in a community-based dementia care study conducted in 2018-2020. Our analysis produces three major findings. First, latent class analysis identifies three distinct types of caregiving experience based on caregiver-reported burden and benefits of caregiving: intensive (high burden and high benefits; 11% of caregivers), satisfied (low burden and high benefits; 54%), and dissatisfied (low burden and low benefits; 35%). Second, multinomial logistic regression shows that both met and unmet needs of care recipients are positively associated with the

intensive caregiving experience, while only met needs are positively associated with the satisfied caregiving experience, in comparison to dissatisfied caregiving experience. Third, met needs in the areas of daytime activities, memory assistance, and mobility are positively related to the satisfied caregiving experience, compared to the dissatisfied caregiving experience. In other words, caregivers are more likely to be satisfied in their caregiving experiences (i.e., low burden and high benefits) if their care recipients' problems with memory, mobility, and finding suitable and adequate daytime activities are properly managed. Our findings thus call for interventions to fulfill care recipients' needs in a more tailored manner in order to increase satisfaction among caregivers.

Session 3055 (Symposium)

HEALTH DISPARITIES IN ALZHEIMER'S DISEASE: A WAKEUP CALL FOR TRANSFORMATION

Chair: Allison Gibson

Co-Chair: Lenora Smith

Discussant: Robert Turner

It is well documented in the scientific literature that health disparities exist within the Alzheimer's disease and related dementias (ADRD) population, particularly among socially disadvantaged individuals experiencing limited opportunities to achieve optimal health. In this symposium, presenters will introduce some of the significant health disparities observed across varying ADRD research. The first presentation, by Robinson-Lane and colleagues, examines caregiving coping and health among Black ADRD families. Findings suggest in addition to traditional stress and coping strategies, additional interventions are needed that improve physical health for family caregivers. Next, Yu and colleagues will discuss the higher levels of emotional distress reported among individuals diagnosed with mild cognitive impairment, compared to their cognitively normal counterparts. In the third presentation, Lin and colleagues share their work on changes in dementia-related behavioral symptoms observed by hospice staff during COVID-19. The pandemic has affected nearly every aspect of healthcare delivery, and many hospice staff are reporting patients diagnosed with dementia have also felt the effects. Next, Xu et al identified that non-Hispanic Black older adults in their help-seeking behaviors and diagnosis process of ADRD, and often were not seen in healthcare settings by an ADRD specialist compared to their White counterparts. In the final session, Agboji will speak on the issue on findings from a systematic examination of the literature that demonstrates apathy being underrecognized and undertreated in healthcare settings. This symposium will conclude with a discussion on how researchers can disrupt these disparities by promoting health equity across ADRD healthcare and social services.

PRELIMINARY FINDINGS OF A NATIONAL SURVEY OF BLACK ADRD FAMILY CAREGIVERS

Sheria Robinson-Lane,¹ Florence Johnson,²

Nicholas Mazzara,² Kayla DeMarco,² and Ivaylo Dinov,¹

1. *University of Michigan School of Nursing, Ann Arbor, Michigan, United States*, 2. *University Of Michigan School of Nursing, Ann Arbor, Michigan, United States*

The National Caregiver Survey aims to capture a representative sample of Black Alzheimer's disease and/or related dementias (ADRD) family caregivers who are 55+ to better understand the relationships between adaptation to caregiving, coping, and health. Following targeted social media marketing, ADRD family caregivers (n=60) completed an electronic survey capturing over 200 data elements. Analysis was completed using Spearman correlation coefficients. Preliminary results suggest that 55% of participants were hypertensive (n=33) and 27% (n=16) had diabetes. Participants were generally overweight with an average BMI of 29. 28% (n=17) of the sample were smokers. A negative correlation was identified between the level of care needs of the recipients (IADLs) and alcohol use (p=0.037). There was also a correlation between identifying positive aspects of caregiving and adaptive coping (p=0.045). Caregiver support programs should facilitate development of effective coping strategies for new family caregivers, with particular attention on smoking cessation, brain-healthy diet, and exercise.

COMPARING THE EMOTION STATUS OF INDIVIDUALS WITH MCI TO THEIR COGNITIVELY NORMAL COUNTERPARTS: I-CONNECT PROJECT

Kexin Yu,¹ Katherine Wild,² Lisa Silbert,² Jeffrey Kaye,² and Hiroko Dodge,² 1. USC, LA, California, United States, 2. Oregon Health & Science University, Portland, Oregon, United States

Socially isolated older adults with MCI are at greater risk of developing ADRD. This study compares the emotional status of older adults with MCI to their cognitively normal counterparts within a socially isolated sample. We used baseline data from the Internet-based Conversational Engagement Clinical Trial (NCT02871921). MCI status was determined according to clinical diagnosis. Three emotion domain scores were calculated: negative affect, social satisfaction, and psychological wellbeing. Linear regressions were conducted for all 17 Emotion Battery measures and 3 domain scores. The 127 participants' mean age was 81.1 (SD=4.6). About 54% were diagnosed with MCI. Older adults with MCI had more negative affect, yet no difference was observed in social satisfaction and psychological wellbeing. Individuals with MCI had higher levels of fear, perceived hostility, perceived stress, sadness, and lower self-efficacy. Better understanding the emotional status could inform the development of behavioral health interventions and early detection of MCI.

CHANGES IN DEMENTIA-RELATED BEHAVIORAL SYMPTOMS OBSERVED BY HOSPICE STAFF DURING COVID-19

Shih-Yin Lin,¹ Kimberly Convery,² Tessa Jones,³ Aditi Durga,⁴ and Abraham Brody,⁵ 1. New York University, New York, New York, United States, 2. New York University Rory Meyers College of Nursing, New York, New York, United States, 3. New York University Silver School of Social Work, New York, New York, United States, 4. NYU Rory Meyers College of Nursing, New York, New York, United States, 5. NYU Hartford Institute for Geriatric Nursing, New York, New York, United States

COVID-19 infection control precautions (e.g., social distancing) and associated isolation and changes to routines can worsen dementia-related behavioral symptoms.

A cross-sectional online survey was administered to 101 hospice staff (95% female; mean age 49) to investigate what dementia-related behavioral symptoms in their care recipients had changed from before to after the COVID-19 outbreak. Of the 101 participants, 47 (46.5%) reported changes in symptoms, three (3%) had not been able to physically observe/assess their care recipients, two (2%) reported changes in routines, and 49 (48.5%) reported no changes. The most common changes in symptoms were increased agitation (N=19), depression (N=16), confusion (N=10), and anxiety (N=6). Some participants (N=14) also commented on potential causes, including not having visitors and inability to go outside for normal activities while not understanding why. Interventions to normalize social environments for hospice recipients with dementia are likely imperative to alleviate behavioral symptoms exacerbated by COVID-19-related precautions.

RACIAL DIFFERENCES IN THE PATHWAY TO DIAGNOSIS OF ALZHEIMER'S DISEASE AND RELATED DEMENTIAS

HANZHANG XU,¹ James burke,² Matthew Dupre,² Se Hee Min,³ Ruth Anderson,⁴ David Page,² and Truls Ostbye,⁵ 1. Duke University School of Medicine, Duke University, North Carolina, United States, 2. Duke University School of Medicine, Durham, North Carolina, United States, 3. Duke University School of Nursing, Durham, North Carolina, United States, 4. University of North Carolina at Chapel Hill, UNC Chapel Hill, North Carolina, United States, 5. Duke University, Durham, North Carolina, United States

This study examined differences in the pathway to diagnosis of Alzheimer's disease and related dementias (ADRD) between Black and White older adults. Using electronic health records from a large health system, we included 2,085 non-Hispanic Black and 6,269 non-Hispanic White older adults with a final/primary diagnosis of ADRD between 2014 and 2020. Black older adults were more likely to receive the ADRD diagnosis from a primary care provider (35.4% vs. 29.8%), during a hospital admission (19.5% vs. 13.6%), or during an emergency department visit (4.2% vs. 2.0%); but were less likely to be diagnosed by an ADRD specialist (31.6% vs. 45.2%). Black older adults had nearly twice as many clinical encounters in the two years prior to the ADRD diagnosis than their White counterparts (43 vs. 26). Despite having more clinical encounters, Black older adults were more likely to be at a later stage when diagnosed than White older adults.

BARRIERS TO AND FACILITATORS FOR OPTIMAL INTERVENTION FOR APATHY IN OLDER ADULTS WITH DEMENTIA

Aderonke Agboji,¹ and Shannon Freeman,² 1. University of Northern British Columbia, Quesnel, British Columbia, Canada, 2. University of Northern British Columbia, Prince George, British Columbia, Canada

Apathy is a persistent symptom in brain disorders. It affects 84% of people with brain disorders. Those affected are more than two times likely to die early than those without. Yet it is often ignored and undertreated. An integrative review guided by Whittlemore and Knaff's (2005) framework

was carried out to identify the factors that inhibit or facilitate the diagnosis and management of apathy among older adults with dementia. The result of the findings revealed five barriers and three facilitators. Barriers included inconsistencies in the definition and diagnostic criteria, lack of awareness, overlap with other neuropsychiatric disorders, a paucity of evidence-based information, and lack of familiarity. Facilitators were standardized definition and assessment tools, good communication among the interdisciplinary team, and adequate training, education, and experience. In conclusion, efforts should be geared towards raising awareness and developing a practice guideline to aid healthcare professionals in detecting and managing apathy optimally.

Session 3060 (Symposium)

INNOVATIVE MULTIDISCIPLINARY CARE MODELS PROVIDED VIA TELEHEALTH DURING THE COVID PANDEMIC

Chair: Shahla Baharlou

Discussant: Lee Lindquist

Integrated and collaborative care lead to better care. Addressing the behavioral and mental health care needs of patients results in better health outcomes. Interdisciplinary and multi-disciplinary approaches to health care delivery yield more effective health care planning. A holistic approach to healthcare sees the individual as more than the sum of diseases. Research studies have supported these assertions and yet, in actual practice, they are often more aspirational than actualized. The COVID-19 pandemic has made it even more difficult to implement collaborative care delivered by varied professional disciplines. This symposium describes efforts to provide more holistic and multidisciplinary care in the primary care geriatrics practice of the Dept. of Geriatrics & Palliative Medicine, Icahn School of Medicine. This New York City practice has 4,500 patients with diverse backgrounds and a median age of 85. In the first paper, Baharlou and her colleagues describe the establishment of an IMPACT collaborative care depression model in the middle of the COVID-19 pandemic. It was adapted to be provided by telephone and uses a different psychosocial intervention than is usually implemented. Hinrichsen and Leipzig outline the successful integration of Cognitive Behavioral Therapy for Insomnia into geriatrics primary care to improve insomnia in older adults and deprescribe sleep medications. Munoz and her colleagues describe the ALIGN program which is an interdisciplinary team effort, informed by the social determinants of health framework, to facilitate access to an array of services delivered virtually because of the pandemic.

IMPROVING MOOD PROMOTING ACCESS TO COLLABORATIVE TREATMENT (IMPACT) PROGRAM IN GERIATRICS PRIMARY CARE

Shahla Baharlou,¹ Gregory Hinrichsen,² Lizette Munoz,³ Katherine Currey,³ Sheila Barton,³ Fay Kahan,³ Blair MacKenzie,³ and Laili Soleimani,² 1. *Icahn School of Medicine at Mount Sinai, Icahn School of Medicine at Mount Sinai, New York, United States*, 2. *Icahn School of Medicine at Mount Sinai, New York, New York, United*

States, 3. *Mount Sinai Health System, New York, New York, United States*

Improving Mood Promoting Access to Collaborative Treatment (IMPACT) is a well-established model for the treatment of depression in primary care. The COVID pandemic has caused increased distress and depression among the older patients in our New York City geriatric practice. This paper describes the establishment of a virtual IMPACT model during the pandemic in which IMPACT services have been provided via telephone. This effort was a multidisciplinary collaboration among geriatric medicine, geriatric psychiatry, social work, and geropsychology. Our IMPACT program uses a brief form of Interpersonal Psychotherapy (IPT) for depression as the psychosocial component instead of Problem Solving Treatment. Delivery of IMPACT by telephone appears to have enhanced engagement and sustained involvement in the program compared with prior efforts to deliver it by in-person meetings. IPT as a psychosocial modality was well-received by patients. To date, treatment outcomes have been favorable and will be reported in this presentation.

COGNITIVE BEHAVIORAL THERAPY FOR INSOMNIA IN GERIATRIC PRIMARY CARE

Gregory Hinrichsen, and Rosanne Leipzig, *Icahn School of Medicine at Mount Sinai, New York, New York, United States*

Insomnia is common in older adults and may have adverse cognitive, emotional, and physical consequences. Some older people are prescribed sleep medications for insomnia despite longstanding concerns about their use with older people (i.e., BEERS criteria). Cognitive Behavioral Therapy for Insomnia (CBT-I) is highly effective in the treatment for insomnia in adults and older adults. However, most studies of CBT-I in late life have been conducted with individuals younger than 70. This paper discusses four years of experience of providing CBT-I to older people in geriatric primary care, two-thirds of whom were older than 75 years of age. Among the subgroup of 29 individuals who completed a full course of CBT-I, almost all of those who had been on sleep medications discontinued them. Treatment outcomes were large and clinically meaningful. This paper will also describe our experience in providing CBT-I via telehealth because of the COVID pandemic.

ALIGNING TO A NEW NORMAL DURING COVID-19

Lizette Munoz, *Mount Sinai Health System, New York, New York, United States*

The Acute Life interventions Goals and Needs Program (ALIGN) is an inter-professional team of medical and social work providers dedicated to offering time-limited intensive ambulatory care to the most complex, high cost, high needs older patient population at Mount Sinai Hospital in NYC. During the 2020 COVID19 pandemic, ALIGN pivoted to focus on emergency planning actions. Such actions included language and culturally concordant goals of care discussions with patients and family, completion of electronic Medical Orders for Life Sustaining Treatment, reassessment of patient's social determinants of health, determination of adequate access to food, medication, and emotional support to those alone and isolated, and assistance with video

telemedicine. ALIGN's model of care has shown how adaptable this program and others were during the height of the pandemic.

Session 3065 (Symposium)

LESSONS LEARNED IN THE DELIVERY OF LIVE REMOTE GROUP WEIGHT LOSS AND PHYSICAL ACTIVITY INTERVENTIONS FOR OLDER ADULTS

Chair: Jason Fanning

Discussant: Barbara Nicklas

Social connection lies at the root of lasting health behavior change, and as such most effective interventions are built around social tools. Group leaders and peers provide education, and act as models of successful change and collaborators in addressing common barriers to behavioral adoption and maintenance. Unfortunately, many older adults do not have access to high quality group programs due to factors such as limited transport options, lack of local availability, or worries over personal safety. Importantly, developing effective, synchronous remote group programming is not as simple as delivering an in-person session via teleconference software. Instead, careful consideration must be paid to technology selection, fostering effective group communication, and developing confidence for use of remote intervention tools. This symposium provides key lessons learned from three group-based activity and weight loss interventions for older adults that focused on live, remote interaction. Jason Fanning will share lessons from the MORPH study, which paired remote group-mediated behavioral counseling with dietary weight loss and the accumulation of aerobic activity across the day. Christina Hugenschmidt will share her experiences adapting a group program involving improvisational dance or social gaming for remote delivery. Kushang Patel will present results from a mixed-methods study on the feasibility and acceptability of a remotely-delivered exercise program for older adults with knee osteoarthritis. Finally, Barbara Nicklas will place these experiences in the context of the development of exercise interventions for older adults over time, and highlighting vital next steps for ensuring more older adults have access to this important behavioral medicine.

DELIVERING A GROUP-MEDIATED WEIGHT LOSS AND ACTIVITY PROGRAM TO OLDER ADULTS WITH CHRONIC PAIN IN THE MORPH STUDY

Jason Fanning,¹ Amber Brooks,² Barbara Nicklas,³ and W. Jack Rejeski,⁴ 1. *Wake Forest University, Winston Salem, North Carolina, United States*, 2. *Department of Anesthesiology, Wake Forest School of Medicine, North Carolina, United States*, 3. *Wake Forest School of Medicine, Winston-Salem, North Carolina, United States*, 4. *Department of Health and Exercise Science, Wake Forest University, North Carolina, United States*

Chronic pain in aging is a potent cause and consequence of obesity, inactivity, and prolonged sedentary behavior, making these especially important targets for behavioral intervention. This study aimed to refine a theory-based group-mediated diet and sedentary behavior intervention for older adults with chronic pain. Participants (N=28) attended 12 weekly

group meetings generally in home via WebEx and used an mHealth self-monitoring app as they attempted to move more often and reduce caloric intake. Relative to a control condition, the program produced improvements in physical function ($\eta^2=.08$), pain intensity ($\eta^2=.12$), sedentary time ($\eta^2=.07$), and weight loss ($\eta^2=.21$). Key findings related to effective remote group intervention delivery included: (1) the importance of a self-efficacy-enhancing technology orientation; (2) the value of small group bonding activities to seed communication; and (3) the impact of software choice on interpersonal communication. We will discuss the value of these findings for future remote intervention design.

THE VIRTUALIZATION OF A MOVEMENT AND SOCIAL GROUP-ACTIVITY INTERVENTION FOR OLDER ADULTS AND THEIR CAREGIVERS

Christina Hugenschmidt,¹ Deepthi Thumuluri,² Christina Soriano,³ Rebecca Barnstaple,⁴ Jason Fanning,⁵ Jessie Laurita-Spanglet,⁶ and Edward Ip,¹ 1. *Wake Forest School of Medicine, Winston-Salem, North Carolina, United States*, 2. *Wake Forest School of Medicine, Winston-Salem, North Carolina, United States*, 3. *Wake Forest University, Winston-Salem, North Carolina, United States*, 4. *York University, Toronto, Ontario, Canada*, 5. *Wake Forest University, Winston Salem, North Carolina, United States*, 6. *University of Southern Maine, Portland, Maine, United States*

COVID-related safety concerns mandated suspension of our ongoing trial testing the effects of movement and social engagement in older adults with early-stage dementia and their caregivers (dyads). Participant vulnerability and the requirement for group social interaction complicated intervention resumption. We present results from a successful pilot to rapidly and iteratively optimize study interventions for remote delivery targeting intervention mediators (social connection, movement) based on participant feedback. Three-dyad groups (n=6 individuals) completed cycles of intervention via Zoom immediately followed by an interview with open-ended and quantitative feedback. Cycles were repeated until no new information was solicited, then repeated with new participants. Optimization revealed needs for technological support, more intensive movement, and social connection. Specifically, the inability to make eye contact, see others' full body, and technology-associated timing asynchronies impeded social connection in the movement group. We will present practical tips for crafting remote group interventions for caregiver/person living with dementia dyads.

FEASIBILITY AND ACCEPTABILITY OF TELE-ENHANCE FITNESS IN OLDER ADULTS WITH KNEE OSTEOARTHRITIS

Kushang Patel,¹ Elise Hoffman,¹ Neta Simon,¹ and Nancy Gell,² 1. *University of Washington, Seattle, Washington, United States*, 2. *University of Vermont, Burlington, Vermont, United States*

Enhance Fitness (EF) is an evidence-based, group exercise program for older adults. When COVID-19 halted in-person EF classes nationally, we adapted EF for remote delivery (tele-EF) by engaging key stakeholders. To determine feasibility and acceptability of tele-EF, we conducted a mixed methods study among 42 older adults (≥ 65 years)

with knee osteoarthritis. Participants attended EF classes for 1-hour, 3 days/week for 4-5 months (1-3 months in-person EF and 2-4 months in tele-EF). Attendance for in-person EF was 80.0% versus 91.0% for tele-EF. Nearly all participants (95.2%) reported that they were satisfied or very satisfied with tele-EF. Qualitative exit interview data mapped well onto Social Cognitive Theory constructs. With tele-EF, participants found that livestream classes facilitated accountability and self-efficacy to participate in exercise and that interactive instruction provided encouragement and support to exercise. Thus, tele-EF is a viable remotely-delivered exercise program for older adults that retains many features of in-person EF.

Session 3070 (Paper)

Love, Romance, and Aging

DOES RELATIONSHIP END PRECEDE COGNITIVE DECLINE? AN ANALYSIS OF THE HEALTH AND RETIREMENT STUDY

Douglas Hanes,¹ and Sean Clouston,² 1. *Stony Brook University, Stony Brook, New York, United States*, 2. *Renaissance School of Medicine, Stony Brook University, Renaissance School of Medicine, Stony Brook University, New York, United States*

Relationship status is thought to be associated with cognitive health in older adults, with married persons performing better on memory assessments than unmarried-cohabitating, single, divorced, and widowed persons. However, questions remain about whether relationship termination causes cognitive decline, is a result of it, or whether they share a cause; and the mechanisms by which such a relationship might operate. To address this gap in the literature, we hypothesized that relationship termination could affect cognition via the following five pathways: (1) post-termination depression; (2) loss of distributed-cognition partner; (3) cognitive depletion from caring for partner in declining and ultimately terminal health; (4) divorce to preserve assets to qualify for Medicaid to cover healthcare for cognitive decline; and (5) post-termination changes in neuropsychiatric symptoms alongside a pre-existing neurodegenerative condition that also causes cognitive decline. Using data from the 2000–2016 waves of the Health and Retirement Study (HRS; N = 23,393), we found that relationship termination, whether due to divorce or widowhood, was associated with cognitive decline. Using mixed-effects regression we found that the rate of cognitive decline increased after relationship termination (widowhood: $\beta = -0.587$, $p < 0.001$; divorce: $\beta = -0.221$, $p < 0.001$), supporting mechanism (5). Using HRS data for respondents and their spouses' mental and physical health, health insurance, and activities of daily living, we also find support for mechanisms (1) and (3). Relationship termination is a critical juncture in a person's life course that has multiple implications and may, ultimately, worsen patients' conditions.

PERCEPTIONS OF PARTNER AFFECT MEDIATE AFFECT CONTAGION IN OLDER COUPLES' DAILY LIFE: AN EXPERIENCE-SAMPLING STUDY

Elisa Weber,¹ and Gizem Hueluer,² 1. *University of Zurich, University of Zurich, Zurich, Switzerland*, 2. *University of Bonn (Germany)*

Intimate relationship partners dynamically covary in their affective states. One mechanism through which intimate relationship partners experience and shape each other's affective states is affect contagion, i.e., the spread of affective states from one person to another. The degree to which social-cognitive processes are involved in affect contagion in daily life remains unclear. The majority of older adults live together with a spouse/partner, and intimate relationships are one of the most important social contexts in their daily lives. Expanding on previous research, we focused on contagion of positive and negative affect between older relationship partners, and examined whether processes of affect contagion were mediated by perceptions of partner affect, i.e., how individuals thought their partners felt at previous moments. We used data from an experience sampling study with 152 older heterosexual couples (304 participants; 65+ years old) who reported on their positive and negative affect, and presence or absence of partners 6 times a day for 14 days. Dyadic multi-level mediation models were used to evaluate our hypotheses. We observed strong evidence that processes of positive affect contagion between partners were mediated by perceptions of partner's affective states. Negative affect contagion was directed from men to women, but not vice versa, and mediated by perceptions of partner's affective states. Partner presence was unrelated to processes of affect contagion. Our findings help identify underlying mechanisms of affect contagion and support the notion that perceptions of close others' emotions might shape our own feelings.

ROMANTIC ATTACHMENT, STRESS, AND COGNITIVE FUNCTIONING IN A LARGE SAMPLE OF MIDDLE-AGED AND OLDER COUPLES

Rebekka Weidmann, and William Chopik, *Michigan State University, East Lansing, Michigan, United States*

Romantic relationships are a key factor contributing to health across the lifespan. Within this research line, attachment theory has been a useful framework to understand how relationships impact health. One primary health concern in late adulthood is reduced cognitive functioning: Alzheimer's disease and related neurodegenerative disorders become increasingly prevalent with age affecting millions of people. Even though much research has identified various sociodemographic, medical, and behavioral risk factors, little knowledge exists on romantic attachment's psychosocial role for cognitive decline. The purpose of this study was to examine the link between insecure attachment, stress, and cognitive functioning in a large sample of middle-aged and older couples. In particular, we wanted to investigate how insecure attachment is linked to both partners' cognitive functioning and whether stress mediates these associations. To that aim, we used data of 1,043 romantic couples (Mage = 64.7 years; 38.5% same-sex couples) who reported on their attachment anxiety and avoidance, their stress levels, their cognitive decline, and their and their partners' dementia symptoms. Couple members also participated in a memory performance task. The results suggest that anxiety is linked to participants' cognitive decline, while avoidance was linked to partners' cognitive decline and poorer memory performance. We also detected significant mediational effects for stress in the association between insecure attachment and cognitive functioning. We conclude that potentially malleable

psychosocial factors, such as insecure attachment and stress, are important research objects when understanding cognitive functioning in middle and late adulthood.

THE CRUSH: A PROTO-ROMANTIC RELATIONSHIP ACROSS THE LIFE COURSE

Joseph Kotarba,¹ and Amanda Couve,² 1. *TxSt University, San Marcos, Texas, United States*, 2. *Encompass Health, San Antonio, Texas, United States*

This presentation describes the “crush” experience as it occurs among older adults. A basic definition of a crush is a one-sided, proto-romantic relationship. The scholarly and commonsense understanding in American culture focuses on the crush as most commonly occurring during the developmental phases of adolescence and pre-adolescence. Symbolic interactionists view life course as a somewhat fluid process of adapting to changing situations in life. Experiences like the crush can potentially occur at almost any age at which romantic thoughts and feelings are possible. Our ethnographic research on older adults residing either in group facilities or in domiciliary locations indicates that crushes are fairly common. These crushes follow the same general narrative as crushes among younger people: a beginning, a middle and an end. There are two narrative styles among older adults: face-to-face and mediated. The crush in a group facility is encouraged by interaction during social hours, meals, entertainment, and religious/spiritual activities. Crushes are more observable among women who do not have to delve into their past for objects of their affection. Available par-amours from the mass media include young celebrities such as Michael Buble and Josh Groban. These crushes differ from those among younger women in the denouement, to the degree affection generally fades away from memory rather than comes to a distinct end. Factors such as increased access to electronic media and music, and increased sociality in the community and in residential environments will create situations in which the security, excitement and rewards of a crush are plausible.

Session 3075 (Paper)

Mood, Emotions, and Health

AGE-RELATED DIFFERENCES IN CLINICAL AND PSYCHOSOCIAL PREDICTORS OF UNMET NEEDS IN BLADDER CANCER SURVIVORS

Nihal Mohamed,¹ Tung Ming Leung,² Katherine Ornstein,³ Naomi Alpert,³ Travonia Brown-Hughes,⁴ Emanuela Taioli,³ and Natasha Kyprianou,³ 1. *Icahn School of Medicine at Mount Sinai Department of Oncological Sciences, New York, New York, United States*, 2. *Northwell Health, Northwell Health, New York, United States*, 3. *Icahn School of Medicine at Mount Sinai, New York, New York, United States*, 4. *School of Pharmacy, Hampton, Virginia, United States*

Understanding of unmet needs and their predictors among bladder cancer (BC) survivors is critical to optimize health care planning for patients. This study compares between younger (<65 Years) and older (≥65 Years) BC patients across seven domains of unmet needs (e.g., informational, psychological, supportive care, daily living, communication,

logistic, and sexuality needs) and their demographic, clinical, and psychosocial predictors. BC survivors (N=159; 47% women) were recruited from the Bladder Cancer Advocacy Network and completed a questionnaire that included the needs assessment survey (BCNAS-32), hospital anxiety and depression scale (HADS), coping (BRIEF COPE), social provisions scale (SPS), and self-efficacy beliefs (GSE) scale. Although no significant group differences in all reported needs emerged, both groups reported more communication (IQR = 50 (62.5) and less sexuality needs (IQR =13 (52.1)). Older patients reported higher depression and anxiety (IQR = 32 (11.5); N = 68) than younger patients (IQR = 28 (11.0); p < .01; N = 88). Multivariable analyses stratified by age showed significant effects of gender among older patients with women experiencing more psychological, care, communication, and sexuality needs than men. Multivariable analyses also showed age-related differences (p < .05) in the predictors of needs controlling for covariates (e.g., gender). Among older patients both higher depression and anxiety and lower self-efficacy beliefs were associated with more psychological, care, and communication needs. Among younger patients, higher depression and anxiety were associated with more psychological, logistic, daily living, and communication needs. Results emphasize the importance of tailoring care planning for patients based on age.

LINKING RELIGIOUS IDENTITY, PARTICIPATION, AND FAITH TO DOMAINS OF MENTAL HEALTH IN LATE LIFE

Eva Kahana,¹ Poshan Dahal,² Tirth Bhatta,³ and Polina Ermoshkina,¹ 1. *Case Western Reserve University, Cleveland, Ohio, United States*, 2. *Case Western Reserve University, Case Western Reserve University, Ohio, United States*, 3. *University of Nevada, Las Vegas, Nevada, United States*

Religiosity in late life has been linked to psychological well-being outcomes. However, there has been insufficient attention to complex associations between different domains of religiosity and domains of psychological wellbeing. We explored associations between religious identity, religious participation, religious coping (trust in God), and mental health indicators of depressive symptoms, life satisfaction, and positive/negative affect among 797 independent, retirement community-dwelling older adults. At baseline, religious identity (expressed as self-concept) and religious participation (church attendance) each were associated with fewer depressive symptoms (b=-0.47, p<0.05; b=-0.19, p<0.05). Religious identity, however, was significantly associated with both life satisfaction and positive affects but not with negative affect. Religious coping was associated with greater life satisfaction and positive affect. Our longitudinal analysis documented a statistically significant decline in depressive symptoms, and increase in life satisfaction and positive affect, with corresponding increase in religious identity over time. However, changes in religious identity did not lead to significant changes in negative affect over time. Religious coping and church attendance fully explained the influence of religious identity on changes in life satisfaction. Although the influence of religious identity on depressive symptoms and positive affect was weakened, its significant influence was maintained even after the consideration of religious coping

and church attendance. Beyond religious identity, we also observed a significant increase in positive affect with a corresponding increase in religious coping. Overall, our findings support expectations that religious identification and practices are associated with greater psychological well-being among community dwelling old-old adults.

THE ASSOCIATION BETWEEN MIDLIFE EDUCATION AND DEPRESSIVE SYMPTOMS IN LATE LIFE: THE AGES-REYKJAVIK STUDY

Milan Chang,¹ Chiharu Nishizuka,² Hrafnhildur Eymundsdottir,³ Sigurveig Sigurdardottir,⁴ Alfons Ramel,⁴ Vilmundur Gudnasson,⁴ and Palmi Jonsson,⁵
 1. *The Icelandic Gerontological Research Institute, Reykjavik, Hofuoborgarsvaio, Iceland*, 2. *Faculty of Social Science, Reykjavik, Hofuoborgarsvaio, Iceland*, 3. *The Icelandic Gerontological Research Institute, Gardabaer, Hofuoborgarsvaio, Iceland*, 4. *University of Iceland, Reykjavik, Hofuoborgarsvaio, Iceland*, 5. *University hospital Landspítali, Reykjavik, Hofuoborgarsvaio, Iceland*

BACKGROUND: Disability and depression are associated with cumulative health adversities such as socioeconomic status (SES), nutrition, medical care, and education among older adults. However, there is little evidence on the longitudinal association between mid-life education level with a disability and depressive symptoms in older adults in Iceland. The aim of the study was to examine the association between mid-life education and prevalence of activity of daily living (ADL) dependency and high depressive symptoms in late-life. **METHODS:** A large community-based population residing in Reykjavik, Iceland (n=4991, 57.3% women, 76.9±5.8 yrs) participated in a longitudinal study with an average of 25 years of follow-up. Mid-life education was categorized into 4 groups (primary, secondary, college, and university). ADL dependency and high depressive symptoms were assessed on average 25 (±4) years later. The 5-item ADL dependency score ranged between 0 (no difficulty) and 18. Depressive symptoms were assessed by the 15-item Geriatric Depression Scale (GDS). **RESULTS:** After controlling for demographic and health-related risk factors, those with higher education at mid-life were significantly less likely to have high depressive symptomatology (6 or higher GDS scores, Odds Ratio (OR) = 0.65, 95% Confidence Interval (CI): 0.52 ~ 0.82, P < 0.0001). However, mid-life education was not associated with ADL dependency in later life. **CONCLUSION:** Our study shows that mid-life education is associated with depressive symptoms 25 years later, while no association found with ADL dependency among Icelandic older adults.

TRANSITION TO WIDOWHOOD: TRAJECTORIES OF DEPRESSIVE SYMPTOMATOLOGY AMONG JAPANESE OLDER ADULTS

Masumi Iida,¹ Shohei Okamoto,² Ikuko Sugawara,³ and Erika Kobayashi,⁴
 1. *Arizona State University, Tempe, Arizona, United States*, 2. *Tokyo Metropolitan Institute of Gerontology, Itabashi, Tokyo, Japan*, 3. *Bunri University of Hospitality, Sugunami-ku, Tokyo, Japan*, 4. *Tokyo Metropolitan Institute of Gerontology, Itabashi-ku, Tokyo, Japan*

Spousal loss is one of the most consequential negative life events for the surviving partners. While there is abundant research on mental health and well-being of widows,

most of these studies rely on the post-bereavement data. In this study, we use the data from the National Survey of Japanese Elderly (NSJE), which is a publicly available longitudinal data set collected from Japanese adults aged 60 years and older. The current study uses the first seven waves of data from 1987 to 2006, where participants were followed every three to four years. Using the NSJE advances our understanding of the bereavement process as it allows us to observe the levels and trajectories of depressive symptom before, during, and after the loss of their spouses. In our analyses, we selected 522 participants (average age at bereavement: 75.0 years; 27% male) who experienced spousal loss at some point during the seven waves. We examined the trajectories of depressive symptoms assessed using CES-D as these participants transition to widowhood. The results showed a small significant increase in depressive symptoms leading up to the time of the loss. There was also a significant increase in symptoms at the time of the loss, but we did not observe any decline in symptoms after the loss. In addition, we found that their age at bereavement significantly moderated the pattern, such that the increase in depressive symptoms at the time of the loss was attenuated for older participants. The implications of these findings will be discussed.

Session 3080 (Symposium)

MULTIPLE PERSPECTIVES ON DISASTER PREPAREDNESS IN LONG-TERM CARE: FROM HEAT TO HOSPICE

Chair: David Dosa

Co-Chair: Ross Aniel

Discussant: Lisa Brown

Preparedness of residents in long-term care (LTC) exposed to disasters continues to warrant concern. Prior work by our research team highlights explicit evidence of the profound vulnerability of Florida nursing home (NH) residents exposed to Hurricane Irma in 2017. This research adds to our knowledge of the profound effect of disasters on long term care residents. This symposium will utilize mixed methodologies to discuss the varied effects of Hurricane Irma on vulnerable older adults residing in Florida NHs and Assisted Living communities (ALCs). Using a novel methodology for identifying a cohort of ALC residents, the first presentation will present the morbidity and mortality effects of Hurricane Irma on Florida ALC residents and identify high risk groups by health condition. The second presentation will document the effect of Hurricane Irma on NH Residents previously enrolled in Hospice and expound on the effect of the disaster on hospice enrollment after the storm. The third presentation will present qualitative results of interviews with ALC administrators highlighting the effect of the storm on both large and small (<25 beds) facilities. The fourth presentation will address the issue of heat exposure in the days after Hurricane Irma and consider the preventative effect of generators on morbidity and mortality. Finally, a fifth presentation will examine NH staffing level variation in the days leading to the hurricane. To conclude, this symposium offers a multifaceted view of a disaster's effects on LTC residents across Florida, including novel data from the NH environment and lesser-examined ALCs.

RESOURCES AND RELATIONSHIPS IN DISASTERS: DIFFERENCES AMONG SMALL AND LARGE ASSISTED LIVING COMMUNITIES

Lindsay Peterson,¹ Debra Dobbs,² Joseph June,³ David Dosa,⁴ and Kathryn Hyer,⁵ 1. *University of South Florida, Bradenton, Florida, United States*, 2. *University of South Florida, School of Aging Studies, University of South Florida, Florida, United States*, 3. *University of South Florida, Tampa, Florida, United States*, 4. *Brown University, Providence, Rhode Island, United States*, 5. *University of South Florida, University of South Florida, Florida, United States*

Disaster preparedness among assisted living communities (ALCs) has not been widely researched, despite the growth of ALCs and evidence of disability in this population. An additional issue of concern is the way in which ALCs vary, including variation by size. The purpose of this paper was to explore the experiences of ALCs in Florida that experienced Hurricane Irma in 2017 and how experiences varied by ALC size. Qualitative interviews and focus groups were conducted with representatives of small ALCs (<25 beds; n=32) and large ALCs (25+; n=38). Transcripts were analyzed using Atlas.ti version 8, and research team members collaborated to reach consensus on codes and further analyze differences based on ALC size. Results suggest there are differences among ALCs in their disaster preparedness and response, and these differences are related to size (e.g., access to resources, organizational characteristics). Implications for ALC resident wellbeing and future disaster planning will be discussed.

THE ROLE OF HOSPICE IN FLORIDA NURSING HOMES POST-HURRICANE IRMA

Debra Dobbs,¹ Julianne Skarha,² Lily Gordon,³ Dylan Jester,⁴ Lindsay Peterson,⁵ and David Dosa,² 1. *University of South Florida, School of Aging Studies, University of South Florida, Florida, United States*, 2. *Brown University, Providence, Rhode Island, United States*, 3. *Health Services, Policy and Practice, Brown University, Providence, Rhode Island, United States*, 4. *University of California San Diego, La Jolla, California, United States*, 5. *University of South Florida, Bradenton, Florida, United States*

There is little known about the effect of hospice post-disaster. This study utilized exposure to Hurricane Irma (2017) to evaluate the differential mortality effect of the disaster on Florida NH residents (N=45,882) compared to a control group of residents in the same NHs in 2015 (N=47,690) by hospice status. We also examine the difference in hospice utilization rates post-storm for short- and long-stay (LS) residents. There was an increase in mortality for those in the cohort not on hospice within 90 days in 2017 compared to 2015 (OR= 1.06, 95% CI: 1.01, 1.11). For the rate of hospice enrollment post-storm among residents previously not on hospice, there was an increase among LS residents within 30 days (OR =1.15, 95% CI: 1.02, 1.23) and 90 days (OR= 1.12, 95% CI: 1.05, 1.20). It is important to further examine the increase in the rate of hospice enrollment in LS NH residents post-storm.

NURSE STAFFING IN NURSING HOMES DURING HURRICANE IRMA

Dylan Jester,¹ Kali Thomas,² Lindsay Peterson,³ David Dosa,⁴ Ross Andel,⁵ and Kathryn Hyer,⁶ 1. *University of California San Diego, La Jolla, California, United States*,

2. *Brown University, Brown University/Providence, Rhode Island, United States*, 3. *University of South Florida, Bradenton, Florida, United States*, 4. *Brown University, Providence, Rhode Island, United States*, 5. *University of South Florida, Tampa, Florida, United States*, 6. *University of South Florida, University of South Florida, Florida, United States*

Little is known about the effect of hurricanes on nurse staffing in nursing homes. Hurricane Irma made landfall on September 10th, 2017 in Florida. This study examined daily nurse staffing levels from September 3rd-24th, 2017 in 653 nursing homes; 81 facilities evacuated and 572 facilities sheltered-in-place. Data from Payroll-Based Journaling (PBJ), Certification and Survey Provider Enhanced Reports (CASPER), and Florida's health providers' emergency reporting system were used. Among all facilities, we found significant increases in staffing for licensed practical nurses (p=.02) and certified nursing assistants (p<.001), but not for registered nurses (p=.10) before Hurricane Irma made landfall. In comparison to facilities that sheltered-in-place, evacuating facilities increased staffing levels of all nurse types (all p<.001). From one week before landfall to two weeks after landfall, an additional estimated \$2.41 million was spent on nurse staffing. Policymakers attempting to reduce the burden of natural disasters on nursing homes should reimburse staffing-related expenses.

EXCESS MORTALITY ATTRIBUTED TO HURRICANE IRMA AMONG ASSISTED LIVING RESIDENTS WITH CHRONIC CONDITIONS IN FLORIDA

Cassandra Hua,¹ Kali Thomas,² Lindsay Peterson,³ Debra Dobbs,⁴ Ross Andel,⁵ and David Dosa,¹ 1. *Brown University, Providence, Rhode Island, United States*, 2. *Brown University, Brown University/Providence, Rhode Island, United States*, 3. *University of South Florida, Bradenton, Florida, United States*, 4. *University of South Florida, School of Aging Studies, University of South Florida, Florida, United States*, 5. *University of South Florida, Tampa, Florida, United States*

Little is known about the impact of hurricanes on residents in assisted living communities (ALs), especially among individuals with chronic conditions that increase their risk of death after storms. We examined how the association between exposure to Hurricane Irma in 2017 and mortality differed by select chronic conditions. With Medicare data, we identified cohorts of AL residents in 2015 (n= 30,712) and 2017 (n= 29,842) and compared their rates of 30-day and 90-day and mortality. We adjusted rates for demographic characteristics and other comorbidities. AL residents with diabetes were at highest risk of death after the storm; between 2015 and 2017 they experienced a 50% increase in their 30-day mortality rates (0.6% in 2015, 0.9% in 2017) and a 43% increase in their 90-day mortality rates (2.1% in 2015, 3.0% in 2017). Policy makers should consider strategies to ensure that diabetic residents maintain continuity of medical care during disasters.

HEALTH EFFECTS OF POWER LOSS AFTER HURRICANE IRMA ON NURSING HOME RESIDENTS IN FLORIDA

Lily Gordon,¹ Julianne Skarha,¹ Nazmus Sakib,² Joseph June,³ Dylan Jester,⁴ Lindsay Peterson,⁵ and David Dosa,¹ 1. *Brown University, Providence, Rhode*

Island, United States, 2. Department of Industrial and Management Systems, University of South Florida, Tampa, Florida, United States, 3. University of South Florida, Tampa, Florida, United States, 4. University of California San Diego, La Jolla, California, United States, 5. University of South Florida, Bradenton, Florida, United States

Previous research establishes that hurricanes adversely affect nursing home (NH) resident health but specific causal pathways are still unclear. We combined power outage data with Medicare claims to determine the effects of power loss from Hurricane Irma (2017) among NH residents in Florida. Out of 580 facilities, 289 reported power loss. These facilities had higher star ratings; higher beds counts, and were preferentially in the Southeast region of Florida compared to facilities without outages. There were 27,767 residents living in a NH without power. They were comparable in characteristics to residents that did not lose power ($N=26,383$). We ran adjusted generalized linear models with robust standard errors, clustering for NH. We found power loss was associated with a trend towards increased odds of mortality within 7-days ($OR:1.12$, 95% $CI:0.96, 1.30$) and 30-days ($OR:1.10$, 95% $CI:1.00, 1.21$) post-storm, but not with hospitalization. Future research should investigate the time-specific effects of power outages.

Session 3085 (Symposium)

NEW DEVELOPMENTS IN VIEWS ON AGING RESEARCH: VARIABILITY, INNOVATIVE CONCEPTS, AND CONTEXTUAL PERSPECTIVES

Chair: Anna Kornadt

Co-Chair: Hans-Werner Wahl

Discussant: Susanne Wurm

Views on aging (VoA) such as attitudes toward own aging, awareness of aging or subjective age, have a large impact on outcomes related to positive development in later life. Recent research in this domain has focused on complex research designs and inter-systemic linkages at different levels. Indicators of short-term variability of VoA have increasingly been investigated, linking the respective findings with performance indicators, biomarkers, and trait-like data. In addition, bidirectional relationships of VoA and outcomes over time as well as data contextualizing VoA across historical time may offer new insights on the plasticity of VoA seen in bio-cultural co-construction. The symposium will showcase these recent trends with studies from the U.S. and Germany. First, Zhu and Neupert extend previous studies by linking established VoA indicators with future time perspective, all assessed by means of a daily diary study with 60-90 year-old adults. Kornadt et al. examined the variability of subjective age within a day and the relationship with trait subjective age and cortisol levels. Mejia et al. extend VoA to the area of subjective awareness of fall risks in daily life and links them with physical performance. Wettstein et al. investigate the bidirectional relationship of VoA indicators and perceived stress over time. Finally, we move from the micro to a macro-micro design in Wahl et al.'s presentation addressing historical change in VoA across 20 years in the Berlin Aging Study and in MIDUS. Susanne Wurm will discuss how different levels of VoA analysis will find better interlinkage in the future.

PERCEIVING MORE AGE-RELATED LOSSES? THE ROLE OF GENERAL CONTROL BELIEFS AND DAILY DISTURBANCE TO PLANS

Shevaun Neupert,¹ and Xianghe Zhu,² 1. North Carolina State University, Raleigh, North Carolina, United States, 2. North Carolina State University, North Carolina State University, North Carolina, United States

We examined daily fluctuations in future time perspective within the daily stress and awareness of aging processes. Awareness of age-related change (AARC) focuses on everyday experiences that highlight changes in behavior and functioning as a result of growing older. We integrated individual differences in control beliefs because those with higher control tend to be more resilient to stressors. We conducted a daily diary study of 112 older adults (aged 60-90) who completed measures of control beliefs at baseline and then daily measures of stressor exposure, appraisal (e.g., threats to future plans), and AARC for eight consecutive days. Increases in threats to future plans were associated with increases in AARC losses, and those with low control were especially vulnerable to increases in threats to future plans. With a constricted future time perspective, any threats to future plans may be especially harmful for older adults who are low in control beliefs.

SHORT-TERM FLUCTUATION OF SUBJECTIVE AGE AND ITS CORRELATES: AN ECOLOGICAL MOMENTARY ASSESSMENT OF OLDER ADULTS

Anna Kornadt,¹ Theresa Pauly,² Denis Gerstorff,³ Ute Kunzmann,⁴ Oliver Schilling,⁵ David Weiss,⁴ Anna Luecke,⁶ and Hans-Werner Wahl,⁶ 1. University of Luxembourg, Esch-sur-Alzette, Luxembourg, 2. University of Zurich, University of Zurich, Zurich, Switzerland, 3. Humboldt University of Berlin, Humboldt University of Berlin, Brandenburg, Germany, 4. Leipzig University, Leipzig, Sachsen, Germany, 5. University of Heidelberg, Heidelberg, Baden-Wuerttemberg, Germany, 6. Heidelberg University, Heidelberg, Baden-Wuerttemberg, Germany

We examined short-term fluctuations of subjective age with data obtained from 123 young-old ($Mage = 67.19$ years) and 47 old-old adults ($Mage = 86.59$ years) who reported their momentary subjective age six times a day over seven consecutive days as they were going about their everyday lives. Participants felt younger on a large majority of occasions, and 25% of the total variability in subjective age could be attributed to within-person variation. Those with younger trait subjective ages exhibited larger moment-to-moment variation, while chronological age did not impact variability. Furthermore, we investigated relationships between within-day fluctuations of subjective age and daily cortisol fluctuations. Our findings extend the literature on subjective age by showing that how old people feel can vary on a momentary basis, that state and trait components of subjective age are related, and that fluctuations in subjective age are related to biomarkers of stress.

AWARENESS OF BALANCE AS AN INTRAINDIVIDUAL DYNAMIC OF OBJECTIVE AND SUBJECTIVE EXPERIENCES OF FALL RISK IN DAILY LIFE

Shannon Meija,¹ Tai-Te Su,² Aileen Griffin,³ Faith Washington,¹ Jason Fanning,⁴ and Jacob Sosnoff,⁵

1. University of Illinois, Champaign, Illinois, United States, 2. University of Illinois at Urbana-Champaign, United States, 3. University of Illinois at Urbana-Champaign, Aurora, Illinois, United States, 4. Wake Forest University, Winston Salem, North Carolina, United States, 5. School of Health Professions, University of Kansas Medical Center, Kansas City, Kansas, United States

Falls are life-changing events in older adulthood. With an accurate understanding of balance, older adults can adapt to age-related changes in physical ability without prematurely restricting physical activity. The Daily Balance Project examines the implications of older adults' awareness of fall risk in daily life. For 30-consecutive days, following a fall-risk assessment, 40 older adults used a smartphone to report balance confidence and then perform four balance assessment and a 30-second sit-to-stand task to measure postural sway and fall-risk. Measures of postural sway showed greater intraindividual variability than balance confidence and fall risk. Multilevel models showed that awareness of balance fluctuated during the study and varied across individual differences in baseline fall-risk. Baseline fall risk also differentiated how balance confidence and postural sway were linked to subsequent momentary fall risk assessments. The findings are discussed within the framework of action-perspectives of adult development and awareness of aging.

LONGITUDINAL RELATIONS BETWEEN VIEWS ON AGING AND PERCEIVED STRESS: EVIDENCE FOR MUTUAL ASSOCIATIONS

Hans-Werner Wahl,¹ Anna Kornadt,² and Markus Wettstein,³ 1. Heidelberg University, Heidelberg, Baden-Wuerttemberg, Germany, 2. University of Luxembourg, Esch-sur-Alzette, Luxembourg, 3. German Centre of Gerontology, Berlin, German Centre of Gerontology, Berlin, Berlin, Germany

We investigated the reciprocal longitudinal relation between perceived stress and three established domains of views on aging (VoA): (1) subjective age; (2) attitude toward own aging [ATOA]; and (3) aging-related cognitions including social loss, physical decline, and continuous growth. We also examined the potentially moderating role of chronological age. Data of the German Ageing Survey, comprising two measurement occasions (2014 and 2017) and a sample of 4,588 individuals aged between 40 and 95 years, were analyzed. Controlling for socio-demographic and health-related indicators, cross-lagged models indicated mutual longitudinal relations between VoA and stress. Whether the pathway from stress to VoA or the opposite pathway was stronger varied depending on the VoA considered. With increasing age, most VoA domains were less strongly associated with subsequent perceived stress. Our findings suggest that less favorable VoA predict higher perceived subsequent stress, but they are also preceded and predicted by higher levels of perceived stress.

NO HISTORICAL CHANGE IN VIEWS ON AGING AND THEIR CORRELATES: EMERGING EVIDENCE FROM GERMANY AND THE UNITED STATES

Hans-Werner Wahl,¹ Johanna Drewelies,² Sandra Duezel,³ Margie Lachman,⁴ Jacqui Smith,⁵ Nilam Ram,⁶ Ulman Lindenberger,³ and Denis Gerstorf,⁷ 1. Heidelberg University, Heidelberg, Baden-Wuerttemberg, Germany,

2. Humboldt University, Berlin, Berlin, Germany, 3. Max-Planck-Institute for Human Development, Berlin, Berlin, Germany, 4. Brandeis University, Brandeis University, Massachusetts, United States, 5. University of Michigan, University of Michigan, Michigan, United States, 6. Stanford University, Stanford, California, United States, 7. Humboldt University of Berlin, Humboldt University of Berlin, Brandenburg, Germany

To examine historical changes in views on aging, we compared matched cohorts of older adults within two independent studies that assessed differences across a two-decade interval, the Berlin Aging Studies (BASE, 1990/93 vs. 2017/18, each $n = 256$, $\text{Mage} = 77$) and the Midlife in the United States Study (MIDUS, 1995/96 vs. 2013/14, each $n = 848$, $\text{Mage} = 67$). Consistent across four different dimensions of individuals' subjective views on aging (age felt, age appeared, desired age, attitudes towards own aging) in the Berlin Aging Studies and corroborated with subjective age felt in the MIDUS, there was no evidence whatsoever that older adults of today have more favorable views on how they age than older adults did two decades ago. We discuss reasons for our findings, including the possibility that individual age views may have become increasingly decoupled from societal age views.

Session 3090 (Symposium)

OLDER ADULT SUBSTANCE USE, SUPPORT, HEALTH, AND WELL-BEING: UNDERSTANDING A COMPLEX PICTURE

Chair: Bethany Bareham

Co-Chair: Verena Cimarolli

Discussant: Alexis Kuerbis

Substance Use Disorders (SUDs), particularly hazardous alcohol use and Opioid Use Disorder (OUD), are increasingly common in older populations. Both are associated with poor mental and physical wellbeing. Alcohol use can also contribute positively to older people's social and emotional wellbeing, and may be used by older people in managing pain. Health concerns can make older people more aware of the impact of their lifestyle, including substance use, for their health. The relationship between substance use, health and wellbeing in old age is complex, raising questions for how older people with SUDs are best supported. We aim to give insight into this complexity, drawing on five recent studies. Our first presentation examines the impact of health concerns in old age on alcohol use. Our second presentation explores the complicated relationship between experiences of pain, and alcohol use with age. Our third presentation considers wellbeing in older people with OUD, and the impact of Adverse Childhood Experiences, psychosocial, health and sociodemographic factors; and what this means for how wellbeing is promoted in this population. Our fourth presentation explores how those supporting people with dementia navigate alcohol use amongst older residents, in a care context where autonomy is prioritised, but health risk behaviours must be managed. Our final presentation considers alcohol use in 'the new normal'; examining the impact of the COVID-19 pandemic on older people's alcohol use, and motivations to engage in healthier/unhealthy use. We consider implications of these complex considerations around addressing substance use amongst older people for practice.

COVID-19, OLDER PEOPLE'S ALCOHOL USE AND ENGAGEMENT WITH SUPPORT: A RAPID EVIDENCE SYNTHESIS

Bethany Bareham,¹ Eileen Kaner,² Liam Spencer,² Hannah O'Keefe,² and Barbara Hanratty,² 1. *Newcastle University, Newcastle upon Tyne, England, United Kingdom*, 2. *Newcastle University Population Health Sciences Institute, Newcastle upon Tyne, England, United Kingdom*

COVID-19, and associated restrictions, have likely impacted older people's alcohol use and related support needs, given disrupted routines and stress increase alcohol use in older populations. This rapid evidence synthesis aimed to examine older people's (aged 50+) alcohol use, and engagement with alcohol support services during COVID-19. Seventy-six articles were identified through systematic database searches, reporting 63 survey, five qualitative, three pilot, and five hospital admission studies; of general and service-user populations of older drinkers. Data were drawn together through narrative synthesis. Alcohol use increased for up to 32% of older people, including service-users; particularly older women. Increased use was linked to anxiety, depression and emotional distress. Decreased use was more common in some older populations; particularly Mediterranean. Barriers such as web access and safe transport affected older service-users' engagement with support. Support to address hazardous alcohol use amongst older people must be prioritised in wake of the pandemic.

OLDER ADULT HEALTH AND REMISSION OF RISKY DRINKING AND ALCOHOL USE DISORDER: A LIFESPAN-DEVELOPMENTAL STUDY

Matthew Lee,¹ Ellen Yeung,² Thomas Kwan,¹ and Kenneth Sher,³ 1. *Rutgers University, Piscataway, New Jersey, United States*, 2. *George Washington University, Washington, District of Columbia, United States*, 3. *University of Missouri, Columbia, Columbia, Missouri, United States*

Older-adult drinking is a growing public-health concern. As part of a larger project investigating older adulthood by contrasting this with other adult developmental periods, this study used longitudinal U.S.-representative data to test bidirectional associations between drinking and health, emphasizing aging-related health concerns as potential mechanisms of remission from risky/problem drinking. In multiple-group cross-lag models, we found that effects of poor self-reported health on drinking reductions increased with age, reached significance around midlife, and were strongest in older adulthood. However, a caveat revealed by additional Markov transition models was that these effects did not extend to relatively severe older-adult drinkers (indexed by DSM-5 AUD). In some instances, poor health even predicted less older-adult AUD remission. Altogether, findings support the notion of aging-related health concerns as important mechanisms of older-adult drinking reduction; but highlight a need to understand barriers to these mechanisms among severe older-adult drinkers, in part toward guiding lifespan-developmentally-informed interventions.

AGE EFFECT ON THE BIDIRECTIONAL RELATIONS BETWEEN ALCOHOL CONSUMPTION AND PAIN

Ellen Yeung,¹ Matthew Lee,² and Kenneth Sher,³ 1. *George Washington University, Washington, District of Columbia,*

United States, 2. *Rutgers University, Piscataway, New Jersey, United States*, 3. *University of Missouri, Columbia, Columbia, Missouri, United States*

Alcohol consumption reduces but pain rises over the life course. Thus, we hypothesized that developmental variability in the bidirectional association between alcohol consumption and pain would vary as a function of age. This hypothesis was tested across three age groups – younger (<29), middle (29-65), and older (>65) using NESARC wave 1 and 2 data (N=34,653). The effect of pain interference at baseline on alcohol consumption at follow-up was non-significant across the age groups, indicating that self-medication theory was unsupported. The effect of alcohol consumption at baseline on pain interference at follow-up was significant among the middle (Estimate -.007, p=.002) and older (Estimate -.019, p<.001) groups, but non-significant among the younger group. This latter effect differed significantly between the younger and older groups (p=.005) and the middle and older groups (p=.041). Results show that alcohol consumption reduces pain interference, especially later in life.

GENDER DIFFERENCES IN WELL-BEING AMONG PEOPLE AGE ≥ 50 IN MEDICATION-ASSISTED TREATMENT FOR OPIOID USE DISORDER

Sahil Angelo,¹ Mary Mitchell,² Molly Perkins,³ and Alexis Bender,⁴ 1. *Medstar Georgetown University Hospital, Medstar Georgetown University Hospital, District of Columbia, United States*, 2. *Friends Research Institute, Baltimore, Maryland, United States*, 3. *Emory University of Medicine, Atlanta, Georgia, United States*, 4. *Emory University, Atlanta, Georgia, United States*

The impact of Adverse Childhood Experiences (ACEs) on the physical and mental well-being of older adults with Opioid Use Disorder (OUD) is unclear, and we know even less about gender differences. This study explores this association and investigates additional factors (e.g., pain, depression) that may affect physical and mental well-being in this population with a focus on gender. The sample for the present analysis includes 90 adults aged 50 and older from a larger study focused on aging with OUD across eight opioid treatment programs in Georgia. We performed multivariable linear regression analyses by gender. There was a small, but significant, association between ACEs and mental well-being for men only. Other significant predictors of physical and mental well-being (e.g., insurance status, pain, satisfaction with social role, stigma) varied by gender. We discuss the importance of these gender differences in identifying appropriate areas for intervention to improve physical and mental well-being.

WHERE'S THE BAR? ALCOHOL AND MEANINGFUL ENGAGEMENT AMONG ASSISTED LIVING RESIDENTS WITH DEMENTIA

Alexis Bender,¹ Candace Kemp,² and Elisabeth Burgess,³ 1. *Emory University, Atlanta, Georgia, United States*, 2. *Gerontology Institute, Georgia State University, Atlanta, Georgia, United States*, 3. *Georgia State University, Georgia State University - Atlanta, Georgia, United States*

Alcohol use across the life course provides some physical and psychological benefits when used in moderation. As a social model of care, assisted living (AL) communities emphasize autonomy; yet, we do not know how this philosophy

extends to drinking. Using ethnographic and interview data from a larger 5-year NIA-funded study in four diverse AL communities designed to identify best practices for the meaningful engagement of AL residents with dementia, we examine how residents, families, and staff interpret residents' rights about alcohol use and how staff and families facilitate or limit alcohol use of residents with dementia. Findings indicate staff and families frequently rely on a narrative of "watchful oversight" to limit or restrict alcohol consumption while simultaneously affirming the social connection of drinking (e.g., alcohol-free socials). We discuss the implications of our findings for research and practice aimed at promoting meaningful engagement and quality of life among persons with dementia.

Session 3095 (Paper)

Pain Management

ACCEPTANCE AND COMMITMENT THERAPY AND EXERCISE: CAN THEY HELP OLDER ADULTS MANAGE CHRONIC PAIN?

Dara KY Leung,¹ Annabelle PC Fong,² Wai-Wai Kwok,² Angie KY Shum,² Tianyin Liu,³ Gloria HY Wong,³ and Terry YS Lum,³ 1. *The University of Hong Kong, Hong Kong, Hong Kong*, 2. *The University of Hong Kong, Pokfulam, Hong Kong*, 3. *The University of Hong Kong, Hong Kong, Hong Kong*

Chronic pain is common among older adults and affects their physical and psychological well-being. While exercise can reduce pain and promote physical functions, psychological interventions may enhance pain management by addressing the psychosocial contributors to the prolonged pain. Acceptance and Commitment Therapy (ACT) is a psychological intervention that emphasizes on psychological flexibility, values, and mindfulness. This approach may be particularly helpful in dealing with chronic pain, where symptoms can be beyond one's control. This single group pre-post study investigated the feasibility and efficacy of an intervention combining ACT and exercise for chronic pain management in older adults. The intervention consisted of 16 sessions delivered over eight weeks. ACT and exercises were modified according to the individual's capability when needed. Clinical outcomes regarding pain severity and interference, pain acceptance, value of life, depression, anxiety, and physical functioning were assessed. Twenty-four older adults attended all sessions and completed the assessments. Preliminary results showed that, while participants experienced similar level of pain after the intervention, they reported less pain interference on mood and enjoyment of life, and improved chronic pain acceptance, pain self-efficacy, success at living their values, committed action, depressive symptoms, physical functioning in the lower body strength, aerobic and endurance, agility and dynamic balance, and upper body strength (all $p < .050$). This study lends support to the feasibility of a combined ACT and exercise intervention for chronic pain management in older adults. The efficacy of ACT may not be directly on reducing pain, but on increased psychological flexibility to co-live with pain.

CAREGIVER-ASSISTED PAIN COPING SKILLS TRAINING FOR PATIENTS WITH DEMENTIA: A PILOT STUDY

Laura Porter,¹ Francis Keefe,² Deborah Barnes,³ Lisa Gwyther,⁴ Kenneth Schmadar,⁵ and Christine Ritchie,⁶ 1. *Duke University Medical Center, Durham, North Carolina, United States*, 2. *Duke University School of Medicine, Durham, North Carolina, United States*, 3. *University of California, San Francisco, San Francisco, California, United States*, 4. *Duke Center for Aging, Chapel Hill, North Carolina, United States*, 5. *Duke, Durham, North Carolina, United States*, 6. *Massachusetts General Hospital, Boston, Massachusetts, United States*

Pain is common and undertreated in patients with dementia, and contributes to disability, psychological distress, neuropsychiatric symptoms and caregiver stress. The goal of this study was to develop a caregiver-assisted pain coping skills training protocol tailored for community-dwelling adults with mild-moderate dementia and their family caregivers. We conducted interviews with patients and caregivers to develop the protocol. We then conducted a single arm pilot test of the intervention's feasibility and acceptability. Patients were recruited from an outpatient memory care clinic and screened for pain using the validated Pain, Enjoyment, General Activity (PEG) scale. The intervention included five sessions of training in pain assessment, relaxation, pleasant activity scheduling, and integrative movement. Initially sessions were conducted in person or by videoconference according to the dyad's preference; during COVID-19 (latter half of study) all sessions were conducted remotely. Eleven dyads consented and provided baseline data [patients: mean age=77.7 years (SD=4.8), 70% non-Hispanic white; caregivers: mean age=69.6 years (SD=13.3); 91% non-Hispanic white; 73% spouses]. Nine dyads (82%) completed all five sessions. Caregivers reported high levels of satisfaction with the intervention (mean=3.4 on 1-4 scale) and frequent use of pain coping skills (mean=3-4 days/week). On average, patients reported pre-post decreases in pain severity (mean=-1.2, SD=1.8) and pain interference (mean=-0.64, SD=0.67) on the Brief Pain Inventory. Overall these findings suggest that a behavioral pain coping intervention for patients with mild-moderate dementia and their caregivers is feasible, acceptable, and potentially helpful for managing pain.

DEMENTIA CARE: ADDRESSING PAIN AND MAXIMIZING COMFORT

Deepa Vinoo, *NYC Health Hospitals/Coler, Roosevelt Island, New York, United States*

Pain is common in older people who have Dementia, and is associated with a number of chronic and acute conditions. There is evidence that as many as 83% of nursing home residents experience pain that often goes unrecognized or inappropriately treated. Pain has a powerful effect on mood, sleep quality, functional ability, and overall quality of life. Rejecting care due to pain is very common among patients with Dementia. An association between pain and increased agitation has been noted, Significant reduction of agitation and psychotropic usage have been demonstrated by pain treatment in patients with moderate to severe dementia. This project was conducted in six memory care units with 150 residents at 815 bedded long-term geriatric care facility. All

residents in memory care units from May 2018 to December 2019 were individually assessed for pain management, rejection of care, usage of psychotropics, falls and physical altercations. Trained interdisciplinary staff to evaluate pain by using PAIN AD. Educated interdisciplinary team on pharmacological and non-pharmacological pain management, and Pain management has improved from 40% to 90%, Rejection of care reduced from 80% to 30%. Usage of antipsychotics reduced by 12%. Falls reduced from 12% to 2%. Physical altercations reduced to zero. Staff call out due to work related injury significantly reduced. Staff verbalized improved job satisfaction and increased morale.

PSYCHOLOGICAL RESILIENCE, STRESS, AND PAIN: THE MODERATING ROLE OF POSITIVE AFFECT AND WELL-BEING

Calia Morais,¹ Michael Robinson,¹ Roger Fillingim,² and Emily Bartley,³ 1. *University of Florida, University of Florida, Florida, United States*, 2. *University of Florida, Gainesville, Florida, United States*, 3. *University of Florida, Gainesville, Florida, United States*

Chronic low back pain is the leading cause of disability among older adults. The impact of psychological factors, including high levels of stress, are associated with increased risk for pain. Despite the growing evidence suggesting that psychological well-being is associated with better health outcomes, limited research has examined positive psychological factors in the context of pain among older adults. In this secondary data analyses of we examined the association of perceived stress on pain and physical functioning, and the moderating role of positive affect and well-being (PAW) on these relationships. A total of 60 adults over the age of 60 completed questionnaires assessing perceived stress (Perceived Stress Scale) and positive affect and well-being (Neuro-QOL PAW). The Back Performance Scale measured back-related physical functioning and movement-evoked pain. We hypothesized that PAW would be inversely associated with pain outcomes and would moderate the relationship between perceived stress and pain. Bivariate correlations assessed the association between study variables, while the interaction of PAW and perceived stress was examined via linear regression. Age ($r=.30$), income ($r=.28$), and being married ($r=.32$) were associated with higher PAW scores, while there was an inverse association with movement-evoked pain ($r=-.28$). After controlling for demographic covariates, moderation analysis revealed that higher levels of perceived stress were associated with poorer physical functioning, but only among those with lower positive affect and well-being ($b=0.14$). As seen, examining the influence of positive psychological functioning on pain-related outcomes has important clinical implications that may promote positive pain adaptation in this population.

RURAL OLDER ADULTS' EXPERIENCES WITH PAIN FROM CHRONIC ILLNESSES AND ITS TREATMENT

Hyunjin Noh,¹ Zainab Suntai,¹ and Cho Rong Won,² 1. *University of Alabama, Tuscaloosa, Alabama, United States*, 2. *University of Alabama, Tuscaloosa, Alabama, United States*

Although pain control is an essential factor in promoting quality of life, pain is undertreated among certain sub-populations, such as older adults and rural residents.

The purpose of this study was to explore pain experiences and its treatment among rural older adults. A qualitative research design was adopted to capture the common essence of participants' experiences through a phenomenological method. Purposeful sampling was used, and the participant criteria was: age 55+, have good thinking skills, resident of Alabama, have chronic/serious health conditions, and experienced pain or discomfort in the last 3 months. Twenty-three participants were recruited from rural counties of West and South Alabama through the local Area Agency on Aging and health and senior service centers. Individual semi-structured interviews were conducted via phone and were recorded and transcribed verbatim. Thematic analysis was conducted to identify emerging themes and repeated patterns from the data. Our results revealed themes in four categories: 1) impact of pain: physical limitations and coping strategies, 2) Impact of Covid-19: physical health, social, and mental health impact, 3) challenges in pain treatment: transportation (driver/time/cost/Covid-19 exposure) and non-transportation related problems (lacking resources/mistrust/limited health insurance coverage), and 4) suggestions: transportation-related (more transportation options/financial assistance) and non-transportation-related support (improved insurance coverage/non-pharmacological care). Findings of this study highlight rural older adults' unique needs in access to pain treatment, further amplified during the Covid-19 pandemic. Increase in sustainable, funded transportation programs and the supply of local pain specialists is critical to meet such needs and improve their quality of life.

Session 3100 (Symposium)

PRESIDENTIAL SYMPOSIUM: DISRUPTION TO TRANSFORMATION OF COMMUNITIES OF CARE: KEY ISSUES AND OPPORTUNITIES IN HEALTH SCIENCES

Chair: Christine Mueller

Co-Chair: Kirsten Corazzini

Discussant: Jennifer Wolff

Consistent with the theme of the conference this year, this symposium explores the impact of the pandemic and our commitment to redress structural racism and health inequities on health of older adults, and our collective capacity to transform and innovate through our gerontological health sciences lens. Each presenter will focus on one sector of care: (1) the health system and healthcare workforce; (2) older persons; and (3) families and care partners. The first presenter provides a systems-level perspective on key disruptors in healthcare systems for care of older adults and the workforce, and emerging innovations to address increasingly transparent care inequities. Emerging research implications as a result of these disruptions will be highlighted. The second presenter highlights how the predominant features of the pandemic in older adults, loneliness and isolation, are co-occurring with significant resilience and innovation, and the resultant potential to create a paradigm shift in how we design and advance communities of care. The third presenter provides the perspective of family members and care partners of older adults during the time of the pandemic, focusing on disruptions that have informed changes going forward,

innovations that have emerged, and implications for research to be addressed. Our discussion situates the presentations within the larger context of ‘the new normal’, with a particular focus on considering the global, inter-connected context of communities of care, a commitment to reducing inequities for older adults, and implications for health sciences education and policy.

LEVERAGING DISRUPTIONS TO CREATE AN EQUITABLE, AGE-FRIENDLY, LEARNING HEALTH SYSTEM

Beth Prusaczyk,¹ Eric Lenze,¹ Brian Carpenter,² and Nancy Morrow-Howell,² 1. *Washington University School of Medicine in St. Louis, Saint Louis, Missouri, United States*, 2. *Washington University in St. Louis, Saint Louis, Missouri, United States*

In a learning health system, the system’s own data and the experiences of its workforce are integrated with external evidence to provide better care. In an age-friendly health system, core principles of age-friendly care are integrated into every point in the system. Disruptions caused by the COVID-19 pandemic, and the innovations that addressed them, present an opportunity to discuss how these two frameworks may be combined and leveraged to transform care for older adults. We will present examples of pandemic-related disruptions, including rapid changes in how patients and providers move within and between facilities and the significant toll on healthcare workers’ mental health. We will also highlight innovative solutions to these disruptions that could transform healthcare systems. Critical to these points is a discussion of how these disruptions have disproportionately impacted healthcare workers and patients of color and how the innovations must be implemented using an anti-racist, health equity lens.

INNOVATION DURING DISRUPTION: SUPPORTING WHAT MATTERS MOST TO OLDER ADULTS THROUGH PERSON-ENVIRONMENT FIT

Sarah Szanton, *Johns Hopkins University, Baltimore, Maryland, United States*

The fragile and improvised systems of care for older adults have been decimated by isolation and fragmented care during the pandemic. However, innovations are increasingly being offered to older adults to improve the fit between them and their environment. This includes fit within the home, the social environment, the policy environment, and with clinicians. Advancing these “fits” requires evidence-based solutions like CAPABLE, a 4 month self-efficacy and function program that provides an occupational therapist, nurse and handyworker to assess and address older adults’ functional goals. The older adult identifies what matters most and experiences a tailored program that taps into their purpose in life and supports engaging in meaningful activities. Starting in research sites, CAPABLE is now offered in 34 sites in 17 States and expanding through policy and insurers. Such efforts to leverage the strength of older adults and their families, builds capacity to evolve our communities of care.

LESSONS FROM DISRUPTION: A NEW NORMAL FOR FAMILIES AND CARE PARTNERS

Beth Fields, *University of Wisconsin-Madison, Madison, Wisconsin, United States*

COVID-19 has forced community-dwelling older adults to rely on family members and care partners more than ever before for support. Often at the expense of their own health and well-being, family members and care partners help older adults manage physical and psychosocial needs, navigate a complex, ever-changing healthcare system, and follow public health guidelines. Given the increasing demands and poor outcomes, there is no better time than now to develop policies and practices that better recognize and support family members and care partners of older adults. To inform policy and practice development, this symposium will present findings from a literature review of peer-reviewed studies published from 2019 through 2021 that identifies and addresses challenges and opportunities related to caregiving for an older adult in a pandemic. The experiences of the past year demonstrate that the new normal needs to recognize and support family members and care partners.

Session 3105 (Symposium)

RE-ENVISIONING AGING IN THE RIGHT PLACE TO DISRUPT HOMELESSNESS FOR OLDER PEOPLE

Chair: Rachel Weldrick

Co-Chair: Sarah Canham

Discussant: Joyce Weil

Recent developments in the aging-in-place literature have recognized the significance of aging-in-the-right-place. That is, aging in a place that supports an individual’s unique values, vulnerabilities, and lifestyles. This symposium will build upon existing research by critically examining the potential for older persons with experiences of homelessness (OPEH) and/or housing insecurity to age-in-the-right-place. Presenters will include interdisciplinary researchers with a diversity of perspectives stemming from gerontology, social work, and environmental design. The symposium will begin with Weldrick and Canham presenting a conceptual framework for aging-in-the-right-place that has been developed to outline indicators relevant to OPEH and housing-insecure older people. Elkes and Mahmood will then discuss findings from a study of service providers working with OPEH to consider the relative benefits and challenges of temporary housing programs. Following, Brais and colleagues will present findings from an environmental audit, developed as a novel assessment tool to evaluate the accessibility and physical design of housing programs for OPEH. A final presentation by Kaushik and Walsh will highlight findings from a photovoice study on perspectives of aging-in-the-right place among OPEH during the Covid-19 pandemic. Joyce Weil, an expert in measurement of person-place fit and life course inequalities, will discuss the implications of these papers and reflect on the potential for the aging-in-the-right-place framework to address the diverse needs of the growing population of OPEH through policy and practice. Together, the participants of the symposium will advance this emerging scholarship using a wide range of methods and perspectives.

AGING IN THE RIGHT PLACE: A CONCEPTUAL FRAMEWORK FOR HOUSING INSECURE OLDER PEOPLE

Rachel Weldrick,¹ Sarah Canham,² Atiya Mahmood,¹ Tamara Sussman,³ and Christine Walsh,⁴ 1. *Simon Fraser University, Vancouver, British Columbia, Canada*,

2. *University of Utah, Salt Lake City, Utah, United States,*
3. *McGill University, Montreal, Quebec, Canada,*
4. *University of Calgary, Calgary, Alberta, Canada*

Emerging research has highlighted the significance of aging in the right place (AIRP) by recognizing that secure and optimal housing should support an individual's unique vulnerabilities and lifestyles. Existing literature, however, has yet to consider what it means for older people experiencing homelessness and/or housing insecurity to age-in-the-right-place. In order to address this knowledge gap, a review of person-environment fit models for older people and other relevant literature was conducted to determine critical identifiers of AIRP for housing insecure older people. Findings from this literature review were then refined in collaboration with interdisciplinary scholars and community partners to establish a conceptual framework. This paper presents the resulting conceptual framework and outlines the key indicators of AIRP relevant to housing insecure older people. The proposed framework provides a practical and meaningful contribution to the literature which can be used to promote housing security among individuals often excluded from existing aging-in-place models.

AGING IN THE RIGHT PLACE? PHOTOVOICE WITH OLDER ADULTS RESIDING IN SHELTERS DURING COVID-19

Vibha Kaushik, Jill Hoselton and Christine Walsh, *University of Calgary, Calgary, Alberta, Canada*

Aging in the right place (AIRP) involves supporting older adults to live as long as possible in their homes and communities, recognizing that where an older person lives impacts their ability to age optimally and must match their unique lifestyles and vulnerabilities. Photovoice, a participatory action research strategy, allows people to document their experiences through photography, promoting critical dialogue about issues such as AIRP and rights-based housing. This presentation highlights the concept of AIRP from the perspectives of a diverse group of older adults living in promising practices shelters in Vancouver, Montreal, and Calgary, Canada using photovoice. Findings indicate that the process promoted a sense of empowerment among participants. Insights about older adults' perceptions of AIRP residing in shelters to best meet their intersectional identities, housing, and support needs will be shared. Findings inform policy initiatives that promote AIRP and the right to adequate housing for older adults experiencing homelessness.

EVALUATING SPACES FOR OLDER ADULTS EXPERIENCING HOMELESSNESS: FINDINGS FROM AN ENVIRONMENTAL AUDIT

Hannah Brais,¹ Émilie Cormier,² Diandra Serrano,³ Atiya Mahmood,⁴ Tamara Sussman,³ and Valérie Bourgeois-Guerin,² 1. *Old Brewery Mission, Old Brewery Mission, Quebec, Canada,* 2. *Université du Québec à Montréal, Montreal, Quebec, Canada,* 3. *McGill University, Montreal, Quebec, Canada,* 4. *Simon Fraser University, Vancouver, British Columbia, Canada*

Homeless populations require spaces and services that take into account their life trajectories. The Aging in the Right Place - Environmental Checklist (AIRP-ENV) is an environmental audit tool developed by our team to evaluate the

accessibility and overall design features of housing targeted for aging individuals experiencing homelessness. Researchers in Vancouver, Calgary and Montreal employed this tool in 2021 to evaluate environmental features in selected promising practices to identify built environment factors that promote aging in the right place. Preliminary findings reveal the following themes across sites: access to communal and recreational spaces encourage social inclusion and meaningful recreation opportunities; barrier-free built environment features foster independence and safety; and access to services and amenities encourage community mobility. Findings demonstrate a need to employ a broader evaluative lens that incorporates psycho-social factors to gain a nuanced understanding of aging in the right place for older adults who have experienced homelessness.

TEMPORARY HOUSING FOR OLDER PEOPLE: ADDRESSING HOUSING INSECURITY TO PROMOTE AGING IN THE RIGHT PLACE

Shreemouna Gurung,¹ Shelby Elkes,¹ Atiya Mahmood,¹ Holly Lemme,¹ Gelareh Modara,¹ Emily Lam,¹ Maria Juanita Mora,¹ Sarah Canham,² and Rachel Weldrick,¹ 1. *Simon Fraser University, Vancouver, British Columbia, Canada,* 2. *University of Utah, Salt Lake City, Utah, United States*

The Aging in the Right Place (AIRP) project is a multi-year, multi-city partnership grant on aging, housing insecurity and homelessness. This paper presents findings from provider/staff interviews (N=5) at a Temporary Housing Program (THP) serving older people experiencing (or at risk of) homelessness (OPEH) in Vancouver, Canada. The researchers sought to understand the strengths and weaknesses of the program, scale-up (i.e., policies) and/or scale out impacts (i.e., on people and communities), as well as how the program promotes housing security and stability for OPEH. Narrative data reveals the program provided housing stability to OPEH by offering increased access to resources (food, pharmaceutical, transportation, social support and engagement). Additionally, through the promotion of client autonomy, privacy and security in their housing unit, the organization and staff work to support and foster AIRP among their clients and help to transform a temporary housing space into a secure home-type setting.

Session 3110 (Symposium)

SOCIAL ENGAGEMENT AND WELL-BEING AMONG CHINESE OLDER ADULTS

Chair: Wei Zhang
Co-Chair: Bei Wu
Discussant: Yan Yan Wu

Social engagement is increasingly recognized as a protective factor to promote healthy aging. This symposium provides new findings on social participation and social isolation in relation to individuals' health and well-being among the Chinese populations. Using the 2002-2018 Chinese Longitudinal Healthy Longevity Survey, the first study examined the trends of leisure activity engagement among young-old adults aged 65-74 in China over a 16-year period. Findings revealed a general downward trend of

engaging in any form of social leisure activity and upward trends for engaging in home-bound and solitary leisure activities. Similarly, the second study examined social participation patterns and individual factors associated with these patterns using three nationally representative data in China, UK, and US. Their findings highlighted several underlying participation patterns across these nations as well as differences in how socio-demographics were associated with these patterns. Using data collected among Chinese older adults in Hawaii, the third study examined the associations of social isolation with psychological well-being. Results showed that social isolation was positively related to psychological distress, and negatively related to life satisfaction and happiness. These associations were partially mediated by resilience. Their findings revealed the detrimental health effects of social isolation. Using the same dataset in Hawaii, the last study examined the associations between neighbourhood conditions and psychological well-being for Chinese older adults. Their findings revealed that both physical and social neighbourhood conditions were associated with psychological well-being, particularly for foreign-born older adults, and psychological resources such as self-management abilities could mediate the associations.

TRENDS IN LEISURE-TIME ACTIVITY PARTICIPATION AMONG YOUNG-OLD ADULTS IN CHINA

Wei Zhang,¹ Qiushi Feng,² and Huashuai Chen,³
 1. *University of Hawaii at Manoa, Honolulu, Hawaii, United States*, 2. *National University of Singapore, Singapore, Singapore*, 3. *Xiangtan University, Durham, North Carolina, United States*

Engagement of leisure activities is highly associated with health and wellbeing in later life. In this study, we examined the trends of leisure activity engagement in young-old adults aged 65–74 in China for a 16-year period. Panel data for a nationally representative sample of young-old adults were obtained from the 2002–2018 Chinese Longitudinal Healthy Longevity Survey. Findings revealed that, compared with 2002, young-old adults in subsequent years were less likely to engage in any form of social leisure activity. The odds of participating in social events, regular exercise, and outdoor activities decreased most prominently over time, while downward trends in tourism and joining outdoor activities showed signs of reversal post-2014. In contrast, trends for engaging in home-bound and solitary leisure activities generally increased. The future elderly in China have generally tended towards solitary leisure activities over time and public health interventions are required to reverse such trends.

SOCIAL PARTICIPATION PATTERNS AND WELL-BEING AMONG OLDER ADULTS: FINDINGS FROM THE UNITED STATES, THE UK, AND CHINA

Chenxin Tan,¹ Yun Zhou,² and Bei Wu,¹
 1. *New York University, New York, New York, United States*,
 2. *Department of Sociology, Peking University, Beijing, Beijing, China (People's Republic)*

This study used Latent Class Analysis to examine patterns of social participation among older adults in the US, the UK, and China, from the three nationally representative surveys conducted in 2018–2019: The Health and

Retirement Study, the English Longitudinal Study of Ageing, and the China Health and Retirement Longitudinal Study. Although the profiles of social participation were distinctively different, several common patterns were found: Comprehensive Participants, Occasional Participants, and Deficient Participants. It was estimated that less than 10% of older adults from these countries were extensively engaged in social participation. Seventy-seven percent of Chinese older adults were shown being “Deficient Participants”, and the percentages were 29% and 20% in the US and the UK, respectively. The findings showed positive associations of levels of participation with socioeconomic status and health. The magnitudes of these associations varied across the nations. Actions are needed to promote levels of participation for Chinese older adults.

SOCIAL ISOLATION, RESILIENCE, AND PSYCHOLOGICAL WELL-BEING IN OLDER CHINESE AMERICANS

Xiang Qi,¹ Wei Zhang,² Katherine Wang,³ Yaolin Pei,⁴ and Bei Wu,⁴
 1. *Rory Meyers College of Nursing, New York, New York, United States*, 2. *University of Hawaii at Manoa, Honolulu, Hawaii, United States*, 3. *Duke University, Durham, North Carolina, United States*, 4. *New York University, New York, New York, United States*

Using data collected in 2018 on 398 older Chinese Americans aged 55+ residing in Hawaii, we examined the associations of social isolation with psychological well-being and the mediating role of resilience. Social isolation was measured by their marital status, living arrangement, contact with children/family/friends, and participation in social activities. Psychological well-being was measured by psychological distress, life satisfaction, and happiness. Results from multivariate linear regressions and ordered logistic regressions showed social isolation was positively associated with psychological distress ($\beta=0.017$, $p<0.05$), and negatively associated with life satisfaction ($\beta=-0.220$, $p<0.001$) and happiness ($\beta=-0.086$, $p<0.05$). By contrast, resilience was associated with lower psychological distress and higher life satisfaction and happiness. Moreover, mediation analysis showed that resilience contributed to 32% of the association between social isolation and psychological distress, 24.9% of the association between social isolation and life satisfaction, and 16.3% of the association between social isolation and happiness.

NEIGHBORHOOD CONDITIONS, SELF-MANAGEMENT ABILITIES, AND PSYCHOLOGICAL WELL-BEING AMONG CHINESE OLDER ADULTS

Keqing Zhang,¹ Bei Wu,² and Wei Zhang,³
 1. *University of Hawaii at Manoa, Honolulu, Hawaii, United States*,
 2. *New York University, New York, New York, United States*, 3. *University of Hawaii at Manoa, Honolulu, Hawaii, United States*

Abstract Few studies have examined the associations between neighborhood conditions and psychological well-being for Chinese older adults in the U.S. This study examined how neighborhood conditions were associated with psychological well-being through self-management abilities as a pathway among Chinese older adults in Hawai'i. Survey data were collected in 2018 and ordinary Least Square

regressions and mediation analysis were conducted. For the whole sample, both neighborhood physical conditions and social cohesion were significantly associated with psychological well-being, and the associations were significantly mediated by self-management abilities. The foreign-born subsample shared similar results with the whole sample. For the U.S.-born subsample, psychological well-being was only significantly associated with neighborhood physical conditions, and the association was mediated by self-management abilities. Our findings suggest that both physical and social neighborhood conditions are associated with psychological well-being, particularly for foreign-born older adults, and psychological resources such as self-management abilities could mediate the associations.

Session 3115 (Paper)

Social Support During the COVID-19 Pandemic

CORRELATES OF SOCIAL ISOLATION AMONG MINORITY OLDER ADULTS DURING THE COVID-19 PANDEMIC

Omolola Adepouju,¹ Daniel Howard,² Kendra Smith,³ Luz Herrera,⁴ Daikwon Han,⁵ and LeChauncy Woodard,⁶

 5. *Texas A&M University, Texas A&M University, Texas, United States*,
 6. *University of Houston College of Medicine, Houston, Texas, United States*

Background: Over the past year, engagement with older adults has been severely curtailed given the high rates of COVID-19 morbidity and mortality in this population. This study examined the correlates of social isolation among African American and LatinX older adults during the COVID-19 pandemic. **Methods:** Working with community-based organizations and senior living centers, we administered a survey to older adults 55+, in the Houston metroplex, between 11/2020 and 01/2021 (n=575). The survey assessed COVID-19 prevention behaviors and health-related social needs. Responses to "How often do you feel lonely or isolated from those around you?" were used to create a dichotomous social isolation dependent variable. The main independent variable, family/community support, was based on responses to the validated question "If for any reason you need help with day-to-day activities such as bathing, preparing meals, shopping, managing finances, etc., do you get the help you need?" Multivariate logistic regression adjusting for socioeconomic status, medical conditions, positive COVID test (for self or family), COVID-19 prevention behaviors, and emergency preparedness levels was used. **Results:** Limited family/community support was strongly associated with social isolation (OR=6.2; p<0.01), as was having any chronic condition (OR=2.9, p=0.02). Females and seniors who reported daily social distancing were more likely to report being socially isolated (OR=2.4, p=0.04; OR=1.09; p=0.09, respectively). Of all chronic conditions

examined, diabetes was the single strongest predictor of social isolation (OR=2.49, p=0.02). **Conclusion:** Being female, having diabetes and limited family/community supports are associated with COVID-19-induced social isolation in African American and Latinx communities.

MODERATING EFFECT OF SOCIAL SUPPORT BETWEEN LONELINESS AND DEPRESSION: YOUNG-OLD AND OLD-OLD ADULTS

Sunghwan Cho,¹ and Kyuhung Chung,² 1. *Virginia Commonwealth University, Richmond, Virginia, United States*, 2. *Semyung University, Semyung University, Ch'ungch'ong-bukto, Republic of Korea*

Depression increases suicidal risk lowers quality of life in older adults. However, it is unknown how loneliness and depression are associated with young-old and old-older adults. This study examined association of loneliness and depression from the National Social Life, Health, and Aging Project (NSHAP) (2015-2016), estimating moderating effects of social support. The sample of this study was community dwelling Medicare beneficiaries aged 65+ (n=1,532): young-older adults (n=903) and old-older adults (n=629). Loneliness was measured by the Revised University of California, Los Angeles Loneliness Scale short form (3 items; young, M=.86, SD=.73; old, M=.87, SD=.67; range 0-3). Social support consists of two variables each measured by 4 items, spouse/partner support (young, M=2.29, SD=.50; old, M=2.26, SD=.51; range 0-3) and family support (young-old, M=2.19, SD=.52; old-old, M=2.23, SD=.52; range 0-3). Depression was measured by Center for Epidemiological Studies Depression scale (11 items, young, M=1.41, SD=.42; old, M=1.45, SD=.42; range 1-4). Multiple linear regression was used in this study, including relevant covariates. Findings indicated loneliness in both groups (young, p<.001; old, p<.001), spouse support in both groups (young, p<.001; old, p<.001) had statistical significance in depression. Family support in young-older adults (p<.05) had a statistical significance for depression. Interaction of loneliness and spouse support moderated the relationship between loneliness and depression in old-older adults (p<.05). Findings suggest old-older adults' loneliness and depression could be soothed by spousal support. Spousal support could be important in that the informal caregiver is likely to focus on older adults with fragility at the end of their lives.

SENIOR CENTERS AND LGBT PARTICIPANTS: ENGAGING OLDER ADULTS VIRTUALLY IN A PANDEMIC

Suzanne Marmo,¹ Manoj Pardasani,² and David Vincent,³
 1. *Sacred Heart University, Fairfield, Connecticut, United States*,
 2. *Adelphi University, Garden City, New York, United States*,
 3. *SAGE, NEW YORK, New York, United States*

Upon the outbreak of COVID-19, recommendations to cease all non-essential in-person social services were mandated across the United States to prevent transmission to non-infected individuals. As a result, approximately 96% of all senior centers in the United States were closed to in-person programming (National Council on Aging, 2020). LGBT older adults in particular were at higher risk of isolation and declines in overall health as they were more likely to live

alone, experience loneliness or have less immediate family support systems when compared to non-LGBT older adults (Yang, Chu & Salmon, 2017). The purpose of this presentation is to explore how LGBT older adult participants in senior centers transitioned to virtual programming during the pandemic. Using a risk-resiliency theory framework, the purpose of this presentation is to share the impact of virtual programming on the health and well-being of LGBT community-dwelling older adults. An exploratory, cross-sectional study was conducted utilizing an online survey to understand their needs, concerns and experiences. Participants reported a relatively easy adaptation to technology, steady participation in programs and services, satisfaction with virtual senior center programming and a consistent sense of engagement with their peers. Higher levels of engagement with senior center programs were associated with greater perceptions of social support. Additionally, stronger perceptions of social support and participation in exercise and fitness programming were associated with higher life satisfaction and lesser symptoms of depression and anxiety. Strategies for outreach, engagement and service provision will be presented.

STRESS RELATED TO COVID-19 AND LONELINESS AMONG MIDDLE-AGED AND OLDER ADULTS IN THE UNITED STATES

Sukyung Yoon, and Neely Mahapatra, *University of Wyoming, Laramie, Wyoming, United States*

Intensified levels of stress and loneliness have been attributed to the COVID-19 pandemic (Havnen et al., 2020; Luchetti et al., 2020). Moreover, loneliness has been reported to exacerbate psychological and physical health issues (Holt-Lunstad et al., 2015). The current research aims to investigate the impact of stress-related to COVID-19 on loneliness. The roles of age, sex, living arrangements, health, and resilience were also investigated. Data was collected on 267 middle-aged and older adults (ages 45 through 88) living in the U.S during COVID-19. A path analysis was employed. For both the direct and indirect effects, 95% confidence intervals were estimated using bootstrapping (a bootstrap sample of 1,000 was specified). Model fit was acceptable. $\chi^2(5) = 7.913, p > 0.05, CFI=0.972, RMSEA = 0.047$. Regarding direct effects, the results indicate that COVID-19 related stress (hereafter stress) was negatively associated with perceived good health (hereafter health) ($\beta = -.213, p < 0.001$). It was also found that health was positively associated with resilience ($\beta = .324, p < 0.001$). Being male was positively associated with resilience ($\beta = .144, p < 0.05$), and resilience was negatively associated with loneliness ($\beta = .230, p < 0.001$). Meanwhile, stress had negative indirect effects on resilience, whereas stress had positive indirect effects on loneliness. Finally, health and being male had negative indirect effects on loneliness. The findings indicate that health practitioners and service providers should develop programs to improve and maintain good health, resilience, and social support among middle-aged and older adults during the COVID-19 pandemic. Moreover, gender-based services are also needed.

THE ASSOCIATION BETWEEN ONLINE SOCIAL NETWORK SUPPORT AND FEAR OF COVID-19 AMONG OLDER ADULTS

Andrew Steward,¹ Matthew Schilz,² Kaipeng Wang,² M. Pilar Ingle,² Carson De Fries,² and Leslie Hasche,²

1. *University of Denver, Lone Tree, Colorado, United States*,
2. *University of Denver, Denver, Colorado, United States*

Public health concerns related to the COVID-19 health crisis are particularly salient among older adults. Fear surrounding COVID-19 has also been associated with increased spread, morbidity, and mortality of the disease. Prior to the pandemic, loneliness and social isolation were already a concern for older adults, and the pandemic further constrained how older adults may socially connect with others because of public health safety precautions. Social networks are a valuable form of support for older adults, and to our knowledge limited prior research has addressed whether social networks are associated with fear of COVID-19. Thus, the purpose of this study is to examine the association between social network and fear of COVID-19 among older adults. A convenience sample ($n = 239$) of adults 60+ years of age in the U.S. completed a 20-minute survey online or by phone. The independent variable was social network support measured by six items which asked about in-person and virtual contacts with members of the same and other generations. The dependent variable was measured by the Fear of COVID-19 scale (seven items). Results of ordinary least squares regression show that increased social network support was significantly associated with decreased fear of COVID-19 ($p < 0.05$), while holding constant age, sex, race, marital status, education, whether a respondent lives alone, and self-rated health. Findings highlight the importance of social networks for older adults during the COVID-19 crisis. Existing social networks which engage older adults should be expanded, with the knowledge that such efforts may also help reduce fear of COVID-19 for older adults.

Session 3120 (Symposium)

STEP-HI STUDY: A MULTIMODAL INTERVENTION OF EXERCISE AND TESTOSTERONE THERAPY: DESIGN AND REAL-WORLD CHALLENGES

Chair: Ellen Binder

Discussant: Jay Magaziner

Hip fractures are common among older women and can have a devastating impact on their ability to remain independent. Many women who were high functioning before the hip fracture do not return to their pre-fracture level of function, have persistent weakness and mobility impairments, and may require ongoing supportive services. Age-associated androgen deficiency may contribute to deficits in muscle mass, strength and power that are common in older female hip fracture patients. The Starting a Testosterone and Exercise Program after Hip Injury (STEP-HI) Study is a three-group, randomized, double-blinded, placebo-controlled Phase III clinical trial designed to evaluate a multimodal intervention aimed at improving functional outcomes in older female hip fracture patients. 168 female hip fracture patients, age 65 yrs. and older are being recruited from 6 clinical sites in the USA. Participants are being assigned to one of three groups: supervised exercise (EX) plus 1% testosterone topical gel; EX plus placebo gel; or enhanced usual care. The primary outcome is six-minute walk distance. This symposium will present information related to key aspects of the design of the STEP-HI trial, including recruitment of a frail patient population during a period of injury recovery,

the testosterone and exercise interventions and related fidelity procedures, and implementation challenges for this multi-modal intervention prior to and during the COVID-19 pandemic. In addition, the underlying mechanisms by which testosterone and exercise are expected to have a synergistic effect on muscle strength and function will be discussed.

THE STEP-HI TRIAL: PRAGMATIC CHALLENGES AND DESIGN ISSUES

Ellen Binder, *Washington University in St. Louis School of Medicine, Saint Louis, Missouri, United States*

Multi-modal interventions present many implementation challenges, especially for studies of frail older adults. The STEP-HI study is an ongoing multi-center, randomized, controlled, double-blinded clinical trial that is evaluating whether six months of topical testosterone therapy combined with a supervised center-based exercise-training program can improve mobility, functional performance, and quality of life after hip fracture, compared to exercise training alone or Enhanced Usual Care. Female hip fracture patients ≥ 65 yrs. old who are living in the community or assisted living are being randomized within 26 weeks of surgical repair for the fracture, and re-evaluated 24 weeks later. This presentation discusses the rationale and study design, and modifications to the protocol in response to challenges, including the COVID-19 pandemic.

RECRUITMENT CHALLENGES AND STRATEGIES FOR MULTIMODAL INTERVENTION TRIALS

Jenna Bartley, *Center on Aging, UConn Health, Farmington, Connecticut, United States*

Determining ways to improve hip fracture recovery in older adults is important, however recruitment of this target population into clinical trials is challenging. Multimodal interventions that target multiple mechanisms of recovery may improve outcomes, but each component presents unique recruitment barriers. While exercise interventions have been shown to be beneficial for hip fracture recovery, offering exercise following completion of conventional physical therapy can be viewed as a burdensome time commitment. Hormone replacement therapy may hold promise for overcoming anabolic resistance, but concern about adverse side effects can also deter participation. STEP-HI is a multisite trial testing whether exercise and testosterone can improve hip fracture recovery in older women. In this talk, recruitment barriers experienced in STEP-HI and strategies employed to overcome these barriers will be discussed. Strategies include: partnering with hospitals, skilled nursing facilities and orthopedic surgeons. providing talks and education materials; and featuring past participant testimonials in recruitment materials.

IMPLEMENTATION OF A REMOTE FIDELITY OVERSIGHT PROGRAM FOR A MULTI-SITE EXERCISE INTERVENTION

Jennifer Stevens-Lapsley, *University of Colorado School of Medicine, Aurora, Colorado, United States*

The STEP-HI exercise protocol is a supervised, 2 phase, multimodal, high-intensity exercise program that emphasizes resistance training. Exercise sessions are conducted at an exercise facility and occur on two non-consecutive days/

week for 6 months. During specified exercises, the exercise interventionist targets the participant's eight-repetition maximum (8-RM), defined as the greatest resistance that can be moved 8 times through full range of motion with good form. A rigorous, remote fidelity monitoring program maximizes consistency of the intervention across sites. This fidelity oversight program is a model for future exercise studies because of its unique remote, hierarchical structure. All exercise interventionists are initially certified by written examination and direct observations. Some exercise sessions are also video recorded and reviewed using fidelity checklists. After initial certification, repeated direct observation and video-based verification of fidelity are repeated at prescribed intervals for each interventionist to ensure sustained consistency of implementation across sites.

HOW DOES TESTOSTERONE AUGMENT THE ANABOLIC RESPONSE TO EXERCISE IN FRAIL OLDER ADULTS?

Shalendar Bhasin, *Brigham and Women's Hospital, Harvard Medical School, Boston, Massachusetts, United States*

Testosterone treatment increases muscle mass, strength, and leg power in menopausal women, hypogonadal men, older men with mobility limitation, COPD and ESRD. Testosterone's effects on muscle mass and strength are augmented by exercise training and growth hormone. Testosterone treatment improves some measures of physical performance, such as stair climbing power and aerobic capacity; the improvements in gait speed have been modest. Testosterone increases muscle mass by inducing the hypertrophy of type 1 and 2 muscle fibers, and by increasing satellite cell number. Testosterone promotes the differentiation of mesenchymal progenitor cells into myogenic lineage and inhibits their differentiation into adipogenic lineage by activating Wnt-target genes, including follistatin that plays an important role in mediating testosterone's effects on the muscle. Testosterone also increases polyamine synthesis in the muscle. Combined administration of testosterone plus multi-component exercise intervention that includes functional training may be needed to improve function and mobility in older adults.

Session 3125 (Symposium)

THE IMPLICATIONS OF AGING COUPLES' LINKED LIVES: DYADIC ASSOCIATIONS IN HEALTH AND WELL-BEING

Chair: Stephanie Wilson

Co-Chair: Christina Marini

Discussant: Amy Rauer

Older adults age in the context of their intimate partnerships. Partners' lives—their emotions, behaviors, and health—are intricately linked as they navigate the challenges associated with aging. This symposium presents research that illuminates ways partners influence one another later in life. The talks are diverse with regard to their timescale (e.g., years vs. hours) and context (e.g., dementia vs. pain). Dr. Martire will examine associations between declines in one spouse's physical health over 5 years and the other's mental health. This talk will further consider whether discussing health concerns exclusively with one's spouse intensifies such

associations. Ms. Nah will show how the pain of both partners (care providers and recipients) contributes to escalating marital conflict over 2 years. Dr. Wilson will demonstrate that emotional reactivity to spousal distress in the lab is associated with increased proinflammatory gene expression up to 80 minutes later, a risky pattern for health if repeated over time. Dr. Monin will examine actor and partner associations of affect and depressive symptoms among people with early-stage dementia and their spouses; the absence of partner associations suggests that emotional spillover may operate differently in early-stage dementia dyads. Dr. Novak will identify correlates of four latent profiles derived from couples' physical, psychological, and relationship well-being: happy, healthy couples; unhappy, unhealthy couples; and two groups with blissful marriages despite individual problems. Dr. Amy Rauer, an internationally recognized scholar of relationships and health, will discuss ways in which this research advances our understanding of couples' linked lives.

EXPRESSION OF EMOTIONS AND GENES: PROINFLAMMATORY GENE EXPRESSION RISES WITH SPOUSAL DISTRESS

Stephanie Wilson,¹ Steven Cole,² M. Shrout,³ and Janice Kiecolt-Glaser,³ 1. *Southern Methodist University, Dallas, Texas, United States*, 2. *UCLA School of Medicine, Los Angeles, California, United States*, 3. *The Ohio State University College Of Medicine, Columbus, Ohio, United States*

Marital quality shares ties to inflammation-related conditions like cardiovascular disease and diabetes. Lab-based studies implicate hostility during marital conflict as a mechanism via inflammatory reactivity. However, developmental theories suggest that conflict declines with age. Spousal distress is an important but overlooked context for aging couples as networks shrink and assistance needs increase. To examine the effects of spousal distress on changes in proinflammatory gene expression, 38 adults ages 40-81 witnessed their spouse relive an upsetting personal memory aloud, rated their mood before and after, and provided blood samples at baseline and twice post-task. Those whose negative mood increased more in response to spousal disclosure showed larger elevations in proinflammatory gene expression 40 ($p=.022$) and 80 minutes ($p<.0001$) after the task. Effects were robust to race, gender, age, alcohol, smoking, and body mass index. These novel findings identify spousal distress as a key marital context that may escalate inflammation-related health risks.

EFFECTS OF LATE-LIFE HEALTH TRANSITIONS ON SPOUSES' PSYCHOLOGICAL WELL-BEING

Lynn Martire,¹ Ruixue Zhaoyang,¹ and Christina Marini,² 1. *The Pennsylvania State University, University Park, Pennsylvania, United States*, 2. *Adelphi University, Garden City, New York, United States*

Declining physical health likely affects not only older adults' own well-being, but also that of their spouse. Using two waves of data from 610 couples in the National Social Life, Health and Aging Project, we examined effects of health declines over five years on change in self and spousal psychological well-being. Actor-Partner Interdependence Model findings showed that declines in spouses' physical health (i.e.,

increased pain and decreased physical and cognitive function) predicted increases in older adults' anxiety. Given the increasing importance of later-life social ties outside of marriage, we further considered the role of non-spousal health confidants. Preliminary findings suggest that effects of health declines on both partners' well-being depend on the availability of these confidants. When older adults have people in addition to their spouse with whom they can talk about their health, detrimental effects of spouses' declining health on older adults' well-being are weakened for some health outcomes

A DYADIC LATENT PROFILE ANALYSIS OF OLDER COUPLES' PSYCHOLOGICAL, RELATIONAL, AND PHYSICAL HEALTH

Josh Novak,¹ Ashley Ermer,² and Stephanie Wilson,³ 1. *Auburn University, Auburn University, Alabama, United States*, 2. *Montclair State University, Montclair, New Jersey, United States*, 3. *Southern Methodist University, Dallas, Texas, United States*

The present study explored the heterogeneity of older couples' psychological, relational, and physical health using a sample of 535 couples above the age of 62. A dyadic latent profile analysis was conducted to identify and predict unique clusters of couples' relative psychological (depressive symptoms and daily hassles), relational (problematic affective communication and marital satisfaction), and physical health (number of health problems and self-reported health satisfaction). Predictors of class membership included relationship length, age, income, and hours worked outside the home. Results revealed 4 distinct classes: Happy & Healthy Together (63.5%), Individually & Relationally Strained (14.7%), Relationally Happy with Strained Wives (12.3%), and Relationally Happy with Strained Husbands (9.3%). Typology descriptions and predictors of class membership will be discussed. These findings highlight that health promotion efforts should be tailored to the specific psychological, relational, and physical health concerns of both partners rather than a one-size-fits-all approach.

EFFECTS OF OWN AND PARTNER PAIN ON SPOUSAL CAREGIVERS' MARITAL QUALITY

Suyoung Nah, and Lynn Martire, *The Pennsylvania State University, University Park, Pennsylvania, United States*

Little is known about whether care recipients' and their spousal caregivers' own pain influence the marital quality perceived by caregivers. Considering that experiencing and witnessing pain may be related to marital distress, we hypothesized that care recipient and caregiver pain would be associated with caregivers' greater increases in marital conflict over time. We focused on 264 spousal caregivers of older adults with chronic illnesses or disability from the 2015 and 2017 National Study of Caregiving. Sixty-nine percent of care recipients and 54% of caregivers in this study were bothered by pain at baseline. Findings revealed that caregiver ($b = 0.25$, $p = .02$) and care recipient pain ($b = 0.34$, $p < .01$) at baseline were both associated with caregivers' higher marital conflict at follow-up. These findings suggest the importance of accounting for not only care recipients' pain but also spousal caregivers' own pain when examining caregivers' marital quality.

INTERPERSONAL ASSOCIATIONS BETWEEN AFFECT AND DEPRESSIVE SYMPTOMS IN PERSONS WITH EARLY DEMENTIA AND THEIR SPOUSES

Joan Monin,¹ Amanda Piechota,² and Sumaiyah Syed,²

1. *Yale School of Public Health, New Haven, Connecticut, United States*, 2. *Yale School of Public Health, New Haven, Connecticut, United States*

Positive and negative affect have independent effects on health and occur frequently in close relationships. No research to our knowledge has examined self-reported affective experiences of persons with dementia (PWD) and their spouses and interpersonal associations with their psychological health. Secondary analysis of baseline interviews from a randomized clinical trial testing a stress reduction intervention in 45 couples (n=90) examined whether individuals' positive and negative affect were associated with their own depressive symptoms (actor effects) as well as their partner's depressive symptoms (partner effects) and whether these associations differed for PWD and spouses. Actor partner interdependence model results showed that for PWDs and spouses, one's own positive affect was related to one's own lower depressive symptoms ($B=-3.10$, $SE=.59$, $df=58.70$, $p<.001$), and one's own negative affect was associated with one's own greater depressive symptoms ($B=6.62$, $SE=.60$, $df=65.67$, $p<.001$). These effects were independent from each other. Partner effects were not significant.

Session 3130 (Symposium)

THE INTERSECTION OF CANCER, GERIATRICS, AND GERONTOLOGY: A MULTIDISCIPLINARY APPROACH ACROSS THE CANCER CONTINUUM

Chair: Jessica Krok-Schoen

Despite the majority of cancer survivors being older adults, the connection between oncology, geriatrics, and gerontology remains unexplored. Our symposium will provide insights across the cancer continuum from prevention through survivorship as well as a comprehensive view of the connection between gerontological and geriatric factors in oncology. Specifically, we will discuss the biopsychosocial and behavioral factors among older adults with cancer, their effect on health outcomes, and how researchers and clinicians can intervene to improve health outcomes. The first abstract by Dr. Cadet found that despite a lack of knowledge of options and harms of cancer screening among older adults with low health literacy, there was a desire to understand more to better their health. The second abstract by Dr. Bhattacharyya found that older patients with cancer experience high levels of social isolation, loneliness, and fear that are heightened by individual and technology-based barriers to telehealth. The third abstract by Dr. Carroll found that breast cancer survivors with good sleep quality had less accelerated biological aging than those with sleep problems. The fourth abstract by Dr. Krok-Schoen utilized one of the largest datasets of older women, the Women's Health Initiative, and found multiple gerontological and geriatric factors associated with physical activity among older female cancer survivors. Closing this symposium is Dr. Guida, a Program Director at the National Cancer Institute (NCI), who will profile the current research efforts, programmatic priorities, and current funding in aging and cancer. These multidisciplinary researchers and clinicians

will provide a comprehensive symposium regarding geriatric oncology.

SHARED DECISION-MAKING AND COLORECTAL CANCER SCREENING BEHAVIORS AMONG OLDER ADULTS WITH LOW HEALTH LITERACY

Tamara Cadet,¹ Rebekah Halmo,² Siobhan McDonold,² and Mara Schonberg,³ 1. *University of Pennsylvania, Philadelphia, Pennsylvania, United States*, 2. *Simmons University, Boston, Massachusetts, United States*, 3. *Division of General Medicine, Beth Israel Deaconess Medical Center, Harvard Medical School, Boston, Massachusetts, United States*

National guidelines recommend adults >75 engage in shared decision making (SDM) around colorectal cancer (CRC) screening because of the uncertain benefit to risk ratio. There are no decision tools to support CRC decision making for adults >75 years with low health literacy (LHL). The purpose of this mixed-methods study was to better understand the perspectives of adults >75 with LHL on SDM around CRC screening and to obtain their feedback on an existing higher literacy CRC decision aid. Utilizing the Brief Health Literacy Screening Tool to identify participants with LHL, semi-structured interviews were conducted with 30 adults. Findings indicate that 80% of participants were non-Hispanic Black and 42% had < high school degree. 76% felt they would benefit from CRC screening despite their age. Themes related to CRC screening included lack of knowledge of options and harms, but a desire to understand more to better take care of their health.

BIOLOGICAL AGING IN BREAST CANCER SURVIVORS AND THE ROLE OF SLEEP

Judith Carroll, *University of California, Los Angeles, Los Angeles, California, United States*

Although cancer treatments can prolong life, they may lead to long-term changes in physical health and well-being. The lasting symptoms experienced after cancer treatment include greater fatigue, pain, cognitive complaints, and functional decline. Cancer and its related cytotoxic treatments are proposed to directly altering biological aging pathways. Our recent findings support this hypothesis, suggesting that women with breast cancer exposed to therapy have alterations in indicators of biological aging, including elevated DNA damage, reduced telomerase activity, and more rapid epigenetic aging. There was variability in risk for signs of biological aging, and given the high prevalence of sleep problems among breast cancer survivors, we sought to examine whether healthy sleep might be protective. Results suggest that those with good sleep quality had less accelerated biological aging than those with sleep problems. Results point to healthy sleep as a modifiable target to protect women with breast cancer from experiencing biological aging.

PREDICTORS OF PHYSICAL ACTIVITY AMONG OLDER BREAST CANCER SURVIVORS: FINDINGS FROM THE WHI LILAC STUDY

Jessica Krok-Schoen,¹ Michael Pennell,² Michelle Naughton,³ Xiaochen Zhang,³ Aladdin Shadyab,⁴ Candyce Kroenke,⁵ Nazmus Saquib,⁶ and Electra Paskett,⁷ 1. *The Ohio State University, Columbus, Ohio, United*

States, 2. College of Public Health, The Ohio State University, Columbus, Ohio, United States, 3. Comprehensive Cancer Center, Columbus, Ohio, United States, 4. University of California, San Diego, San Diego, California, United States, 5. Kaiser Permanente Northern California Division of Research, Oakland, California, United States, 6. College of Medicine, Sulaiman Al Rajhi University, Bukairyah, Al Qasim, Saudi Arabia, 7. Department of Internal Medicine, College of Medicine, The Ohio State University, Columbus, Ohio, United States

We examined the factors associated with physical activity following cancer treatment among older breast cancer survivors from the WHI LILAC study. The majority of participants ($n=3,710$, mean age= 78.8 ± 5.9) were white (86%), and had in situ/localized breast cancer (79%). Women who received radiation therapy, were underweight/normal weight, had fewer reported cancer-related symptoms, no lymphedema, higher self-rated health, higher physical functioning, no pain, no depressive symptoms, and higher social support had significantly greater participation and duration of physical activity (all $p<0.05$). Women aged <75 who received radiation had longer duration of total minutes of physical activity ($\beta=19.7$, $p<0.05$), while women aged 75-85 who received radiation had shorter duration of total minutes of physical activity ($\beta=-3.2$, $p<0.05$). These results indicate that multiple health and social factors are associated with physical activity in this cohort. Interventions to facilitate physical activity among this group should consider body weight, symptom burden, comorbidity status, and social support.

NATIONAL CANCER INSTITUTE'S CANCER AND AGING PRIORITIES

Jennifer Guida, *National Cancer Institute, Bethesda, Maryland, United States*

Modern improvements in cancer detection and treatment coupled with the implementation of population-based cancer prevention and control strategies have contributed to a sustained decline in overall cancer mortality rates. Although this trend is promising, challenges at the nexus of cancer and aging are, in turn, becoming more prominent. Older adults (age 65 years and older) are the largest growing segment of the U.S. population, and aging into older adulthood is disproportionately associated with the incidence of common cancers. Many survivors of childhood cancer will live for decades after cancer treatment and mature into older age. Strategic investments in aging research will contribute to population health by preserving or improving healthspan and ensuring equitable access to – and benefit from – advances in cancer prevention, control, and population science. This presentation will describe ongoing cancer and aging efforts at the National Cancer Institute, including programmatic priorities and current funding opportunities.

Session 3135 (Symposium)

THE NEW FACES AND NEW PLACES OF GEROSCIENCE

Chair: Felipe Sierra

The field of geroscience is rapidly evolving, as well as expanding worldwide. The Program will highlight new approaches and players in the field. Notably, geroscience was initiated as an effort to improve recognition of the role

played by basic aging biology in our efforts to improve the health of older adults. Substantial recognition by multiple players of that role of basic aging biology have resulted in significant interest on the part of clinicians and translational biology practitioners. The program will highlight examples of hand-picked efforts in industry and academia, both in the US and in Europe, and will bring into the same stage researchers interested in the various facets of geroscience, from basic biology, translation, clinical and, ultimately, industry viewpoints.

INSPIRE: A NEW EFFORT ON GEROSCIENCE IN TOULOUSE, FRANCE

Felipe Sierra,¹ and Bruno Vellas,² 1. *CHU Toulouse, France, Toulouse, Midi-Pyrenees, France*, 2. *CHU Toulouse: Centre Hospitalier Universitaire de Toulouse, Gérontopôle de Toulouse, Institut du Vieillessement, Midi-Pyrenees, France*

The Inspire project of the Toulouse Hospital System is a comprehensive approach to health care in older adults, focused on maintenance of health and physical function. At the core of the project are human, mouse and killifish cohorts, which in the case of humans, is comprised of 1,000 subjects of ages 20 and above, which are followed for a total of 10 years, both via visits to the clinic, and electronic follow-up via the ICOPE app. At recruitment they are stratified as robust, pre-frail or frail according to Fried's criteria, and then followed for loss of Intrinsic Capacities, as defined by WHO. A parallel cohort of Swiss mice with enhanced (exercise) and decreased (high fat diet) health will be used to measure concordant parameters. The project is generating a significant biorepository that is being used to pursue research in several areas where Toulouse has a significant research strength.

THE RISE AND THE DEATH OF SENESCENT CELLS: FROM MECHANISMS TO INTERVENTIONS

Marco Demaria, *Medical Faculty, Groningen, Groningen, Netherlands*

Aging is at the root of age-related diseases and therapies targeting basic age-associated mechanisms have the potential to extend healthy lifespan. A common feature of older organisms is the accumulation of senescent cells – cells that have irreversibly lost the capacity to undergo replication. Senescent cells are characterized by an irreversible cell cycle arrest and by the Senescence-Associated Secretory Phenotype (SASP), which include many tissue remodeling and pro-inflammatory factors. Senescent cells are intermittently present during embryogenesis and in young organisms. On the contrary senescent cells accumulate and persist in aging tissues. Significantly, these persistent senescent cells can drive low-grade chronic inflammation, and their genetic or pharmacological elimination is sufficient to delay a number of diseases and to improve health span. Here, I will discuss the mechanisms by which senescent cells can promote tissue aging and dysfunction and the potential of targeting senescent cells to delay human aging.

THE GROWING GLOBAL HEALTHY LONGEVITY ECOSYSTEM

Thomas Seoh, *Kitalys Institute, Charlottesville, Virginia, United States*

The geroscience field has started to grow exponentially in recent decades. This in turn has led to a rapidly emerging global ecosystem of players and nodes that has radiated out

into fields from clinical investigation to medical practice to capital markets and startup activity to consumer-facing goods and services, regulations, laws and policies and the general wellness-conscious public. These are still early days, and there is uncertainty and a lack of awareness about the shape and activities of this rapidly growing and evolving community. This presentation will attempt a high-level survey of the current landscape in the hope of promoting awareness and collaborations among diverse, multiple initiatives that can accelerate the field.

TRANSLATIONAL GEROSCIENCE: HUMAN MODELS OF HEALTHY AGING AND LONGEVITY

Sofiya Milman, *Albert Einstein College of Medicine, Bronx, New York, United States*

While insulin like growth factor-1 (IGF-1) is a well-established modulator of aging and longevity in model organisms, its role in humans is less well understood. Previous ambiguities in part have been attributed to cohort characteristics and unawareness of interactions between age and IGF-1. Centenarians have emerged as an ideal model of healthy aging because they delay the onset of age-related diseases and often remain disease free for the duration of their lifespan. In cohorts of centenarians and generally healthy older adults, we demonstrated that reduced IGF-1 is associated with extended lifespan and health-span. Additionally, we confirmed that IGF-1 interacts with age to modify risk in a manner consistent with antagonistic pleiotropy: younger individuals with high IGF-1 are protected from dementia, vascular disease, diabetes, cancer, and osteoporosis, while older individuals do not exhibit IGF-1-associated protection from disease. These findings offer evidence for IGF-1 modulating health-span and lifespan in humans.

Session 3140 (Symposium)

POLICY SERIES: THE OLDER AMERICANS ACT, THE AGING NETWORK, AND THE PANDEMIC

Chair: Brian Lindberg

This session provides insights into how the pandemic challenged the capabilities and ingenuity of the Older Americans Act (OAA) programs and the aging network and what it means for in-home and community aging services now and in the future. Speakers will include key aging network stakeholders, who will discuss the overnight evolution of programs serving often isolated older adults.

OLDER AMERICANS ACT MEALS PROGRAMS: RESPONDING TO THE PANDEMIC

Katie Jantzi, *Meals on Wheels America, Arlington, Virginia, United States*

This session provides insights into how the pandemic challenged the capabilities and ingenuity of the Older Americans Act (OAA) programs and the aging network. Speakers will include key aging network stakeholders, who will discuss the overnight evolution of programs serving often isolated older adults.

OLDER AMERICANS ACT SUPPORTS AND SERVICES: ADAPTING TO THE PANDEMIC

Amy Gotwals, *USAgging, Washington, District of Columbia, United States*

This session provides insights into how the pandemic challenged the capabilities and ingenuity of the Older Americans Act (OAA) programs and the aging network. Speakers will include key aging network stakeholders, who will discuss the overnight evolution of programs serving often isolated older adults.

Session 3145 (Symposium)

THE TIES THAT BIND: HOW ONLINE AND OFFLINE INTERACTIONS AFFECT SOCIAL SUPPORT AND QUALITY OF LIFE FOR OLDER ADULTS

Chair: Shelia Cotten

Though a digital divide still exists, older adults are increasingly using a range of information and communication technologies (ICTs) – smartphones, apps, tablets, and computers – to communicate and engage with social ties. This symposium focuses on modalities of interaction – whether online or offline – that older adults use to interact with social ties. The research projects detailed examine the frequency of different interaction modalities, as well as impacts of these interaction modalities on older adults' perceptions of social support and quality of life. Kadylak and colleagues focus on social robots and how older adults may engage with this evolving technology to improve social engagement and aging in place. Kim and Fingerman investigate whether daily social media use is associated with same-day negative or positive mood in later life. Xie and colleagues examine older adults' patterns of both online and offline social interaction during COVID-19, and how older adults perceive these interactions. Schuster and Cotten, using a national sample of individuals aged 65 and older, examine whether social media use may be related to a range of quality of life indicators. Each of these studies provides additional insights into the ways through which older adults interact and communicate with social ties, and potential impacts of the different ways through which they interact, which may provide insights into groups seeking to increase social engagement among older adults in general and during times when social isolation may be exacerbated due to societal stressors, such as pandemics.

OLDER ADULTS' ONLINE AND OFFLINE SOCIAL INTERACTIONS DURING THE COVID-19 PANDEMIC

Bo Xie,¹ Kristina Shiroma,² Atami De Main,³ and Nathan Davis,¹ 1. *The University of Texas at Austin, Austin, Texas, United States*, 2. *The University of Texas at Austin, The University of Texas at Austin, Texas, United States*, 3. *School of Nursing, the university of texas at Austin, Austin, Texas, United States*

During the COVID-19 pandemic, much of our social interaction has transitioned from in-person to online. This study examined older adults' social interaction during COVID-19, online and offline. Participants were recruited from community-dwelling older adults in Central Texas. Data collection took place via the telephone during June-August 2020 (N = 200; age range: 65-92 years; Mean: 73.6; SD: 6.33). Participants used a variety of communication modes, including phone or texting (used by 99% of the participants); email (44%); in person (35%); video chat (31%); social media (24%); and postal mail (4%). Most participants (77%) used more than one communication mode.

Participants discussed their preferences for and challenges of technology (i.e., smart phones) and its applications (i.e., video chat, telehealth, and social media). Participants' self-reported experiences ranged from positive (50%), mixed (35%), to negative (15%). These findings will inform policy and community interventions to promote older adults' social interactions during the pandemic.

WELL-BEING FACTORS THAT RELATE TO FACEBOOK-USING OLDER ADULTS' PERCEIVED SOCIAL SUPPORT ON FACEBOOK

Amy Schuster,¹ Travis Kadylak,² and Shelia Cotten,¹

1. *Clemson University, Clemson, South Carolina, United States*, 2. *University of Illinois Urbana Champaign, Champaign, Illinois, United States*

The majority of literature on Facebook use and well-being focuses on younger demographics. The number older adults using Facebook continues to increase. Facebook use by older adults has been found to increase well-being and decrease feelings of depression. This study investigates the effect that perceived social support on Facebook may have on loneliness, depression, social support (offline), and fear of missing out (FOMO) for older adult Facebook users. Older adults aged 65 and older in the U.S. completed a Qualtrics survey (N=798). Participants were, on average, 74 years old. Perceived social support on Facebook had a positive association with social support, depression, and FOMO. The results suggest that among Facebook using older adults, higher levels of perceived social support on Facebook were associated with higher levels of social support, feelings of depression, and FOMO. Future research should investigate the possibility that depression could be driving perceived social support on Facebook.

DAILY SOCIAL MEDIA USE, SOCIAL TIES, AND EMOTIONAL WELL-BEING IN LATER LIFE

Yijung Kim, and Karen Fingerman, *The University of Texas at Austin, Austin, Texas, United States*

Research has seldom explored older adults' daily social media use and its interface with 'offline' social ties. Using data from the Daily Experiences and Well-being Study (N = 310; Mage = 73.96), we investigated whether more daily social media use was associated with the same-day negative or positive mood in later life, and how these associations varied with older adults' daily social encounters and social network structure. More daily social media use was associated with less same-day negative mood. Additionally, more daily social media use was associated with less negative mood on days with more in-person encounters, compared to the days with fewer in-person encounters. More daily social media use was also associated with more positive mood for individuals with a relatively small social network, but not for their counterparts. Post-hoc analyses supported a compensatory function of social media for those older adults lacking social connections in their daily lives.

EXPLORING SOCIAL AND ASSISTIVE DOMESTIC ROBOTS FOR OLDER ADULTS: ROBOT SOCIABILITY, TRUST, AND ACCEPTANCE

Travis Kadylak,¹ Megan Bayles,² and Wendy Rogers,²

1. *University of Illinois Urbana Champaign, Champaign, Illinois, United States*, 2. *University of Illinois Urbana-Champaign, Champaign, Illinois, United States*

Older adults prefer to age in place, to live independently while maintaining social connection and engagement with the community. Though older adults can encounter barriers to these goals, social and assistive domestic robots hold promise for promoting independence and online/offline social engagement. However, social robots must be designed to meet their needs and preferences. Open questions remain regarding how to facilitate the development of trust and acceptance in robot support. We investigated the associations between robot social characteristics, sociability, trust, and acceptance for instrumental activities of daily living. We used an online survey to assess older adults' perceptions towards social and assistive robots. Robots with more social abilities were rated as more acceptable and trustworthy across different task types. We discuss design implications that may promote the development of robot trust and acceptance by older adults, and ultimately help enable aging in place and social engagement.

Session 3150 (Symposium)

THE VERTICAL AND HORIZONTAL RELATIONS OF KOREAN AND KOREAN AMERICAN OLDER ADULTS AND THEIR WELL-BEING

Chair: Meeryoung Kim

Co-Chair: Nan Sook Park

Discussant: Michin Hong

Various relationships are important for the well-being of older adults. This session focuses on the vertical and horizontal relations of Korean and Korean American older adults and their well-being. The purpose of this session is to highlight the importance of intergenerational relations and social involvement of Korean and Korean American older adults. For vertical relations, two studies focus on intergenerational relationships and solidarity. The first study investigated whether intergenerational relationships and social support mediate the distressing consequences of life events, and how this improved the psychological well-being of Korean older adults. The second study developed a standardized measurement tool for intergenerational solidarity because intergenerational conflicts caused by rapid socioeconomic changes have highlighted the importance of strengthening intergenerational solidarity. The third and fourth studies focus on horizontal relations involving social isolation and social involvement. Guided by the double jeopardy hypothesis, the third study examined the health risks posed by the coexistence of social and linguistic isolation in older Korean Americans. As the opposite of social isolation, social involvement was an important factor of social integration of older adults. The fourth study examined volunteering as an example of social involvement by focusing on older adults' volunteering on the social integration and role identity. Implications of this study suggest not only the importance of social involvement but also the intergenerational relationships on older adults' well-being.

INTERGENERATIONAL RELATIONSHIPS, SOCIAL SUPPORT, AND PSYCHOLOGICAL WELL-BEING AMONG KOREAN OLDER ADULTS

Yoomi Lee, and Janet Wilmoth, *Syracuse University, Syracuse, New York, United States*

Using longitudinal data from the 2006 to 2018 Korean Longitudinal Study of Aging, this study explores depression trajectories among individuals who are 60 or older with at least one living adult child at baseline. We estimated linear growth curve models of depression trajectories separately for married, unmarried and widowed using the Center for Epidemiologic Studies Depression Scale (CES-D). Results indicate that declining health and recent widowhood are positively related to depressive symptoms. Satisfactory intergenerational relationships and social support in the form of caregiving decrease depressive symptoms of older parents, especially among the widowed. Having at least one son and a first-born daughter positively impact psychological well-being of older parents. A son was particularly important for those who are widowed. We conclude that the psychological benefits of intergenerational relationships and social support are contingent upon the vulnerability of Korean older adults and discuss the implications for public policy.

A STUDY ON THE DEVELOPMENT AND VALIDATION OF AN INTERGENERATIONAL SOLIDARITY MEASURING TOOL USING MIXED METHODS

Joosuk Chae,¹ and Seok In Nam,² 1. *Comprehensive Support Center for Seniors Living Alone, Seoul, Seoul-t'ukpyolsi, Republic of Korea*, 2. *Yonsei University, Seoul, Seoul-t'ukpyolsi, Republic of Korea*

Intergenerational conflicts caused by rapid socioeconomic changes have highlighted the importance of strengthening intergenerational solidarity, emphasizing the necessity of tool designed to measure intergenerational solidarity. This study developed a standardized intergenerational solidarity measurement tool using mixed methods. In the qualitative research stage, 27 main survey questions were derived through literature research, in-depth interviews, and content validity verification. In the quantitative research stage, based on the results of a survey of 1,109 adults, both exploratory and confirmatory factor analyses of the questions were conducted, and the validity of the questions was confirmed. The analysis results were used to develop a 10-item measurement tool consisting of two factors: "recognition of intergenerational solidarity in the family" and "recognition of social intergenerational solidarity." This study is the first attempt to develop a standardized measure of intergenerational solidarity, and it can be used for nationwide panel surveys in academic and policy research.

THE IMPACT OF VOLUNTEERING MOTIVATION FOR OLDER KOREAN ADULTS ON SOCIAL INTEGRATION AND ROLE IDENTITY

Meeryoung Kim, *Daegu University, Daegu, Kyongsangbukto, Republic of Korea*

As life expectancy increases, older Korean adults need more activities for the next 20 to 30 years after their retirement. Rowe and Kahn indicate active social participation as an area of successful aging. After retirement, older adults uphold a desire to be part of society. This study examines the motivation effects for volunteering on social integration, role identity and volunteer satisfaction. Subjects for this study are 303 older volunteers belonging to the Korean Senior Citizens' Association throughout South Korea. According to the results, the skills obtained through volunteering had

a significant effect on social integration, role identity, and volunteer satisfaction. Value motivation also had a significant effect on social integration, and reinforcement motivation significantly affected role identity. Implications of this study were found to have various effects according to the motivation for volunteering. Therefore, it will be important to understand the older adults' motives so that they can volunteer accordingly.

HEALTH RISKS POSED BY SOCIAL AND LINGUISTIC ISOLATION IN OLDER KOREAN AMERICANS

Juyoung Park,¹ Yuri Jang,¹ Hyunwoo Yoon,² Nan Sook Park,³ David Chiriboga,³ and Miyong Kim,⁴ 1. *University of Southern California, Los Angeles, California, United States*, 2. *School of Social Work, Portland State University, Portland, Oregon, United States*, 3. *University of South Florida, Tampa, Florida, United States*, 4. *School of Nursing, The University of Texas at Austin, Austin, Texas, United States*

Guided by the double jeopardy hypothesis, the present study examined the health risks posed by the coexistence of social and linguistic isolation in older Korean Americans. Using data from the Study of Older Korean Americans (SOKA, n = 2,032), comparisons of four isolation typologies (no isolation, social isolation only, linguistic isolation only, and dual isolation) were made, and their impacts on physical (self-rated health), mental (mental distress), and cognitive health (cognitive performance) were examined. The 'dual isolation' group exhibited greater sociodemographic and health disadvantages. The odds of having fair/poor health, mental distress, and cognitive impairment were 2.21-3.17 times higher in the 'dual isolation' group than those in the group with no isolation. Our findings confirm that both social relationships and language proficiency are key elements for older immigrants' social connectedness and integration, deprivation of which puts them at risk in multidimensions of health.

Session 3155 (Symposium)

TRAINING IN INTERDISCIPLINARY, PRACTICE-ORIENTED MINORITY AGING RESEARCH: HONORING THE WORK OF DR. JAMES JACKSON

Chair: Briana Mezuk

Co-Chair: Robert Taylor

Discussant: Roland Thorpe, Jr.

Few scientists had the breadth and depth of scholarship, the keen interest in interdisciplinary scientific collaboration, and the commitment to mentoring the next generation of scientists as Dr. James Jackson. His passing remains a tremendous loss for the field. This symposium, organized by members of the Michigan Center for Urban African American Aging Research (MCUAAAR), which was founded by James over 20 years ago, reflects on the impact of transdisciplinary team science, of the importance of research networks and resource sharing, of the need to center research within practice and community, and of the scientific innovation that comes from integrating conceptual models, data sources, and methodological approaches from seemingly disparate fields. The session is co-chaired by Dr. Robert Taylor, longtime faculty

member and current PI of MCAAAR. The talk by session chair Dr. Briana Mezuk will discuss the ways in which the training approach of Analysis Core has inspired new training programs on integrative methods focused on minority health and disparities. The talk by Dr. Tam Perry will describe the innovations of the Community Liaison and Recruitment Core, including how COVID-19 impacted the activities of the Healthier Black Elder Center. The third talk by Dr. Rodlescia Sneed, a MCAAAR early-career scientist, provides an example of how this Center supports interdisciplinary minority aging research through her project focused on older adults who have a history of incarceration. Finally, Discussant Dr. Roland Thorpe, a member of the MCAAAR Advisory Board, will reflect on Dr. Jackson's legacy of mentorship and collaboration.

METHODS TRAINING TO ADVANCE INTEGRATIVE SCIENCE ON MINORITY AGING

Briana Mezuk,¹ Monica Firestone,² and Wassim Tarraf,³

1. *University of Michigan, Ann Arbor, Michigan, United States*,
2. *Department of Epidemiology, University of Michigan School of Public Health, Michigan, United States*, 3. *Institute of Gerontology & Department of Healthcare Sciences, Wayne State University, Detroit, Michigan, United States*

Minority aging is an inherently interdisciplinary field. However, it can be difficult for early-career investigators to develop skills on how to integrate data sources, study designs, measurement approaches, and analytic tools from disparate fields into their research programs. This session will illustrate how the biopsychosocial framework has been used to structure the content and delivery of methods training related to minority health/aging research in two NIH-funded exemplar programs: the MCAAAR Analysis Core, and the Michigan Integrative Well-Being and Inequality (MIWI) Training Program. This talk will illustrate how the 20-year history of MCAAAR informed the development of MIWI, and how both initiatives approach early-career scientist training through: i) centering learning within a mentorship structure to model team science, ii) avoiding false dichotomizes and hierarchies in study designs and data sources, and iii) attending to the unique challenges faced by scientists working in minority health through knowledge sharing.

PROMOTING CONNECTIONS THROUGH CREATIVE APPROACHES TO RESEARCH ENGAGEMENT FOR OLDER AFRICAN AMERICANS

Tam Perry,¹ Jamie Mitchell,² Kent Key,³ Vanessa Rorai,⁴ Sean Knurek,⁵ and Peter Lichtenberg,¹ 1. *Wayne State University, Detroit, Michigan, United States*, 2. *University of Michigan School of Social Work, Ann Arbor, Michigan, United States*, 3. *Michigan State University, Flint, Michigan, United States*, 4. *Wayne State University Institute of Gerontology, Detroit, Michigan, United States*, 5. *Michigan State University, Corunna, Michigan, United States*

This presentation will feature innovative retention approaches that contributed to sustaining connections to older Black participants in the long-standing Healthier Black Elders Center (HBEC). The HBEC aims to address and reduce health disparities through research and education. In 2020, this outreach has included a telephone outreach program and a weekly social group, "The Party Line," to promote

connections and collect data on mental health, coping mechanisms and newly acquired skills, as well as health care access including access to masks, testing and tele-health. The presentation will also describe tailored approaches to initiating a Community Advisory Board and programming in Flint, MI and creative efforts to retain participants in Detroit, MI, thus ensuring the relationships between researchers and older community members are sustained despite program modifications.

SOCIAL RELATIONSHIPS AND SOCIAL ENGAGEMENT AMONG AFRICAN AMERICAN ADULTS WITH A HISTORY OF INCARCERATION

Rodlescia Sneed, Bridget Farmer, and Jennifer Johnson, *Michigan State University, Flint, Michigan, United States*

Strong social relationships and social engagement are crucial for both successful aging and successful community re-entry after incarceration. Here, we utilized a mixed methods approach to understand the impact of incarceration on social relationships and social engagement among formerly incarcerated community-dwelling African-American adults aged >50. Participants in the 2012 or 2014 waves of the Health and Retirement Study answered questions regarding prior incarceration, social relationships, and participation in social activities. Additionally, we utilized key informant interviews to further explore how incarceration might impact relationships and social engagement. This presentation will describe quantitative associations between prior incarceration and social relationship structure & function. Further, we will use our qualitative interview data to further explore possible explanations for our findings. Finally, we will describe how MCAAAR Scientist/Faculty interactions facilitated this work.

Session 3160 (Paper)

Alzheimer's Disease II (HS Paper)

ASSOCIATION BETWEEN LATE-LIFE HYPERTENSION AND RESILIENCE TO ALZHEIMER DEMENTIA AMONG OLDER ADULTS

Mo-kyung Sin,¹ and Yan Cheng,² 1. *Seattle University, Seattle, Washington, United States*, 2. *George Washington University, Washington, District of Columbia, United States*

While midlife hypertension is known as one contributing factor for cognitive impairment and Alzheimer dementia in late-life older adults, less is known about the role of late-life hypertension in resilience to Alzheimer dementia. We examined the relationship between late-life hypertension and Alzheimer dementia resilience among older adults using the National Alzheimer's Coordinating Center data from 2005-2020 (n=3,170). Hypertension, captured within 5 years prior to death, was defined as blood pressure (BP) \geq 140/90 mmHg in at least two visits and/or ever treated with anti-hypertensive agents. Resilience was defined as positive Alzheimer disease (AD) pathology (CERAD score moderate or severe and BRAAK stage V or VI) from autopsy and Clinical Dementia Rating (CDR) - Sum of Boxes (SOB): 0.5-2.5 or CDR global (0-0.5) from last data point before autopsy. Student's t-tests and Chi-square tests were conducted to compare patients

with and without resilience. A multivariate logistic regression was conducted to estimate the association between late-life hypertension and resilience, adjusting for covariates of demographics and neuropathological characteristics. We had 55 resilient cases among 1,195 positive AD pathology cases. Those resilient were older (88 ± 6.7) and had higher systolic BP (136 ± 18.2 mmHg) than non-resilient (82 ± 7.9 years old, 130 ± 20 mmHg). Untreated hypertension had a protective effect on resilience (adjusted OR: 3.69 (1.10-13.5, $p=0.05$)). Patients with a systolic BP in the range of 135-145 mmHg and a diastolic BP in the range of 65-75 mmHg had the highest resilience possibility. Unlike midlife hypertension, late-life hypertension may have different effect on dementia, prompting further studies.

LINKS OF AUTOIMMUNE THYROID DISORDERS TO ALZHEIMER'S DISEASE FOR MEDICARE BENEFICIARIES AGES 65+

Stanislav Kolpakov Nikitin,¹ Arseniy Yashkin,² and Igor Akushevich,¹ 1. *Duke University, Durham, North Carolina, United States*, 2. *Duke University, Morrisville, North Carolina, United States*

To explore racial disparities in the interaction between Hashimoto thyroiditis (HT), Graves disease (GD), and Alzheimer's disease (AD) we used age-adjusted rates for Medicare beneficiaries aged 65+. We investigated race/ethnicity/gender-specific trends of age-adjusted prevalence of HT and GD over 1991-2017 and used the Cox proportional hazards model with propensity score matching to explore the associations between AD and these thyroid disorders. The total age-adjusted prevalence of GD was increasing over the study period reaching a maximum of 0.35% in 2014 followed by a gradual decline. Except for relatively high prevalence rates in Native American Males, no statistically significant sex/race-related differences were identified. GD was found to be associated with an increased risk of AD onset [HR: 1.129; CI: 1.050-1.215]. The mechanism of interaction between thyroiditis and AD could follow several alternative pathways. The primary mechanism involves changes in blood vessel function, mostly arterial wall stiffness, which leads to increased pulse wave velocity and consequently to the higher amplitude of oscillation of the peripheral microcapillary system in the brain leading to cerebral leukoariosis and damage in kidney tissue. This, in turn, leads to kidney diseases (themselves associated with AD/ADRD), increased for HT and decreased for GD LDL cholesterol levels and an increased for HT and decreased for GD total/HDL cholesterol ratio, which has an important role in increased common carotid intima-media thickness (CIMT) in hypothyroid patients and is linked to arteriosclerosis. Additionally, both, endothelial dysfunction and arterial stiffness are risk factors for coronary or artery disease and consequently increase risks for AD/ADRD.

NEIGHBORHOOD GREENSPACE AND COGNITION: THE CARDIOVASCULAR HEALTH STUDY

Sara Godina,¹ Andrea Rosso,¹ Gina Lovasi,² Lilah Besser,³ Jana Hirsch,⁴ Jonathan Platt,⁵ Annette Fitzpatrick,⁶ and Yvonne Michael,⁷ 1. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2. *Drexel Dornsife School of Public Health, Philadelphia, Pennsylvania, United States*,

3. *Florida Atlantic University, Boca Raton, Florida, United States*, 4. *Drexel University, Philadelphia, Pennsylvania, United States*, 5. *Columbia University Mailman School of Public Health, New York, New York, United States*, 6. *University of Washington, Seattle, Washington, United States*, 7. *Drexel University, PHILADELPHIA, Pennsylvania, United States*

Access to greenspace has been positively associated with cognition among older adults, however prior research has been limited in temporal and geographic scope. We evaluated associations between neighborhood greenspace and incidence of dementia and change in cognitive functioning using a longitudinal sample of non-demented adults ($n=2,465$) from the Cardiovascular Health and Cognition Study. Percent greenness (1-km radial buffers) was derived from the National Land Cover Dataset. Cognitive function was measured using the Mini-Mental State Examination (3MSE) and dementia status was clinically adjudicated. Cox proportional hazard and logistics regression analyses were used to examine associations of baseline greenness with risk of incident dementia and risk of mild cognitive impairment, respectively. Generalized linear mixed models accounting for within-subject correlations were used to examine the association between greenspace in the neighborhood at baseline and 3MSE score (1991-1999). Ongoing results will be presented, along with modifiers and mediators of associations.

PREVENTABLE HOSPITALIZATIONS IN ADULTS WITH ALZHEIMER'S DISEASE AND RELATED DEMENTIAS: UNITED STATES, 2016-2018

Benjamin Olivari,¹ Christopher Taylor,¹ Roshni Patel,² Raza Lamb,³ Matthew Baumgart,³ and Lisa McGuire,⁴ 1. *Centers for Disease Control and Prevention (CDC), Atlanta, Georgia, United States*, 2. *Center for Disease Control and Prevention, Atlanta, Georgia, United States*, 3. *Alzheimer's Association, Chicago, Illinois, United States*, 4. *CDC, Atlanta, Georgia, United States*

Alzheimer's disease and related dementias (ADRD) are a significant public health burden. Preventing hospitalizations in adults with ADRD is a public health priority. Data from the 2016-2018 Healthcare Cost Utilization Project National Inpatient Sample, an all-payer representative sample of US hospitalizations, were used to describe potentially preventable hospitalizations in adults ≥ 45 years with ADRD using International Classification of Disease, Tenth Edition, Clinical Modification (ICD-10-CM) codes. Definitions for principal or any-listed ICD-10-CM codes from the Agency for Healthcare Research and Quality defined potentially preventable hospitalizations where admissions might have been avoided by appropriate outpatient primary care management. Of discharges in adults ≥ 45 years with a potentially preventable hospitalization diagnosis, 11.4% ($N=389,155$) had a diagnosis of ADRD listed in any position. Of those discharges with ADRD, a significantly higher proportion (82.6%) with diagnosis related to potentially preventable hospitalizations were aged ≥ 75 years compared to 78.9% without potentially preventable hospitalizations. Additionally, of those with ADRD and potentially preventable hospitalization diagnoses, a higher proportion died in the hospital (5.7%) compared to those without potentially preventable hospitalization diagnoses (3.4%). The most

common potentially preventable hospitalization diagnoses among adults with ADRD were related to sepsis (34.0%), injuries (20.8%), urinary tract infections (14.2%), and heart failure (12.7%). Measures focusing on preventing injuries as well as identifying early signs and symptoms of potentially preventable hospitalizations like urinary tract infections and sepsis in adults with ADRD could reduce the number of preventable hospitalizations in this population.

THE EFFECT OF TRAUMATIC BRAIN INJURY ON ALZHEIMER'S DISEASE AND COGNITIVE DECLINE IN VETERANS AND NON-VETERANS

Igor Akushevich,¹ Arseniy Yashkin,²
Stanislav Kolpakov Nikitin,¹ and Julia Kravchenko,¹
1. *Duke University, Durham, North Carolina, United States*,
2. *Duke University, Morrisville, North Carolina, United States*

We assess the differences in the effect of traumatic brain injury (TBI) on the decline in cognitive status and the risk of Alzheimer's disease and related dementia (AD/ADRD) between veteran and non-veteran respondents of the Health and Retirement Study (HRS) and measure the sensitivity of these differences to the incremental introduction of controls for associated risk factors. Three groups of AD/ADRD risk-related variables were used: i) demographic/socioeconomic factors, including gender, race, marital status, education, income, and the number of limitations in activities of daily living; ii) comorbidities, including co-existing depression/post-traumatic stress syndrome (PTSD), substance (alcohol, tobacco and/or prescription drug) abuse, diabetes mellitus, stroke, and heart failure; and iii) genetic factors, including the presence of at least one pair of the APOE4 allele and a series of polygenic risk scores associated with AD hallmarks. The dynamics of changes in cognitive impairment in response to TBI, PTSD, and mild cognitive impairment were validated against respective measures estimated using the Department of Defense Alzheimer's Disease Neuroimaging Initiative (DoD-ADNI) data. The results of the analyses showed that TBI and PTSD were strongly associated with cognitive decline and the risks of AD/ADRD in both veteran and non-veteran subpopulations in HRS data and the difference between them was not statistically significant. Effect magnitude decreased with the addition of risk-related control variables but remained associated with the increased risks. Prevalence of mild cognitive impairment was associated with TBI at baseline in DoD-ADNI data, but no cognitive decline was observed during one year of follow-up.

Session 3165 (Symposium)

BREAKING NEW GROUND: INCENTIVIZING INNOVATIVE CAREGIVING PROGRAMS

Chair: C. Grace Whiting

Discussant: Theresa Harvath

Caring for someone with chronic illness is a demanding job, and as a result 46% of caregivers caring for adults with chronic illnesses report a significant level of burden (AARP and National Alliance of Caregiving, 2015). Recent reviews note a prevalence rate of 31.2% for depression (Collins & Kishita, 2019) and 32.1% for anxiety (Kaddour & Kishita, 2020). In addition, most caregivers also report high levels

of negative emotions including frustration, guilt, and a sense of hopelessness regarding the future (Schulz & Eden, 2016). This symposium will focus on innovative programming to address caregiver needs and concerns. The first presenter will set the foundation as she explores her caregiver journey and the issues she experienced as a caregiver. Using her personal experience, this healthcare professional will explore her interactions with the medical system as a caregiver, including the unique issues experienced during the pandemic. The second presenter will examine why are caregiver program needed, what benefits can be expected, and what is considered best practices when addressing the unmet needs of family caregivers in caregiver programs. The third and fourth presenters will discuss two exemplar caregiving programs - Caregiver Clinic at the Memorial Sloan Kettering Cancer Center and the Caregiver Initiative from the Rush University Medical Center. They will describe the program, the process of creation, funding, barriers experienced, and working solutions. Pertinent data regarding the integration of the programs within the medical systems, the programs scope, and the effects of the pandemic on the programs will be shared.

THE LONG AND WINDING ROAD: A CAREGIVER'S JOURNEY

Dolores Gallagher-Thompson,¹ and Theresa Harvath,²
1. *Stanford University School of Medicine, LOS ALTOS, California, United States*, 2. *University of California, Davis, UC Davis, California, United States*

In a discussion about innovative caregiving programs, it is important to hear the voice of the caregiver. In this section, using her personal experience, this healthcare professional will explore her interactions with the medical system as a caregiver for her partner. She will discuss her caregiver journey from the cancer diagnosis in 2014 through her partner's final days in hospice, which occurred during the pandemic. She will discuss pertinent issues regarding in what ways the healthcare system response was helpful, which responses were problematic, and where it outright failed to address caregiver needs. Issues, such as caregiver perceived invisibility during the hospital stay, how ageism affected policy decisions and what effect those policies had on her as the caregiver, and other important issues will be explored, including the how the pandemic affected her as a caregiver.

CAREGIVER SERVICES: NEEDS, BENEFITS, AND BEST PRACTICES

Susan Reinhard, *AARP Public Policy Institute, Washington, District of Columbia, United States*

Just under 1 in 5 Americans (19.2%) are caregivers for adults with chronic illnesses. Caregiving is the great equalizer as caregiving remains an activity that occurs among all generations, racial/ethnic groups, income or educational levels, family types, gender identities, and sexual orientations. This presentation will provide a snapshot of the current status of caregiving in the United States. It will explore why caregiver services are needed and will highlight the impacts many caregivers face as a result of their stepping up to help family and friends. In addition, this presentation will discuss what is considered best practice in caregiver services and how the public and private sectors can work together to develop solutions to support family caregivers and those under their care.

CAREGIVERS CLINIC AT MEMORIAL SLOAN KETTERING CANCER CENTER

Allison Applebaum, *Memorial Sloan Kettering Cancer Center, New York, New York, United States*

The mission of the Caregivers Clinic at Memorial Sloan Kettering Cancer Center (MSK) is to assure that no caregiver of an MSK patient experiencing significant distress as a result of their caregiving responsibilities goes unidentified and deprived of necessary psychosocial services. This presentation will cover the steps taken and barriers faced in the development of the Clinic, including advocating for caregivers to receive their own unique medical records. Data regarding the number of caregivers seen for psychotherapy and for medication management will be presented, as will data regarding presenting complaints and average length of care. Also included is a discussion of the challenges faced in expanding and maintaining the capacity of the Clinic, especially in the setting of the pandemic during which caregivers' use of psychosocial care at MSK is notably higher than in years past. Several current adjunct approaches to address capacity needs currently being piloted will be discussed.

THE RUSH CAREGIVER INITIATIVE: A MODEL FOR CAREGIVER HEALTH AND WELLNESS IN AGE-FRIENDLY HEALTH SYSTEMS

Robyn Golden,¹ Leslie Pelton,² and Ellen Carbonell,¹

1. *Rush University Medical Center, Chicago, Illinois, United States*, 2. *Institute for Healthcare Improvement, Boston, Massachusetts, United States*

The Rush Caregiver Health and Well-Being Initiative (Caregiver Initiative) draws together evidence-based practices into a single framework to improve care for older adults and caregivers. The Caregiver Initiative has two components: system-level and caregiver level interventions. The complexities of system change take place within leadership, data management, and provider teams throughout the health care system, and solutions to resistance have been developed. Caregiver-level interventions start with an assessment using evidence-based tools, and offer an opportunity to participate in a Teach-Back Clinic, Family Care Planning sessions, and/or Goals of Medical Care meetings, all connected to the 4Ms of an Age-Friendly Health System. Contact and follow-up issues were addressed, and as of February 2021, 191 caregivers have enrolled. Outcomes to date show statistically and clinically significant reductions in depression, anxiety, and caregiver burden. This presentation will highlight lessons learned in the development of the model and caregiver outcomes to date.

Session 3170 (Symposium)

CHALLENGES OF IMPLEMENTING THE PRISM 2.0 TRIAL FOR SUPPORTING SOCIAL CONNECTIVITY THROUGH TECHNOLOGY

Chair: Walter Boot

Co-Chair: Sara Czaja

Discussant: Dana Plude

Following the success of the Personal Reminder Information and Social Management (PRISM) trial, which found that a specially designed computer system for older

adults can enhance social connectivity and reduce loneliness among older adults at risk for social isolation, the PRISM 2.0 trial sought to replicate and extend these results to a new technology platform (tablet rather than desktop) with expanded social features and diverse populations of older adults, including older adults living in rural areas, assisted living communities, and senior housing. This symposium discusses the aims of the trial conducted by the Center for Research and Education on Aging and Technology Enhancement (CREATE), challenges encountered (including challenges related to the COVID-19 pandemic), and solutions to those challenges. S. Czaja will begin with an overview of the PRISM 2.0 system and the trial. J. Sharit will discuss challenges encountered working within the context of assisted living facilities and with impaired participants. This will be followed by a discussion of technical challenges encountered during the course of the trial presented by N. Charness. W. Rogers will present training issues involved (both with respect to participants and assessors). Finally, W. Boot will describe challenges encountered with measuring and quantifying technology use during the trial. Lessons learned are applicable to many types of technology interventions administered in diverse contexts. D. Plude, Deputy Director in the Division of Behavioral and Social Research of NIA, will serve as discussant.

PRISM 2.0: A TECHNOLOGY SYSTEM TO SUPPORT RESOURCE ACCESS AND SOCIAL AND COGNITIVE ENGAGEMENT

Sara Czaja,¹ Walter Boot,² Neil Charness,² Wendy Rogers,³ and Joseph Sharit,⁴ 1. *Weill Cornell Medicine/Center on Aging and Behavioral Research, New York, New York, United States*, 2. *Florida State University, Tallahassee, Florida, United States*, 3. *University of Illinois Urbana-Champaign, Champaign, Illinois, United States*, 4. *Department of Industrial Engineering, University of Miami, Coral Gables, Florida, United States*

Social isolation and lack of engagement are common among older adults and present a risk for emotional, physical and cognitive decline. Technology offers the potential of remediating these risks and enhancing opportunities for connectivity. In this paper we present an overview of the PRISM 2.0 multi-site RCT, which evaluated a simple to use Personalized Reminder Information and Social Management System (PRISM) among a sample of two hundred and forty-eight adults age 65+ in diverse contexts (Rural Locations, Assisted Living Communities and Senior Housing). PRISM 2.0 is a tablet-based system, intended to provide support for access to resources and information, new learning, social and cognitive engagement, and memory. We describe the goals and content of PRISM, the user-centered design process, and measurement strategies. We also discuss the challenges of conducting the trial during the COVID-19 pandemic and the strategies used to adapt the trial protocol within the three contexts.

CHALLENGES OF IMPLEMENTING THE PRISM 2.0 CLINICAL TRIAL WITH ASSISTED LIVING AND IMPAIRED PARTICIPANTS

Joseph Sharit,¹ Sara Czaja,² Jerad Moxley,³ and Carlos Almirola,⁴ 1. *Department of Industrial Engineering, University of Miami, Coral Gables, Florida, United States*,

2. *Weill Cornell Medicine/Center on Aging and Behavioral Research, New York, New York, United States*, 3. *Weill Cornell Medicine, New York, New York, United States*, 4. *University of Miami Miller School of Medicine, Miami, Florida, United States*

The PRISM 2.0 clinical trial examined the benefits of a software system, implemented on a computer tablet, which was designed to support access to information, engagement, and social connectivity among older people. Participants across three sites were recruited from rural locations, senior living housing facilities, and assisted living facilities (ALFs) and correspondingly randomized into either the Prism or control (tablet computer without the PRISM system) conditions. In this talk, we focus on the challenges associated with including ALF participants at key stages of the trial. These stages included telephone prescreening, baseline assessment, training on the system, and 6-, 9-, and 12-month follow-up assessments. Inability to meet inclusion criteria related to cognitive and sensory-motor considerations was a common problem, as was the ability to sustain attention during the training sessions. Recommendations for recruitment and retaining older adults in ALFs for these types of studies will be offered.

PRISM 2.0: TECHNICAL CHALLENGES

Neil Charness,¹ Walter Boot,¹ Sara Czaja,² Wendy Rogers,³ and Joseph Sharit,⁴ 1. *Florida State University, Tallahassee, Florida, United States*, 2. *Weill Cornell Medicine/Center on Aging and Behavioral Research, New York, New York, United States*, 3. *University of Illinois Urbana-Champaign, Champaign, Illinois, United States*, 4. *Department of Industrial Engineering, University of Miami, Coral Gables, Florida, United States*

PRISM 2.0 was designed to run on Android tablets and made use of both customized apps that relied on Google's browser and e-mail functionality as well as commercial apps, such as Microsoft's Skype for videoconferencing. We also made use of functionality provided by our partner AT&T, such as their sim cards to provide cell-based internet connectivity to participants who did not have access to Wi-Fi internet services to their home (cable, DSL), as well as tablet management software to deploy updates. The Miami site provided central management and tablet deployment and redeployment services and support as well as coordinating locally provided tech support at the three sites. We discuss some of the technical challenges associated with these arrangements. We focus on how changes to the operating system broke some of our apps necessitating substitution of other apps and provision of new training, and how Covid-19 affected technical support.

TRAINING CHALLENGES FOR EFFECTIVELY IMPLEMENTING A TECHNOLOGY CLINICAL TRIAL: A SNAPSHOT FROM PRISM 2.0

Wendy Rogers,¹ Tracy Mitzner,² Kara Cohen,³ and Jerad Moxley,⁴ 1. *University of Illinois Urbana-Champaign, Champaign, Illinois, United States*, 2. *Georgia Institute of Technology, Atlanta, Georgia, United States*, 3. *Georgia Institute of Technology, Atlanta, Georgia, United States*, 4. *Weill Cornell Medicine, New York, New York, United States*

Technology interventions can only be adequately assessed for efficacy if participants are adequately trained to use the

technology. Only then can an evaluation be made about whether the technology intervention affects the outcome of interest. In the PRISM study, our goal was to teach inexperienced older adults to use either a tablet computer (control) or the PRISM 2.0 system. In this presentation we will discuss the training processes we used for both groups (e.g., segmenting sessions, providing homework, observations), to enable us to evaluate the relative benefits of PRISM for social connectedness. We will describe the training challenges and the need for assessors to be able to troubleshoot technology issues. We will evaluate individual differences in training success and drop-outs to provide insights for other technology intervention studies. Understanding these individual differences can provide guidance for the deployment of new technologies that may benefit health, social interaction, or cognitive engagement.

CHALLENGES OF QUANTIFYING PRISM 2.0 AND TABLET USE

Walter Boot,¹ Neil Charness,¹ and Jerad Moxley,² 1. *Florida State University, Tallahassee, Florida, United States*, 2. *Weill Cornell Medicine, New York, New York, United States*

As with the PRISM 1.0 trial, an important outcome of the PRISM 2.0 trial is use of the PRISM system and use of the PRISM system compared to the control condition (a standard tablet without the PRISM software). Frequent use over time is an important measure of system success. Further, use data provide key measures of system usefulness and usability. What features do participants use most and how often? Within those features, what activities do they engage in? What are the patterns of use throughout the trial, and how does PRISM system use compare to the control condition? However, quantifying use is not an easy task. This talk presents the challenges of quantifying use of a complex, multi-faceted system, and of making meaningful comparisons in use between two very different systems. Analysis approaches and solutions are discussed.

Session 3175 (Paper)

Cognitive Aging I

COGNITION-MORTALITY ASSOCIATIONS ARE STRONGER WHEN ESTIMATED JOINTLY IN LONGITUDINAL AND TIME-TO-EVENT MODELS

Stephen Aichele,¹ Sezen Cekic,² Patrick Rabbitt,³ and Paolo Ghisletta,² 1. *Colorado State University, Fort Collins, Colorado, United States*, 2. *University of Geneva, University of Geneva, Geneva, Switzerland*, 3. *University of Oxford, University of Oxford, England, United Kingdom*

Objectives: With aging populations worldwide, there is growing interest in links between cognitive decline and elevated mortality risk—and, by extension, analytic approaches to further clarify these associations. Toward this end, some researchers have compared cognitive trajectories of survivors vs. decedents while others have examined longitudinal changes in cognition as predictive of mortality risk. A two-stage modeling framework is typically used in this latter approach; however, several recent studies have used joint longitudinal-survival modeling (i.e., estimating

longitudinal change in cognition conditionally on mortality risk, and vice versa). Methodological differences inherent to these approaches may influence estimates of cognitive decline and cognition-mortality associations. These effects may vary across cognitive domains insofar as changes in broad fluid and crystallized abilities are differentially sensitive to aging and mortality risk. Methods: We applied each of the above analytic approaches to data from a large-sample repeated-measures study of older adults (N = 5,954, of whom 4,453 deceased; ages 50–87 years at assessment). Results: Cognitive trajectories indicated worse performance in decedents and when estimated jointly with mortality risk, but this was attenuated after adjustment for health-related covariates. Better cognitive performance predicted lower mortality risk, and, importantly, cognition-mortality associations were stronger when estimated in joint models. Associations between mortality risk and crystallized abilities only emerged under joint estimation, confirming the greater power of this statistical approach. Discussion: These results suggest that joint estimation of cognition-mortality associations may be beneficial for research in cognitive epidemiology and cognitive reserve in adult development.

EFFECTS OF HEALTH-PROMOTING LIFESTYLES IN MIDLIFE ON COGNITIVE FUNCTIONING IN LATER LIFE

Eunsaem Kim,¹ Yunhwan Lee,¹ Jonggak Shin,² Gyeonghui Kim,² and Jihye Yoon,¹ *1. Ajou University School of Medicine, Suwon, Kyonggi-do, Republic of Korea, 2. Korea Employment Information Service, EUMSEONG-GUN, Ch'ungch'ong-bukto, Republic of Korea*

Maintaining cognitive function in later life is key to healthy aging because cognitive impairments compromise everyday functional abilities, impeding independent living. Numerous studies have discovered early life experiences and lifestyle behaviors over the lifespan to have substantial influences on cognitive functioning with age. Especially, subtle brain changes related to dementia occur as early as midlife, and lifestyle factors in midlife influence neuropathological development, suggesting that midlife is a critical period for preserving cognitive health in later life. This study investigated the association between lifestyle behaviors in midlife and cognitive performance in later life using 12-year follow-up data from the Korean Longitudinal Study on Aging (KLoSA). Cognitive function was assessed with the Harmonized Cognitive Assessment Protocol (HCAP) for KLoSA. Eight thousand respondents from the KLoSA sample were administered HCAP neuropsychological tests. Hierarchical multiple regression analyses were used to examine whether health-promoting lifestyles at baseline (2006) predicted cognitive function in 2018 after controlling for health-related covariates. We identified a positive influence of health-protective behaviors (non-smoking, moderate drinking, regular exercise, weight management, and health screening) at baseline on language abilities in 2018 ($\beta = .05$, $p < .05$). In addition, health-promoting behaviors covering interpersonal relationships, social engagement, optimistic outlook, and positive attitudes at baseline were predictive of language abilities ($\beta = .08$, $p < .01$), executive function ($\beta = .06$, $p < .01$), and the visuospatial ability ($\beta = .06$, $p < .05$) in 2018. This study highlights the importance of midlife

health-promoting lifestyles in maintaining cognitive health in later life.

HAPLOGROUPS OF MITOCHONDRIAL DNA DIFFERENTIATE PATTERNS OF COGNITIVE CHANGE OVER 7 YEARS

Amber Watts,¹ Elias Michaelis,¹ and Russell Swerdlow,² *1. University of Kansas, Lawrence, Kansas, United States, 2. University of Kansas Alzheimer's Disease Center, Fairway, Kansas, United States*

Mitochondrial DNA (mtDNA) may play an important role in Alzheimer's disease (AD) and cognitive decline. A particular haplogroup of mtDNA (haplogroup J), has been observed more commonly in patients with AD than in cognitively normal controls. We used mtDNA haplogroups to predict change in cognitive performance over seven years. We hypothesized that haplogroup J would predict poorer cognitive function and steeper cognitive decline. We analyzed data from 140 cognitively normal older adults (age 65+) who participated in the University of Kansas Alzheimer's Disease Center annual registry. We used factor analysis to create three composite scores (verbal memory, attention, executive function) from 11 individual cognitive tests. We performed latent growth curve modeling to describe trajectories of cognitive performance and change. We compared haplogroup H, the most common, to haplogroup J, the potential risk group. Results indicated haplogroup J carriers had significantly lower baseline performance ($B = -.049$, $p < .01$) and slower rates of improvement ($B = -.046$, $p < .05$) on tests of verbal memory compared to haplogroup H. For executive function, groups did not differ at baseline ($B = .065$, $p > .10$), but haplogroup J had slower rates of improvement ($B = -.097$, $p < .01$). There were no differences in attention across groups in performance ($B = .135$, $p > .10$) or change ($B = -.01$, $p > .10$). Our results reinforce the important role of mtDNA in changes to cognitive function with aging and imply that the effects of haplogroup J may vary across cognitive domains. Future research should investigate the mechanisms by which mtDNA might affect performance on specific cognitive domains across haplogroups.

OLDER ADULTS' ENGAGEMENT IN COGNITIVELY STIMULATING ACTIVITIES PRIOR TO THE PANDEMIC PREDICTS LONELINESS

Lilian Azer,¹ Isaac Quintanilla Salinas,¹ Esra Kürüm,¹ Leah Ferguson,¹ Elizabeth Davis,¹ Weiwei Zhang,¹ Carla Strickland-Hughes,² and Rachel Wu,³ *1. University of California, Riverside, Riverside, California, United States, 2. University of the Pacific, University of the Pacific, California, United States, 3. University Of California - Riverside, Riverside, California, United States*

Loneliness, which may be more prevalent in older than younger adults, may lead to increased subjective cognitive decline and cognitive impairment may in turn predict perceived loneliness. COVID-19 physical distancing restrictions may exacerbate perceived loneliness, especially that experienced by older adults. The present study investigated whether self-reported cognitive abilities (i.e., executive functions) would predict loneliness during the COVID-19 pandemic. Younger (YA; n = 136, 18-35 years), middle-aged (MA; n = 126, 36-54 years), and older (OA; n = 171, 55-88 years) adults

completed questionnaires assessing self-reported executive functions (EF) and perceived loneliness using the BRIEF-A and UCLA Loneliness scale respectively. Forty-nine of the 171 older participants partially completed a cognitive learning intervention, which has previously been found to increase EF. In the current study, age group did not significantly predict perceived loneliness. However, OA who participated in the prior intervention reported less loneliness than those who did not participate in the intervention. Additionally, OA who participated in the intervention and self-reported worse EF during the current study, also reported feeling lonelier than adults who did not participate in the intervention. Although results from our prior research found most OA who participated in the intervention improved their EF, the results from the current study suggest that it left them more susceptible to the negative effects of physical distancing restrictions if they had lower self-reported EF during the pandemic. Decreased engagement, real or perceived, in cognitively stimulating activities due to the pandemic strengthens the relationship between lower self-reported EF and perceived loneliness.

THE IMPACT OF GROWTH MINDSET ON OLDER ADULTS' COGNITIVE FUNCTIONING IN A MULTI-SKILL LEARNING INTERVENTION

Pamela Sheffler,¹ Esra Kürüm,¹ Angelica Sheen,² Leah Ferguson,¹ Diamond Bravo,¹ George Rebok,³ Carla Strickland-Hughes,⁴ and Rachel Wu,⁵ 1. *University of California, Riverside, Riverside, California, United States*, 2. *University of California, Irvine, Irvine, California, United States*, 3. *Johns Hopkins University, Baltimore, Maryland, United States*, 4. *University of the Pacific, University of the Pacific, California, United States*, 5. *University Of California - Riverside, Riverside, California, United States*

Motivational factors, such as perceived control and self-efficacy, have been shown to affect older adults' cognitive functioning. Growth mindset, the belief in the malleability of intelligence and abilities, represents a related but distinct factor that has been widely studied in children and young adults' learning but less applied to the older adult population. Two studies investigated growth mindset, motivation, and cognitive functioning in a 3-month multi-skill learning intervention that incorporated weekly discussions on growth mindset and successful aging. Participants reported on their growth mindset, general pursuit of novel skill learning, and intrinsic motivation to learn, and completed a cognitive battery before, during, and after the intervention. Study 1 (n = 15, 67% female, M age = 68.67 years, SD age = 8.68, range 58-86) included both an experimental and control group and indicated that from pretest to post-test, intervention participants increased their growth mindset, while control participants did not. Study 2, which included a larger, all experimental sample (n = 28, 68% female, M age = 69.36 years, SD age = 7.00, range 58-86) revealed strong positive associations between growth mindset, pursuit of novel skill learning and intrinsic motivation. Further, participants showed a significant increase in growth mindset from pretest to post-test. Participants with higher pre-existing growth mindset showed larger cognitive gains at post-test, although growth mindset change did not affect post-test change in cognitive functioning. These findings suggest that growth mindset may facilitate older adults'

continued learning and cognitive gains, and they may complement older adult learning interventions.

Session 3180 (Symposium)

CONDUCTING RESEARCH IN PERSONS WITH DEMENTIA DURING THE COVID-19 PANDEMIC: CHALLENGES AND STRATEGIES

Chair: Ying-Ling Jao

Co-Chair: Diane Berish

Discussant: Ann Kolanowski

The COVID-19 pandemic has caused a health crisis for vulnerable older adults, physically and psychologically. Despite the urgent demand for clinical research for people with dementia, research activities are restricted due to the pandemic. This symposium will share the experiences of researchers conducting studies with older persons with dementia during the COVID-19 pandemic. The presenters share their strategies to overcome challenges at different stages of the study process during the pandemic. The research projects include work conducted in acute care, assisted living, nursing homes, and the community. The presentations include perspectives from different geographic areas and across countries in North America. The first presenter reports the challenges in continuing an ongoing research project, and shares strategies to engage stakeholders and plan a new protocol for recruitment and in-person data collection with residents with dementia in nursing homes. The second presenter reports on the barriers and facilitators of conducting an ongoing clinical trial with older adults with dementia across hospital and community settings and discusses strategies to meet project goals which include modifications to the protocol and analytic plan. The third presenter describes adaptations made to a study intervention designed to promote quality resident-staff interactions in assisted living and alterations to stakeholder engagement. The fourth presenter describes challenges and strategies to engage older adults with dementia via technology. The discussant will synthesize the findings across studies and highlight policy and research implications for the COVID-19 pandemic as well as other emergency situations.

EXAMINING CAREGIVER-RESIDENT COMMUNICATION AND APATHY IN DEMENTIA IN NURSING HOMES DURING THE COVID-19 PANDEMIC

Ying-Ling Jao,¹ Diane Berish,¹ Yo-Jen Liao,² and Marie Boltz,¹ 1. *Pennsylvania State University, University Park, Pennsylvania, United States*, 2. *Penn State University, University Park, Pennsylvania, United States*

This presentation shares lessons learned from conducting a study examining the impact of staff caregivers' communication approach on apathy in residents with dementia in nursing homes. Due to COVID-19 restrictions, this study had to be paused and required major revisions to continue, which resulted in significant delays and increased expenses. Additionally, this study required in-person data collection and video recordings to capture staff caregivers' communication with residents with dementia during caregiving activities. However, due to the pandemic, nursing home residents'

daily routines have been significantly changed, making it challenging to capture the nature of caregiver-resident interactions. Furthermore, using masks created unforeseen barriers for capturing communication between staff caregivers and residents including difficulties in identifying residents' facial expressions, which are a vital component of assessing apathy. The presentation describes approaches to communication with funders, collaborators, and clinical sites and discusses strategies to recruit participants and conduct data collection.

PILOT TESTING OF THE PROMOTING POSITIVE CARE INTERACTIONS (PPCI) IN ASSISTED LIVING STUDY DURING A PANDEMIC

Anju Paudel,¹ Elizabeth Galik,² Barbara Resnick,² Kelly Doran,² Marie Boltz,³ and Shijun Zhu,⁴ 1. *Penn State Ross and Carol Nese College of Nursing, University Park, Pennsylvania, United States*, 2. *University of Maryland School of Nursing, Baltimore, Maryland, United States*, 3. *Pennsylvania State University, University Park, Pennsylvania, United States*, 4. *University of Maryland, Baltimore, Maryland, United States*

The purpose of this study was to test the feasibility and preliminary efficacy of Promoting Positive Care Interactions (PPCI)—a four step intervention designed to establish positive care interactions between staff and residents with cognitive impairment or dementia in Assisted Living (AL). Initially designed as a traditional on-site intervention, PPCI was later transformed to be conducted remotely through webinar and virtual meetings due to challenges related to onsite engagement in AL during the COVID-19 pandemic. Additionally, the study adopted shorter timeline, a single group pretest-posttest design, and limited recruitment to staff only; 17 care staff were recruited, and data was collected via online surveys and interviews. PPCI was successfully implemented as intended with considerable stakeholder engagement. Findings demonstrated feasibility and promising staff adoption of PPCI. Continued research is needed to optimize the quality of care interactions in AL and evaluate whether on-line approach to staff training can change staff behavior.

CLINICAL RESEARCH IN THE HOSPITAL DURING THE PANDEMIC: WHAT'S WORKED AND NOT WORKED?

Marie Boltz,¹ Ashley Kuzmik,¹ Irene Best,¹ and Jacqueline Mogle,² 1. *Pennsylvania State University, University Park, Pennsylvania, United States*, 2. *Penn State University, University Park, Pennsylvania, United States*

Under normal conditions, the hospital setting presents multiple challenges to research with persons with dementia and their care partners. This presentation describes the additional barriers posed by the COVID-19 pandemic, as well as the strategies to meet those challenges, in a cluster randomized controlled trial that examines the efficacy of a nurse-family partnership to promote functional recovery of persons with dementia. In response to research restrictions, the research team altered their plan for recruitment, implementation of the intervention, data collection, and analytic approach. This presentation describes these alterations and discusses the plan to meet the aims of the project while meeting the requirements of the Institutional Review Board, accountability

to the funder, and university regulations. Modifications in staffing patterns, staff training, and procedures will also be discussed, as well as the study timeline. Finally, strategies to maintain a positive attitude and productivity within the team will be discussed.

SUPPORTING PATIENT ENGAGEMENT IN DEMENTIA RESEARCH VIA TECHNOLOGY DURING THE COVID-19 PANDEMIC

Lillian Hung,¹ Sophie Yang,¹ Mario Gregorio,² and Alison Phinney,¹ 1. *University of British Columbia, Vancouver, British Columbia, Canada*, 2. *Vancouver, British Columbia, Canada*

The COVID-19 pandemic brings challenges to patient partnerships in research. In-person research meetings with patient partners were prohibited. In this presentation, we outline specific issues we encountered in a patient-led dementia research project, which involved a literature review study and gathering community stakeholders to identify the top 10 local priorities in the development of a dementia-friendly community. We will describe how we found shared solutions to complete the project. In response to COVID, computers and training were provided for patient partners to maintain team connection, plan project activities, conduct team analysis, and host a community workshop in the lockdown time. The drastic shift to virtual research methods created barriers and opportunities for co-research with older people with dementia. Virtual meetings can generate inequities for those who do not have a computer and knowledge in videoconferencing. Practical strategies to overcome barriers to using virtual technologies will be explored.

Session 3185 (Symposium)

COPING WITH COVID-19: CHALLENGES AND RESILIENCE

Chair: Lauren Mitchell

Co-Chair: Lauren Mitchell

Discussant: Daniel Mroczek

COVID-19 has introduced unprecedented challenges for older adults. At the same time, older adults have adapted to meet the challenges of the pandemic. In this symposium, we explore a number of difficulties brought about by COVID-19, while also investigating the ways in which individual, social, and community resources and strengths have bolstered older adults' resilience through the pandemic. Paper 1 investigates family caregivers of older adults with dementia living in long-term residential care facilities, a group that has been especially heavily affected by the pandemic. Using longitudinal data spanning Fall 2017-Spring 2021, the authors estimate caregivers' trajectories of well-being pre-and-post pandemic. With an exceptionally large qualitative data sample, Paper 2 examines the influence of COVID-19 on older adults' neighborhood engagement. Thematic analysis has revealed diverse patterns of response to the pandemic, as well as community and personal characteristics that have facilitated older adults' coping and resilience. Papers 3 and 4 examine how older adults' personality traits may influence their responses and adjustment to the pandemic, each using assessments of personality taken before the pandemic. Specifically, Paper 3

investigates the relationship between Big Five personality traits and older adults' concerns, precautions, and preparatory behaviors. Paper 4 explores how optimism predicts older adults' emotional responses, including worry, loneliness, and benefit-finding. Using a variety of methods and populations, these studies illustrate the challenges that older adults and their families have faced over the past year, as well key factors at the level of individuals, relationships, and communities that have contributed to their resilience.

DEMENTIA CAREGIVERS' TRAJECTORIES OF WELL-BEING BEFORE AND DURING THE COVID-19 PANDEMIC

Lauren Mitchell,¹ Elizabeth Albers,² Robyn Birkeland,³ Colleen Peterson,³ Anna Drake,¹ and Joseph Gaugler,²
 1. *Emmanuel College, Boston, Massachusetts, United States*,
 2. *University of Minnesota, Minneapolis, Minnesota, United States*,
 3. *University of Minnesota, University of Minnesota, Minnesota, United States*

Residents of long-term care settings and their family caregivers have been severely impacted by the COVID-19 pandemic. The present mixed-methods study examines trajectories of well-being pre- and post-pandemic onset for caregivers of persons with dementia living in residential long-term care. Participants were taking part in, or had recently completed, an ongoing intervention trial to support families transitioning a relative into long-term care. Beginning in summer 2020, we started assessing caregivers' COVID-19-related experiences and added three surveys spanning 4-months beyond the 12-month parent study period to capture caregivers' adjustment throughout the pandemic. Using latent growth curve models, we estimated caregivers' ($N = 104$) trajectories of depressive symptoms, burden, and self-efficacy before and during the pandemic. We also tested whether the counseling intervention had protective effects for participants in the treatment group, and examined moderators including long-term care facility size, care recipient's dementia and health status, and quality of staff interactions.

OPTIMISM IS PROSPECTIVELY ASSOCIATED WITH RESILIENCE DURING THE COVID-19 PANDEMIC

William Chopik,¹ Jeewon Oh,¹ Mariah Puro,¹ and Eric Kim,²
 1. *Michigan State University, East Lansing, Michigan, United States*,
 2. *University of British Columbia, Vancouver, British Columbia, Canada*

Emerging research has identified how protective factors—like optimism—are associated with resilience to stress during the COVID-19 pandemic. However, the majority of research is cross-sectional, which creates ambiguity around the causal direction because these very protective factors might have also changed due to the pandemic. In the current study, we used longitudinal data from the Health and Retirement Study ($N = 921$; $Mage = 64.54$, $SD = 10.71$; 59.6% female; 57.5% White) to examine how optimism measured in 2016 predicted adjustment during the pandemic (in 2020). Higher baseline levels of optimism were subsequently associated with less worrying and stress resulting from changes in social contacts ($\beta s > 1.10$), less loneliness and not feeling overwhelmed ($\beta s > 1.16$), and greater COVID-related resilience and benefit-finding ($\beta = .21$). The findings will be discussed in

the context of mechanisms that facilitate the protective functions of optimism and other psychological characteristics.

AGING IN PLACE SINCE THE COVID-19 PANDEMIC ONSET: A QUALITATIVE STUDY OF NEIGHBORHOOD ENGAGEMENT

Jessica Finlay,¹ Lindsay Kobayashi,¹ Melissa Cannon,² and Gabriella Meltzer,³
 1. *University of Michigan, Ann Arbor, Michigan, United States*,
 2. *Western Oregon University, Independence, Oregon, United States*,
 3. *Department of Social and Behavioral Sciences, New York University, New York, United States*

The COVID-19 pandemic may fundamentally change neighborhood environments and ways of aging in place. This research aimed to investigate perceptions of and engagement in neighborhoods since the pandemic onset among online survey respondents of the COVID-19 Coping Study. We analyzed a random stratified sample of 500 open-ended responses collected July-September 2020 with quotas for age, gender, race/ethnicity, and education to match the US population aged 55+. Qualitative thematic analysis identified both increased and decreased local activity and varying levels of social interaction, support, and civic engagement. Community characteristics including age structure, socioeconomic diversity, density, housing patterns, weather, and social infrastructure were related to neighborhood perceptions. These interacted with personal characteristics such as duration of residence, living arrangements, family closeness, health status, and preferred lifestyle. Results highlight coping strategies among aging adults and their neighbors, sources of individual and community vulnerability, and opportunities to strengthen social infrastructure and resiliency within neighborhoods.

DOES PERSONALITY SHAPE COVID-19 RESPONSES IN OLDER ADULTS?

Damaris Aschwanden,¹ Angelina Sutin,² Amanda Sesker,² Ji Hyun Lee,³ Martina Luchetti,² Yannick Stephan,⁴ and Antonio Terracciano,⁵
 1. *Florida State University, Tallahassee, Florida, United States*,
 2. *Florida State University College of Medicine, Tallahassee, Florida, United States*,
 3. *University of Michigan, Ann Arbor, Michigan, United States*,
 4. *University of Montpellier, Montpellier, Languedoc-Roussillon, France*,
 5. *Florida State University, Florida, United States*

Knowing how personality plays out in a pandemic can provide guidance to improve public health messaging. In a sample of 2066 participants ($Mage = 51.42$; 48.5% female), we examined whether personality is associated with concerns, precautions, preparations, and duration estimates of the COVID-19 pandemic. Personality traits were measured before the pandemic; responses were assessed in late March 2020. We investigated whether age moderates the trait-response associations because older adults are at higher risk for severe complications of COVID-19. Among the 65-96-year-olds, higher conscientiousness was associated with more preparations, higher openness was associated with greater concerns, and both higher openness and agreeableness were related to more preparations and longer duration estimates. This pattern has implications: If all older adults took COVID-19 seriously, individual differences in

personality should not matter; however, our findings indicate that they do matter and could be considered in the development of personality-tailored communication to older adults.

Session 3190 (Paper)

Developmental Change Over the Life Course

CHILD'S DEVELOPMENTAL DISABILITIES AND PARENTAL HEALTH IN LATER LIFE: DO PARENTAL RACE AND GENDER MATTER?

Juha Lee,¹ Manjing Gao,² and Chioun Lee,² 1. *University of California, Riverside, Anaheim, California, United States*, 2. *University of California, Riverside, Riverside, California, United States*

Parents, particularly mothers, who experienced early life adversities (ELAs) are more likely to have a child with developmental disabilities (DD). We have little knowledge about how parental health varies across race-gender groups among those with a DD child and the role of ELAs in the associations. Using Black and White adults ($n = 8,778$; 25% Blacks) from the Midlife in the United States (MIDUS) study, we examine racial disparities in the impact of having a child with DD (vs. having healthy children) on parental health outcomes. This study questions (1) the extent to which parents' ELAs (e.g., poverty and abuse) are associated with having a child with DD and (2) how considering early-life factors reveals racial and gender disparities in the impact of having a child with DD. We found that as the number of ELAs increases, the probability of having a healthy child decreases for all race-gender groups, but most dramatically for Black women. Having a DD has adverse effects on chronic illnesses and functional limitations more for mothers than fathers. Black women are most adversely affected, with no effect on Black men. There is no gender difference in the impact of having a DD child on depressive symptoms, yet White parents are more vulnerable than Black parents. After controlling for ELAs, the adverse effects of having a DD child on both physical and mental health remain significant. Future research should identify life-course circumstances that reveal why the impact of having a DD child varies by race and gender.

CHILDHOOD LEAD EXPOSURE AND COGNITIVE FUNCTIONING AMONG OLDER ADULTS: EVIDENCE FROM THE HEALTH AND RETIREMENT STUDY

Haena Lee,¹ Mark Lee,² and John Robert Warren,² 1. *University of Southern California, Los Angeles, California, United States*, 2. *University of Minnesota, Minneapolis, Minnesota, United States*

Many children born in the early 20th century were exposed to water-borne lead, a neurotoxin that negatively impacts brain development. While lead exposure has been linked to poor cognition among children and young adults, no population-level research has examined the long-term implications of lead exposure for cognitive functioning in later life. Our study is the first to address this gap by utilizing novel data linkages between the 1940 U.S. Census and the Health and Retirement Study (HRS). Our sample includes respondents who were under age 17 (born 1924-1940) by the time of the decennial enumeration on April 1, 1940. Given

that the dominant source of lead exposure was water during this period, we assessed lead exposure by using water chemistry and piping material data for each HRS respondent's city of residence in 1940. Late-life cognitive functioning for HRS participants (observed 1998-2016) was measured using the Telephone Interview for Cognitive Status. We find that lead exposure during childhood is significantly and negatively associated with cognitive functioning in later life. HRS participants who lived in cities with lead pipes and acidic or alkaline water—the conditions required for lead to leech into municipal water—showed lower levels of cognitive functioning decades later as compared to other participants. This association persisted net of race, gender, childhood socioeconomic status and childhood health. However, the association was largely accounted for by adjusting for educational attainment. This implies that childhood lead exposure impacts later-life cognition via its effect on educational attainment.

CHILDHOOD PHYSICAL ABUSE CASTS A VERY LONG SHADOW: PHYSICAL AND MENTAL ILLNESS AMONG OLDER ADULTS

Esme Fuller-Thomson,¹ and Anna S. Buhrmann,² 1. *University of Toronto, Toronto, Ontario, Canada*, 2. *McMaster University, McMaster University, Hamilton, Ontario, Canada*

A burgeoning literature indicates adverse childhood experiences (ACEs) are associated with chronic illness. Most research, to date, has not focused on health outcomes among older adults. The objectives of the current study were to identify the prevalence and adjusted odds of two mental health and six physical health conditions among survivors of childhood physical abuse (CPA) who were aged 60 and older ($n=409$) in comparison to their peers who had not been physically abused ($n=4,659$). Data were drawn from a representative sample of older British Columbians in the Canadian Community Health Survey. Logistic regression analyses took into account sex, race, age, immigration status, marital status, education, income, smoking, obesity, binge drinking and number of other ACEs. For 3 health outcomes, CPA survivors had adjusted odds ratio more than twice that of their peers (Anxiety OR=2.22; 95% CI=1.46, 3.38; Depression OR=2.17; 95% CI=1.57, 3.01; COPD OR=2.03; 95% CI=1.40, 2.94). For CPA survivors, the adjusted odds ratios were more than 50% higher for cancer (OR=1.71; 95% CI=1.31, 2.24), migraine (OR=1.67; 95% CI=1.15, 2.45) and debilitating chronic pain (OR=1.58; 95% CI=1.22, 2.03), and 33% higher for arthritis (OR=1.33; 95% CI=1.05, 1.69). CPA was not significantly associated with either heart disease or diabetes ($p>.05$). The association between CPA and two mental health and four physical health outcomes remained significant, even after controlling for sociodemographic characteristics, health behaviors and other ACEs. Further research is needed to investigate potential pathways through which childhood physical abuse is linked to a wide range of chronic later-life health problems.

LINKS BETWEEN EARLY-LIFE CONTEXTUAL FACTORS AND LATER-LIFE COGNITION AND THE ROLE OF EDUCATIONAL ATTAINMENT

Jordan Palms, and Laura Zahodne, *University of Michigan, Ann Arbor, Michigan, United States*

Educational attainment is a well-documented predictor of later-life cognition, but less is known about upstream contextual factors. This study aimed to identify which early-life contextual factors uniquely predict later-life global cognition and whether educational attainment mediates these relationships. Participants were drawn from the Michigan Cognitive Aging Project (N=461; Mage=63.51; SDage=3.13; 50% non-Hispanic Black). School-level contextual factors included U.S. region during elementary school (Midwest, South, Northeast), racial diversity of school (mostly White, mostly Black, diverse), self-reported education quality, and school type (public versus private). Household-level contextual factors included mother's and/or father's education, number of adults (1, 2, 3+), and number of children. Later-life global cognition was operationalized with a composite score derived from a comprehensive neuropsychological battery. A mediation model controlling for sociodemographics estimated total, direct, and indirect effects of contextual factors through educational attainment (years). Lower education quality, attending a mostly Black or diverse school, attending a public school, and reporting three or more adults in the household were each associated with lower cognition. After accounting for educational attainment, associations remained for education quality, school type, and reporting three or more adults in the household. Indirect effects through educational attainment were observed for elementary school region, education quality, racial diversity of school, and mother's education. School context appears to more consistently predict later-life cognition than household context, highlighting the potential long-term benefits of school-level interventions for cognitive aging. Future research should consider causal relationships among household-level and school-level contextual factors, as well as additional mediators beyond educational attainment.

Session 3195 (Symposium)

DISRUPTION TO TRANSFORMATION: AGING IN THE NEW NORMAL: NIA SESSION FOR EARLY-CAREER RESEARCHERS

Chair: Melinda Kelley

Discussant: Melinda Kelley

The National Institute on Aging (NIA) at the National Institutes of Health, Department of Health and Human Services, supports biomedical and behavioral research with a lifespan focus. NIA research seeks to understand the basic processes of aging, improve prevention and treatment of diseases in later life, improve the health of older persons, in addition to a focus on Alzheimer's disease and related dementias. The NIA also supports the training and career development of scientists focusing on aging research and the development of research resources. This symposium, meant for junior faculty and emerging scholars, will provide an update on the latest research findings from the NIA followed by a segment on funding mechanisms and strategies.

OVERVIEW OF NIA RESEARCH AND PRIORITIES

Richard Hodes, *National Institute on Aging, Bethesda, Maryland, United States*

Dr. Hodes will provide an overview of NIA's structure and mission, in addition to discussing research foci from across the Institute's scientific divisions.

HOW TO GET AN NIA GRANT

Kenneth Santora, *National Institute on Aging, Bethesda, Maryland, United States*

Dr. Santora will provide an overview of the NIA application process and will share information on relevant policy changes.

Session 3200 (Symposium)

EMERGING CONCEPTS IN DYADIC RESEARCH

Chair: Karen Lyons

Discussant: Amy Rauer

This session includes four papers that explore and expand upon emerging concepts in dyadic research in health, illness, and end-of-life. First, Dr. Karen Lyons and colleagues examine the concept of dyadic mental health in mid-late life couples living with lung cancer. The paper examines the impact of having optimal versus poor dyadic mental health at diagnosis on the physical health of the couple over time, but also explores the ways we examine the concept of dyadic health in research and potential implications of these methods. Second, Dr. Lyndsey Miller and colleagues take a dyadic approach to understanding the roles of social activity and connectedness on depressive symptoms in a sample of community-dwelling older couples. The paper not only highlights important gender differences, but also the salient role of incongruent dyadic physical health. Third, Dr. Ranak Trivedi and colleagues describe the findings of a novel pilot intervention targeted at improving dyadic self-management in care dyads where one member is a Veteran with chronic conditions. The paper draws upon concepts of collaboration and dyadic coping to conceptualize self-management as a dyadic phenomenon. Finally, Dr. Buck and colleagues explore the novel concept of dyadic dissolution in a sample of family caregivers after the death of their care partner. The paper explores the concept as a cognitive and affective process with implications for how the surviving partner adapts over time. Speakers and Discussant, Dr. Amy Rauer, will focus on implications of these concepts for advancing dyadic science of health and illness across the lifespan.

THE ROLE OF OPTIMAL DYADIC MENTAL HEALTH IN COUPLES LIVING WITH LUNG CANCER: INTERDEPENDENCE, CONGRUENCE, OR BALANCE?

Karen Lyons,¹ and Lyndsey Miller,² 1. *Boston College, Chestnut Hill, Massachusetts, United States*, 2. *School of Nursing, Oregon Health & Science University, Oregon, United States*

Optimizing dyadic health is a central goal of dyadic frameworks. Yet, research has focused on interdependent individual health or the transactional nature of health within dyads. Emerging research has explored dyadic health through the lens of congruence and balance. This longitudinal study examined dyadic mental health in 76 couples (M = 67.88 ± 11.54) during the first year of lung cancer. As expected, multilevel modeling found mental and physical

health of couples were significantly associated at baseline ($p < .05$). Congruence in mental health was significantly associated with changes in physical health over time for survivors ($p < .05$) but not partners, whereas balanced mental health had differential effects on the physical health of survivors and partners ($p < .01$). Discussion will focus on the implications of congruent versus balanced dyadic health for the couple, evaluation of interventions, and propose ways to define optimal dyadic health.

DISTINCT INFLUENCES OF SOCIAL ACTIVITY AND SOCIAL CONNECTEDNESS ON DEPRESSIVE SYMPTOMS IN OLDER ADULT COUPLES

Joel Steele,¹ Lyndsey Miller,² Chao-Yi Wu,² Hiroko Dodge,² Jeffrey Kaye,² and Karen Lyons,³ 1. *Portland State University, Portland, Oregon, United States*, 2. *Oregon Health & Science University, Portland, Oregon, United States*, 3. *Boston College, Chestnut Hill, Massachusetts, United States*

This study aimed to simultaneously examine the associations between social activity and connectedness and depressive symptoms in older adult couples. Using SEM and data from 116 community-dwelling couples (age 76.18 ± 8.49), we found that engagement in social activities was associated with lower depressive symptoms in men ($p = 0.014$), whereas more close friendships were associated with lower depressive symptoms in women ($p = 0.018$), controlling for partner effects, age, education, and cognitive function (CFI: 1.00, TLI: 1.35, RMSEA: 0.00 [0.00, 0.08]). Unexpectedly, we also found better female physical health to be associated with greater depressive symptoms in males ($p = 0.029$). When examined as dyadic physical health, more incongruence between the physical health of partners was associated with greater depressive symptoms in men ($p = 0.007$). Discussion will focus on distinct influences of social activity and connectedness on mental health, and the context of gender, marriage, and dyadic health.

A WEB-BASED SELF-MANAGEMENT INTERVENTION FOR VETERANS WITH CHRONIC CONDITIONS AND THEIR CAREGIVERS: A PILOT STUDY

Ranak Trivedi,¹ Katherine Plummer,¹ Madhuvanthi Suresh,² Rashmi Risbud,³ Marika Humber,⁴ Donna Zulman,⁵ Christine Timko,⁵ and John Piette,⁶ 1. *Stanford University, Menlo Park, California, United States*, 2. *Palo Alto University, Atlanta, Georgia, United States*, 3. *VA Palo Alto Health Care System, Palo Alto, California, United States*, 4. *VA Palo Alto Healthcare System, Menlo Park, California, United States*, 5. *VA Palo Alto Health Care System, Menlo Park, California, United States*, 6. *University of Michigan, Menlo Park, California, United States*

Web-based Self-management Using Collaborative Coping Enhancement in Diseases (Web-SUCCEED) is a dyadic intervention for patients and their caregivers designed to improve self-management through improving dyadic stress coping, dyadic relationships, and positive emotions. Veterans Affairs (VA) patients with one or more chronic conditions and positive screen for self-management distress were recruited with their informal caregiver from VA Palo Alto. Of the 17 patients and 16 caregivers recruited (62.3% of eligible), 8 patients and 8 caregivers (48.5%) completed the intervention

and assessments. Twelve participants withdrew mostly citing the stress of the pandemic as their reason; 5 did not respond to multiple outreach efforts. Veterans were 66 ± 18 y and caregivers were 58 ± 16 y. Veterans and caregivers who completed the program rated it high on usability and acceptability. Pre-post t-tests across a psychosocial battery did not reveal significant differences; results were limited by incomplete post-intervention data. Further testing with modified retention strategies is recommended.

CAREGIVERS' LOSS OF THE DYADIC EXPERIENCE AFTER THEIR CARE PARTNER'S DEATH

Harleah Buck, *University of Iowa, Iowa City, Iowa, United States*

One emerging dyadic concept is the experience of family caregivers when their care partner dies and their dyadic relationship comes to an end. This study qualitatively examined and characterized the loss of the dyadic experience for the caregiver after the death of their care partner. Data was accrued as part of a randomized clinical trial in 29 older hospice caregivers. Iterative thematic analysis focused on dyadic processes before, during and post death. Using two relational parameters from Relational Turbulence Theory resulted in a preliminary characterization of a new concept - dyadic dissolution as a cognitive and affective process whereby a remaining member of a dyad experiences relational uncertainty and partner interference while adapting (or not) to the death of their care partner. Findings suggest that asking several open-ended questions about the dyadic relationship will enable assessment for any continuing impact of relational uncertainty and partner interference on bereaved caregivers.

Session 3205 (Symposium)

ENGAGING ISOLATED AND UNDERSERVED OLDER ADULTS IN 4MS CARE: AGE-FRIENDLY CARE, PA

Chair: Diane Berish

Discussant: Terry Fulmer

Older adults, the largest segment of the US rural population, face significant disparities in health and healthcare compared to their non-rural peers, including more chronic health conditions, financial challenges, and social isolation. They have limited access to healthcare and social services for prevention, management and treatment of chronic conditions. Age-Friendly Care-PA, a partnership between Primary Health Network and Penn State College of Nursing, aims to reduce these disparities in care and services for rural older adults through co-designing their Geriatric Workforce Enhancement Program. Age-Friendly Health Systems, an initiative of the John A Hartford Foundation and the Institute for Healthcare Improvement, in partnership with the American Hospital Association and the Catholic Health Association of the United States, equips providers, older adults, and their care partners with the support necessary to address What Matters, Medication, Mentation, and Mobility. This symposium describes how the 4Ms are integrated into clinician training and competencies, older adult education, operations, care delivery, and quality improvement. Year two outcome data will be shared. Drs. Hupcey and Fick will provide an overview of the project and its reach. Dr. Berish will describe

the process of engaging stakeholders in co-developing our 4M metrics and the data generated. Jenny Knecht, CRNP, will describe a pilot study to extend the reach and acceptability of telehealth to hard-to-reach older persons. Finally, Dr. Garrow will detail a new initiative focused on equity in care. Our discussant, Dr. Terry Fulmer will lead a discussion of this work as well as next steps and policy implications.

BUT HOW WILL WE MEASURE IT? CO-CREATING ASSESSMENTS OF OUTCOMES IN AGE-FRIENDLY CARE, PA

Diane Berish, *Pennsylvania State University, University Park, Pennsylvania, United States*

Moving from concept to quantitative measurement can be complex. There were several challenges in co-designing measures to assess the impact of Age-Friendly Care, PA, a geriatric workforce enhancement program. First as a FQHC, our clinical partner had not captured the metrics of interest. Second, the co-developed operational definitions for our metrics should be feasible, relevant, and useful for all project members. Third, funder reporting requirements must also be addressed. Working within this context, we co-created 11 outcome indicators structured around the 4Ms (IHI) now with 9 months of data. EMR changes to make data reportable included measuring opioid misuse mitigation, high-risk medication elimination, cognitive assessment and dementia care management, advanced care planning, care partner presence, annual wellness visit completion, pneumonia vaccination rates, colorectal screening rates, mobility goal tracking, and presence of a caregiver. Work continues around formulating themes to create a reportable mechanism for assessing What Matters.

AGE-FRIENDLY CARE, PA: A GERIATRIC WORKFORCE ENHANCEMENT PROGRAM

Erica Husser,¹ Donna Fick,² Judith Hupcey,² Marie Boltz,² and Lisa Kitko,³ *1. Penn State Ross and Carol Nese College of Nursing, Spring Mills, Pennsylvania, United States, 2. Pennsylvania State University, University Park, Pennsylvania, United States, 3. Pennsylvania State University, Pennsylvania State University, Pennsylvania, United States*

Age-Friendly Care, PA is co-led by Primary Health Network, the largest Federally Qualified Health Center in Pennsylvania, and Penn State College of Nursing that aims to bring reliable, high-quality, age-friendly care to all older adults living in rural PA. Sponsored by HRSA through its Geriatric Workforce Enhancement Program, Age-Friendly Care, PA utilizes the ECHO, all-teach-all-learn, platform to engage isolated rural providers in incorporating the 4Ms (IHI) into their practice. Age-Friendly Care, PA reaches out directly to rural older adults and their care partners to co-design education and support. We have hosted 28+ events and reached 450+ individuals. Results include tracking and improvement in quality indicators assessed including support for individuals living with dementia and their care partners (NA-66.7%), risk for opioid misuse (NA-78%), high-risk medication management (NA-47.8%), fall-risk management (NA-9.4%), and advanced care planning (NA-8.9%). We will discuss the creation, co-development, implementation, lessons learned, and future of Age-Friendly Care, PA.

REACHING OUT TO OLDER ADULTS IN RURAL COMMUNITIES BY UTILIZING COMMUNITY HEALTH WORKERS DURING A PANDEMIC

Jenny Knecht, *Pennsylvania State University, University Park, Pennsylvania, United States*

Older adults in rural communities have access, isolation, and technology barriers to healthcare that are exacerbated by the COVID-19 pandemic. A shortage of healthcare professionals combined with limited resources and poor broadband access have limited their ability to benefit from telehealth. The pandemic has further worsened isolation in rural communities. This Age-Friendly Care, PA pilot study uses community health workers (CHW) as a bridge to connect isolated and underserved older adults with their healthcare team. The CHWs facilitate access to telehealth provided by a Federally Qualified Health Center (FQHC), and also provide “check-ins” to housebound patients. The focus of the intervention is CHW delivered facilitation of telehealth and other supports to better manage their healthcare needs. We will describe the co-design of the project and discuss lessons learned in attempting to bridge the digital divide for rural older adults during and after the pandemic.

ONE POSSIBLE CONSEQUENCE OF COVID-19 VACCINE: INEQUITABLE DISTRIBUTION

George Garrow, *Primary Health Network, Sharon, Pennsylvania, United States*

Primary Health Network (PHN) is the largest Federally Qualified Health Center (FQHC) in Pennsylvania expanding over 17 counties. Getting Pennsylvanians vaccinated is a critical step in reducing the spread and impact of COVID-19, although research suggests that the inequitable distribution of the COVID-19 vaccine may be a critical barrier. Although concerns regarding vaccine hesitancy are prevalent, experts also suggest that disparities in vaccination rates are in part due to the lack of accessible scheduling; adversely affecting underserved, such as rural communities, and minority populations. To address these obstacles, Primary Health Network is creating a COVID-19 Vaccination/Health Equity Team. Their objectives include: creating tools to provide comprehensive information on vaccine supply, identifying potential challenges and proactively planning for ways to mitigate likely disparities, identifying people who wish to be vaccinated but lack the means to do so, and connecting them in an equitable way, to vaccinations.

Session 3210 (Symposium)

ENVIRONMENTAL GERONTOLOGY DURING COVID-19: AGING IN PLACE SINCE THE PANDEMIC ONSET

Chair: Melissa Cannon

Co-Chair: Jessica Finlay

Discussant: Graham Rowles

The COVID-19 pandemic is fundamentally changing neighborhood landscapes as we shelter in place and adjust our lifestyles. To age-in-place is to live in one’s home and/or community “safely, independently, and comfortably.” The ability to age-in-place is a public health priority for all, regardless of income or health status, and requires a variety of community resources to be sustainable. Since the pandemic

onset, access to neighborhood resources was limited to reduce transmission risks. Changes to economic arrangements and socio-spatial norms have profoundly impacted daily life, though how these influence health and well-being is largely unknown. It is likely that these effects may vary in different communities and contexts; for example, neighborhoods that are able to self-organize to safely provide social support and resources may fare better. This symposium brings together cutting-edge studies in urban and rural U.S. places to explicate how the pandemic is transforming aging-in-place experiences and perspectives. The first presentation shows how rapidly community-based services have adjusted operations to meet the needs of their communities. The second presentation explores strategies to provide social support in rural communities. The third presentation highlights the social health needs of a subset of older adults who had not formed friendships with their neighbors. Together, these studies suggest that close examinations of aging-in-place conditions and mechanisms from organizational, socio-spatial, and social network perspectives are evermore important amid a pandemic. We discuss the implications of these empirical findings in relation to emerging theories within environmental gerontology.

UNSUNG HEROES: HOW SENIOR CENTERS HAVE ADAPTED TO PROVIDE ESSENTIAL SERVICES IN THE FACE OF COVID-19

Ceara Somerville, Jan Mutchler, and Caitlin Coyle, *University of Massachusetts Boston, Boston, Massachusetts, United States*

This presentation will describe the ways in which senior centers in Massachusetts have adapted during the COVID-19 pandemic. Three surveys (distributed in April, August, and November, 2020) were conducted with 342 senior centers in the state to learn about current operations through the pandemic, challenges faced, and steps taken to solve those challenges. Results suggest that almost all senior centers (91%) continued to provide limited programming or essential services during the pandemic. Senior centers are prioritizing socialization and nutritional needs as critical services, but are changing the way they operate to continue to meet those needs. Despite facing uncertainty about the future, senior centers continue to adapt to changing conditions as they seek to meet their core mission. This presentation will discuss effects of COVID-19 on how senior centers will continue to operate through and post-pandemic times as well as local and state policy implications.

COMMUNITY LEADERS' PERSPECTIVE OF STRATEGIES TO ENHANCE SOCIAL CONNECTEDNESS IN RURAL COMMUNITIES

Patricia Oh,¹ Len Kaye,² and Lori Parham,³ 1. *UMaine Center on Aging, Bangor, Maine, United States*, 2. *University of Maine, Orono, Maine, United States*, 3. *AARP Maine, Portland, Maine, United States*

Age-Friendly communities are charged with fostering a social environment where social connections are available, accessible, and meaningful. Thematic content analysis of 67 interviews (representing 73 communities) conducted between 12/09/2019 and 01/24/2020 and 59 interviews (representing 71 communities) conducted between 12/14/2020 and

1/19/2021 with age-friendly leaders in rural Maine suggested the importance of expanding multi-sectoral collaborations and developing flexible strategies that allow older people to create and maintain social connections, even during COVID. Prior to the pandemic, common strategies were: (1) local partners and volunteers; (2) in-person activities; (3) accessibility; (4) reciprocity; and, (5) neighborhood-specific solutions. During the pandemic, there was an increased reliance on regional partners and funders to develop low or no-tech and tech-enabled social opportunities. Additional adaptive strategies included: (1) intergenerational ties; (2) emphasizing fun; and, (3) flexibility. The study has implications for understanding how rural age-friendly communities develop and grow multi-sectoral collaborations to enhance social connections.

SOCIAL CONTACT PRIOR TO COVID-19 AND LONGITUDINAL MENTAL HEALTH TRAJECTORIES DURING COVID-19 AMONG ADULTS AGES ≥ 55

Daniel R. Y. Gan,¹ John Best,¹ and Jessica Finlay,² 1. *Simon Fraser University, Vancouver, British Columbia, Canada*,

2. *University of Michigan, Ann Arbor, Michigan, United States*

Social support protects mental health during a crisis. We examined whether prior contact with social organizations and friends/neighbors was associated with better trajectories of loneliness, depression and self-rated memory during the COVID-19 pandemic. We conducted latent class analysis and regression analysis on longitudinal data from the COVID-19 Coping Study of US adults aged ≥ 55 from April-October 2020 ($n=3105$). Overall, prior contact with friends ($B=-.075, p<.001$), neighbors ($B=-.048, p=.007$), and social organizations ($B=-.073, p<.001$) predicted better mental health amid COVID-19. Three classes were identified: Class1 had the best outcomes, whereas Class3 had the worst outcomes and were most likely to live alone ($B=.149, p<.001$). For Class1, prior contact with social organizations ($B=.052, p=.044$) predicted decreasing loneliness. For Class2, prior contact with friends ($B=-.075, p<.001$) predicted decreasing loneliness and better memory ($B=-.130, p=.011$). Conversely, prior contact with neighbors ($B=-.165, p=.010$) predicted worsening loneliness among Class3. Our findings pose new questions on the role of neighborhood networks to mitigate poor mental health outcomes among older adults during a crisis.

Session 3215 (Symposium)

ESPO AND BEHAVIORAL AND SOCIAL SCIENCES SECTION SYMPOSIUM: ADDRESSING THE NEEDS OF BLACK, INDIGENOUS, AND PEOPLE OF COLOR (BIPOC) COMMUNITIES THROUGHOUT THE STAGE MODEL

Chair: Briana Sprague

Co-Chair: Kylie Meyer

Discussant: Chivon Mingo

Behavioral interventions have been successfully deployed to prevent and manage chronic conditions among older persons, improve mental health, and support caregivers' ability to cope with care stressors. However, intervention effects may not be equally distributed among populations, nor equally acceptable or accessible among Black, Indigenous,

and People of Color (BIPOC) communities. In this symposium, we will discuss how behavioral interventions can better meet the needs of BIPOC older adults and caregivers, who may not equally benefit from advancements in behavioral interventions due to issues such as a reliance on non-diverse study samples and lack of cultural tailoring. This symposium will be structured in accordance with the National Institutes of Health Stage Model of Behavioral, and will feature researchers whose work address BIPOC needs across the trajectory of intervention development. Representing Stage 1 research, Fayron Epps, PhD, RN, will describe her use of a community advisory council to develop a faith-based toolkit to support African Americans living with dementia and their caregivers. Next, Laura Gitlin, PhD, MA, will describe her experiences testing a Stage 3 intervention to lower depression among African Americans, including challenges advancing the culturally-tailored program to Stage 4. Lastly, Shanae Rhodes, BSN, RN will describe her Stage 2 evaluation of a conversation group created and attended by women of color to socially connect in response to COVID-19. Although speakers will describe research projects that represent specific research Stages, this symposium will have a large discussion-based component and will cover all parts of the Stage Model of Behavioral Intervention.

USING ADVISORY BOARDS TO DEVELOP A FAITH-BASED TOOLBOX TO SUPPORT AFRICAN AMERICAN FAMILIES FACING DEMENTIA

Fayron Epps, *Emory University, Atlanta, Georgia, United States*

For this project, we are designing and testing the feasibility of employing components of a Faith-based Home Activity Toolbox (Faith-HAT). The goal of this NIH stage 1 intervention development project is to go beyond the four walls of the church to find ways to meet the spiritual needs of persons living with moderate and severe dementia “where they are” to help them remain religiously and spiritually engaged. This mixed-methods project is designed in 2 phases: (a) developing a prototype Faith-HAT and (b) testing the feasibility and exploring preliminary effectiveness. To successfully conduct this project, we have included a community advisory board of church leaders, caregivers, and persons living with dementia as members of the research design team to advise on the design and implementation of the Faith-HAT. Brainstorming workshops with the board are used to ensure the research is meeting the needs of the African American families affected by dementia.

STUCK IN STAGE 3: THE CASE OF AN EFFECTIVE DEPRESSION INTERVENTION FOR AFRICAN AMERICAN OLDER ADULTS

Laura Gitlin, *Drexel University, College of Nursing and Health Professions, Drexel University, Pennsylvania, United States*

Beat the Blues (BTB) is a culturally tailored depression program for older African Americans. Tested in an NIA Stage 3 efficacy trial, findings showed statistically and clinically significant benefits, including decreased depressive symptoms, improved depression knowledge and symptom recognition, and behavioral activation. The multi-component intervention was co-constructed in partnership with a large senior center. Drawn from previously tested depression programs

and tailored to preferences/needs of the targeted population, its five components included care management, depression education and symptom recognition, resources/referrals, and stress reduction and behavioral activation techniques. Despite significant findings, strong effect sizes and high acceptability, moving BTB to NIA Stage 4 (effectiveness) or 5 (dissemination) has been challenging. Challenges that will be discussed include lack of senior center funding to support training and delivery and infrastructure to embed BTB in community-based programs, and reluctance of health systems to adopt BTB because of its focus on one racial group.

BONDING IN SISTERHOOD: A QUALITATIVE STUDY OF A VIRTUAL, HEALTH-RELATED PROGRAM FOR WOMEN OF COLOR AMID COVID-19

Shanae Rhodes, *UT Health San Antonio, San Antonio, Texas, United States*

My Sister's Keeper is an online education and support group created by women of color in response to disproportionate stresses related to COVID-19 experienced by women of color. The current study aims to examine the Stage 2 evidence that an online support group formed by members of the community may help mediate inequity-related stressors and increase receptiveness to health-related recommendations. To begin to develop this evidence, a thematic analysis of 8 in-depth individual interviews was performed. Resulting themes included: 1) feeling empowered; 2) solidarity in sisterhood (e.g., shared ownership of a virtual community); 3) being focused (on women of color) yet being inclusive; 4) currency of knowledge (e.g., responsibility to share knowledge with others); and 5) preferring virtual accessibility to stay connected. Preliminary data suggest that social support offered through an online platform dedicated to women of color can promote health during the pandemic and possibly beyond.

Session 3220 (Symposium)

POLICY SERIES/ESPO AND SOCIAL RESEARCH, POLICY, AND PRACTICE SECTION SYMPOSIUM: IT'S A PRACTICE, NOT AN END STATE: CENTERING EQUITY IN GERONTOLOGICAL RESEARCH AND POLICY

Chair: Sarah Dys

Co-Chair: Claire Pendergrast

Social, economic, and health inequities shape the experience of aging, reflecting a landscape of unequal resources, opportunities, and stressors that accumulate over the life-course. These inequities are not accidental, but rather reflect systems of power that act through institutions, policies, and people to simultaneously privilege some groups and disadvantage others based on socially constructed categories. These systems include, but are not limited to, racism, ageism, and capitalism. The unequal and unjust distribution of resources and opportunities over the lifespan results in health, social, and economic disparities in older adulthood. For example, Black older adults are at higher risk of experiencing chronic disease burden and shorter life expectancy than white older adults due to greater economic disinvestment, interpersonal and systemic racial discrimination, and lower health services access over the life course. This symposium features

three leading scholars whose work centers racial and health equity in later life. The symposium will engage with issues related to long-term services and supports infrastructure, community-engaged and culturally relevant programs and education, and research activities (e.g., recruitment, study design, grant writing, dissemination). Panelists will also discuss their research agendas and recent scholarship, career trajectories, insights, and practices. We hope symposium attendees will identify opportunities and strategies for focusing on elimination of health disparities across the life-course in their own work. We believe this symposium can serve as an opportunity for SRPP members and emerging scholars and practitioners to center equity, highlight intersectionality, and amplify our colleagues at the forefront of addressing inequity through their work.

ENGAGING RURAL AND RACIAL-ETHNIC POPULATIONS IN GERONTOLOGICAL RESEARCH

Ishan Williams, *University of Virginia, Charlottesville, Virginia, United States*

Older adults from racial/ethnic populations, as well as rural-dwelling older adults, are often at heightened risk for experiencing health disparities. Reasons for these disparities may include access issues, language barriers, distrust, lack of awareness, and of culturally appropriate materials. Racial/ethnic populations and rural-dwelling populations are also less likely to be included in research to help minimize the impact of these disparities. Shifting from reducing disparities to eliminating disparities will require attentiveness to designing programs and research that focus on increasing representation of racial/ethnic groups in research, integrating diverse populations (particularly rural and other marginalized groups) into the development of ideas and projects, and finally a commitment to culturally appropriate and inclusive approaches to research and education. Applying these strategies can provide guidance on how to best facilitate inclusive and equitable research, collaborative partnerships, and equitable healthcare for everyone, especially those from populations often underrepresented.

FROM CARE MANAGER TO RESEARCHER: ADDRESSING HEALTH DISPARITIES IN LONG-TERM SERVICES AND SUPPORTS

Chanee Fabius, *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*
