Racial and socioeconomic disparities are prevalent in long-term services and supports (LTSS). There is a need for innovative research with practical application informing aging and disability policies to reduce health care disparities for older adults and people with disabilities using LTSS. This presentation will provide an overview of the career trajectory of Dr. Chanee Fabius, whose research agenda is informed by applied care management experience, where she helped older adults remain at home and delay the need for nursing home care. She will also present findings from work that (1) examines networks of care used by older adults (e.g., paid care and/or support from family and unpaid caregivers) and how they vary by race and socioeconomic status and (2) describes the effect of LTSS utilization on quality of life and health service utilization across diverse groups of older adults.

ANTI-RACISM AND HEALTH EQUITY AS MISSING VALUES TO PRODUCTIVE AGING: IMPLICATIONS FOR EMERGING PROFESSIONALS

Ernest Gonzales, *New York University, New York, New York, United States*

Productive aging scholarship has grown in scope and rigor over the last four decades, yet anti-racism and health equity have not been formally integrated into the conceptual framework. Furthermore, there is a dearth of research that explicates heterogeneity among a growing diverse older adult population. This presentation will integrate anti-racism and health equity as core values to productive aging scholarship in order to explore risk and protective factors to employment, volunteering, and caregiving among a growing diverse older adult population. Part of this presentation will include major findings from longitudinal population-based studies as well as key findings from a Consensus Statement by the National Academies of Sciences, Engineering, and Medicine (NASEM) on work and retirement trajectories. Dr. Gonzales will also share professional strategies (e.g., grant submissions, publishing, teaching) with ESPO members who want to center anti-racism, health equity, and social justice in their scholarship.

Session 3225 (Paper)

Family and Intergenerational Relationships I

CHANGES IN GRANDPARENTING DURING THE PANDEMIC AND EFFECTS ON MENTAL HEALTH: EVIDENCE FROM ENGLAND

Giorgio Di Gessa,¹ Valeria Bordone,² and Bruno Arpino,³
 1. *University College London, London, England, United Kingdom*,
 2. *University of Vienna, Vienna, Wien, Austria*,
 3. *University of Florence, Florence, Toscana, Italy*

Policies aiming at reducing rates of hospitalisation and death from Covid-19 encouraged older people to reduce their physical contacts. For grandparents in England, this meant that provision of care for grandchildren was allowed only under very limited circumstances. To date, evidence on changes in grandparenting during the pandemic is scarce and little is known about whether and to what extent reduction in grandchild care provision impacted grandparents' mental health. Using pre-pandemic data from Wave 9 (2018/19) and the second Covid-19 sub-study (November/December 2020) of the English Longitudinal Study of Ageing, we first described changes in grandparenting since the start of the pandemic. Then, using regression models, we investigated associations between changes in grandparenting and mental health (depression, quality of life, life satisfaction, and anxiety) during the pandemic, while controlling for pre-pandemic levels of the outcome variables. Almost a third of grandparents reported that the amount of grandchild care during the pandemic reduced or stopped altogether, whereas 10% provided as much or more care compared to pre-pandemic levels, mostly to help parents while working. Compared to grandparents who provided grandchild care at some point during the pandemic, those who stopped altogether were more likely to report poorer mental health, even taking into account pre-pandemic health. A reduction in grandparenting

was only marginally associated with higher depression. Although policies to limit physical contacts and shield older people reduced their risks of getting ill from Covid-19, our study shows the consequences of stopping childcare provision in terms of poorer mental health among grandparents.

CHILDHOOD ABUSE AND CAREGIVING FOR PERPETRATING PARENTS: IMPACTS ON ADULT CHILD WELL-BEING

Jaime Goldberg,¹ Jooyoung Kong,¹ and Sara Moorman,²
1. *University of Wisconsin-Madison, Madison, Wisconsin, United States*, 2. *Boston College, Chestnut Hill, Massachusetts, United States*

Combining the stress process model of caregiving and life course perspective, this study examined the long-term influences of childhood abuse on perpetrating parent-adult child relationships and adult child well-being in the context of caregiving. Using a sample of family caregivers from the Wisconsin Longitudinal Study (969 caregivers of mothers; 280 caregivers of fathers), we investigated whether contact frequency and emotional closeness with an abusive parent mediate the longitudinal effects of parental childhood abuse on adult child caregivers' depressive symptoms and the moderating effects of self-acceptance and mastery on this mediational association. Key findings indicate that maternal childhood abuse may negatively affect emotional closeness between an adult child caregiver and perpetrating mother ($b = -0.24, p < .001$). This could lead the adult child caregiver to experience increased depressive symptoms ($b = 0.02, p < .05$). Although the mediation paths for the effect of maternal childhood abuse on depressive symptoms via emotional closeness with mothers did not differ by caregivers' level of psychological resources, we found that psychological resources significantly moderated the association between maternal childhood abuse and depressive symptoms ($b = -0.08, p < .05$). Further research may explore this phenomenon in light of the heterogeneity of contemporary families. Practitioners working with adults with a history of parental childhood abuse who are caregiving for their perpetrator are encouraged to employ a trauma-informed approach to maximize the caregivers' health and well-being.

EARLY INTERGENERATIONAL RELATIONSHIPS AND LATER SUPPORT PROVIDED TO OLDER PARENTS: TIME-TO-DEATH AS A CONTINGENCY

Merril Silverstein,¹ Wencheng Zhang,² Douglas Wolf,³ and Maria Brown,¹
1. *Syracuse University, Syracuse, New York, New York, United States*, 2. *Syracuse University, Syracuse University, New York, United States*, 3. *Syracuse University, Syracuse, New York, United States*

This paper focuses on whether stronger relationships with parents early in the family lifecycle results in adult children providing more support to them 45 years later, and whether this association is contingent on parents' remaining years of life. We test time-to-death of parents as an indicator of vulnerability, an easy to ascertain and potentially powerful predictor of support. Data derived from the Longitudinal Study of Generations, a panel of three-generation families, originally fielded in 1971 and continuing to 2016. Focusing on the youngest generation (mean age = 19 in 1971), the analytic sample consists of 356 child-father relationships 473 child-mother relationships. We examined trajectories of

instrumental support provided to parents over four waves between 1997 and 2016 as a function of each parent's remaining years of life (mortality data from the National Death Index). We also examined variation in those trajectories based on frequency of shared activities and intensity of emotional closeness in 1971. Ordinal multi-level growth curve analysis revealed that proximity to death was a significant predictor of instrumental support provided over time. Only in child-father relationships did greater emotional closeness, as expressed in 1971, produce stronger associations between remaining years of life and provision of instrumental support. Findings are discussed in terms of understanding intergenerational dynamics that unfold over many decades and the utility of time-to-death as an alternative metric for assessing vulnerability. This research is timely in light of growing uncertainty about the family as a reliable source of care in later life, particularly for older men.

EFFECTS OF INTERGENERATIONAL RELATIONSHIP AND SUPPORT ON MHEALTH APP ADOPTION AMONG OLDER ADULTS

Yi-Hsuan Tung,¹ Shinyi Wu,² and Iris Chi,³
1. *University of Southern California, PASADENA, California, United States*, 2. *University of Southern California, SANTA MONICA, California, United States*, 3. *University of Southern California, University of Southern California, California, United States*

As a growing body of literature examining the effects of mHealth for older adults' diabetes self-management, how relational factors affect seniors adopting mHealth is still unclear. Guided by the transactional approach of intergenerational relations and the technology acceptance model, this study aims at investigating the perceived ease-of-use, perceived usefulness, and intention-to-use of a mHealth app among older adults with Type-2 diabetes in relation to familial (parent-child) relationship and to e-learning support from child/ren or from external youth volunteering tutors. Using data from the Intergenerational Mobile Technology Opportunities Program (IMTOP), 304 Taiwanese participants (an average age of 64.6 years, 43% female, and 62.5% received at least a high school degree) who had at least a child were included for analysis using structural equation modeling. Results showed that perceived ease-of-use ($\beta = .58, p < .001$) and perceived usefulness ($\beta = .27, p < .001$) are significant predictors of intention-to-use. Positive associations are found only between external intergenerational, but not familial, e-learning support and perceived ease-of-use ($\beta = .45, p < .001$) and perceived usefulness ($\beta = .42, p < .001$). Parent-child relationship is positively associated with both familial ($\beta = .73, p < .001$) and external intergenerational support for e-learning ($\beta = .36, p < .001$), as well as directly ($\beta = .12, p = .030$) and indirectly related to intention-to-use. Our findings suggest the importance of intergenerational relationship and appreciation of both familial and external support to facilitate and sustain older adults' adoption for mHealth programs.

INTERGENERATIONAL EXCHANGES IN AGING SOUTH ASIAN MUSLIM FAMILIES: AN INTERSECTIONAL LIFECOURSE PERSPECTIVE

Mushira Khan,¹ Karen Kobayashi,² and Andre Smith,²
1. *Mather Institute, Plainfield, Illinois, United States*, 2. *University of Victoria, Victoria, British Columbia, Canada*

International migration flows are increasing at a rapid pace and are often accompanied by emergent global realities, (re)negotiation of identities and familial bonds, anticipated challenges, and unforeseen exigencies. Concomitantly, advances in public health have resulted in longer lives with an increasing proportion of the global population now 65 years and older. While these demographic shifts have received considerable research attention, little is known about aging South Asian Muslim families in the US and the ways in which they adjust and adapt to shifting social realities. To address this gap, this qualitative study explores the intersections of faith, culture, gender, age, and immigrant status, and how these seminal life course events shape intergenerational care and support exchanges in South Asian Muslim families. Building on findings from 30 in-depth narrative interviews with three generations of immigrant South Asian Muslim women, and using an intersectional lifecourse perspective, this study explores the (re)negotiation of familial bonds and the enactment of religious beliefs and practices such as those around filial expectations in a transnational Islamic context. It shows how, for the grandmothers, daughters, and granddaughters in the study, their Islamic faith was a part of both the public sphere and a collective ideology, as well as a deeply personal and intimate attachment that provided structure and continuity in their everyday lives. Finally, the implications of these findings in the broader context of Islamophobia and salient structural barriers to accessing available health and social support services for aging South Asian Muslim families are discussed.

Session 3230 (Paper)

Family Caregiver Impact of the COVID-19 Pandemic

COVID-19'S IMPACT ON BURDEN AND NUTRITION FOR FAMILY CAREGIVERS OF PEOPLE WITH PARKINSON'S DISEASE

Dara LoBuono,¹ Rachel Robin,² and Mehmet Uygur,²

1. Rowan University, North Haledon, New Jersey, United States, 2. Rowan University, Glassboro, New Jersey, United States

The COVID-19 pandemic has worsened Parkinson's disease (PD) symptoms; however how COVID-19 has impacted family caregivers of people with PD (PwPD) is unknown. A 38-item open-and closed-ended online survey that explored caregiver burden and nutrition behaviors during COVID-19 was completed by 34 caregivers. Quantitative variables related to how COVID-19 has impacted caregiver burden are reported as percentages. Responses to open-ended questions related to COVID-19's impact on caregiver burden and dietary behaviors were double-coded by two researchers, differences in codes were discussed until consensus was reached, and themes were finalized. The mean age of caregivers was 67.2±8.7 (47-82 years of age) and the majority were female (64.7%). Since the COVID-19 pandemic, 61.7% of caregivers felt their relationship with their PwPD stayed the same or slightly improved, 41% reported having to make a slight or increased number of adjustments to their schedules to provide care and experienced a slight or increased

physical strain because of providing care. 58.8% reported a slight or increased number of times they felt sad/hopeless and 76.5% reported a slight or increased number of times they felt anxious/worried. Themes related to COVID-19's impacts on caregiver burden included: fear, stress, and isolation; increased caregiver responsibilities; no change in caregiving. Themes highlighting COVID-19's impact on dietary behaviors included: healthier dietary patterns; increase in snack foods and boredom eating; no change in dietary patterns. Results suggest COVID-19 has negatively impacted caregiver well-being and further exploration in changes in dietary intake are warranted.

DETERMINING THE IMPACT OF COVID-19 ON END-OF-LIFE EXPERIENCES OF FAMILY CAREGIVERS FOR PEOPLE LIVING WITH DEMENTIA

Sameer Mithani, Gwen McGhan, Deirdre McCaughey, and Kristin Flemons, *University of Calgary, Calgary, Alberta, Canada*

COVID-19 has impacted all of our lives, but the population most at risk are older adults. Family caregivers (FCGs) for people living with dementia (PLWD) face challenges in providing care, which are compounded with the introduction of COVID-19 public health policies. The purpose of this study was to examine the experiences of FCGs where the PLWD died during the COVID-19 pandemic. FCGs were invited to participate in an online survey to examine their caregiving experiences during the COVID-19 pandemic, with the option of participating in a follow-up focus group. Sixteen FCGs whose family members with dementia died during the pandemic participated in the survey. A follow-up focus group was conducted to further examine how COVID-19 policies impacted their role as a caregiver in long-term care (LTC) and affected their ability to grieve. The results of the survey and focus group suggest that a lack of role clarity and inadequate communication channels between the FCG and LTC due to COVID-19 increased the strain FCGs faced during end-of-life care. At the end of life, public policies, such as reduced or no visitation, led to feelings of inadequacy and regret. Several participants also expressed appreciation for completing Advanced Care Planning documentation prior to COVID-19. Based on these results, policymakers can help ease the increased turmoil faced by FCGs during end-of-life care in future public health emergencies by involving FCGs of PLWD in the decision-making process. The completion of Advanced Care Planning documentation can also ease the burden FCGs may experience during end-of-life care.

RESOURCES AND SERVICES FOR FAMILY CAREGIVERS IN THE TIME OF COVID-19

Gwen McGhan, Deirdre McCaughey, Kristin Flemons, and Whitney Hindmarch, *University of Calgary, Calgary, Alberta, Canada*

COVID-19 has led to increased burden on family caregivers (FCGs) for people living with dementia (PLWD), while simultaneously limiting the resources available to them. Our study surveyed Alberta, Canada FCGs to assess their needs and generate recommendations to inform policies about care access, resources, and agency supports. We conducted a mixed methods study using a sequential triangulation

design (QUANTITATIVE + qualitative). Our Community Advisory Committee was involved in all stages of study planning, execution, and dissemination. Survey results informed the qualitative data collected from focus groups with FCGs. A total of 230 FCGs participated in the survey, with an average age of 59. The average age of PLWD was 75. The majority were women (77%), 46% were spouses and 41% were adult children. Respondents reported feeling more isolated (69%), more strain (66%) and decreased quality of life (55%) compared to pre-pandemic. Resource use by FCGs decreased from an average of 5 resources pre-pandemic to 1.6 during COVID-19. Services including day programs and home care were no longer available or reconfigured, leading to greater strain and heightened need for respite, which was also unavailable. Focus groups highlighted that system navigation and accessing services during COVID-19 was overly burdensome, leaving FCGs feeling abandoned by the system. FCGs reported an increase in caregiving responsibility and less access to services resulting in PLWD experiencing a decline in wellness and function. As such: 1) resources should be consistently available for FCGs and 2) FCGs require clear, correct, and concise information about COVID-19.

THE EXPERIENCE OF FAMILY MEMBERS IN LONG-TERM CARE FACILITIES DURING THE SARS COV2 (COVID-19) PANDEMIC

Raeann LeBlanc,¹ and Hyeyoung Park,² 1. *University of Massachusetts, Amherst, Royalston, Massachusetts, United States*, 2. *University of Massachusetts Amherst, Amherst, Massachusetts, United States*

In-person visits are one form of care support offered by family members for residents in a Long-term Care Facility (LTCF). Family member visitation may extend to close social relationships with the residential care staff, which can be important in managing care. The long-term care population has been significantly impacted by a high number of SARS-COV2 (Covid-19) cases in morbidity and mortality but, in-person visits were limited due the public health concern. This study aimed to describe the experience of family members of persons in LTCFs during the Covid-19 pandemic. We used an online survey of 34 questions. Forty-six family members were recruited through online caregiver support platforms, and 22 completed the survey. Average participant age was 57. Majority were female with high-moderate ($M=3.48$) Kessler psychological distress scores. Participants reported less frequent communication with their family members in LTCFs. Difficult to reach nursing staff, who were the primary contact, was a concern. Their preferred means of communication was the telephone followed by window visits; residents preference remained for in-person visits followed by telephone. Participants described a decrease in relationship closeness with staff and a decrease in confidence in the quality of care. These results, limited by sample size, offer a beginning insight into the importance of communication between the family member and nursing staff, including the contact frequency. Structural disparities such as LTCF nursing staff levels may partly explain these deficits in supporting families during the Covid-19 pandemic. Opportunities to support family members remain a needed focus of long-term care reforms.

Session 3235 (Paper)

Family Caregiving II (BSS Paper)

CROSS-CULTURAL DIFFERENCES IN CAREGIVING: INVESTIGATING THE ROLE OF FAMILISM AND SOCIAL SUPPORT

Francesca Falzarano,¹ Jerad Moxley,² Karl Pillemer,³ and Sara Czaja,⁴ 1. *Weill Cornell Medicine, Douglaston, New York, United States*, 2. *Weill Cornell Medicine, New York, New York, United States*, 3. *Cornell University, Ithaca, New York, United States*, 4. *Weill Cornell Medicine/Center on Aging and Behavioral Research, New York, New York, United States*

Cultural diversity in the United States (US) reflects a demographic shift, with a growing population of minority older adults and a subsequent increase in minority family caregivers providing care to aging adults. Research has demonstrated heterogeneity in the caregiving experience, with increasing focus placed on examining the impact of cultural values on caregiver (CG) outcomes. Familism has been investigated as a driving mechanism of cross-cultural differences in caregiving outcomes, yet prior work examining this relationship has yielded mixed findings. Using the sociocultural stress and coping model as a guiding framework, we examined, in a sample of 243 CGs who participated in the Caring for the Caregiver Network Study, a randomized controlled trial examining a culturally-tailored technology-based psychosocial intervention, the influence of familism and social support on positive aspects of caregiving, depressive symptoms, and caregiver burden. We also examined how these relationships vary as a function of race/ethnicity, the CG's relationship to the care-recipient, other sociodemographic characteristics (e.g., SES status), and acculturation. Results showed that African American and Hispanic CGs exhibited higher levels of familism compared to Whites. In African Americans, familism predicted higher positive caregiving appraisals, and social support significantly predicted lower burden and depression. In Hispanics, levels of familism varied as a function of acculturation, with lower levels of familism identified among US Hispanic natives. Our findings highlight that cultural beliefs, such as familism, as well as social support may be adaptive in protecting against adverse CG outcomes and point to directions for future culturally congruent, family-centered intervention approaches.

DEHUMANIZATION OF OLDER FAMILY MEMBERS: NOVEL DETERMINANTS OF ELDER ABUSE PROCLIVITY BY CAREGIVERS

E-Shien Chang,¹ Joan Monin,² Daniel Zelterman,² Naomi Isenberg,³ and Becca Levy,⁴ 1. *Weill Cornell Medicine, New York City, New York, United States*, 2. *Yale School of Public Health, New Haven, Connecticut, United States*, 3. *University of Wisconsin, Madison, Madison, Wisconsin, United States*, 4. *Yale University, Woodbridge, Connecticut, United States*

Elder abuse affects one in six older persons globally. Three limitations converge to impede progress in prevention: most research is victim- rather than perpetrator-based; the reliance on explicit, self-reported factors; and failure to account for

psychological factors that motivate abuse in the first place. The current study will be the first to address these gaps by examining whether family caregivers' dehumanization of older persons, or the denial of humanness to older persons as one of the most hateful age stereotypes, could explain elder abuse proclivity. Implicit dehumanization of older persons was measured by a novel implicit-association-test developed for this study. Explicit dehumanization was measured by a semantic differential question widely used in the literature. We used the reliable and validated 8-item Caregiver Abuse Screen to measure elder abuse proclivity. In the final survey of 585 caregivers, dehumanization was found to be prevalent with 51% of the caregivers implicitly and 31% explicitly dehumanizing older persons. As predicted, implicit and explicit dehumanization uniquely contributed to elder abuse proclivity (OR=1.23, 95% CI=1.02-1.50, p=.03) and (OR=1.26, 95% CI=1.05-1.51, p=.01), respectively, after adjusting for relevant covariates including caregiver burden, and caregivers' and care-recipients' health. Also as predicted, implicit dehumanization improved the prediction of abuse proclivity above and beyond the explicit dehumanization of older persons and caregiver burden. Socio-etiological models of elder abuse perpetration and corresponding prevention design should consider the inclusion of dehumanization as a key risk factor for abuse proclivity in family caregivers.

DURATION OF FAMILY CAREGIVING AND ITS EFFECTS ON INFLAMMATION IN THE CAREGIVING TRANSITIONS STUDY

David Roth, *Johns Hopkins University, Baltimore, Maryland, United States*

Sustained caregiving for older adult family members with disabilities can be a chronically stressful experience that may adversely affect the health of caregivers. Systemic inflammation is thought to be one mechanism by which caregiving stress might impact health, but previous studies of inflammation in caregivers have generally found inconsistent or very small effects with questionable clinical significance when comparing caregiving and non-caregiving control samples. The Caregiving Transitions Study (CTS) enrolled 283 family caregivers and 283 carefully-matched controls from an ongoing national epidemiologic study. This population-based sample of caregivers included an unusual subsample of 32 long-term caregivers who had been providing care to the same care recipients for over 9 consecutive years. Analyses of covariance indicated that these 32 long-term caregivers had statistically significant ($p < 0.05$) elevations on three circulating biomarkers of inflammation – C-reactive protein, Interleukin-6, and D-dimer – compared 1) to their 32 individually-matched non-caregiving controls, and 2) to the 248 caregivers who had been providing care for less than 9 years. Covariates in the analytic models included age, sex, race, and body mass index. Similar effects were observed for caregivers of persons with or without dementia. Polynomial regression models across all caregivers revealed significant curvilinear associations of inflammation with caregiving duration. Inflammation was not markedly elevated throughout the first several years of caregiving but then begin to increase more dramatically at around 10 years of caregiving. These findings suggest that long-term caregiving, in particular, may be associated with specific physical health risks through chronically elevated systemic inflammation.

PREVALENCE AND CHARACTERISTICS OF SUBJECTIVE COGNITIVE DECLINE AMONG CAREGIVERS, 2015-2019

Eva Jeffers,¹ Roshni Patel,² Erin Bouldin,³ Kenneth Knapp,⁴ Dana Guglielmo,¹ Christopher Taylor,¹ and Lisa McGuire,⁵
1. *Centers for Disease Control and Prevention (CDC), Atlanta, Georgia, United States*, 2. *Center for Disease Control and Prevention, Atlanta, Georgia, United States*, 3. *Appalachian State University, Boone, North Carolina, United States*, 4. *New York Medical College, Valhalla, New York, United States*, 5. *CDC, Atlanta, Georgia, United States*

Approximately 20% of U.S. adults provide unpaid care to family members and friends with a health condition or disability, and 20% of caregivers reported being in fair or poor health themselves. Much of the assistance caregivers provide have cognitive components, such as medication or financial management, yet little is known about caregivers' cognitive functioning. Subjective cognitive decline (SCD), or self-reported worsening of memory over the past year, among caregivers could impact the quality of care they provide. This study assessed prevalence of SCD by caregiving status and, among caregivers, the distribution of sociodemographic and other characteristics by SCD status. The study included 93,851 community-dwelling adults aged ≥ 45 years in 22 states who completed both the Behavioral Risk Factor Surveillance System Cognitive Decline and Caregiving modules during 2015-2019. All data were weighted; comparisons are based on modified Rao-Scott chi-square tests ($\alpha=0.05$). Among caregivers ($n=21,238$), 12.6% (95%CI:11.7-13.5) reported SCD, compared with 10.2% (95%CI:9.7-10.7) of non-caregivers ($p<0.0001$). Caregivers with SCD had more chronic health conditions, lower educational attainment, and were less likely to be married or employed than caregivers without SCD, despite a similar age distribution. Caregivers with SCD were also more likely than caregivers without SCD to report fair or poor health, frequent mental distress, a history of depression, and frequent activity limitations. SCD may negatively impact caregivers' health, function, and ability to provide care. With the anticipated increases in the need for caregiving, it is critical to understand the cognitive health of caregivers to better support caregivers and care recipients.

PSYCHOMETRIC TESTING OF THE BRI UNMET NEED INSTRUMENT: A COMPREHENSIVE MEASURE OF DEMENTIA CAREGIVERS' NEEDS

Morgan Minyo,¹ David Bass,² Kate McCarthy,³ and Katherine Judge,¹
1. *Cleveland State University, Cleveland, Ohio, United States*, 2. *Benjamin Rose Institute on Aging, Cleveland, Ohio, United States*, 3. *Benjamin Rose Institute on Aging, Benjamin Rose Institute on Aging, Ohio, United States*

Compared to non-dementia caregivers, family/friend caregivers of individuals with dementia experience more negative caregiving consequences. One reason is the myriad of negatively impacted life domains including: managing symptoms; family communication; financial and legal matters; and finding and coordinating services. Few psychometrically tested measures exist for assessing the range of potential unmet needs of dementia caregivers. Such a measure would describe the frequency and correlates of unmet needs and provide a key outcome for intervention research. This study tested the psychometric properties of a comprehensive

measure of unmet needs, the BRI Unmet Need Instrument. Data from 192 family/friend dementia caregivers was used to test reliability and four validity types. Results showed total unmet needs, as well as its nine subscales, had good reliability (Cronbach's alpha .70 - .95). Discriminant validity was confirmed through factor analyses of the 45 unmet needs and items in measures of depression and care-related strain. Unmet need items loaded on separate factors that were deemed acceptable (.72-.38). Predictive validity was assessed by the association with depression, which was significant and an acceptable range ($r = .22, p < .01$). Convergent validity was confirmed by significant associations with three caregiver strain measures, mastery ($r = .40, p < .01$), emotional strain ($r = .19, p < .01$), and relationship strain ($r = .15, p < .05$). Good structural validity for nine predetermined unmet needs subscales was found using principal component analysis (loadings = .82-.39). Results suggest the BRI Unmet Needs Instrument is a ready-to-use, reliable and valid comprehensive measure.

Session 3240 (Paper)

Financial Exploitation and Adult Protection

A SCOPING REVIEW OF FINANCIAL ELDER EXPLOITATION INTERVENTIONS

Stephanie Skees, *Washington University in St. Louis, Saint Louis, Missouri, United States*

Elder financial exploitation (EFE), defined by the National Center for Elder Abuse (2021) as “the misappropriation of an older person’s money or property,” is a continuing public health crisis shown to cost individuals at least \$2.9 billion a year (MetLife Mature Market Institute, 2011). Many believe this impact will increase exponentially due to the effects of COVID-19. In fact, a recent study conducted by Chang & Levy (2021) found that the prevalence of elder abuse as a whole increased from 1 in 10 older adults to 1 in 5 in the past year. Although increased collaboration between state attorneys general, Adult Protective Services, and financial institutions has driven progress in the field; there is still little known regarding EFE interventions. To address this issue, this study conducts a scoping review of the EFE intervention literature. This approach was chosen over a systematic review primarily due to the lack of a universal definition of EFE, as well as the limited number of studies available delineating between EFE and elder abuse as a whole. The main findings of the review reveal that current EFE intervention practices are focused on preventing abuse before it occurs by addressing risk factors for abuse in older adults; and are largely reliant on Adult Protective Services and the legal system. This finding is significant because state policies differ in their qualifications of EFE, thus leaving many older adults vulnerable and unprotected. Further interventions that address EFE while it is occurring and alignment across governing bodies are needed.

I MIND MY OWN BUSINESS AND EXPECT OTHERS TO DO THE SAME: CONVERSATIONS ABOUT DECLINING FINANCIAL CAPACITY

Mingyang Zheng,¹ and Marguerite DeLiema,² *1. Radford University, Minneapolis, Minnesota, United States,*

2. University of Minnesota, Twin Cities, SAINT PAUL, Minnesota, United States

Introduction: One of the smartest ways to prepare for declines in financial decision making capacity is to appoint an agent under power of attorney for finances and to share important financial information and preferences with trusted family or friends. Yet only 12% of older Americans with children think that they’ll need help with their finances as they age, and more than half are uncomfortable talking about their finances with children. Method: We conducted four in-depth interviews with older adults and four focus groups with Black, Latino, low income, and low-middle income adults aged 65 and older. An average of 9 participants were in each 2-hour focus group. Results: Barriers included lack of awareness, denial of future changes in capacity, lack of trustworthy surrogate decision-makers, shame about one’s financial situation, desire for privacy, fear of being a burden, and resistance to overtures by children. Barriers differed by ethnicity and socioeconomic status, with lower income older adults having less knowledge of advance planning and Powers of Attorney. Implications: Significant education is needed around Powers of Attorney and how to begin the advance planning process. Study findings informed the Thinking Ahead Roadmap, a guide to facilitate planning and communication around future money management. The Roadmap uses an empowerment framework to motivate individuals to appoint trusted financial advocates and prepare them for a smooth transition in money management, thereby reducing risk of exploitation, costly mistakes, and family conflict.

IDENTITY THEFT AND OLDER ADULTS: HOW MINORITIES AND THE POOR SUFFER THE WORST CONSEQUENCES

David Burnes,¹ Marguerite DeLiema,² and Lynn Langton,³

1. University of Toronto, Toronto, Ontario, Canada, 2.

University of Minnesota, Twin Cities, SAINT PAUL,

Minnesota, United States, 3. RTI International, RTI International, District of Columbia, United States

Society’s growing reliance on technology to transfer and store private information has created more opportunities for identity thieves to access personal data. Prior work using data from the National Crime Victimization Survey (NCVS) Identity Theft Supplement (ITS) showed that baby boomers were significantly more likely than Millennials to be victims of identity theft and that older people and minorities experience more severe economic and psychological consequences. This study examines how socioeconomic status, demographic characteristics, and incident-specific factors relate to how much money is stolen during identity theft, the likelihood of experiencing out-of-pocket costs, and emotional distress among identity theft victims age 65 and older. Using combined data from the 2014 and 2016 NCVS-ITS, this study examines the correlates of financial and psychological consequences of identity theft among 2,307 victims age 65 and older. Older Black victims are more likely to have greater amounts of money stolen and are more likely feel distressed than older non-Latino white identity theft victims. The most disadvantaged older adults living at or below the federal poverty level are nearly five times as likely to suffer out-of-pocket costs. The length of time information is misused and the hours spent resolving identity theft are significantly

associated with emotional distress. More than one-third of older victims experience moderate to severe emotional distress following identity theft, and those who can least afford it suffer out-of-pocket costs. Greater advocacy and psychological support are needed to help older adults recover, in addition to tools to protect their personal information from misuse.

OLDER VICTIMS OF MASS MARKETING SCAMS: AN ANALYSIS OF DATA SEIZED FROM SCAMMERS

Marguerite DeLiema,¹ and Lynn Langton,² 1. *University of Minnesota, Twin Cities, SAINT PAUL, Minnesota, United States*, 2. *RTI International, RTI International, District of Columbia, United States*

Mass marketing scams are some of the most common frauds in America, and include scams perpetrated through the mail. A growing body of research indicates that older adults face a greater risk of victimization due to age-related changes in cognitive functioning and social isolation, and may be more likely to fall victim repeatedly. The aim of this study is to determine the frequency of repeat mass marketing fraud (revictimization) among older adults and patterns of victimization associated with age, scam type, seasonality, and geography. We use two decades of non-public administrative data from the United States Postal Inspection Service (USPIS). These databases were seized during law enforcement investigations of mass mailing scam organizations and contain more than 2 million unique U.S. victims and their transactions with four different fraud organizations. Victims were matched across datasets using name, address, and a change of address file. We find that revictimization rates increase with age in psychic scams. The 10,000 victims who responded the most times (between 82 and 562 times) were 78 years old on average and suffered \$4,700 in total losses per person. Other significant trends emerged for lottery and sweepstakes scams. Unlike prior fraud victimization studies, inferences on victim characteristics are based on actual victim experiences with fraud rather than hypothetical scenarios or surveys where victims must self-report fraud. Findings provide valuable policy-relevant information regarding older victims and the patterns of chronic victimization.

USING VOICE AND TOUCHSCREEN TECHNOLOGY TO PROTECT VULNERABLE CLIENTS IN RESIDENTIAL CARE FACILITIES

Jocelyn Brown,¹ Joan Davitt,² Pam Luby,³ and Dorinda Adams,³ 1. *University of Maryland Baltimore, Martinsburg, West Virginia, United States*, 2. *University of Maryland, Baltimore, Maryland, United States*, 3. *Social Services Administration, Baltimore, Maryland, United States*

Due to the COVID-19 pandemic, the Centers for Medicare and Medicaid Services (CMS) issued a memorandum for long term care facilities to restrict visitation by all nonessential personnel, including guardianship case managers. To enhance caseworker access to their guardianship clients, an eastern seaboard state agency distributed Amazon Echo Show devices to clients in long term care facilities. These touchscreen and voice-activated devices have both video and audio capabilities. This study reports the results of the first phase of a comprehensive evaluation, pilot testing the devices via a group of “superuser” case managers

to understand the potential challenges and benefits of using these devices. Sixteen case managers participated in two virtual focus groups before and after the installation of an Echo device with one of their guardianship clients. Participants were asked to discuss experiences in accessing clients and client engagement before and after device installation. The focus groups were audio-recorded and transcribed verbatim and two researchers independently identified themes using open and axial coding. Major themes identified included: challenges to device installation and use, strategies to overcome challenges, benefits to using Echo devices, and ethical concerns. These findings suggest that touchscreen or voice-activated devices with video capability can assist case managers in protecting vulnerable clients and ensuring their well-being when in-person access is restricted. Additionally, the devices can be used to enable isolated residents to connect to the outside world, including family, friends, and case managers through technology. Strategies for replication of this innovative program will be discussed.

Session 3245 (Paper)

Geriatric Care Management

ADDRESSING THE NEW NORMAL IN HEALTH CARE USING AN INTERPROFESSIONAL MODEL OF CARE COORDINATION

Sam Cotton,¹ Anna Faul,² and Pamela Yankeelov,² 1. *University of Louisville Trager Institute, University of Louisville Trager Institute, Louisville KY, Kentucky, United States*, 2. *University of Louisville, University of Louisville, Kentucky, United States*

There has been significant discourse surrounding the widespread system failures within healthcare during COVID-19. Older, frailer, and poorer persons across the United States have been the most impacted by the pandemic. Given this, our FlourishCare team, received funding through the COVID Cares Act, as part of our Geriatric Workforce Enhancement Program (GWEP) grant, to create innovative programming for individuals that were the most impacted by the pandemic. Remote patient monitoring (RPM) is one intervention been shown as an effective way to assist persons in managing their conditions. Patients from our Optimal Aging Clinic were identified as struggling with hypertension, diabetes and/or COPD. Interprofessional teams of nursing and social work learners were assigned to work with patients. The kits contain all of the necessary technology and a virtual app platform that allows a patient to check their heart rate, blood pressure, oxygen levels, and glucose levels. This information was then disseminated to the team coordinating the patient’s care. The sample was mostly female (88%), African American (64%) and retired (70%). The mean age was 60 (SD=4), and 40% had less than a high school diploma. After 3 months in the program, we saw a significant improvement across all determinants of health, with a particular overall change in access to health services and individual health behaviors. This study showed the importance of providing patients with access to technology and the support of an interprofessional team can improve patient outcomes, lead to improvements in individual health behaviors and improve health literacy.

COMPARATIVE PERSPECTIVES ON GERIATRICS-SURGERY CO-MANAGEMENT PROGRAM BY SPECIALTY AND STAFF ROLE

Sonia Pandit,¹ Mark Simone,¹ Alyson Michener,¹ Lisa Walke,² and Ingrid Nembhard,³ 1. *University of Pennsylvania, Philadelphia, Pennsylvania, United States*, 2. *University of Pennsylvania, University of Pennsylvania, Pennsylvania, United States*, 3. *The Wharton School, University of Pennsylvania, Philadelphia, Pennsylvania, United States*

Co-management programs between geriatrics and surgical specialties have gained popularity in the last few years. Little is known about how these programs are perceived across surgical specialties and staff roles. We conducted a mixed methods study to assess perspectives on a geriatrics-surgery co-management program (GSCP) at a hospital where geriatricians co-manage patients 65 or older admitted to Orthopedic Trauma, General Trauma, and Neurosurgery. We used semi-structured interviews (n=13) and online surveys (n=45) to explore program value, facilitators, use, understanding, and impact by specialty and staff roles (physicians, advanced practice providers, nurses, case managers, social workers). Interview transcripts were analyzed using qualitative thematic analysis, and survey data were analyzed using Kruskal-Wallis, ANOVA, and Fisher's exact tests. Interviews revealed three themes: 1) GSCP is valued because of geriatricians' expertise in older adults, relationship with patients and families, and skill in addressing social determinants of health; 2) GSCP facilitators include consistent availability of geriatricians, clear communication, and collaboration via shared data-driven goals; and 3) GSCP use varies by surgical specialty and role depending on expertise and patient complexity. Survey data analysis affirmed interview themes and showed significant differences (p-values<0.05) between perspectives of surgical specialties and roles on GSCP use, understanding, impact, and which specialty should manage specific clinical issues. Findings suggest that while there are similarities across surgical specialties and roles regarding the value of, and facilitators for, a GSCP, specialties and roles differ in use, understanding, and perceived program impact on care. These findings suggest strategies for optimizing this intervention across groups.

GERIATRIC COMANAGEMENT REDUCES HOSPITAL-ACQUIRED GERIATRIC SYNDROMES IN OLDER VASCULAR SURGERY INPATIENTS

Janani Thillainadesan,¹ Sarah Aitken,² Sue Monaro,³ John Cullen,³ Richard Kerdic,³ Sarah Hilmer,⁴ and Vasi Naganathan,² 1. *Concord Hospital, NSW, New South Wales, Australia*, 2. *University of Sydney, Concord, New South Wales, Australia*, 3. *Concord Hospital, Concord, New South Wales, Australia*, 4. *The University of Sydney, St Leonards, New South Wales, Australia*

Aims Based on our meta-analysis, surveys and qualitative studies of geriatricians in Australia and New Zealand, we designed and implemented a novel inpatient model to co-manage older vascular surgical inpatients at a tertiary academic hospital in Sydney. This model, called Geriatrics co-management of older vascular surgery patients (Gerico-V), embedded a geriatrician into the vascular surgery unit who introduced a range of interventions targeting older people.

Here we evaluated this model of care. **Methods** We undertook a prospective before-and-after study of consecutive patients aged ≥ 65 years admitted under vascular surgery. One hundred and fifty-two Gerico-V patients were compared with 150 patients in the pre- Gerico-V group. The primary outcomes were hospital-acquired geriatric syndromes, delirium, and length of stay. **Results** The Gerico-V group had more frail (43% vs 30%), urgently admitted (47% vs 37%), and non-operative patients (34% vs 22%). These differences were attributed to COVID-19. Gerico-V patients had fewer hospital-acquired geriatric syndromes (49% vs 65%; $P = .005$) and incident delirium (3% vs 10%; $P = .02$), in unadjusted and adjusted analyses. Cardiac (5% vs 20%; $P < .001$) and infective complications (3% vs 8%; $P = .04$) were fewer in the Gerico-V group. LOS was unchanged. Frail patients in the Gerico-V group experienced significantly less geriatric syndromes and delirium. **Conclusions** The Gerico-V model of care led to reductions in hospital-acquired geriatric syndromes, delirium, and cardiac and infective complications. These benefits were seen in frail patients. The intervention requires close collaboration between surgeons and geriatricians, and may be translated to other surgical specialties.

REFERRAL PROCESSES AND DISPOSITIONS IN A MULTIDISCIPLINARY TEAM FOR OLDER ADULTS WITH COGNITIVE VULNERABILITY

Richard Fortinsky,¹ Kristen Annis-Brayne,² Marie Smith,³ Kathleen Obuchon,⁴ Julie Robison,³ George Kuchel,⁵ and Shawn Ladda,⁴ 1. *University of Connecticut School of Medicine, Farmington, Connecticut, United States*, 2. *UConn Health, UConn Health, Connecticut, United States*, 3. *University of Connecticut, University of Connecticut, Connecticut, United States*, 4. *UConn Health, Farmington, Connecticut, United States*, 5. *University of Connecticut Health, Farmington, Connecticut, United States*

Multidisciplinary team care for community-dwelling older adults with multiple chronic conditions has proven value. Older adults receiving team care experience better outcomes than by solo practitioners alone, and teams are being established as outgrowths of primary care and other clinical settings. Yet little is known about the inner workings of multidisciplinary teams, both in terms of how referral patterns among team members are established and the extent to which older adults and their families accept referrals from team leaders to other clinical disciplines within teams. In this presentation, we provide details about referral patterns and rates of acceptance by study participants in an ongoing clinical trial testing a multidisciplinary team designed to provide care management to older adults (age >65) with cognitive vulnerability due to dementia, depression, and/or delirium (3D Team). Nurse practitioners lead the 3D Team, conduct in-home clinical assessments and make referrals to other team members based on study protocols specifying participants' eligibility for each 3D Team member. Results are based on the first 209 older adults randomized to the 3D Team. Pharmacist: all 209 members accepted having their medications reviewed and reconciled. Registered Dietician: of 134 referrals, 52 (38.8%) accepted. Occupational Therapist, of 117 referrals, 65 (55.6%) accepted. Physical Therapist: of 109 referrals, 92 (84.4%) accepted. Community Health Educator: of 106 referrals, 101 (95%) accepted. LCSW for

depression-related problem solving therapy: of 76 referrals, 55 (72.4%) accepted. Criteria for referrals and interpretations of variations in referral acceptance rates by older adults and their families will be discussed.

STAFF PERSPECTIVES ON LESSONS LEARNED FROM AN INTERDISCIPLINARY MEMORY CARE COORDINATION PROGRAM

Inga Antonsdottir,¹ Quincy Samus,² Melissa Reuland,³ Deirdre Johnston,² Morgan Spliedt,⁴ and Danetta Sloan,⁵
 1. *Johns Hopkins School of Nursing, Baltimore, Maryland, United States*, 2. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*, 3. *Johns Hopkins University, Baltimore, Maryland, United States*, 4. *The Johns Hopkins University, Baltimore, Maryland, United States*, 5. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

MIND at Home is a home-based care coordination program for persons living with dementia (PLWD) and their informal care partners (CP). Assessments, care planning and coordination is delivered by trained non-clinical Memory Care Coordinators (MCCs), working together on an interdisciplinary team with nurses and geriatric psychiatrists. We report qualitative results from program staff (two nurses and eight MCCs) who implemented the program in the context of two clinical trials. Care team respondents answered open-ended questions covering 5 domains pertaining to: helpful skillsets; positive and challenging factors aspects of care coordination; barriers to care coordination for clients; and improvements suggestions/resources to strengthen the program. Compassion, finding common ground, listening, organization, and time management were reported as critical skills. Staff enjoyed team collaboration, being in and learning about the community, increasing CP confidence and mastery when caring for a PLWD. Reported challenges included documentation in EHR, accessing/navigating resources, driving long distances, unsafe neighborhoods, ambiguous assessment tools, and working with low engagement clients. Common barriers faced by clients (as reported by staff) were financial struggles/poverty, and lack of insurance coverage for needed services. Staff suggested several improvements: better communication strategies, integration with LTSS services and medical providers, 24-hour program hotline, continuous education for staff, simplified data collection and care delivery tracking process. This presentation on the experience of MIND at Home trained nurses and MCCs provides deep insight on how this and similar care coordination programs might be successfully implemented or strengthened.

Session 3250 (Paper)

Geriatric Education for Health Professionals

INTERGENERATIONAL LEARNING: AN OPPORTUNITY TO TRANSFORM NURSING STUDENTS' PERSPECTIVES OF OLDER ADULTS

Marleen Thornton,¹ Kathryn Burns,² and Lara Street,²
 1. *Notre Dame of Maryland University, Baltimore, Maryland, United States*, 2. *Notre Dame of Maryland, Baltimore, Maryland, United States*

The purpose of this pilot project was to explore the experience of an intergenerational learning environment focused on healthy aging for nursing students and older adults. Intergenerational learning experiences provide opportunities for individuals from different age groups to communicate and participate in learning activities together. The growing population of older adults calls for increased geriatric nursing expertise. Nursing students' attitudes toward older adults are often negative though, and result in decreased interest in geriatric nursing. The opportunity to transform nursing students' perspectives on older adults has the potential to improve nursing care for older adults, and the number of nurses focused on geriatric nursing care. This qualitative inquiry used a convenience sample of 10 participants from a cross-listed university course on healthy aging for baccalaureate nursing students and older adult members of a lifelong learning institute. Semi-structured focus group interviews were conducted. Narrative transcripts were analyzed using an inductive approach. Analysis illustrated improved nursing students' perspectives of older adults and aging. A similar theme was noted for older adults' perspectives of younger adults. The importance of social interaction within an intergenerational learning environment and the need for opportunities to challenge ageist perspectives was illustrated. Increased exposure to healthy older adults, personally and professionally, may increase nursing students' interest in geriatric nursing and improve nursing care for older adults. Future research should examine more specifically how intergenerational learning experiences can decrease ageism, improve nursing students' and nurses' perspectives on older adults, and improve nursing practice for older adults.

PERSON-CENTERED CARE FOR FAMILY CAREGIVERS: CO-DESIGNING AN EDUCATION PROGRAM FOR THE HEALTHCARE WORKFORCE

Jasneet Parmar,¹ Sharon Anderson,² Cheryl Pollard,³ Lesley Charles,⁴ Bonnie Dobbs,⁴ Myles Leslie,⁵ Cecelia Marion,⁶ and Gwen McGhan,⁵
 1. *Department of Family Medicine, University of Alberta, Edmonton, Alberta, Canada*, 2. *Faculty of Medicine & Dentistry University of Alberta, Edmonton, Alberta, Canada*, 3. *McEwan University, Edmonton, Alberta, Canada*, 4. *University of Alberta, Edmonton, Alberta, Canada*, 5. *University of Calgary, Calgary, Alberta, Canada*, 6. *Covenant Health, St. Albert, AB, Alberta, Canada*

Background: Research recommends the healthcare workforce receive competency-based education to support family-caregivers [FCGs]. typically, education has been directed at FCG's to increase their care skills rather than at healthcare providers to provide person-centered care to FCGs. Objectives: We present the co-design process used to create a competency-based education program for the healthcare workforce that ensures a person-centered focus on FCGs and introduce our Health Workforce Caregiver-Centered Care Education. Approach: Co-design is the act of creating with stakeholders to ensure useable results that meet stakeholder's needs. We began by coining the concept "caregiver-centered care," defined as a collaborative working relationship between families and healthcare providers aimed at supporting FCGs in their caregiving role, decisions about care management, and advocacy. From this definition

we co-designed, then validated the Caregiver-Centered Care Competency Framework in a Delphi Process. Stakeholders ($n=101$) including FCGs, providers, policy makers, community organizations, researchers, and educational designers then used effective practices for health workforce education to co-design the ‘foundational’ level of a Caregiver Centered Care education. Results: Teaching and learning resources include six competency-aligned educational modules with videos and interactive exercises that encourage reflection. With the COVID-19 pandemic, we moved the education online (caregivercare.ca). In the first four months online, 815 healthcare providers completed the education. We continue to use mixed methods to evaluate the Caregiver-Centered Care Education, for acceptability and effectiveness, in five care contexts (primary, acute, home, supportive living, long-term care). Conclusion: We expect that our education will support caregiver-centered care in all healthcare settings.

TEACHING END-OF-LIFE DECISION MAKING TO UNDERGRADUATE NURSING STUDENTS

Sherry Greenberg,¹ Nancy Innella,² and Bryan Pilkington,³
 1. *Seton Hall University College of Nursing, Seton Hall University College of Nursing, New Jersey, United States,*
 2. *Seton Hall University College of Nursing, Nutley, New Jersey, United States,* 3. *Seton Hall University, Nutley, New Jersey, United States*

This presentation highlights the development, implementation, and results of an educational session with undergraduate nursing students about end-of-life decision making. The purpose of this qualitative thematic analysis study was to explore student perspectives of end-of-life decision making following an education session. The aims were to 1) develop themes from student feedback on end-of-life decision making and 2) refine educational strategies to teach end-of-life decision making to nursing students. The study was conducted with 72 junior level baccalaureate nursing students enrolled in an undergraduate gerontological nursing course. An interactive lecture was developed, following short philosophical ethics readings, which brought the students up to date on the history of end-of-life discussions, key cases, and different frameworks to approach a cluster of ethical issues associated with end-of-life care. A debate pedagogical model was employed as an engaging activity in which students directly applied recently learned concepts. In the debate activity, students were divided into two teams. Each team was assigned a position, which was a specific response to the case question: Should practitioners assist in their patient’s committing suicide? Should practitioners offer medical aid in dying? Each team conferred, presented their position, responded to the arguments or reasons from the opposing position. The session ended with a debrief by the course instructors. In the first semester, 31 nursing students completed four open-ended questions following the class. Results included increased student confidence discussing end-of-life issues and identification of two concepts commonly referred to in end-of-life care discussions and in bioethics, autonomy and dignity.

VIRTUAL GERIATRIC EDUCATION PREFERENCES OF RURAL SOCIAL WORKERS

Joan Ilardo,¹ Raza Haque,² and Angela Zell,¹ 1. *Michigan State University College of Human Medicine, East Lansing,*

Michigan, United States, 2. *Michigan State University, East Lansing, Michigan, United States*

Older adults in rural communities need access to comprehensive healthcare services provided by practitioners equipped with geriatric knowledge and skills. The Geriatric Rural Extension of Expertise through Telegeriatric Service (GREETS) project goal is to use telemedicine and telehealth to expand geriatric service options to underserved Michigan regions. GREETS educational programs train health practitioners to provide geriatric care for vulnerable older adults. To determine gaps in geriatric competencies, the team conducted an online survey of health professionals including behavioral health practitioners. Respondents identified educational topics and preferred virtual delivery methods. Demographic information included respondent’s professional position, practice setting, and county. The respondents were asked to indicate level of educational need using a scale ranging from a low, medium, or high need. Fifty (47%) of 106 total responses were from social workers. We compared the percent of social workers to other practitioners’ responses in our analysis. Four topics emerged for both groups as medium or high educational needs: 1) transitional care when changing residential settings or post-hospitalization; 2) assisting family caregivers cope with caregiving responsibilities; 3) incorporating community-based services into care plans; and 4) and managing frail older adults. Social workers noted higher need than the other respondents for: 1) managing chronic pain; 2) managing care of patients with multiple chronic conditions; 3) having serious illness conversations; 4) diagnosing dementia; and 5) discussing advance care planning. Both social worker and other respondents indicated interactive case-based webinars; published tools, toolkits, tip sheets; and didactic webinars as their top three learning formats.

Session 3255 (Symposium)

IMPROVING QUALITY AND ACCESS TO CARE IN LONG-TERM CARE SETTINGS

Chair: Nancy Dudley

Discussant: Nancy Dudley

Innovative delivery models that assure access to quality care in long-term care settings are needed for the diverse high-risk aging U.S. population. The 2008 National Academy of Medicine report, “Retooling for an Aging America: Building the Health Care Workforce” highlighted the need for changing the roles of health care providers in order to provide high-quality and cost-effective care to older Americans. Moreover, from the providers’ perspective, workplace violence in health care institutions, such as nursing homes, negatively affect the delivery, quality, and accessibility of health care. In this symposium, we identify needs and care provisions in the context of older adults aging in long-term care settings and discuss the implications for policy and health care transformation. This symposium comprises three distinct presentations: (1) identifying and addressing the needs of diverse older adults aging in low-income independent living facilities in community health practice; and based on pilot survey results from nurses in the State of New Hampshire, (2) reframing residents’ violence directed toward providers as self-protection and (3) proposing legislative and policy changes designed to meet the needs of staff and residents of long-term care facilities. These presentations

represent efforts across long-term care settings to improve access and quality of care in the context of diverse older adults aging in the U.S.

ADDRESSING NEEDS OF OLDER ADULTS IN LOW-INCOME INDEPENDENT LIVING FACILITIES IN COMMUNITY HEALTH

Nancy Dudley,¹ Lisa Rauch,² Toby Adelman,² and Daryl Canham,² 1. *San Jose State University, Los Altos, California, United States*, 2. *San Jose State University, San Jose, California, United States*

Access to quality care in long-term care settings including independent living facilities is needed for a diverse high-risk aging U.S. population. There is an urgent need to assess and address complex care needs of older adults living longer with chronic conditions and serious illness. However, a system to assess and identify health problems, intervene, and evaluate outcomes is lacking. This session presents learnings from a pilot study developed in collaboration with Nurse Managed Centers at low-income independent living facilities for older adults and undergraduate nursing students in community health practice. We will discuss the adaptation of the Omaha System for provision of care in independent living facilities to address complex care needs. Finally, we will discuss the impact of this project and its potential for healthcare transformation in independent living facilities and transformation of education in undergraduate nursing programs.

REFRAMING OLDER ADULTS' VIOLENCE TOWARD STAFF AS SELF-PROTECTION

Raelene Shippee-Rice,¹ Rosemary Taylor,² Lisa Mistler,³ Pamela DiNapoli,⁴ and Karla Armenti,⁴ 1. *University of New Hampshire, Nottingham, New Hampshire, United States*, 2. *University of Massachusetts Medical School, Worcester, Massachusetts, United States*, 3. *Geisel School of Medicine; Dartmouth-Hitchcock Health; New Hampshire Hospital, Concord, New Hampshire, United States*, 4. *University of New Hampshire, Durham, New Hampshire, United States*

One of the first studies on workplace violence in nursing homes was published in 1985. Forty-five (45) years later, resident violence against staff continues to increase in incidence and severity. At the request of a state senator, a New Hampshire psychiatrist formed a research group to conduct the first New Hampshire survey on staff experience of workplace violence. Study questions focused on experiences of workplace violence and incident reporting, and the availability and benefit of workplace violence training programs. Results were consistent with recently published literature: violence is an expected, normalized element when providing care; potential repercussions and perceived resident lack of intent were major reasons for incident non-reporting. Analysis of study results and review of the literature led to the question: Are older residents' violent behaviors towards staff an act of self-protection?

IMPROVING POLICY AND LEGISLATION RELATED TO HEALTHCARE WORKPLACE VIOLENCE

Lisa Mistler,¹ Rosemary Taylor,² Raelene Shippee-Rice,³ Pamela DiNapoli,⁴ and Karla Armenti,⁴ 1. *Geisel School of Medicine; Dartmouth-Hitchcock Health; New Hampshire Hospital, Concord, New Hampshire, United States*,

2. *University of Massachusetts Medical School, Worcester, Massachusetts, United States*, 3. *University of New Hampshire, Nottingham, New Hampshire, United States*, 4. *University of New Hampshire, Durham, New Hampshire, United States*

Our group conducted the first known New Hampshire survey on healthcare staff experience of workplace violence. Study questions focused on experiences of workplace violence, incident reporting mechanisms, and the availability and benefit of workplace violence training programs. Results were consistent with recently published literature: violence against healthcare workers remains a serious public health problem that is under-reported, understudied, "tolerated and largely ignored." We will discuss the aspects of policy and legislative responses to workplace violence that have been insufficient to address this problem. We also will present some strategies that, if implemented, could lead to improved policy and legislation that may be more proactive in reducing such violence.

Session 3260 (Symposium)

INEQUITIES IN PALLIATIVE AND DEMENTIA CARE AND HEALTH IN LONG-TERM SUPPORTIVE SERVICES SETTINGS

Chair: Abraham Brody

Most older adults with serious illness, including Alzheimer's Disease and Related Dementias (ADRD) reside in community-based settings. These individuals and their care partners rely on Long Term Supportive Services (LTSS) including nursing home, home health, hospice, and adult day centers to provide support. LTSS are often under-resourced and reimbursed however, with significant regulatory restrictions on the care they can provide. These issues combined with other systemic factors in our healthcare system and society, including racism and poverty, lead to substantial inequities. Even preceding the use of LTSS, ADRD is diagnosed later in non-white individuals and access to high-quality services, including palliative care is severely limited. Moreover, few palliative care interventions address ADRD and even fewer have been specifically tailored to address the needs of our multi-cultural, racially and ethnically diverse society. This symposium will therefore utilize data from several nationwide data sets collected as part of routine care for clinical, billing, and/or regulatory purposes to assess inequities that exist across LTSS sites related to ADRD and palliative care. The individual abstracts show a clear pattern of inequities that stem from endemic systems failures towards people of color in the United States that must be addressed through a multipronged approach. This research shows that policies must be changed to require adequate collection of social determinants of health, to target policies that allow sub-standard or limited access to care, and research and clinical reform to produce a more culturally sensitive approach to care for those with ADRD and other serious illnesses.

ASSOCIATIONS BETWEEN DEMENTIA, RACE-ETHNICITY, AND INTENSIVE AND PATIENT-CENTERED END-OF-LIFE CARE

Elizabeth Luth,¹ Amanda Reich,² Robert Semco,² Holly Prigerson,³ Joel Weissman,² and Adoma Manful,² 1. *Rutgers University, New Brunswick, New Jersey, United*

States, 2. Harvard Medical School/Brigham and Women's Hospital, Boston, Massachusetts, United States, 3. Weill Cornell Medicine, New York, New York, United States

A retrospective cohort analysis of Medicare administrative claims data from 2016-2018 compared intensive and patient-centered end-of-life care measures in persons with and without dementia, including the moderating effects of race/ethnicity. Over half (53%) of 485,209 Medicare decedents had a dementia diagnosis. Decedents with dementia were 31-34% less likely to receive intensive end-of-life care (hospital death 95%CI: 0.64-0.67; hospitalization in last 30 days 95%CI: 0.68-0.70) and 50% more likely to receive timely hospice care (95%CI: 1.48-1.52). The association between dementia and end-of-life care varied by decedent race/ethnicity. Compared to non-Hispanic white decedents without dementia, non-Hispanic Black, Hispanic and Asian decedents with dementia were significantly more likely to receive intensive end-of-life care. Non-Hispanic Black decedents with dementia were 23% more likely to receive timely hospice care (95%CI: 1.11-1.36). Additional research is needed to understand why persons with dementia receive less intensive end-of-life care and why differences exist based on racial/ethnic status.

NATIONWIDE INEQUITIES IN NURSING HOME PALLIATIVE CARE SERVICES

Leah Estrada,¹ Jordan Harrison,² Andrew Dick,³ and Patricia Stone,¹ 1. Columbia University School of Nursing, New York, New York, United States, 2. RAND Corporation, Pittsburgh, Pennsylvania, United States, 3. Rand Corporation, Boston, Massachusetts, United States

Inequities exist in nursing home (NH) quality of care for racial/ethnic minorities, but the extent of palliative care (PC) disparities is unknown. We used cross-sectional national survey data (2017-18) from 869 NHs to measure PC services (summative score: 0-100). Survey linked to Minimum Data Set and Area Health Resources Files. Descriptive statistics and NH-level, multivariable regressions examined regional differences in NH PC services by varying concentrations of Black and Latino residents. Substantial regional differences were recorded in mean PC score and by concentration. Mean PC services were highest in the Northeast and lowest in the South: Northeast (\bar{x} =50.45, SE=1.50); West (\bar{x} =49.96, SE=1.74); Midwest (\bar{x} =48.18, SE=1.17); South (\bar{x} =44.71, SE=1.30). After adjusting for urbanicity and county level poverty, NHs in the Northeast and West with increasing concentrations of Black and Hispanic residents offered significantly fewer PC services. Overall, NHs serving predominantly serving minority populations offer fewer PC services.

INEQUITY IN HEALTH AMONG PEOPLE LIVING WITH ALZHEIMER'S DISEASE AND RELATED DEMENTIAS IN ADULT DAY CENTERS

Jonelle Boafa,¹ Gary Yu,² Bei Wu,³ Abraham Brody,⁴ and Tina Sadarangani,⁵ 1. Rory Meyers College of Nursing, New York, New York, United States, 2. NYU Rory Meyers College of nursing, New York, New York, United States, 3. New York University, New York, New York, United States, 4. NYU Hartford Institute for Geriatric Nursing, New York, New York, United States, 5. New York University

Rory Meyers College of Nursing, New York University Rory Meyers College of Nursing, New York, United States

In adult day centers (ADCs), 58% of clients identify as racial/ethnic minorities, and at least 30% have Alzheimer's Disease and related dementias (ADRD). ADCs offer culturally and linguistically congruent care to clients, making them well-positioned to address potential health disparities affecting persons with ADRD. We used data from 53 California ADCs (n=3,053) to identify differences in clinical characteristics among ADC clients' with ADRD based on demographics such as race and English proficiency. We found that, when compared to their respective counterparts, a significantly greater proportion of racial/ethnic minorities and non-English speakers ($p<.001$) had 5 or more chronic conditions in addition to ADRD. We noted considerable missing data on race, likely because ADCs in California are not mandated to report data on race/ethnicity. In order to identify inequities in care within this complex population, social determinants of health, including race, must be a standard component of client assessment.

INEQUITIES IN ACCESS TO HIGH-QUALITY HOME HEALTH AGENCIES AMONG RACIAL AND ETHNIC MINORITIES WITH AND WITHOUT DEMENTIA

Chenjuan Ma,¹ Bei Wu,² and Abraham Brody,³ 1. NYU, NYU Rory Meyers College of Nursing, New York, United States, 2. New York University, New York, New York, United States, 3. NYU Hartford Institute for Geriatric Nursing, New York, New York, United States

There are rising concerns of inequities in access to high-quality home health agencies (HHA). Using multiple national data sources that included 574,682 individuals from 8,634 HHA, we examined access to high-quality HHA care among racial and ethnic minorities with and without dementia. Approximately 9.9% of the individuals were Black, 6.2% Hispanic, and 3.3% other race/ethnicity. Over one-third (36.3%) had been diagnosed with dementia. Black and Hispanic individuals were 5.5 percentage points (95% CI, 5.2% - 5.9%) and 7.4 percentage points (95% CI, 7.0% - 7.8%) respectively more likely to receive care from agencies defined as having low-quality compared to White counterparts. Persons living with dementia were 1.3% less likely to receive care from high-quality agencies. Having dementia increased the inequity in accessing high-quality HHA between Black and White individuals. Racial and ethnic minorities, particularly those with dementia were at a disadvantaged position to receive care from high-quality HHA.

HOSPICE CARE INEQUITIES IN INDIVIDUALS WITH ALZHEIMER'S DISEASE AND RELATED DEMENTIAS

Abraham Brody,¹ Leah Estrada,² Aditi Durga,³ Shih-Yin Lin,⁴ and Ariel Ford,³ 1. NYU Hartford Institute for Geriatric Nursing, New York, New York, United States, 2. Columbia University School of Nursing, New York, New York, United States, 3. NYU Rory Meyers College of Nursing, New York, New York, United States, 4. New York University, New York, New York, United States

Despite known benefits of hospice, inequities exist. Using data from a multi-site pragmatic trial in a representative groups of hospices, we examined inequities in length of stay

(LOS) and general inpatient use (GIU) for 12,153 patients with dementia (primary and secondary diagnosis) using descriptive statistics and association tests. There were significant associations between race/ethnicity and GIU and LOS ($p < 0.001$). In those with primary diagnosis of dementia, Asian (31%) and Black/AA (24%) individuals had significantly greater utilization of GIU than Hispanic (19%) and white individuals (21%). Greater inequities were found in those with a secondary diagnosis. LOS amongst Asians were shortest with 78% having an LOS ≤ 14 vs 50-59% in other groups. Differences in long-stay >60 days (7%) vs 14-22% in other groups were found. There were similar differences examining by primary vs. secondary diagnosis. These inequities point to cultural and systems factors that require further study and intervention.

Session 3265 (Symposium)

INTEGRATING STUDY DESIGNS ON EMOTIONAL REACTIVITY AND REGULATION IN OLD AGE: NEW EVIDENCE FROM THE EMIL STUDY

Chair: Oliver Schilling

Discussant: Gloria Luong

Key insights into emotional reactivity and regulation have been gained by studying how these dynamics evolve as older people are confronted with controlled stressors in the lab, go about their everyday routines, or develop across adulthood and old age. Yet, we are only beginning to understand how the dynamics on the different time scales observed in these study designs interact. Aiming for a comprehensive picture of the predictors, correlates, and consequences of emotional reactivity and regulation, the EMIL study integrates a lab-based study with ambulatory in-vivo assessments and a classic long-term longitudinal study. 130 young-old (65-69 years) and 59 very-old adults (83-89 years) from the ILSE study, contributing four waves of health, cognitive, and psycho-social data over almost 25 years, were tested in the lab and assessed six times a day over seven consecutive days. We provide an overview of and first across-design results from EMIL: Katzorreck et al. examined whether the frequency of exposure to daily stressors affects emotion regulation capacity as tested in the lab. Lücke et al. analyzed daily working memory performance, sleep, and its association with long-term change in cognitive functioning. Wieck et al. present differential effects of discrete negative emotions as induced in the lab and reported in daily life on social cognitive performance as indicated by empathic accuracy. Gerstorff et al. examined how long-term cognitive aging affects positive feelings and stressor reactivity in daily life. Gloria Luong will discuss the presentations, considering challenges and opportunities of integrating lab-based, ambulatory, and longitudinal study designs.

LINKING EMOTION REGULATION CAPACITY AND THE FREQUENCY OF DAILY STRESSORS IN OLD AND VERY OLD AGE

Martin Katzorreck,¹ Denis Gerstorff,² Anna Lücke,³ Hans-Werner Wahl,³ Oliver Schilling,⁴ and Ute Kunzmann,⁵
1. University of Leipzig, Leipzig, Sachsen, Germany, 2. Humboldt University of Berlin, Humboldt University of Berlin, Brandenburg, Germany, 3. Heidelberg University,

Heidelberg, Baden-Württemberg, Germany, 4. University of Heidelberg, Heidelberg, Baden-Württemberg, Germany, 5. Leipzig University, Leipzig, Sachsen, Germany

Lifespan theories and lab-based research both suggest that the ability to downregulate negative emotions is often well preserved into old age, but becomes increasingly fragile in very old age. However, little is known about factors that may alleviate such age differences. Here, we ask whether exposure to daily stressors helps very old adults to maintain effective emotion regulation skills. We used data from 130 young-old (65-69 years, 48% women) and 59 very-old adults (83-89 years, 58% women) who watched negative emotion evoking film clips in the lab under emotion regulation instructions and also reported stress situations they experienced in everyday life (42 occasions across seven days). Initial results indicate that very-old adults were indeed less successful in regulating sadness than young-old adults, but those very-old adults who reported many daily stressful situations were as capable of emotion regulation as young-old adults. We discuss possible factors contributing to our age-differential findings.

SLEEP AND WORKING MEMORY: SHORT-TERM LINKS IN DAILY LIFE AND LONG-TERM ASSOCIATIONS

Anna Lücke,¹ Cornelia Wrzus,¹ Denis Gerstorff,² Ute Kunzmann,³ Martin Katzorreck,⁴ and Oliver Schilling,⁵
1. Heidelberg University, Heidelberg, Baden-Württemberg, Germany, 2. Humboldt University of Berlin, Humboldt University of Berlin, Brandenburg, Germany, 3. Leipzig University, Leipzig, Sachsen, Germany, 4. University of Leipzig, Leipzig, Sachsen, Germany, 5. University of Heidelberg, Heidelberg, Baden-Württemberg, Germany

Sufficient sleep is relevant for both momentary cognitive functioning and long-term cognitive developments. However, which factors make people particularly vulnerable to the cognitive consequences of sleep loss remains an open question. Here, we obtained data from 122 young-old (66-69 years) and 35 very old (85-89 years) adults who provided six daily ambulatory assessments of working memory performance and daily sleep over one week, and long-term trajectories in processing speed and working memory performance. Our results add to current knowledge in three ways: First, results from multilevel structural equation models showed both too little and too much daily sleep was associated with poorer working memory in everyday life. Secondly, this association was independent of cognitive aging over the preceding four years. Thirdly, average sleep duration did not predict cognitive changes over the next year. Participants' age and health as well as emotional functioning are discussed as further influences on the associations.

UNDERSTANDING THE LINK BETWEEN DISCRETE NEGATIVE EMOTIONS AND EMPATHIC ACCURACY

Cornelia Wieck,¹ Denis Gerstorff,² Oliver Schilling,³ Martin Katzorreck,⁴ Anna Lücke,⁵ and Ute Kunzmann,¹
1. Leipzig University, Leipzig, Sachsen, Germany, 2. Humboldt University of Berlin, Humboldt University of Berlin, Brandenburg, Germany, 3. University of Heidelberg, Heidelberg, Baden-Württemberg, Germany, 4. University of Leipzig, Leipzig, Sachsen, Germany, 5. Heidelberg University, Heidelberg, Baden-Württemberg, Germany

Extant theories have suggested that negative emotions generally harm cognitive processes. However, adopting a discrete emotion perspective, in this study, we predicted that only anger and fear but not sadness should be negatively associated with empathic accuracy, a process that has been shown to be cognitively highly demanding. Over 100 participants (Mage = 66.66 years, SDage = 1.00) reported their emotional reactions in response to a negative film in the laboratory, documented their everyday momentary emotions six times a day over seven consecutive days, and completed a film-based empathic accuracy test. Initial findings suggest that only fear but not anger or sadness was related to empathic accuracy. More specifically, high levels of fear both in the laboratory and in everyday life predicted low empathic accuracy. This pattern of findings will be discussed in the context of discrete emotions theories.

LONG-TERM COGNITIVE AGING TRAJECTORIES AS PREDICTORS OF DAILY AFFECT

Denis Gerstorff,¹ Oliver Schilling,² Ute Kunzmann,³ Martin Katzorreck,⁴ Anna Lücke,⁵ Hans-Werner Wahl,⁵ and Nilam Ram,⁶ 1. *Humboldt University of Berlin, Humboldt University of Berlin, Brandenburg, Germany*, 2. *University of Heidelberg, Heidelberg, Baden-Württemberg, Germany*, 3. *Leipzig University, Leipzig, Sachsen, Germany*, 4. *University of Leipzig, Leipzig, Sachsen, Germany*, 5. *Heidelberg University, Heidelberg, Baden-Württemberg, Germany*, 6. *Stanford University, Stanford, California, United States*

Multiple-time scale studies provide new opportunities to examine how developmental processes evolving on different cadences are intertwined. Theories about age-related accumulation of stress suggest that long-term progressive loss of cognitive resources should manifest in and shape short-term daily affective experiences. Applying growth modeling and intraindividual variability methods to data obtained from 123 young-old (65-69 years, 51% women) and 47 very-old adults (85-88 years, 49% women) who provided 20+ year longitudinal data on Digit Symbol performance and 42-occasion momentary data about the emotions and stressors they experienced during everyday life (6 reports per day), we found that shallower long-term loss of cognitive performance was associated with less fluctuation in momentary positive affect, as well as less “spikiness” of and reactivity to stress. We discuss and present further results highlighting how mid-term processes surrounding age, gender roles, and health additionally contribute to and shape links between long-term and short-term dynamics of aging.

Session 3270 (Symposium)

LATE BREAKING SESSION: EMERGING COVID-19 RESEARCH: NEW UNDERSTANDING OF THE EFFECTS OF COVID-19 ON HEALTH AND LONGEVITY

Chair: Rebecca Fuldner

GENETIC AND PHENOTYPIC EVIDENCE FOR THE CAUSAL RELATIONSHIP BETWEEN AGING AND COVID-19

Kejun Ying,¹ Ranran Zhai,² Timothy Pyrkov,³ Anastasia Shindyapina,⁴ Marco Mariotti,⁵ Peter Fedichev,³

Xia Shen,² and Vadim Gladyshev,⁵ 1. *Harvard University, Boston, Massachusetts, United States*, 2. *Sun Yat-Sen University, Guangzhou, Guangdong, China (People's Republic)*, 3. *Gero, Singapore, Singapore*, 4. *Brigham and Women's Hospital, Harvard Medical School, Brigham and Women's Hospital, Harvard Medical School, Massachusetts, United States*, 5. *Brigham and Women's Hospital, Boston, Massachusetts, United States*

Epidemiological studies revealed that the elderly and those with comorbidities are most susceptible to COVID-19. To understand how genetics affects the risk of COVID-19, we conducted a multi-instrument Mendelian Randomization (MR) analysis and found that the genetic variation that supports a longer life is significantly associated with the lower risk of COVID-19 infection, as well as being hospitalized after infected. The odds ratio is 0.31 ($P = 9.7e-6$) and 0.46 ($P = 3.3e-4$), respectively, per additional 10 years of life. We further applied aging clock models and detected an association between biological age acceleration and future incidence and severity of COVID-19 infection for all subjects and individuals free of chronic disease. Biological age acceleration was also significantly associated with the risk of death in COVID-19 patients. A bivariate genomic scan for age-related COVID-19 infection identified a key contribution of the Notch signaling pathway and immune system. Finally, we performed MR using 389 immune cell traits as exposure and observed a significant negative correlation between their effect on lifespan and COVID-19 risk, especially for B cell-related traits. More specifically, we discovered the lower CD19 level on B cells indicates an increased risk of COVID-19 and potentially decreases the lifespan expectancy, which is further validated in clinical data from COVID-19 patients. Our analysis suggests that the factors that accelerate aging and limit lifespan cause an increased COVID-19 risk. Thus, the interventions target these factors (e.g., reduce biological age), after further validation, may have the opportunity to reduce the risk of COVID-19.

METFORMIN SUPPRESSES MONOCYTE INFLAMMATION AND METABOLIC REPROGRAMMING BY SARS-COV-2 SPIKE PROTEIN

Brandt Pence,¹ Theodore Cory,² Russell Emmons,¹ and Johnathan Yarbrow,² 1. *University of Memphis, Memphis, Tennessee, United States*, 2. *University of Tennessee Health Science Center, Memphis, Tennessee, United States*

COVID-19 disproportionately affects older adults, and a hallmark of the disease is a hyperinflammatory state that is associated with severity. Various anti-inflammatory therapeutics have shown mixed efficacy in treating COVID-19, and the mechanisms by which hyperinflammation occurs are not well understood. Previous research indicated that monocytes, a key innate immune cell, undergo metabolic reprogramming and produce inflammatory cytokines when stimulated with SARS-CoV-2. We hypothesized that binding by the viral spike protein mediates this effect, and that drugs which regulate immunometabolism – including the geroprotector drug metformin – could inhibit the inflammatory response in monocytes. Monocytes stimulated with recombinant SARS-CoV-2 spike protein subunit 1 showed a dose-dependent increase in glycolytic metabolism that was associated with production of pro-inflammatory cytokines including interleukin-6 and tumor necrosis factor-alpha. This response was

dependent on hypoxia-inducible factor-1alpha, as chetomin inhibited glycolysis and cytokine production. Inhibition of glycolytic metabolism by 2-deoxyglucose (2-DG) or glucose deprivation also inhibited the glycolytic response, and 2-DG strongly suppressed cytokine production. Glucose-deprived monocytes rescued cytokine production by upregulating oxidative phosphorylation, an effect which was not present in 2-DG-treated monocytes due to the known effect of 2-DG on suppressing mitochondrial metabolism. Finally, pre-treatment of monocytes with metformin strongly suppressed spike protein-mediated cytokine production in monocytes, and abrogated glycolytic and mitochondrial metabolism. In summary, the SARS-CoV-2 spike protein induces a pro-inflammatory immunometabolic response in monocytes that can be suppressed by treatments that interfere with glycolytic activation, including metformin. This has potential implications for the treatment of hyperinflammation during COVID-19, which disproportionately affects older adults.

BIOLOGICAL AGING PREDICTS VULNERABILITY TO COVID-19 SEVERITY IN UK BIOBANK PARTICIPANTS

Chia-Ling Kuo,¹ Luke Pilling,² Janice Atkins,³ Jane Masoli,² Joao Delgado,⁴ George Kuchel,¹ David Melzer,² and Morgan Levine,⁵ 1. *University of Connecticut Health, Farmington, Connecticut, United States*, 2. *University of Exeter, Exeter, England, United Kingdom*, 3. *University of Exeter Medical School, University of Exeter, England, United Kingdom*, 4. *University of Exeter Medical School, Exeter, England, United Kingdom*, 5. *Yale University, New Haven, Connecticut, United States*

Age and disease prevalence are the two biggest risk factors for COVID-19 symptom severity and death. We therefore hypothesized that increased biological age, beyond chronological age, may be driving disease-related trends in COVID-19 severity. Using the UK Biobank England data, we tested whether a biological age estimate (PhenoAge) measured more than a decade prior to the COVID-19 pandemic was predictive of two COVID-19 severity outcomes (inpatient test positivity and COVID-19 related mortality with inpatient test-confirmed COVID-19). Logistic regression models were used with adjustment for age at the pandemic, sex, ethnicity, baseline assessment centers, and pre-existing diseases/conditions. 613 participants tested positive at inpatient settings between March 16 and April 27, 2020, 154 of whom succumbed to COVID-19. PhenoAge was associated with increased risks of inpatient test positivity and COVID-19 related mortality (ORMortality=1.63 per 5 years, 95% CI: 1.43-1.86, $p=4.7 \times 10^{-13}$) adjusting for demographics including age at the pandemic. Further adjustment for pre-existing disease s/conditions at baseline (OR_M=1.50, 95% CI: 1.30-1.73 per 5 years, $p=3.1 \times 10^{-8}$) and at the early pandemic (OR_M=1.21, 95% CI: 1.04-1.40 per 5 years, $p=0.011$) decreased the association. PhenoAge measured in 2006-2010 was associated with COVID-19 severity outcomes

more than 10 years later. These associations were partly accounted for by prevalent chronic diseases proximate to COVID-19 infection. Overall, our results suggest that aging biomarkers, like PhenoAge may capture long-term vulnerability to diseases like COVID-19, even before the accumulation of age-related comorbid conditions.

Session 3275 (Paper)

Long-Term Care III (SRPP Paper)

ANTIPSYCHOTIC PRESCRIBING IN VA-CONTRACTED COMMUNITY NURSING HOMES AND INCIDENT USE AMONG VETERANS

Patience Moyo,¹ Emily Corneau,² Portia Cornell,² Amy Mochel,² Kate Magid,³ Cari Levy,³ and Vincent Mor,⁴ 1. *Brown University School of Public Health, Providence, Rhode Island, United States*, 2. *Providence VA Medical Center, Providence, Rhode Island, United States*, 3. *Rocky Mountain VA Medical Center, Aurora, Colorado, United States*, 4. *Brown University, Providence, Rhode Island, United States*

The Veterans Health Administration (VA) is increasingly purchasing long-term care for eligible Veterans from non-VA, community nursing homes (CNHs). Antipsychotics present safety risks for older adults, but it is unknown how the prevalent use of antipsychotics at CNHs influences whether newly admitted Veterans will initiate antipsychotic therapy. This study used 2013-2016 VA data, Medicare claims, Nursing Home Compare, and Minimum Data Set (MDS) assessments. We identified 10,531 long-stay CNH episodes for Veterans not prescribed antipsychotics 6 months before CNH admission. We categorized Veterans by whether, 12 months before admission, they were diagnosed with FDA-approved indications (including schizophrenia, Tourette's syndrome, Huntington's disease) for antipsychotic use. The exposure was the proportion of all CNH residents prescribed antipsychotics in the quarter preceding a Veteran's admission. Using adjusted logistic regression, we analyzed two outcomes measured using MDS assessments collected ~100 days after CNH admission: 1) new antipsychotic use, and 2) new diagnosis for an FDA-approved indication among Veterans without these conditions at admission. Among antipsychotic-naïve Veterans admitted to CNHs, 7,924 (75.2%) lacked an antipsychotic indication. Prevalent antipsychotic use in CNHs ranged 0%-10.9% (quintile 1) and 25.7%-91.4% (quintile 5). The odds of initiating antipsychotic use increased with higher CNH antipsychotic use rates (OR=2.52, 95% CI:2.05-3.10, quintile 5 vs. 1), as did the odds of acquiring a new indication (OR=2.08, 95% CI:1.27-3.40, quintile 5 vs. 1). Provider practices may be influencing new diagnoses indicating antipsychotic use at CNHs with high antipsychotic use. It may be important for VA to consider antipsychotic use when contracting with CNHs.

CASE MANAGEMENT IN PRIMARY CARE ASSOCIATED WITH SERVICE USE BY ADULTS WITH DEMENTIA AND COMORBIDITIES

Emma Quach,¹ Lauren Moo,² Christine Hartmann,³ Shibe Zhao,⁴ and Pengsheng Ni,⁵ 1. *Center for Healthcare Organization and Implementation Research, VA Bedford Healthcare System, Massachusetts, United States*, 2. *VA Bedford Health Care System, Bedford, Massachusetts, United States*, 3. *VA Bedford Healthcare System, VA Bedford Healthcare System, Massachusetts, United States*, 4. *VA Bedford Healthcare System, Bedford, Massachusetts, United States*, 5. *Boston University School of Public Health, Boston University School of Public Health, Massachusetts, United States*

Community-dwelling adults with dementia are at higher risks than counterpart without dementia of poor health outcomes, and those with dementia and co-occurring conditions face even greater risks. Optimal treatment for dementia includes functional and psychosocial support through long-term services and supports (LTSS), but use remains low. Our study investigated whether case management provided in primary care and in dementia care settings facilitated LTSS use for Veterans with dementia and comorbidities. We performed a cross-sectional analysis of 2019 VA-paid health care on a cohort of Veterans with dementia, defined by clinical diagnoses (International Classification of Disease, Tenth Revision). Receipt of case management was measured by whether or not a Veteran enrolled in a VA (1) home-based primary care, (2) geriatric primary care, or (3) dementia clinic. Comorbidities were measured by an adapted Elixhauser comorbidities index and dichotomized as ≤ 3 or ≥ 4 comorbidities. LTSS use was measured by whether or not Veterans used home health, home respite, adult day care, hospice, or veteran-directed care. Multivariate logistic regressions showed that LTSS use was higher for enrollees in each case management program compared to Veterans not enrolled in any. LTSS use was also higher for enrollees in each primary care program with more comorbidities than program counterparts with fewer comorbidities. Case management in primary care settings may facilitate functional and psychosocial support to meet dementia and non-dementia related needs for adults who have dementia with comorbidities.

IMPACT OF INFORMAL CARE ON HEALTH CARE UTILIZATION AMONG OLDER PEOPLE IN CHINA

Yixiao Wang, *King's College London, London, England, United Kingdom*

Population aging has become a challenge to long-term care and health care for the society. Using China as a case study, this paper assesses allocative efficiency of resources in informal care and health care, to explore the effectiveness of the policy, i.e., encouraging informal care as a more cost-effective way to reduce public health care spending. Drawing data from the 2011, 2014, and 2018 waves of the Chinese Longitudinal Healthy Longevity Survey, this study examines the impact of informal care on utilization of health care as well as amount of health care expenditures among older people with functional limitations in China. Using random effects model with instrumental variable approach, our findings suggest that informal care significantly reduces

the utilization of health care, primarily by reducing the utilization of outpatient care. However, informal care significantly increases the amount of inpatient care expenditures for inpatient care users. We do not observe significant association between informal care and amount of outpatient care expenditures for outpatient care users. This study highlights a pressing need for the Chinese government to support informal caregivers by taking economic values of informal caregiving into consideration, and to improve efficiency in inpatient care by a more integrated resource allocation mechanism

NURSING FACILITY AND HEALTH CARE SERVICE USE AND COSTS UNDER THE CMS FINANCIAL ALIGNMENT INITIATIVE

Lauren Palmer,¹ Matt Toth,² Joyce Wang,³ Emily Schneider,² Allison Dorneo,² Giuseppina Chiri,³ and Edith Walsh,¹ 1. *RTI International, RTI International, Massachusetts, United States*, 2. *RTI International, Research Triangle Park, North Carolina, United States*, 3. *RTI International, Waltham, Massachusetts, United States*

The Centers for Medicare & Medicaid Services created the Financial Alignment Initiative (FAI) to test the impact of integrated care and financing models for dually eligible Medicare-Medicaid beneficiaries. Using Medicare claims, the Minimum Data Set 3.0, and state-provided enrollment files, we evaluated demonstration impacts on long-stay nursing facility (NF) use, other health care service utilization, and costs for the overall eligible population in two FAI demonstration States with managed fee-for-service models, Colorado and Washington. We used quasi-experimental, difference-in-differences regression models for the impact analyses. In Colorado, there was a 7.2 percent decrease ($p < 0.001$) in long-stay NF use, relative to the comparison group. Otherwise, the demonstration showed unfavorable service utilization results—increases in preventable emergency department (ED) visits and declines in 30-day follow-up after mental health discharge (MHFU)—and no impact on Medicare costs. In Washington, there was also a decrease in long-stay NF use (12.4 percent, $p < 0.001$) and skilled NF admissions (21.7 percent, $p < 0.001$). However, the demonstration resulted in decreases in physician visits and 30-day MHFU. There was a favorable decrease in Medicare costs. The impact of the FAI demonstrations on NF use was favorable for both States, while the impact on service utilization and Medicare costs was mixed and more favorable in Washington. Washington's care coordination model was intensive and targeted to high-cost individuals while Colorado provided minimal care coordination. Coordinated care and integrated long-term services and support may help postpone NF institutionalization, but there is no evidence these activities reduced preventable hospitalizations or ED visits.

Session 3285 (Paper)

Medications and Prescribing

DEPRESCRIBING BLOOD PRESSURE TREATMENT IN VA LONG-TERM CARE RESIDENTS

Michelle Odden,¹ Sei Lee,² Michael Steinman,² Anna Rubinsky,³ Bocheng Jing,⁴ Kathy Fung,⁴ Laura Graham,⁵ and Carmen Peralta,³ *1. Stanford University, Stanford, California, United States, 2. University of California San Francisco, San Francisco, California, United States, 3. University of California, San Francisco, San Francisco, California, United States, 4. San Francisco VA Medical Center, San Francisco, California, United States, 5. VA Palo Alto Health Care System, Menlo Park, California, United States*

There is growing interest in deprescribing of antihypertensive medications in response to adverse effects, or when a patient's situation evolves such that the benefits are outweighed by the harms. We conducted a retrospective cohort study to evaluate the incidence and predictors of deprescribing of antihypertensive medication among VA long-term care residents ≥ 65 years admitted between 2006 and 2017. Data were extracted from the VA electronic health record, CMS Minimum Data Set, and Bar Code Medication Administration. Deprescribing was defined as a reduction in the number of antihypertensive medications, sustained for 2 weeks. Potentially triggering events for deprescribing included low blood pressure ($<90/60$ mmHg), acute renal impairment (creatinine increase of 50%), electrolyte imbalance (potassium below 3.5 mEq/L, sodium decrease by 5 mEq/L), and fall in the past 30 days. Among 22,826 VA nursing home residents on antihypertensive medication, 57% had describing event during their stay (median length of stay = 6 months). Deprescribing events were most common in the first 4 weeks after admission and the last 4 weeks of life. Among potentially triggering events, acute renal impairment was associated with greatest increase in the likelihood of deprescribing over the subsequent 4 weeks: among residents with this event, 32.7% were described compared to

7.3% in those without (risk difference = 25.5%, $p < 0.001$). Falls were associated with the smallest increased risk of deprescribing (risk difference = 2.1%, $p < 0.001$) of the events considered. Deprescribing of antihypertensive medications is common among VA nursing home residents, especially after a potential renal adverse event.

OPIOID USE AMONG RURAL MEDICARE BENEFICIARIES

Yvonne Catharina Jonk,¹ Heidi O'Connor,² Karen Pearson,³ Zachariah Croll,² and John Gale,³ *1. University of Southern Maine, Muskie School, Portland, Maine, United States, 2. University of Southern Maine, Portland, Maine, United States, 3. University Of Southern Maine, Portland, Maine, United States*

This study examines differences in opioid prescribing rates among a nationally representative sample of Medicare beneficiaries across rural and urban areas, as well as among beneficiaries with chronic overlapping pain conditions (COPCs). We assess whether prescribing patterns exceed the Centers for Disease Control and Prevention guidelines for dose and duration, and identify socioeconomic and health risk factors associated with opioid prescribing using logistic regression analyses. Data were from the 2010-2017 Medicare Current Beneficiary Survey files. Rural-Urban Commuting Area codes were used to identify patients' residential location. The Area Health Resource Files were used to identify market characteristics such as primary care and mental health shortage areas. With the exception of 2010, over years 2011-2017, higher percentages of community-dwelling rural beneficiaries received opioid prescriptions (21.8-25.4%) compared to their urban counterparts (19.1-23.7%). During the same time period, facility-dwelling rural beneficiaries were more likely to receive opioid prescriptions (39.8-47.2%) compared to their urban counterparts (28.8-35.0%). Higher percentages (18.8%) of the community dwelling population in rural had COPCs compared to urban (15.2%), and a higher percentage of rural beneficiaries with COPCs (31.4%) received an opioid prescription than their urban counterparts (22.2%). Previous research points to other factors contributing to a lack of alternatives to opioids for pain management in rural areas, including greater reliance on primary care providers, lack of access to chronic pain specialists and alternative therapies, and travel barriers. Improving the capacity of rural primary care to deal with COPCs and expanding access to specialists via telehealth warrants further attention from policymakers.

PHARMACIST-LED INTERVENTIONS TO IMPROVE MEDICATION ADHERENCE IN OLDER ADULTS: A META-ANALYSIS

Zachary Marcum,¹ Shangqing Jiang,¹ Jennifer Bacci,¹ and Todd Ruppert,² *1. University of Washington, Seattle, Washington, United States, 2. Rush University College of Nursing, Chicago, Illinois, United States*

As pharmacists work to ensure reimbursement for chronic disease management services on the national (e.g., Medicare) level, summative evidence of their impact on important health metrics, such as medication adherence, is needed. The objective of this study was to assess the effectiveness of pharmacist-led interventions on medication adherence

in older adults. In April 2020, a comprehensive search was conducted in six databases for publications of randomized clinical trials of pharmacist-led interventions to improve medication adherence in older adults. English-language studies with codable data on medication adherence and diverse adherence-promoting interventions targeting older adults (age 65+) were eligible. A standardized mean difference effect size (intervention vs. control) was calculated for the medication adherence outcome in each study. Study effect sizes were pooled using a random-effects meta-analysis model. Moderator analyses were then conducted to explore for differences in effect size due to intervention, sample, and study characteristics. The primary outcome was medication adherence using any method of measurement. This meta-analysis included 40 unique randomized trials of pharmacist-led interventions with data from 8,822 unique patients (mean age, range: 65 to 85 years). The mean effect size was 0.57 (95% Confidence Interval [CI]: 0.38-0.76). When two outlier studies were excluded from the analysis, the mean effect size decreased to 0.41 (95% CI: 0.27-0.54). Moderator analyses showed larger effect sizes for interventions containing medication education and when interventions had components delivered at least partly in patients' homes. In conclusion, this meta-analysis found a significant improvement in medication adherence among older adults receiving pharmacist-led interventions.

SEX DIFFERENCES IN POTENTIALLY INAPPROPRIATE PRESCRIBING AMONG OLDER ADULTS WITH MULTIMORBIDITY

Maria Ukhanova,¹ Sheila Markwardt,¹ Jon Furuno,¹ Laura Davis,² Brie Noble,¹ and Ana Quiñones,¹ 1. *Oregon Health & Science University, Portland, Oregon, United States*, 2. *Neighborhood Health Center, Hillsboro, Oregon, United States*

Sex differences in prescribing potentially inappropriate medications (PIMs) for various multimorbidity patterns are not well understood. This study sought to identify sex specific risk of PIMs in older adults with cardiovascular-metabolic patterns. Secondary analysis of the Health and Retirement Study interview data (2004-2014; n=6,341, ≥65 y/o) linked to Medicare claims data was conducted. Four multimorbidity patterns were identified based on the list of 20 chronic conditions and included: 'cardiovascular-metabolic only', 'cardiovascular-metabolic plus other physical conditions', 'cardiovascular-metabolic plus mental conditions', and 'no cardiovascular-metabolic disease' patterns. Presence of PIM prescribing was identified using the 2015 American Geriatrics Society Beers Criteria, limited to the list of medications to avoid in older adults. Chi-square tests and logistic regressions were used to identify sex differences in prescribing PIMs across multimorbidity patterns: (1) for PIMs overall and (2) for each PIM drug class. Results indicate that on average women were prescribed PIMs more often than men (39.4% and 32.8%, respectively). Women with cardiovascular-metabolic plus other physical patterns (Adj.OR=1.25, 95% CI: 1.07-1.45) and cardiovascular-metabolic plus mental patterns (Adj.OR=1.25, 95% CI: 1.06-1.48) had higher odds of PIM compared to men, however, there were no sex differences in PIM prescribing in the cardiovascular-metabolic only patterns (Adj.OR=1.13, 95%

CI: 0.79-1.62). There was variation by sex across different PIM drug classes. Our study emphasizes the need to further reduce PIM prescribing among older adults, and identifies target populations for potential interventions to improve medication prescribing practices.

THYME AND OREGANO TERPENOIDS ACTIVATE AUTOPHAGY AND PROTECT AGAINST HEPATIC STEATOSIS

Gabriele Civiletto, Guillaume Eric Jacot, Federico Sizzano, Kamila Muller, Aurélie Hermant, Umberto De Marchi, Jerome Feige, and Philipp Gut, *Nestlé Research, Lausanne, Vaud, Switzerland*

Caloric restriction has been shown to reduce chronic illness in aging and increase life expectancy in most living organisms including mammals. Autophagy, a ubiquitous catabolic pathway of cellular quality control, is a key mechanism mediating the benefits of caloric restriction. In addition, mutations in genes involved in autophagy have been associated with the early onset of age-related diseases such as neurodegeneration, highlighting autophagy as a potential therapeutic target. Here, we aimed to discover autophagy inducers from a library of edible molecules for potential use in food applications. To this end, we developed a novel in vivo high-content screening strategy using fluorescent reporter zebrafish that monitor autophagy flux in skeletal muscle. We identify the thyme and oregano constituent thymol as a novel potent autophagy inducer in zebrafish, human cells and mouse tissues. Mechanistically, thymol triggers an hormetic effect on mitochondria in synergism with a calcium-dependent autophagy response which, in turn, leads to mobilization of intracellular lipid stores. We tested the effects of chronic thymol supplementation in mice fed a high-fat diet and showed that thymol mobilizes fatty acids, reduces liver triglycerides and improves markers of liver damage. In sum, we validate the use of zebrafish screening as a discovery model for autophagy-based therapeutics and demonstrate that thymol is an autophagy inducer with potential for the prevention of chronic metabolic diseases and other age-related conditions.

Session 3290 (Symposium)

NOVEL APPLICATIONS OF ACCELEROMETRY DATA FOR HEALTH OUTCOMES IN OLDER ADULTS: THINKING BEYOND MVPA

Chair: Jennifer Schrack

Co-Chair: Jacek Urbanek

Discussant: Todd Manini

Physical activity is a well-established predictor of health and longevity. Wearable accelerometers produce high-frequency, time series data that capture multiple aspects of daily physical activity across the spectrum of intensity. Historically, the majority of accelerometry-based physical activity research has employed summary threshold metrics such as moderate-to-vigorous physical activity, or "MVPA." Although these measures are important for understanding compliance with physical activity guidelines, they underutilize the potential of this data. To advance the science of physical activity in older adults, more sensitive, clinically translatable measures are needed. This symposium will examine the associations between novel measures of accelerometry-derived physical activity and various aging-related health

outcomes. Dr. Wanigatunga will discuss the association of physical activity volume and fragmentation with the frailty phenotype in the Study to Understand Vitamin D and Fall Reduction in You (STURDY). Dr. Cai will present evidence on the association of physical activity quantities and patterns with measures of visual impairment in the Baltimore Longitudinal Study of Aging. Ms. Qiao will present a novel accelerometry-derived measure of performance fatigability in the Developmental Epidemiologic Cohort Study. Finally, Dr. Urbanek will discuss the role of accelerometry-derived free-living gait cadence in defining fall risk in STURDY. Collectively, these presentations highlight critical associations between objective measures of physical activity and health outcomes in older adults and illuminate the need for thinking beyond MVPA to improve prevention and intervention efforts.

ACCELEROMETER-DERIVED PATTERNS OF PHYSICAL ACTIVITY AND INCIDENT FRAILITY

Amal Wanigatunga,¹ Yurun Cai,¹ Jacek Urbanek,² David Roth,³ Jeremy Walston,⁴ Karen Bandeen-Roche,¹ Lawrence Appel,² and Jennifer Schrack,¹ 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 2. *Johns Hopkins School of Medicine, Baltimore, Maryland, United States*, 3. *Johns Hopkins University, Baltimore, Maryland, United States*, 4. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*

Low physical activity (PA) is a common phenotype of frailty, but whether disengagement of daily lifestyle PA signals impending frailty remains unexplored. Using STURDY (Study to Understand Fall Reduction and Vitamin D in You) data from 499 robust/prefrail adults (mean age=76 + 5 years; 42% women), we examined whether accelerometer patterns (activity counts/day, active minutes/day, and activity fragmentation) were prospectively associated with incident frailty over 2 years of follow-up; 48 (10%) participants developed frailty. In Discrete-Cox hazard models adjusted for demographics, medical conditions, and device wear days, every 30 min/day higher baseline active time, 100,000 more activity counts/day, and 1% lower activity fragmentation was associated with a 13% ($p=0.003$), 10% ($p=0.001$), and 8% ($p<0.001$) lower risk of frailty, respectively. Our results show that both reduced amounts and fragmented patterns of daily PA captured from accelerometry are associated with phenotypic frailty and might signal frailty onset.

VISUAL IMPAIRMENT AND OBJECTIVELY MEASURED PHYSICAL ACTIVITY IN MIDDLE-AGED AND OLDER ADULTS

Yurun Cai,¹ Jennifer Schrack,¹ Jian-Yu E,² Amal Wanigatunga,¹ Jacek Urbanek,³ Eleanor Simonsick,⁴ and Bonnielin Swenor,³ 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 2. *Johns Hopkins Bloomberg School of Medicine, Baltimore, Maryland, United States*, 3. *Johns Hopkins School of Medicine, Baltimore, Maryland, United States*, 4. *National Institute on Aging/NIH, Baltimore, Maryland, United States*

Vision loss is associated with restricted physical activity (PA), yet the relationship between multiple domains of vision measures and objectively measured PA, especially activity patterns, in mid-to-late life remains unclear. In 603 BLSA participants (mean age=73.5±11 years; 56% women; 69% white), best-corrected and presenting visual acuity (VA), contrast sensitivity, visual fields (VF), stereo acuity were assessed from 2015 to 2019. Free-living PA was assessed using a wrist-worn ActiGraph accelerometer for 7 days. Linear regression models showed that participants with vs. without best-corrected VA impairment had 29.3 fewer active minutes/day ($p=0.03$) and trended towards fewer activity counts ($p=0.05$), adjusting for sociodemographic and health characteristics. VF impairment was associated with 268,636 fewer activity counts ($p=0.02$), 46.2 fewer active minutes/day ($p=0.02$), and a 3% greater activity fragmentation ($p=0.009$). Older adults with visual impairment have restricted and more fragmented activity patterns. Longitudinal studies are warranted to examine causality between visual impairment and PA decline.

DETECTING A NOVEL WALKING-BASED PERFORMANCE FATIGABILITY MARKER WITH ACCELEROMETRY IN OLDER ADULTS

Yujia (Susanna) Qiao,¹ Jaroslaw Harezlak,² Robert Boudreau,³ Jacek Urbanek,⁴ Kyle Moored,³ Jennifer Schrack,⁵ Eleanor Simonsick,⁶ and Nancy W. Glynn,⁷ 1. *University of Pittsburgh, University of Pittsburgh, Pennsylvania, United States*, 2. *Indiana University, Bloomington, Indiana, United States*, 3. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 4. *Johns Hopkins School of Medicine, Baltimore, Maryland, United States*, 5. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 6. *National Institute on Aging/NIH, Baltimore, Maryland, United States*, 7. *University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania, United States*

Walking-based performance fatigability measures (e.g., lap-time difference) may not adequately capture performance deterioration as self-pacing is a common compensatory strategy in those with low activity tolerance. To overcome this limitation, we developed a new approach with accelerometry (ActiGraph GT3X+, sampling=80 Hz, non-dominant wrist) during fast-paced 400m-walk ($N=57$, age=78.7±5.7 years, women=53%). Cadence (steps/second) was estimated using raw accelerometer data (R “ADEPT”). Penalized regression splines (R “mgcv”) were used to estimate the individual-level smoothed cadence trajectories. “Time-to-slow-down” was defined as first timepoint where the full confidence interval of change in cadence<0. Five participants were censored at stopping time (not slow-down or complete walk). Median “time-to-slow-down” was 1.86 minutes (IQR=0.98-2.73, range=0.57-6.25). Participants with longer “time-to-slow-down” had slower starting cadence, longer 400m-walk time, and greater perceived fatigability (Pittsburgh Fatigability Scale), p 's<0.05 (linear regression). Our preliminary findings revealed that detecting accelerometry-based performance fatigability/deterioration in older adults is feasible and needs to account for initial pace.

FREE-LIVING GAIT CADENCE MEASURED BY WEARABLE ACCELEROMETERS FOR ASSESSING FALL RISK

Jacek Urbanek,¹ David Roth,² Marta Karas,² Amal Wanigatunga,³ Stephen Juraschek,⁴ Lawrence Appel,¹ and Jennifer Schrack,³ 1. *Johns Hopkins School of Medicine, Baltimore, Maryland, United States*, 2. *Johns Hopkins University, Baltimore, Maryland, United States*, 3. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 4. *Harvard Medical School, Boston, Massachusetts, United States*

Accelerometers are widespread in research applications, yet whether they are superior to structured clinic-based assessments is unknown. Using negative binomial regression, we compared traditional in-clinic measures of mobility (6-minute gait cadence, speed, and distance, and 4-meter gait speed) with free-living gait cadence from wrist accelerometers (Actigraph GT9X) in predicting fall rates in 432 older adults (age 77.29 ± 5.46 yrs, 59.1% men, 80.2% White) participating in the Study to Understand Fall Reduction and Vitamin D in You (STURDY). Accelerometry-based gait cadence was estimated with the Adaptive Empirical Pattern Transformation algorithm. Across all participants, every 10 steps/min higher cadence was associated with a 13.2% lower fall rate ($p=0.036$). Mobility measures were not related to falls ($p>0.05$). Among higher-functioning participants (cadence ≥ 100 steps/min), every 10 steps/min higher free-living cadence ($p=0.01$) was associated with a 27.7% lower fall rate. Data collected from accelerometers may provide a more sensitive indicator of fall risk than in-clinic tests.

Session 3295 (Symposium)

NOVEL APPROACHES EXAMINING SLEEP HEALTH AS A MARKER OF SUCCESSFUL AGING

Chair: Soomi Lee

Discussant: Meredith Wallace

Sleep is a modifiable determinant of health. It changes with advancing age and in response to diverse contexts (e.g., related to work or one's health). Previous studies have often used single measures of sleep duration or sleep quality. However, a recent paradigmatic shift towards multidimensional sleep health emphasizes the importance of examining how multiple sleep measures are simultaneously associated with health. This approach presents many opportunities for understanding sleep phenotypes and their potential contributions to health. Yet it also presents methodological challenges in analyzing multidimensional sleep data. This symposium showcases the most recent approaches and novel ideas examining the role of sleep health in successful aging. Paper 1 examines sleep profiles (i.e., latent groups with varying sleep characteristics) in middle-aged adults and their linkages to psychological well-being and chronic conditions with differences by age groups. Paper 2 investigates 24-hour patterns of sleep-activity rhythms and their associations with physical functioning performance in older men and women. Paper 3 showcases the utility of a sleep health composite score in examining sleep disparities and their drivers in middle- and later-adulthood. Paper 4 examines whether and how a composite sleep health measure based on actigraphy data is

associated with specific characteristics of adult bipolar disorder patients. These papers use different cohorts, such as the Midlife in the United States Study, Osteoporotic Fractures in Men study, and Multi-Ethnic Study of Atherosclerosis. At the end, Dr. Wallace will discuss key findings from these studies, their methodological contributions and implications for aging, and directions for future research.

IDENTIFICATION OF LATENT SLEEP PROFILES IN MIDDLE-AGED ADULTS AND CONNECTIONS TO WELL-BEING

Claire Smith,¹ and Soomi Lee,² 1. *University of South Florida, University of South Florida, Florida, United States*, 2. *University of South Florida, Tampa, Florida, United States*

For middle-aged adults, achieving adequate sleep is a challenge but essential for long-term health. The present study identified latent sleep profiles to clarify how multiple sleep variables (i.e., regularity, satisfaction, alertness, timing, efficiency, and duration) cooccur within middle-aged adults and the implications these holistic sleep experiences have for well-being. Three profiles emerged within the Midlife in the United States II dataset (MIDUS; $N=4030$, $\text{Mage}=56.23$ years): (i) good sleepers, (ii) nappers/poor night sleepers, and (iii) sufficient but irregular sleepers. Generally, good sleepers reported the best well-being, sufficient/irregular sleepers reported comparatively moderate well-being, and nappers/poor night sleepers reported the worst well-being across a variety of indicators (i.e., chronic health conditions, life satisfaction, positive affect, negative affect, and psychological well-being) after adjusting for sociodemographic characteristics. Age moderated these associations. Our findings advance understanding of sleep health as a multifaceted construct and of its connection to well-being in middle-aged adults.

REST-ACTIVITY RHYTHM PATTERNS AND PHYSICAL FUNCTIONAL PERFORMANCE IN COMMUNITY-DWELLING OLDER MEN

Dorothy Chen,¹ Gregory Tranah,² Patrick Bradshaw,³ Terri Blackwell-Hoge,² Jamie Zeitzer,⁴ Sonia Ancoli-Israel,⁵ Kristine Yaffe,⁶ and Katie Stone,⁷ 1. *Sutter Health, SAN FRANCISCO, California, United States*, 2. *Sutter Health, San Francisco, California, United States*, 3. *UC Berkeley, Berkeley, California, United States*, 4. *Stanford University, Palo Alto, California, United States*, 5. *UC San Diego, La Jolla, California, United States*, 6. *UCSF, UCSF, California, United States*, 7. *University of California, Berkeley, San Francisco, California, United States*

Sleep and activity patterns have been linked to physical performance in older adults. Traditional parametric models of 24-hour activity rhythms fail to adequately capture specific diurnal sleep and wake patterns; functional principal components analysis (fPCA) is a non-parametric approach that addresses this limitation. Using fPCA, we modeled accelerometry data from $n = 2,960$ participants in the Osteoporotic Fractures in Men (MrOS) ancillary sleep study (mean age 77y) and examined cross-sectional associations with gait speed and grip strength measurements. Lower daytime activity (expected difference = -0.049 [$-0.072, -0.028$] m/s), increased sleep duration and a reduced midday dip in activity (-0.015 [$-0.035, 0.006$] m/s) were modestly associated

with worsening gait speed. A modest association between both later sleep and wake times and increased sleep duration with worsening grip strength outcomes was observed (-1.11 [-1.90, -0.32] kg). Specific daily activity patterns may serve as predictive biomarkers for changing physical function in aging populations.

MULTIDIMENSIONAL SLEEP HEALTH: CONCEPTS, ADVANCES, AND IMPLICATIONS FOR RESEARCH AND INTERVENTION

Joon Chung,¹ Matthew Goodman,¹ Tianyi Huang,² Suzanne Bertisch,¹ and Susan Redline,³ 1. *Brigham and Women's Hospital, Harvard Medical School, Boston, Massachusetts, United States*, 2. *Brigham and Women's Hospital, Boston, Massachusetts, United States*, 3. *Harvard Medical School, Boston, Massachusetts, United States*

Sleep is a complex process, sensitive to aging, with theoretical and evidentiary basis for influence on multiple health outcomes. Recent scholarship has argued for a 'multi-dimensional' approach to sleep health, that is, a recognition that healthy sleep consists of more than its quantity (duration) and is more than the absence of sleep disorders. This new conception of sleep health acknowledges sleep's complexity yet presents challenges for methodological treatment. How do we operationalize/analyze multiple dimensions of sleep, some of which are correlated due to physiological reasons, common measurement tools, or sensitivity to common stressors? Is it sensible to talk about 'sleep health' as a single, composite entity with multiple components, akin to a dietary pattern rather than a collection of individual nutrients? Exemplar data from a racial-ethnic disparities project in aging adults suggest the utility of a composite approach, and the value of considering inter-correlations among sleep metrics.

FINDING A COMPOSITE MEASURE FOR DATA FROM WRIST ACTIGRAPHY IN BIPOLAR DISORDER

Christopher Kaufmann,¹ Ellen Lee,² David Wing,³ Sonia Ancoli-Israel,⁴ Colin Depp,² Ho-Kyoung Yoon,⁵ and Lisa Eyer,² 1. *University of Florida, Gainesville, Florida, United States*, 2. *Department of Psychiatry, University of California San Diego, La Jolla, California, United States*, 3. *Center for Wireless and Population Health Systems, University of California San Diego, La Jolla, California, United States*, 4. *UC San Diego, La Jolla, California, United States*, 5. *Department of Psychiatry, Korea University College of Medicine, Seoul, Seoul-t'ukpyolsi, Republic of Korea*

Actigraphy can objectively measure sleep in studies on Bipolar Disorder (BD) where subjective sleep ratings might be influenced by affect. Actigraphy data are complex necessitating data reduction approaches. We created a composite score of actigraphy sleep metrics (total sleep time [TST], wake after sleep onset [WASO], and percent sleep [PS]) in BD. We computed z-scores of sleep measures for n=51 BD vs. n=80 healthy subjects and averaged scores. We examined associations with participant characteristics and used LASSO to identify metrics best explaining composite variability. Higher composite scores (better sleep) were seen in employed vs. unemployed ($t=2.40$, $df=34$, $p=0.02$), and correlated with higher medication load ($r=0.41$, $p=0.004$),

lower mania symptomatology ($r=-0.33$, $p=0.04$) and lower interleukin (IL)-6 levels ($r=-0.32$, $p=0.02$). TST best explained variability in medication load and PS best explained employment, mania symptoms and IL-6. Given observed specificity of associations, selecting theory-driven sleep metrics may be more appropriate than a composite.

Session 3300 (Symposium)

PHYSICAL ACTIVITY AND SEDENTARY BEHAVIOR PATTERNS PRIOR TO AND DURING THE COVID-19 PANDEMIC

Chair: Nancy Gell

Co-Chair: Dori Rosenberg

Discussant: Andrea LaCroix

Understanding patterns in the types of activities older adults engage in during physical activity and sedentary time could help shape intervention designs. Few studies have adequately described the physical activity and sedentary pursuits older adults undertake, including during the COVID-19 pandemic. To answer these questions, this symposium uses data from three recent studies: Adult Changes in Thought (ACT), an epidemiologic study with self-reported and device-based measures of physical activity and sedentary time including time spent in various domains of activity; Objective Physical Activity and Cardiovascular Disease Health in Older Women (OPACH), an epidemiologic study with device and self-report measures of sedentary behavior; and an ongoing clinical trial, the Healthy Aging Resources to Thrive (HART) study with device and self-reported data on sitting time and patterns as well as physical activity. The first session in this symposium will present a description of the rates of meeting the aerobic, strength, and balance recommendations among older adults in the ACT study. Next, we will have a presentation describing sedentary activities in older adults by age, sex and device-based sitting patterns in the ACT study. In the third presentation we will use OPACH data to examine patterns and context of sedentary in relation to aging-related outcomes. Finally, we will describe changes in physical activity and sedentary time in the HART trial in the cohort enrolled prior to the COVID-19 pandemic vs. those enrolled during the pandemic. Our Discussant will provide new insights on the roles of sedentary behavior and physical activity in aging and health.

DEVICE-MEASURED SEDENTARY PATTERNS AND PHYSICAL ACTIVITY BEFORE AND DURING THE COVID-19 PANDEMIC

Dori Rosenberg,¹ Mikael Anne Greenwood-Hickman,² Jing Zhou,¹ Julie Cooper,³ David Arterburn,¹ and Andrea Cook,¹ 1. *Kaiser Permanente Washington Health Research Institute, Seattle, Washington, United States*, 2. *Kaiser Permanente Washington, Seattle, Washington, United States*, 3. *kaiser Permanente Washington Health Research Institute, Seattle, Washington, United States*

Little is known about objective levels of sitting time (ST), patterns of ST, and physical activity (PA) among older adults before compared to during the COVID -19 pandemic. We used data from the Healthy Aging Resources to Thrive Trial to examine differences in activPAL-assessed ST, standing time, breaks from sitting, and steps in study enrollees prior to

March 2020 (N = 97, % female = 60.8, % white = 81.4; Mean BMI = 35.2) compared to post-March 2020 (N = 47, % female = 70.2, % white = 72.3; Mean BMI = 36.1). During the pandemic, participants had higher sitting time (Mean = 11.5 vs. 10.7 hours/day), fewer breaks from sitting (Mean = 40 vs. 44 breaks/day), and fewer steps (Mean = 4441 vs. 5931 steps/day) than prior to the pandemic. Interventions may be needed to support older adults with obesity in recovering losses in time spent physically active.

AEROBIC, STRENGTHENING, AND BALANCE ACTIVITIES PERFORMED BY COMMUNITY-DWELLING OLDER ADULTS

Mariana Wingood,¹ Bonnell Levi,² and Nancy Gell,²

1. *University of Vermont, University of Vermont, Vermont, United States*, 2. *University of Vermont, Burlington, Vermont, United States*

Little is known about whether older adults meet the recommended physical activity (PA) guidelines, including aerobic, strength, and balance components. Given this gap, we examined self-report PA data from 1,352 older adult participants of the Adult Changes in Thought (ACT) study. We classified participants as meeting some components, meeting the full guidelines, or being insufficiently active. Multinomial regression was used to identify factors associated with meeting PA guidelines. Despite performing 9.5 hours of weekly PA, only 11% met the full guidelines, 13% met the aerobic, and 26% met the balance or strength recommendations. Increasing age and body mass index, needing assistance with instrumental daily activities, heart disease, and low income were associated with decreased odds of meeting PA guidelines. Older adults primarily perform aerobic PA and lower intensity PA with fewer participating in strength and balance activities. Interventions targeting strength, balance, and higher intensity PA should be developed.

CHARACTERIZING COMPONENT ACTIVITIES OF OLDER ADULT SEDENTARY TIME BY AGE, GENDER, AND DEVICE-BASED SITTING PATTERNS

Mikael Anne Greenwood-Hickman,¹ Rod Walker,² John Bellettiere,³ Andrea LaCroix,³ and Dori Rosenberg,²

1. *Kaiser Permanente Washington, Seattle, Washington, United States*, 2. *Kaiser Permanente Washington Health Research Institute, Seattle, Washington, United States*, 3. *University of California, San Diego Herbert Wertheim School of Public Health and Human Longevity Science, La Jolla, California, United States*

The activities that compose older adults' considerable sedentary time are not well characterized. We described daily time spent in self-reported sedentary activities and explored differences by age, gender, and activPAL sitting patterns. Participants self-reported a total of 10.7 hours of sitting time and spent the most time watching TV (2.6 hrs/day), using the computer (1.7 hrs/day), and reading (1.6 hrs/day). Women spent more time watching TV, engaged in hobbies, and socializing and less time on the computer compared to men. Older participants spent more time watching TV, reading, and participating in group activities and less time on the computer than younger participants. Those with low activPAL sitting time and frequent activPAL sitting breaks (low mean bout duration) ~1 hr /day less watching TV than

those with high activPAL sitting time. These findings help illuminate future intervention targets and lay the path to explore associations between different sedentary activities and health.

ACCELEROMETER-MEASURED PATTERNS OF SEDENTARY BEHAVIOR IN OLDER WOMEN: THE OPACH STUDY

Benjamin Schumacher,¹ Eric Hyde,² John Bellettiere,³ Blake Anuskiewicz,⁴ and Andrea LaCroix,³ 1. *University of California, San Diego, San Diego, California, United States*, 2. *UC San Diego, San Diego, California, United States*, 3. *University of California, San Diego Herbert Wertheim School of Public Health and Human Longevity Science, La Jolla, California, United States*, 4. *San Diego State University, San Diego, California, United States*

Excessive sedentary behavior (SB) is related to deleterious health outcomes. Understanding the patterns and contexts in which SB accumulates can promote healthy aging. Daily sitting time and mean sitting bout duration (MBD) were measured by triaxial accelerometers. Participants self-reported how much time they spent sitting while: watching TV, reading, using the computer, driving, working, or taking phone calls. Data were compared across aging-related characteristics. Age-adjusted sitting time (minutes/day) for 5,838 diverse (33.2% Black, 16.9% Hispanic), older women (mean age 78.7±6.7) were 577.2 for Hispanic women, 630.3 for Black women, and 632.0 for White women. Those in the lowest vs. highest physical function category had the longest MBD (16.1 vs. 11.7 minutes/bout). Watching television was the most common self-reported sedentary activity. The highest vs. lowest quartile of MBD spent, on average, 30.6 and 22.3 minutes/day watching television, respectively. This presentation will illuminate critical factors associated with sitting patterns in older adults.

Session 3305 (Symposium)

PRESIDENTIAL SYMPOSIUM: FROM GLOBAL TO LOCAL: AN AGE-INCLUSIVE AND RIGHTS-BASED APPROACH TO GERONTOLOGICAL EDUCATION

Chair: Dana Bradley

Co-Chair: Judith Howe

In June 2020, the Gerontological Society of America (GSA) joined in solidarity in the movement to condemn the entrenched racism undermining American society and build upon a gero-rich international historical base of supporting human rights. However, as gerontological educators, we need to expand on the conversation of racism to the broader global discussion of inclusivity and elimination of discrimination. A global focus on human rights of older persons, which began in 1982 at the World Assembly on Aging and has led to the current discussion of the proposed UN Convention on the Rights of Older Persons. The Academy of Gerontology in Higher Education (AGHE) is GSA's education group of colleges and universities that offers education, training, curricular innovations, and research programs in the field of aging. The work of this group is grounded in an age-inclusive and rights-based perspective, and members are committed to an international view demonstrated through AGHE's tagline Global Leaders in Advancing Education on

Aging; This symposium explores the role of age-inclusivity and a rights-based perspective in gerontology and geriatrics education and offers both challenges and best practices for moving forward. The first presentation explores the meaning of age-inclusivity in aging education in a global context and asks how do we build upon our international roots? Our second presenter shares a proposed framework for a rights-based approach to gerontology education. The third presentation explores an example of a rights-based training program. We conclude with a lively discussion focusing on how to take action through education.

A PROPOSED FRAMEWORK FOR IMPLEMENTING A RIGHTS-BASED APPROACH TO GERONTOLOGICAL EDUCATION AND TRAINING

Dana Bradley,¹ and Laura Allen,² 1. *UMBC Erickson School of Aging Studies, Baltimore, Maryland, United States*, 2. *Bar-Ilan University, Ramat Gat, Tel Aviv, Israel*

This paper uses the nine general principles that underpin human rights (Non-discrimination, Respect, Dignity, Autonomy, Equality, Self-fulfillment and Personal development, Full and effective participation, Intergenerational solidarity, and Recognition of intrinsic value and worth as a human being) to frame a right's based approach. This framework looks beyond the older person and the issues they are facing to the structure and culture of the society itself and the ways in which it is contributing to challenges. Using this lens, we will discuss how to develop definitions and standards of right's- based education that are culturally and contextually appropriate, define right's based competencies and recognize, that despite the universal rights of older persons, the implementation may need to be adjusted for unique sociocultural environments. . Lastly we will outline a strategy to identify and train multidisciplinary teaching and research teams using this proposed framework.

PAST, PRESENT, AND FUTURE OF HUMAN RIGHTS IN GERONTOLOGICAL EDUCATION

Judith Howe, *Icahn School of Medicine at Mount Sinai, Yonkers, New York, United States*

The rights of older persons, essential to our work as gerontologists, were discussed in the World Assembly on Aging (1982) and adopted through the United Nations Principles of Older Persons and followed by the Madrid International Plan of Action on Aging (MIPPA) in 2002. Although it has been endorsed by the General Assembly of the United Nations, in contrast to conventions, it is not binding on member states. This paper discusses the rights of older persons and our obligations as educators and researchers to focus on core issues associated with the rights and quality of life of older people. We will review the role of education in meeting this call to action through examples like the UN Decade of Healthy Ageing where education is a required element to accomplish the action areas and the Age-Friendly University movement. Both have involved multiple university communities on a global scale.

BRINGING RIGHTS OF OLDER PERSONS TO THE REAL WORLD: LESSONS LEARNED FROM A RIGHTS-BASED TRAINING

Kimberly Stoeckel,¹ and Kelly Fitzgerald,² 1. *UMBC Erickson School of Aging Studies, Baltimore, Maryland,*

United States, 2. *University of Maryland Baltimore County, Baltimore, Maryland, United States*

When gerontological education and training are grounded in a rights-based approach, this framing provides a tool to ensure the rights of older people are advocated for and experienced. A "train the trainer" program was given to non-governmental organizations (NGOs) providing services to refugees in Jordan. The goal of the training was to educate NGOs on how to use a rights-based approach when responding to and supporting older refugees. The training covered a range of topics in ensuring the rights of older people in the provision of care, protection, and inclusion. Training outcomes revealed an increased awareness of the rights of older people. Skills and knowledge gained as a result of this training empowered participants to further develop their own work, within their cultural context, to reflect a rights-based approach to services and programs.

Session 3310 (Paper)

Social-Environmental Contexts and Well-Being

AIR QUALITY IMPROVEMENT IS ASSOCIATED WITH DECREASING DEPRESSIVE SYMPTOMS IN OLDER WOMEN

Andrew Petkus,¹ Xinhui Wang,¹ Diana Younan,² Daniel Beavers,³ Mark Espeland,³ Joshua Millstein,² Margaret Gatz,² and Jiu-Chiuan Chen,² 1. *University of Southern California, LOS ANGELES, California, United States*, 2. *University of Southern California, Los Angeles, California, United States*, 3. *Wake Forest School of Medicine, Winston-Salem, North Carolina, United States*

Air pollution exposure is an environmental risk factor in brain aging and may also be associated with late-life depressive symptoms (DS). It is unknown if air quality (AQ) improvement is associated with reductions in DS in later life. Longitudinal data from 917 cognitively intact women with no prior history of depression (baseline age 66.4 ± 1.6 years old) participating in the Women's Health Initiative Memory Study of Younger Women (WHIMSY; 2008-2016) were analyzed to examine whether AQ improvement over the 5-years prior to WHIMSY baseline was associated with trajectories of DS (measured by 15-item Geriatric Depression Scale). Annual PM_{2.5} (fine particulate matter of aerodynamic diameter <2.5) and NO₂ were estimated at the participants' residence using regionalized universal kriging models. Estimates were aggregated to the 3-year average at 5 years (remote) and immediately (recent) before WHIMSY baseline. Associations between AQ improvement (difference between remote to recent exposure) and trajectories of DS were estimated using linear mixed effect models, adjusting for sociodemographic, lifestyle, and clinical covariates. AQ improved prior to baseline (PM_{2.5}: 1.62 ± 1.45 $\mu\text{g}/\text{m}^3$ and NO₂: 3.70 ± 2.81 ppb). Women residing in locations with greater improvement in NO₂ (per IQR = 4.34 ppb) or PM_{2.5} (per IQR = 2.30 $\mu\text{g}/\text{m}^3$) reported significant annual reductions in DS ($\beta\text{NO}_2=3.1\%$, $p=.046$; $\beta\text{PM}_{2.5}=1.6\%$, $p=.046$), similar to the effect of engaging in moderate to vigorous physical activity four times or more a week. These findings suggest that improving air quality may reduce depressive symptoms in older women.

AMBIENT AIR POLLUTION AND INCREASING DEPRESSIVE SYMPTOMS IN OLDER WOMEN: THE MEDIATING ROLE OF THE PREFRONTAL CORTEX

Andrew Petkus,¹ Xinhui Wang,¹ Diana Younan,² Daniel Beavers,³ Mark Espeland,³ Joshua Millstein,² Margaret Gatz,² and Jiu-Chiuan Chen,² *1. University of Southern California, LOS ANGELES, California, United States, 2. University of Southern California, Los Angeles, California, United States, 3. Wake Forest School of Medicine, Winston-Salem, North Carolina, United States*

Exposure to air pollution may accelerate brain aging and increase risk of late-life depressive symptoms (DS). Brain structures underlying these associations are unknown. Longitudinal data from 829 community-dwelling women without dementia (baseline age 81.6 ± 3.6 years old) who participated in both the Women's Health Initiative Memory Study Magnetic Resonance Imaging study (WHIMS-MRI; 2005-06) and the WHIMS-Epidemiology of Cognitive Health Outcomes (2008-16) were analyzed to examine whether volumetric measures of brain structures mediated associations between long-term exposure to ambient air pollutants and annual increases in DS (as measured by annually assessed 15-item Geriatric Depression Scale). Annual PM_{2.5} (fine particulate matter of aerodynamic diameter <2.5) and NO₂ were estimated at the participants' residence using regionalized universal kriging models and aggregated to the 3-year average prior to the WHIMS-MRI. Structural equation models were constructed to estimate associations between exposure, structural brain variables, and trajectories of DS (standardized on baseline mean and SD). Living in locations with higher NO₂ (standardized $\beta = 0.023$; 95% Confidence Interval (CI) = 0.004, 0.042) or PM_{2.5} (standardized $\beta = 0.021$; 95% CI = 0.004, 0.038) was associated with larger annual increases in DS (~60% larger annual increase in DS). Higher NO₂, but not PM_{2.5}, was associated with smaller prefrontal cortical volumes (standardized $\beta = -0.431$; 99% CI = -0.518; -0.344). Prefrontal cortical volume explained 30.4% of the total association between annual DS increase and NO₂. These findings underscore the importance of the prefrontal cortex in associations between NO₂ exposure and increasing DS in later-life.

CRIME AND PERCEIVED NEIGHBORHOOD SAFETY ACROSS RACIAL-ETHNIC GROUPS

Alfredo Velasquez,¹ Fangqi Guo,² and Jennifer Robinette,¹ *1. Chapman University, Orange, California, United States, 2. Chapman University, Irvine, California, United States*

Crime often increases safety concerns for residents, and safety concerns are generally associated with worse health. Despite that marginalized racial/ethnic groups are more likely than non-Hispanic Whites to live in areas with more crime, prior studies have documented that these groups differentially view crime as a threat to safety. Furthermore, older adults are more likely to report safety concerns than younger adults, despite a lesser chance of being victimized. Using multiple waves of data from the Health and Retirement Study, a representative sample of US adults aged 51 years and older ($n = 11,161$, mean age of 66 years), we conducted weighted

repeated cross-sectional linear regressions to examine whether the association between crime and perceived neighborhood safety varies by racial/ethnic group, by age, or by wave of data collection. Study results indicated that higher crime rates consistently predicted more safety concerns among non-Hispanic Whites, Hispanics, and "Others," but were inconsistently associated with safety concerns among non-Hispanic Blacks, adjusting for age, household wealth, and census tract-level concentrated disadvantage, population density, and racial/ethnic heterogeneity. Furthermore, among non-Hispanic Whites, greater crime predicted more safety concerns before, but not after including a measure of racial/ethnic heterogeneity. These patterns persisted across the full age span. Racial/ethnic differences in the crime-safety link could be explained by additional sociopolitical and environmental variables including diversity that vary over time. Follow-up analysis is needed to determine if the racial/ethnic differences in crime-safety links extend to health.

SPACE, CONTEXT, HUMAN CAPITAL: A MACRO-MICRO PERSPECTIVE ON SOCIAL ENVIRONMENT AND FINANCIAL LITERACY IN LATER LIFE

Yang Li,¹ Jan Mutchler,² Edward Miller,² Jing Jian Xiao,³ and Reginald Tucker-Seeley,⁴ *1. Institute of Social Sciences, 2. University of Massachusetts Boston, Boston, Massachusetts, United States, 3. University of Rhode Island, Kingston, Rhode Island, United States, 4. University of Southern California, Los Angeles, California, United States*

Despite a large body of literature documenting the association between individual characteristics and financial literacy, our understanding of the impact of macro-environmental conditions on individual financial literacy remains limited, particularly in later life. Drawing from a micro-macro perspective on the social environment and individual processes, we examined the extent to which three state-level contextual characteristics were associated with individual later-life financial literacy in the United States: tertiary educational attainment, poverty prevalence, and Internet penetration. We utilized data from the 2019 Understanding America Study (UAS) for adults aged 50 years or older to assess financial literacy ($n = 2,930$), and data from the American Community Survey to evaluate contextual conditions. The UAS is a nationally representative survey panel supported by the Social Security Administration and the National Institute on Aging. Cross-sectional multilevel regression models were used to examine the hypothesized effects. We found that state-level poverty prevalence was negatively associated with individual financial literacy while state-level Internet penetration was positively associated with individual financial literacy, over and above individual characteristics known to impact financial literacy. No association was found between state-level educational attainment and individual financial literacy after controlling for respondents' own education. Findings suggest that the social environment may condition financial literacy in later life through exposure to opportunities that promote knowledge acquisition. Interventions to enhance later-life financial literacy may benefit from targeted approaches that take into account the environmental characteristics of their locations of residence.

Session 3315 (Symposium)

TESTING IMPLEMENTATION OF FFC-AL-EIT

Chair: Barbara Resnick

Co-Chair: Marie Boltz

Residents in assisted living settings engage in limited amounts of physical activity and decline functionally more rapidly than peers in nursing homes. To address the persistent functional decline and increased time spent in sedentary activity Function Focused Care was developed. Function Focused Care involves teaching caregivers to evaluate residents' underlying functional capability and physical activity and engage them in physical activity during all care interactions. Prior research has demonstrated that implementing function focused care improves or maintains function and increases physical activity, improves mood and decreases behavioral symptoms among residents. To optimize implementation of Function Focused Care a theoretically based implementation strategy, Function Focused Care for Assisted Living Using the Evidence Integration Triangle (FFC-AL-EIT), was developed. FFC-AL-EIT combines the social ecological model, social cognitive theory and the Evidence Integration Triangle. The social ecological model includes intrapersonal, interpersonal, environmental, and policy factors that influence behavior. Social cognitive theory guides the interpersonal interactions that motivate caregivers and residents to engage in function focused care. Lastly, the Evidence Integration Triangle facilitates systemic implementation of function focused care. A total of 85 facilities from three states were randomized (FFC-AL-EIT versus Education Only) and 794 residents consented. The Reach, Effectiveness, Adoption, Implementation, and Maintenance (RE-AIM) model was used to evaluate outcomes. This symposium will provide the implementation outcomes and value of the Evidence Integration Triangle, the effectiveness of FFC-AL-EIT on function and physical activity and the effectiveness on psychosocial outcomes and care interactions.

THE VALUE OF THE EVIDENCE INTEGRATION TRIANGLE

Barbara Resnick, *University of Maryland School of Nursing, Baltimore, Maryland, United States*

The Evidence Integration Triangle involved engaging stakeholders in the 12 month FFC-AL-EIT activities including identifying community specific goals, supporting the staff implementing the intervention, and intervening when champions or staff were not engaged in intervention activities. Ongoing participation of the stakeholder team occurred through monthly meetings. Evaluation of implementation was based on the Reach Effectiveness Adoption Implementation and Maintenance (RE-AIM) Model. Reach was based on 85 of 90 communities participating and 794 residents recruited. Effectiveness was supported based on less functional decline and more function focused care performed by residents. Adoption was based on evidence that monthly meetings were held, 77% of settings engaged as, or more than expected, and caregivers increased the amount of function focused care provided. The intervention was implemented as intended, knowledge was received, and environments and policies supporting function focused care were

maintained. The Evidence Integration Triangle is an effective implementation approach for assisted living.

THE IMPACT OF FFC-AL-EIT ON RESIDENT AND SETTING OUTCOMES

Marie Boltz, *Pennsylvania State University, University Park, Pennsylvania, United States*

FFC-AL-EIT was implemented by a Research Nurse Facilitator working with a community champion and stakeholder team for 12 months to increase function and physical activity among residents. FFC-AL-EIT included four steps: (Step I) Environment and Policy Assessments; (Step II) Education; (Step III) Establishing Resident Function Focused Care Service Plans; and (Step IV) Mentoring and Motivating. A total of 85 communities and 794 residents were included. The age of participants was 89.48 (SD=7.43), the majority was female (N=561, 71%) and white (N=771, 97%). Resident measures, obtained at baseline, four and 12 months, included function, physical activity, and performance of function focused care. Setting outcomes, obtained at baseline and 12 months, included environment and policy assessments and service plans. Effectiveness was based on less decline in function ($p<.001$), more function focused care ($p=.012$) and better environment ($p=.032$) and policy ($p=.003$) support for function focused care in treatment sites.

THE EFFECTIVENESS OF FFC-AL-EIT ON PSYCHOSOCIAL OUTCOMES AND CARE INTERACTIONS

Elizabeth Galik, *University of Maryland School of Nursing, Baltimore, Maryland, United States*

This study included a subset of 59 communities and 550 residents from the full FFC-AL-EIT study. Participants were mostly white (98%), female (69%) and had a mean age of 89.30 (SD=7.63). Sites were randomized to the four step FFC-AL-EIT intervention implemented by a function focused care nurse facilitator working with a facility champion over 12 months versus education only. Resident measures included depression, agitation, resistiveness to care and the quality of care interactions and were obtained at baseline, 4 and 12 months. There was a significant positive treatment effect related to depression, agitation, resistiveness to care and quality of care interactions with either less decline or some improvement in these behaviors and symptoms and improvement in the quality of care provided between the treatment versus control group. The study suggests there is some benefit to implementing FFC-AL-EIT for psychosocial outcomes and care interactions among residents in assisted living communities.

Session 3320 (Symposium)

2020 EDITOR'S CHOICE ARTICLES FROM JGMS: FOCUS ON VULNERABLE POPULATIONS

Chair: Lewis Lipsitz

Discussant: Tamara Baker

This symposium will present four 2020 "Editor's Choice" articles from the Journal of Gerontology Medical Sciences that focus on issues relevant to vulnerable older populations. Justin Golub and colleagues, in their article "Audiometric

Age-Related Hearing Loss and Cognition in the Hispanic Community Health Study”, broaden the scope of age-related studies on audiometric hearing loss by using a large Hispanic cohort, a community largely excluded from previous hearing loss studies. By examining audiometrically-defined hearing loss and cognitive measures, Golub found links between hearing loss and lower neurocognition. Janice Atkins and colleagues, in “Preexisting Comorbidities Predicting COVID-19 and Mortality in the UK Biobank Community Cohort”, challenge the practice of simple age-based targeting of older adults to prevent severe COVID-19 infections, and show that specific high-risk comorbidities are better indicators of hospitalization and mortality. “Comparison of Recruitment Strategies for Engaging Older Minority Adults: Results from Take Heart”, by Jessica Ramsay and colleagues, examines methods used to recruit older adults of color from primarily low socio-economic households for behavioral and clinical health research. Ryon Cobb and coauthors, in their article “Self-reported Instances of Major Discrimination, Race/Ethnicity, and Inflammation among Older Adults: Evidence from the Health and Retirement Study”, investigate whether self-reported lifetime discrimination is a psychosocial factor influencing inflammation in older adults. Tamara Baker, the discussant, will highlight commonalities and lessons learned from these studies, including links between racial, socio-economic, or disease-related vulnerabilities of older adults and their health status, as well as best practices to account for these factors in future clinical trials.

MAJOR DISCRIMINATION, RACE-ETHNICITY, AND INFLAMMATION AMONG OLDER ADULTS

Ryon Cobb,¹ Lauren Parker,² and Roland Thorpe, Jr.,²

1. *University of Georgia, Athens, Georgia, United States*,
2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

This study examines the relationship between self-reported instances of major discrimination and inflammation among older adults, and explores whether this relationship varies in accordance with race/ethnicity. Data from 2006/2008 Health and Retirement Study was used to collect measures of self-reported instances of major discrimination and high-risk C-reactive protein (CRP), which was assayed from blood samples. Modified Poisson regression with robust standard errors was applied to estimate the prevalence ratios of self-reported instances of major discrimination, as it relates to high-risk CRP (CRP \geq 22 kg/m²), and test whether this relationship varies by race/ethnicity. Respondents who experienced any instances of major discrimination had a higher likelihood of high-risk CRP (prevalence ratio [PR]: 1.14, 95% confidence interval [CI] = 1.07–1.22) than those who did not report experiencing any instances of major discrimination. This relationship was weaker for blacks than whites (PR: 0.81, 95% CI = 0.69–0.95).

AUDIOMETRIC AGE-RELATED HEARING LOSS AND COGNITION IN THE HISPANIC COMMUNITY HEALTH STUDY

Justin Golub,¹ Adam Brickman,¹ Adam Ciarleglio,² Nicole Schupf,³ and José Luchsinger,¹ 1. *Columbia University, New York, New York, United States*, 2. *George Washington University, Washington, DC, District of*

Columbia, United States, 3. *Columbia University, Mailman School of Public Health, New York, New York, United States*

Studies associating age-related hearing loss (HL) with cognition have been limited by non-Hispanic cohorts, small samples, or limited confounding control. We overcome these limitations in the largest study of formal, audiometric HL and cognition to date using the multicentered Hispanic Community Health Study (n=5,277, mean age=58.4 [SD=6.2]). The main exposure was audiometric HL. The main outcome was neurocognitive performance. Adjusting for demographics, hearing aid use, and cardiovascular disease, a 20-dB increase (one-category worsening) in HL was cross-sectionally associated with worse performance in multiple neurocognitive measures: -1.53 (95% CI = -2.11, -0.94) raw score point difference on Digit Symbol Substitution Test, -0.86 (-1.23, -0.49) on Word Frequency Test, -0.76 (-1.04, -0.47) on Spanish-English Verbal Learning Test (SEVLT) 3 trials, -0.45 (-0.60, -0.29) on SELVT recall, -0.07 (-0.12, -0.02) on Six-Item Screener. Because HL is common and potentially treatable, it should be investigated as a modifiable risk factor for neurocognitive decline/dementia.

COMPARISON OF RECRUITMENT STRATEGIES FOR ENGAGING OLDER MINORITY ADULTS: RESULTS FROM TAKE HEART

Jessica Ramsay,¹ Cainnear Hogan,² Mary Janevic,³ Rebecca Courser,³ Kristi Allgood,³ and Cathleen Connell,³ 1. *University of Michigan School of Public Health, Detroit, Michigan, United States*, 2. *VA Ann Arbor Healthcare System, Ann Arbor, Michigan, United States*, 3. *University of Michigan School of Public Health, Ann Arbor, Michigan, United States*

Few studies report best practices for recruiting older adults from minority, low SES communities for behavioral interventions. In this presentation, we describe recruitment processes and numbers for Take Heart, a randomized controlled trial testing the effectiveness of an adapted heart disease self-management program for primarily African American, low SES adults 50 years or older in Detroit. Community-based (CB), electronic medical record (EMR), and in-person hospital clinic (HC) recruitment methods were implemented. Within 22 months, 453 participants were enrolled, with an overall recruitment yield of 37%. The CB method had the highest yield (49%), followed by HC (36%) and EMR (16%). The average cost of recruiting and enrolling one participant was \$142. Face-to-face interactions and employing a community health worker were particularly useful in engaging this population. Further research is needed to confirm these findings in other minority and low SES populations and share lessons learned about recruitment challenges and successes.

PREEXISTING COMORBIDITIES PREDICTING COVID-19 AND MORTALITY IN THE UK BIOBANK COMMUNITY COHORT

Janice Atkins,¹ Jane Masoli,² Joao Delgado,³ Luke Pilling,² Chia-Ling Kuo,⁴ George Kuchel,⁴ and David Melzer,² 1. *University of Exeter Medical School, University of Exeter, England, United Kingdom*, 2. *University of Exeter, Exeter, England, United Kingdom*, 3. *University of Exeter Medical School, Exeter, England, United Kingdom*, 4. *University of Connecticut Health, Farmington, Connecticut, United States*

Hospitalized COVID-19 patients tend to be older and frequently have hypertension, diabetes or CHD, but whether these co-morbidities are more common than in the general older population is unclear. We estimated associations between pre-existing diagnoses and hospitalized COVID-19 alone or with mortality (during the first COVID-19 outbreak, tests performed between March 16 and April 26, 2020). In 269,070 UK Biobank participants aged 65+, 507 (0.2%) became COVID-19 hospital inpatients, of which 141 (27.8%) died. Common preexisting co-morbidities in hospitalized inpatients were hypertension (59.6%), history of falls/fragility fractures (29.4%), CHD (21.5%), T2 diabetes (19.9%) and asthma (17.6%). However, in adjusted models, pre-existing diagnoses of dementia, T2 diabetes, COPD, pneumonia, depression, atrial fibrillation and hypertension emerged as independent risk factors for COVID-19 hospitalization, the first five remaining statistically significant for related mortality. There are specific high risk pre-existing co-morbidities for COVID-19 hospitalization and deaths in community based older men and women.

Session 3325 (Symposium)

A STAKEHOLDER-BASED STUDY IMPROVING RESIDENT AND FAMILY ENGAGEMENT IN THE SAFETY OF ASSISTED LIVING

Chair: Anna Beeber

Co-Chair: Ruth Anderson

Discussant: Lindsay Schwartz

Assisted living (AL), is a long-term care service that provides housing and care for over 800,000 older adults in 30,000 residences. AL culture and operations have been transforming to enhance resident personhood and increase autonomy, however, these practices are balanced with the need to minimize safety issues (e.g., medication errors, infections, falls, and in cases of dementia, elopement and injuries). In this stakeholder-based study, we are translating existing strategies for improving patient safety to AL residences and developing an evidence-based tool for implementing these engagement strategies in AL. This symposium presents the methods and findings from a federally-funded mixed methods study including qualitative interviews with 105 AL residents, staff and family caregivers, and a series of focus groups with an AL stakeholder group to develop a toolkit to improve resident and family engagement in AL safety. The first paper outlines our methodological approach, including our efforts to work with stakeholders throughout the research process. The second paper reports findings from a scoping review of existing tools to support resident and family engagement in the safety of AL. The third paper presents the findings from our interviews with AL residents, families and staff exploring their safety priorities, and how they differ across stakeholder groups. The fourth paper presents the findings from our qualitative interviews exploring the challenges and promising practice to resident and family engagement in AL safety during the COVID-19 pandemic. All four presentations in this symposium illustrate important issues for future practice, policy, and research.

STAKEHOLDER-BASED METHODS TO DEVELOP A TOOLKIT TO PROMOTE ENGAGEMENT IN ASSISTED LIVING SAFETY

Anna Beeber,¹ Ruth Anderson,¹ Matthias Hoben,² Stephanie Chamberlain,³ Victoria Bartoldus,⁴ and

Stephanie Palmertree,⁵ 1. *University of North Carolina at Chapel Hill, UNC Chapel Hill, North Carolina, United States*, 2. *University of Alberta at Edmonton, Edmonton, Alberta, Canada*, 3. *University of Alberta, University of Alberta, Alberta, Canada*, 4. *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States*, 5. *University of North Carolina at Chapel Hill School of Nursing, Chapel Hill, North Carolina, United States*

This presentation provides an overview of a mixed-methods stakeholder engaged study to develop a toolkit to encourage resident and family engagement in the safety of assisted living (AL). This study uses stakeholder-based data and stakeholder engaged processes to adapt existing tools and strategies from other settings to encourage resident and family engagement in the safety of AL. We will improve resident safety in AL by developing an evidence-based tool to implement these engagement tools/strategies in AL. The presentation will outline the theoretical base, the approach for this study, including efforts to recruit and retain stakeholders throughout the study, and stakeholder engaged process to develop the toolkit. The presentation will include challenges and strategies to encourage participation of AL staff, residents, and family caregivers in the study. The presentation will conclude with a discussion of implications for future design and research efforts aiming to impact AL care, policy, and research implementation.

TOOLS TO ENHANCE RESIDENT AND FAMILY ENGAGEMENT IN ASSISTED LIVING SAFETY: A SCOPING REVIEW.

Thi Vu,¹ Jennifer Leeman,² Marianne Baernholdt,² Christine Kistler,³ Elizabeth Moreton,⁴ Terri Ottosen,⁴ Pam Dardess,⁵ and Anna Beeber,⁶ 1. *Yale University, New Haven, Connecticut, United States*, 2. *University of North Carolina at Chapel Hill School of Nursing, Chapel Hill, North Carolina, United States*, 3. *University of North Carolina at Chapel Hill Division of Geriatric Medicine and Dept. of Family medicine, Chapel Hill, North Carolina, United States*, 4. *University of North Carolina at Chapel Hill Health Sciences Library, Chapel Hill, North Carolina, United States*, 5. *Institute for Patient- and Family-Centered Care, McLean, Virginia, United States*, 6. *University of North Carolina at Chapel Hill, UNC Chapel Hill, North Carolina, United States*

This presentation reports the results of a scoping review which identified and evaluated existing engagement strategies, tools, and interventions for their fit with assisted living (AL). Using the PRISMA criteria, we evaluated 54 empirical studies in assisted living/residential care or nursing homes (NH) for how they engaged families and residents, promoted person-centered and/or safety in AL/NH care, and assessed relevant outcomes (safety, experience, service use, satisfaction with care, health behaviors, and quality of life). The strategies, tools, and interventions aimed to improve residents' activities of daily living, function, and quality of life. Studies also targeted staff and family caregivers to increase knowledge, improve relationships, and decrease caregiving stress. Overall, the studies reported statistically significant changes in resident quality of life, agitation, antipsychotic use, staff knowledge and job satisfaction. Results from this systematic review will inform the development of a testable toolkit to increase engagement and improve safety in AL.

UNDERSTANDING RESIDENT, FAMILY, AND STAFF SAFETY PRIORITIES TO GUIDE DEVELOPMENT OF AN ENGAGEMENT TOOLKIT

Youngmin Cho,¹ Victoria Bartoldus,¹ Cloie Chiong,² Tabitha Linville,³ Stephanie Palmertree,³ and Anna Beeber,⁴
 1. *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States*, 2. *University of North Carolina at Chapel Hill Gillings school of Global Public Health, Chapel Hill, North Carolina, United States*, 3. *University of North Carolina at Chapel Hill School of Nursing, Chapel Hill, North Carolina, United States*, 4. *University of North Carolina at Chapel Hill, UNC Chapel Hill, North Carolina, United States*

Resident and family engagement (the desire, ability, and activation as a partner in care) is a necessary component of keeping assisted living (AL) residents safe. Barriers to engagement include differing priorities between the resident/family and staff. This presentation outlines the results of a content analysis of qualitative interviews with 105 AL staff, residents, and family members, in which we examined AL stakeholder priorities for safety. Qualitative interviews were analyzed to first identify safety priorities by stakeholder type (staff, resident, and families), and then compared across stakeholder group. Stakeholder-specific safety priorities were identified, including infection management (COVID-19 and others), medications errors, falls, elopement, lack of AL resources/staffing, conflict, adverse events, nutrition, physical hazards, building security, chemical agents, fire/natural disasters, and abuse/neglect – the importance of these priorities vary by stakeholder type. Presentation discussion will include implications for future intervention to address the top safety problems in AL.

ENGAGEMENT IN ASSISTED LIVING DURING THE COVID-19 PANDEMIC: CHALLENGES AND PROMISING PRACTICES.

Victoria Bartoldus,¹ Youngmin Cho,¹ Janelle Perez,² Jing Wang,³ Stephanie Palmertree,² and Anna Beeber,⁴
 1. *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States*, 2. *University of North Carolina at Chapel Hill School of Nursing, Chapel Hill, North Carolina, United States*, 3. *Fudan University, Chapel Hill, North Carolina, United States*, 4. *University of North Carolina at Chapel Hill, UNC Chapel Hill, North Carolina, United States*

The “lockdown” in assisted living (AL) from the COVID-19 pandemic has physically isolated residents from the outside world and affected resident and family engagement in care. This presentation outlines a content analysis of qualitative semi-structured telephone interviews conducted from April 2020 with 105 AL staff, residents, and family members exploring COVID-19 experience/restrictions and engagement during the pandemic. Analysis revealed AL families and residents expressed difficulties with COVID-19 visiting and distancing restrictions, reduced family visitations, discontinuity of care, and worries about COVID-19 infection. Staff/administrators expressed uncertainty about lack of knowledge about COVID-19, worries about transmission, and if staff will get exposed outside of work. Promising factors include enhanced communication between staff and families regarding care, improved virtual communication, creative

strategies to socially engage residents, and improved infection control practices and staff training. The presentation discusses the implications of the findings for future research, policy, and practice.

Session 3330 (Symposium)

A SYSTEMS-WIDE APPROACH FOR EARLY DETECTION AND MANAGEMENT OF DEMENTIA IN PRIMARY CARE

Chair: Annette Fitzpatrick

Discussant: Basia Belza

Dementia is frequently unrecognized and under-reported by health care providers. The needs of an aging population increase the burden on an already over-worked primary care system that is often without the appropriate training, resources, and reimbursement to address the growing number of people with cognitive decline in the US. In this symposium we present a systems-wide approach within University of Washington (UW) Primary Care to increase awareness of early signs and symptoms, detection of cognitive impairment, and support of providers, patients and caregivers that will ultimately improve outcomes of care. This quality improvement (QI) program integrates stakeholder-selected components of the GSA KAER (Kickstart-Assess-Evaluate and Refer) Model and Toolkit (2020 Edition), developed by the Gerontological Society of America (GSA), into primary care practice. We describe content and logistics of a continuing education intervention for primary care providers and clinical staff to increase skills for evaluation and management of dementia. Working with UW clinic managers and information technology (IT), we have developed a pragmatic system for streamlining operations and documenting care utilizing newly developed interdisciplinary workflows and electronic health record order sets. Using input from our Community Advisory Board, we explain development of a web-based resource directory to be used in-clinic and at home to support providers, staff, patients, families, and caregivers across cognitive changes. Strategies presented here are aimed to help other health care systems initiate steps to integrate KAER and other tools into a practical QI program for improving detection and management of dementia through support of primary care.

INTEGRATING THE GSA KAER TOOLKIT INTO PRACTICAL TRAINING FOR PRIMARY CARE CLINICS

Barak Gaster,¹ Jaqueline Raetz,¹ Basia Belza,¹ Monica Zigman Suchsland,² Judit Illes,³ Benjamin Olivari,⁴ Lisa McGuire,⁵ and Annette Fitzpatrick,¹
 1. *University of Washington, Seattle, Washington, United States*, 2. *University of Washington, Seattle, University of Washington, Washington, United States*, 3. *The Gerontological Society of America, Washington, District of Columbia, United States*, 4. *Centers for Disease Control and Prevention (CDC), Atlanta, Georgia, United States*, 5. *CDC, Atlanta, Georgia, United States*

Education is central to driving change in clinical practice. First, primary care providers and their clinic team members need to understand why detecting cognitive impairment is important, how it can be done efficiently, and what the next steps in referral and management are. To engage primary

care clinics in this change process, we developed a continuing education intervention, based on the KAER Model, using a live video format. Four evidence-based, 45-minute training modules presented core knowledge skills, including how to have difficult conversations, which are essential to diagnosing cognitive impairment. To overcome the obstacles to doing so in primary care, our team relied on a deep understanding of busy primary care practice. With a combined 35 years of direct experience in primary care, our collaborative interdisciplinary team was able to use the KAER Model to develop a highly acceptable intervention for primary care.

IMPLEMENTATION OF THE GSA KAER TOOLKIT IN A LARGE CLINIC SYSTEM: WORKFLOW MODIFICATIONS AND EMR TOOLS

Jaqueline Raetz,¹ Barak Gaster,¹ Basia Belza,¹ Monica Zigman Suchsland,² Judit Illes,³ Benjamin Olivari,⁴ Lisa McGuire,⁵ and Annette Fitzpatrick,¹ 1. *University of Washington, Seattle, Washington, United States*, 2. *University of Washington, Seattle, University of Washington, Washington, United States*, 3. *The Gerontological Society of America, Washington, District of Columbia, United States*, 4. *Centers for Disease Control and Prevention (CDC), Atlanta, Georgia, United States*, 5. *CDC, Atlanta, Georgia, United States*

We implemented the KAER toolkit in the University of Washington primary care clinics. In this session we share the workflows implemented to promote the KAER model and share the tools we developed within EPIC, the system's electronic medical record (EMR). We collaborated with clinic staff to develop interdisciplinary workflows including: training patient service representatives, social workers, nurses, and medical assistants (MAs) about 'red flags;' training medical assistants to complete the Patient Health Questionnaire (PHQ-9) and Montreal Cognitive Assessment (MoCA); and assuring they are appropriately entered into flowsheets in EPIC. We created a checklist (EPIC 'SmartPhrase') and educated the clinics' interdisciplinary teams to utilize it within their scope of practice. Additionally, we created an order set (EPIC 'SmartSet') of commonly ordered tests and referrals to expedite evaluation of patients with suspected cognitive impairment. Lastly, we created a direct link from our EMR to our website containing community resources.

COGNITION IN PRIMARY CARE COMMUNITY RESOURCE DIRECTORY FOR INDIVIDUALS, CAREGIVERS, AND PROVIDERS

Monica Zigman Suchsland,¹ Annette Fitzpatrick,² Barak Gaster,² Jaqueline Raetz,² Judit Illes,³ Benjamin Olivari,⁴ Lisa McGuire,⁵ and Basia Belza,² 1. *University of Washington, Seattle, University of Washington, Washington, United States*, 2. *University of Washington, Seattle, Washington, United States*, 3. *The Gerontological Society of America, Washington, District of Columbia, United States*, 4. *Centers for Disease Control and Prevention (CDC), Atlanta, Georgia, United States*, 5. *CDC, Atlanta, Georgia, United States*

A KAER Model recommendation is to refer individuals diagnosed with dementia to resources that help them prepare for the future and services that provide ongoing support. The purpose of this project was to locate local quality services

and develop a resource directory for persons with cognitive impairment for use by providers, staff, individuals, families, and caregivers. We worked with a Community Advisory Board and interviewed individuals and caregivers to understand what resources are useful and important to include in the resource directory. We built a web-based resource directory that allows users to query resources based on specific needs. We integrated the resource directory within the electronic health record for providers to include after visit summaries. A resource directory was deployed for community use, with goals of sustainability and longevity after this project is completed.

Session 3335 (Symposium)

APPROACHING MULTIMORBIDITY FROM A TRANSLATIONAL GEROSCIENCE PERSPECTIVE

Chair: Anne Newman

Multimorbidity describes the accumulated burden of chronic disease. Multimorbidity erodes physiologic reserve, increasing the risk of frailty, disability and death. Most older adults have at least one chronic health condition by age 65. Once established, many age-related conditions progress and accumulate with age. Geroscience holds that there are key biologic pathways that explain the increase with age in multimorbidity, frailty and disability Translation of geroscience principles to human studies requires careful assessment of biomarkers of these pathways and multisystem outcomes. In this symposium, translational researchers in geriatric medicine and gerontology will present current work to elucidate biologic underpinnings of aging and potential intervention targets. We will address whether blood biomarkers of aging processes are prognostic using combinatorial techniques and explore the potential for proteomics to identify novel pathways for health aging. New insights into the role of inflammation will be discussed with an emphasis on its relationship to multimorbidity. Brain aging will be considered with respect to the interactions between external stressors and resilience evaluating the role of ketone bodies which have immunomodulatory effects particularly on innate immune cells. Finally, the role of multimorbidity as an intervention target and potential intermediate outcomes including biomarkers will be presented with discussion of next steps needed to realize the potential for translational geroscience clinical trials to improve health span.

OPERATIONALIZING HEALTHSPAN AS AN OUTCOME FOR CLINICAL TRIALS IN GEROSCIENCE

Jamie Justice, *Wake Forest School of Medicine, Wake Forest School of Medicine, North Carolina, United States*

Efforts targeting biological aging pathways are advancing interventions which could extend healthy lifespan. Design of clinical trials to test such interventions necessitates an operational definition of healthspan, such as slowed accumulation or progression of multiple chronic diseases, functional decline, and disability. In this talk we explore these composite measures of healthspan proposed as outcomes for clinical trials in aging. This will be examined in example cases including multimorbidity and deficit accumulation frailty indices in an 8-Year intensive lifestyle intervention trial, and an update on multimorbidity, functional, and biomarker

endpoints in the trial Targeting Aging with METformin (TAME). Through these examples we will explore issues related to effect sizes and statistical challenges related to composite endpoints. Finally, we will discuss the role existing and emerging biomarkers of aging in clinical trials in geroscience and summarize evidence linking biomarkers to clinically meaningful outcomes.

UNBIASED PROTEOMICS AND TARGETED BIOMARKERS ASSOCIATED WITH EXCEPTIONAL LONGEVITY AND MULTIMORBIDITY IN HUMANS

Michelle Odden, *Stanford University, Stanford, California, United States*

Biomarkers ideal for geroscience trials could be those simultaneously identified using targeted and discovery assays and which strongly associate with complementary disease (multimorbidity) and longevity (exceptional survival) outcomes. To identify a tractable set of biomarkers for use in geroscience trials, we used the Cardiovascular Health Study (CHS), whose participant makeup closely aligns with the Targeting Aging with METformin (TAME) trial. In ~4800 CHS participants, quantitative assays of nine a priori-identified biomarkers were used to construct a biomarker index which strongly associated with the TAME primary outcome of mortality and multimorbidity over 6 and 10 years of follow-up. In ~3000 CHS participants, 1300 proteins were measured with unbiased aptamer proteomics and associated with survival to age 90 over 25 years of follow-up. Proteins in the biomarker index were identified as some of the strongest associated with survival to 90. This convergent evidence suggests these biomarkers may be well-suited for geroscience trials.

CHRONIC INFLAMMATION AND THE ACCELERATION OF CHRONIC DISEASE STATES

Jeremy Walston, *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*

The chronic activation of the immune system is commonly observed in older adults, and is highly associated with multiple chronic disease states and Geriatric syndromes including physical frailty, sarcopenia and mild cognitive impairment. Chronic inflammation is multifactorial, and the individual inflammatory mediators that drive the development and propagation of disease states impact normal tissue homeostasis as well as stem cell vitality. This session will discuss age-related etiologies of chronic inflammation and specific inflammatory mediators and their measurement, including Tumor Necrosis Factor (TNF) alpha and its receptors. Inflammation-driven molecular pathways that most impact relevant chronic disease states such as the tryptophan degradation pathway, and its relationship to pathophysiological changes, will also be considered. Finally, discussion of potential treatment modalities, including several emerging from Geroscience research, will be described as will their impact on chronic disease states.

IMMUNOMETABOLIC STRESS AND KETONE BODIES IN DISORDERS OF THE AGING BRAIN

John Newman, *Buck Institute for Research on Aging, Novato, California, United States*

Delirium is an acute confusional state that is a common complication of acute illness in older adults, and is associated

with increased risk of death, disability, and dementia. Delirium in older adults is an example of a geriatric syndrome, with multifactorial, multi-system causes that include existing aging-related physiological changes as well as external acute stressors. Its pathophysiology delirium is not well understood but may include glycolytic energy deficits associated with acute inflammation in the brain. The endogenous ketogenic system provides ketone bodies as a lipid-derived alternative to glucose for cellular energy, and ketone bodies are increasingly understood to have immunomodulatory effects particularly on innate immune cells. We used a mouse model of acute inflammation-associated behavioral change to investigate how age-related differences in energy utilization in the brain affect delirium-like phenotypes, focusing on energy metabolism and innate immune activation in the brain as an example of immunometabolic approaches to geriatric syndromes.

Session 3340 (Symposium)

BEHAVIORAL HEALTH, SOCIAL ENGAGEMENT, AND LONG-TERM CARE SERVICES USE AMONG COMMUNITY OLDER ADULTS: USA VS. TAIWAN

Chair: Su-I Hou

Co-Chair: Chien-Ching Li

Discussant: Darren Liu

As healthcare advances, older adults are living longer. While 90% of older adults prefer aging in their own homes and communities, it is important to examine key factors influencing healthy aging-in-community and community-based long-term care (LTC) services available in different countries. This symposium examines behavioral health, social engagement, and LTC services utilization among community-dwelling older adults in the USA and Taiwan. Lessons learned from older adults across countries will provide insights for tailored community-based LTC services and program development. Dr. Hou from The University of Central Florida (UCF) will highlight similarities and differences in behavioral health profiles and the topics that most interest community-dwelling older Americans participating in three aging-in-community programs in Central Florida. Dr. Wang from Case Western Reserve University will examine the impact of neighborhood social cohesion on mobility among community-dwelling older Americans aged 65 and older from the national Health and Retirement Study. Dr. Liu from National Cheng-Kung University in Taiwan will share results of healthy lifestyle on quality of life among community-dwelling older adults in southern Taiwan. Dr. Young from State University of New York at Albany will compare long-term care use among community-dwelling older adults with and without dementia in Central Taiwan. Finally, Drs. Cao and Hou from UCF will analyze home and community-based services in the USA versus Taiwan. This symposium will further discuss similarities and differences of key factors related to healthy aging-in-community, along with practical recommendations and lessons learned across countries and cultural environments to improve community-based long-term care services and programs.

BEHAVIORAL HEALTH AND MOST-INTERESTED TOPICS AMONG OLDER ADULTS IN THREE AGING-IN-COMMUNITY PROGRAMS IN FLORIDA

Su-I Hou, *School of Global Health Management & Informatics, University of Central Florida, University of Central Florida, Florida, United States*

This study compares behavioral health and most-interested topics among older adults in three aging-in-community (AIC) programs: a university-based lifelong learning program (LLP; 38%), a county neighborhood lunch program (NLP; 29%), and a village program sample (33%) (total n=289). Mean age was 72.4 (SD=8.68) years. Although perceived health was similar (mean=3.76), LLP and village members reported higher quality of life than NLP participants ($p=.004$). Two-thirds of the participants indicated at least half of their daily plates filled with fruits and vegetables, and at least 10 min. walking in 4.5 days during a typical week. The duration of each walking was lower among NLP members (23 min.), compared with village (31 min.) or LLP members (35 min.) ($p=.002$). The top three most interested topics were brain health, giving back, and keep community healthy. Older adults in AIC programs were overall healthy and active. Results have implication on tailored program development.

NEIGHBORHOOD COHESION AND MOBILITY LIMITATIONS AMONG OLDER AMERICANS: THE ROLES OF DEPRESSIVE SYMPTOMS AND MASTERY

Fei Wang,¹ Weidi Qin,² and Jiao Yu,³ *1. Case Western Reserve University, Cleveland Heights, Ohio, United States, 2. University of Michigan, 3. Department of Sociology, College of Arts and Sciences, Case Western Reserve University, Cleveland, Ohio, United States*

Neighborhood environment has been playing an important role in late-life health; yet, the social aspect of neighborhood environment and its impact on mobility limitations have been rarely examined. This study examines the relationship between neighborhood social cohesion and mobility limitations and the potential mediators (i.e., depressive symptoms, mastery) of this relationship. A total of 8,317 Americans aged 65 and older were selected from the Health and Retirement Study. Using ordinary least squares (OLS) regressions, this study shows that neighborhood social cohesion is negatively associated with mobility limitations, and this association is mediated by depressive symptoms and mastery respectively. Specifically, neighborhood social cohesion can reduce mobility limitations through mitigating depressive symptoms and increasing mastery. The findings have implications for developing community measures to promote neighborhood social cohesion and applying psychosocial interventions to reduce depressive symptoms and improve mastery among older adults.

HEALTHY LIFESTYLE DOES MATTER FOR COMMUNITY-DWELLING ADULTS PURSUING QUALITY OF LIFE

Li-Fan Liu, *National Cheng Kung University, National Cheng Kung University, Tainan, Taiwan (Republic of China)*

It has been well documented that socioeconomic factors influence lifestyle behaviors and all the physical and mental status at the individual level do matters for elderly people

experiencing healthy aging. This study aimed to explore to what extent the healthy lifestyle including exercise and social participation influence on the health status of the community dwellings and their quality of life in Taiwan. Using a cross-sectional survey design, 1032 adults, aged ≥ 50 years, were interviewed with complete data from four communities in southern Taiwan. The results showed that for older community dwellings adults, doing exercise was significantly associated with feeling less stress, less depress, higher life satisfaction and higher quality of life ($p<0.001$). Being volunteers was found to be significantly associated with better quality of life ($p<0.001$). In the aging society, it is necessary to apply multifaceted approaches extending from individual solutions to public policy efforts in promoting healthier lifestyles.

A COMPARISON OF LONG-TERM CARE USE BY COMMUNITY-DWELLING OLDER ADULTS WITH AND WITHOUT DEMENTIA

Yuchi Young,¹ Arianna Stone,² Kuo-Piao Chung,³ HSIU-HSI CHEN,⁴ and Yen-Po Yeh,⁵ *1. State University of New York at Albany, Rensselaer, New York, United States, 2. University at Albany School of Public Health, Albany, New York, United States, 3. National Taiwan University, School of Public Health, Taipei, Taipei, Taiwan (Republic of China), 4. National Taiwan University, National Taiwan University, Taipei, Taiwan (Republic of China), 5. Changhua County Public Health Bureau, Changhua City, Changhua, Taiwan (Republic of China)*

Introduction. This study compares long-term care (LTC) use among community-dwelling older adults with and without dementia. **Methods.** Participants ($n=14,483$) were aged 65+ residents of Changhua County, Taiwan who qualified for LTC services. Data were collected (4/1/2017-10/26/2018) through health assessments. Multivariate logistic regression quantifies the study aim. **Results.** Preliminary results show that on average participants with dementia are older than people without dementia (81.1 vs. 80.5; $p<.001$), more females (13.4% vs. 8.0%; $p<.001$), higher mean ADL (12.4 vs. 9.8; $p<.001$) and IADL (21.4 vs. 17.8; $p<.001$), and lower mean comorbidity (2.5 vs. 2.8; $p<.001$). Multivariate regression results indicate people with dementia use twice the health-related LTC services than their counterpart (OR= 2.0; 95% CI 1.90–2.14). **Discussion.** People with dementia use more health-related LTC services. Future dementia studies should examine the pattern of non-health-related LTC services concomitant with health-related services, so that person-centered care can be tailored to foster aging-in-community.

HOME AND COMMUNITY-BASED SERVICES BETWEEN THE USA AND TAIWAN

Xian Cao,¹ and Su-I Hou,² *1. University of Central Florida, University of Central Florida, Florida, United States, 2. School of Global Health Management & Informatics, University of Central Florida, University of Central Florida, Florida, United States*

Home and community-based services (HCBS) are critical to support our rapidly growing and aging population around the world. This paper takes initial steps to compare HCBS between the USA and Taiwan from four perspectives: funding sources, service types, challenges, and

recommendations. Peer-reviewed articles and governmental reports (both English and Chinese) in the U.S.A. and Taiwan were reviewed. Analyses showed both countries mainly use tax dollars to fund HCBS. Although both countries have similar service categories, USA lack a clear organization scheme whereas Taiwan has detailed and clear services provisions. Workforce quality and shortage were common challenges for both countries, especially from culture perceptive. Recommendations for USA include expanded funding pool, better coordination between agencies, and rebalancing HCBS and institutional care with limited budget. Recommendations for Taiwan include expanded service coverage and quality to reduce disparity in rural areas, and providing more support for informal caregivers.

Session 3345 (Paper)

Broadening the View of Gerontological Education and Practice

ALZHEIMER'S DISEASE AMONG AMERICAN MINORITY POPULATIONS: AN ECOLOGICAL EXPLORATORY STUDY

Maria LaQuaglia,¹

Marina Celly Martins Ribeiro de Souza,² and

Carolina Marques Borges,² 1. *The College of New Jersey, Ewing, New Jersey, United States*, 2. *The College of New Jersey, The College of New Jersey, New Jersey, United States*

A significant public health concern with regards to increasing rates of Alzheimer's is that it disproportionately affects minority groups in the United States. The present ecological exploratory study uses secondary aggregate data from the fifty United States in the year of 2019. The purpose of this study was to address the disparities in Alzheimer's in minority populations in the US and explore associated factors. The "minority" populations considered were African American and Latino populations, and the "majority" population was referred to as "white". The data was extracted from the United States Census Bureau, the CDC National Center for Health Statistics, and the Behavioral Risk Factor Surveillance System (BRFSS) Dataset. The prevalence rates of Alzheimer's disease are greatest in both older Latinos (12.2%) and African Americans (13.8%), compared to older whites (10.3%) in the investigated time period. Our results showed that being over 65 years old ($p=.009$), with a below-average (\$62,843) median household income ($p=.024$), history of stroke ($p=.029$), and being a part of the Latino population ($p=.036$), were significantly associated with Alzheimer's mortality rates in the United States. By identifying disparities in access to Alzheimer's healthcare and at-risk communities, more comprehensive intervention strategies can be developed to promote change and advocate for more Alzheimer's education and resource allocation for minority populations.

DIFFERENCES IN GERIATRIC-FOCUSED EDUCATION PREPARATION AND BELIEFS ABOUT PROVIDING CARE TO OLDER PATIENTS IN GHANA

Grace Karikari,¹ and Samuel Asante,² 1. *University of North Dakota, Grand Forks, North Dakota, United States*, 2. *Northeastern State University, Broken Arrow, Oklahoma, United States*

With the increasing growth rate of older persons and a rise in related illnesses in Ghana, it is vital that health practitioners are equipped with geriatric-oriented knowledge and expertise to provide the needed services to geriatric patients. The purpose of this study was to examine (i) the differences in the level of geriatric-focused educational preparation between graduating medical and nursing students in a Ghanaian public institution, and (ii) the association between educational preparation and students' beliefs about providing care to geriatric patients. The study hypothesized that students with more positive beliefs will be linked to higher educational preparation. Descriptive and inferential statistics were conducted ($n=136$ students). Findings show significant differences in the educational preparation of medical and nursing students ($t [134] = -3.790, p < .001$). Graduating nursing students, comparatively, had higher educational preparation ($M=23.14, SDe3.30$) than medical students ($M=21.14, SD=2.76$). However, there was no significant association between students' educational preparation and their beliefs about geriatric care. The findings underscore the need for extensive or more focused training. Further, the association between beliefs and educational preparation warrants further exploration. The need to examine the social cultural environment within which the research participants reside are discussed.

ONLINE GERONTOLOGY COURSES: ISSUES OF EQUITY

Anita Sharma, *University of Louisiana at Monroe, Monroe, Louisiana, United States*

The COVID-19 Pandemic changed higher education in several significant ways. The most significant impact was on methods of course delivery. In March 2020, all educational institutions changed their methods of instruction to fully online instruction. It happened almost overnight and left the students as well as the instructors unprepared for the unanticipated metamorphosis. The sudden and unanticipated change in the method of instruction and delivery of course contents also highlighted issues of equity. There appeared to be high levels of inequity in the use of technology across school and college campuses. A survey of students conducted by the author at the University of Louisiana at Monroe revealed different types of inequity such as, lack of finances to buy equipment, lack of training in the use of technology, and lack of personal space to study from home. A significant percentage of student population at ULM consists of first-generation college students. These students were impacted the most by the new methods of course delivery. Additionally, the author looked up similar surveys at other educational institutions and conducted a meta-analysis of published studies. This paper presents these findings.

THE STATE OF GERONTOLOGICAL TRAINING IN GHANA: IMPLICATIONS FOR A SPECIALIZED WORKFORCE AND THE AGING POPULATION

Samuel Asante,¹ and Grace Karikari,² 1. *Northeastern State University, Broken Arrow, Oklahoma, United States*, 2. *University of North Dakota, Grand Forks, North Dakota, United States*

The rise in older population in Ghana is accompanied by several challenges that may require trained professionals with specialized knowledge in geriatrics and gerontology to

help address. Extensive review of existing literature, however, indicates a lack of comprehensive geriatric focused training in Ghana's education system. Unfortunately, the scope of this training deficiency, potential impact on the geriatric workforce, as well as the health and wellbeing of the aging population on the national level have not been extensively examined. With the older adult population set to increase over the next few years, the need for geriatric-trained human service professionals in diverse disciplines, including medicine, nursing, psychology, social work and public health has become more pronounced. This paper is a review of the current state of gerontological education in higher institutions in Ghana. Specifically, authors examined (1) current geriatric-focused training programs available to students in all public/government owned institutions, (2) existing national level programs, and policies addressing training deficiencies, and (3) the implications of findings for future geriatric workforce as well as the health and wellbeing of older Ghanaians. The findings call attention to the need for a nationwide geriatric-focused training system and policies aimed at prioritizing specialized care for the older population. Culturally appropriate recommendations for integrating gerontological training and education in tertiary institutions are discussed. Guidelines and standards based on the Academy for Gerontology in Higher Education (AGHE) Competencies for Undergraduate and Graduate Education are proposed.

WHAT DO ISRAELI GERONTOLOGY STUDENTS THINK ABOUT MEDICAL MARIJUANA USE FOR ALZHEIMER'S AND PARKINSON'S DISEASE?

Offer Edelstein,¹ Richard Isralowitz,² Oren Wacht,² Alexander Reznik,² and Yaacov Bachner,³ 1. *Ben-Gurion University of the Negev, Beer-Sheva, HaDarom, Israel*, 2. *Ben-Gurion University of the Negev, Be'er-Sheva, HaDarom, Israel*, 3. *Ben-Gurion University, Beer-Sheva, HaDarom, Israel*

Aims: The aims of the current study were as follows: 1) to assess gerontology graduate students' beliefs about medical marijuana's (MMJ) effectiveness for two common age-related conditions - Alzheimer's (AD) and Parkinson's disease (PD); 2) to assess students' beliefs and attitudes toward MMJ; 3) to explore associations linking background characteristics, MMJ-related attitudes and beliefs, and beliefs about the MMJ effectiveness for AD and PD. Method: A sample of 104 (84 women and 20 men) gerontology graduate students voluntarily participated in an anonymous online survey. Results: The vast majority (95%) of the participants indicated they had no formal education about MMJ and reported being unprepared to answer clients' MMJ-related questions (84.6%). Most of the participants believed that MMJ is effective for use with AD (70.2%) and PD (80.8%) patients. Participants reported favorable beliefs about MMJ benefits, concerns about risks, the need for training, and positive attitudes toward recreational marijuana use legalization. Prior marijuana use (e.g., self-use, friends or family) was found to be associated with more positive beliefs about MMJ benefits, risks, and its legalization for recreational purposes. Prior marijuana use was the only factor associated with the belief that MMJ is an effective therapy for use with individuals diagnosed with AD or PD. Conclusions: The study findings stress the need for students' MMJ education in order to provide

future gerontology service providers with the necessary knowledge and ability to address clients' questions about MMJ use. Efforts to develop curricula and training programs need to be promoted.

Session 3350 (Symposium)

POLICY SERIES: CONGRESSIONAL UPDATE

Chair: Brian Lindberg

This popular annual session will provide cutting-edge information on what the 117th Congress has and has not accomplished to date, and what may be left for end of the First Session. Speakers will discuss key issues such as pandemic relief, Social Security, Medicare, Medicaid, and the Older Americans Act.

Session 3355 (Symposium)

DISASTER PREPAREDNESS AND COPING AMONG OLDER ADULTS: EMPIRICAL ANALYSIS AND VIRTUAL REALITY PLATFORM DEVELOPMENT

Chair: Zhen Cong

This symposium included 4 studies that use national and regional data to examine older adults' disaster preparedness and coping. The first study examined age differences in preparedness for the continuation of COVID-19 with a sample of 443 residents in Dallas, TX. The findings highlight older adults' resilience and special needs for different types of support during the pandemic. The second study examined the association of having COVID-19 and intergenerational relationships using the COVID-19 module of the Health and Retirement Study with a sample of 3266 respondents. Using a national sample of 1,467 respondents from the 2017 U.S. National Household Survey, the third study examined age differences relationships among the type of disasters (i.e., disasters with different lead-time), response efficacy, and disaster preparedness. The findings highlighted older adults' unique vulnerability and resilience in different types of disasters. The fourth study discussed a pilot virtual reality platform under development to assist older adults to develop tailored household emergency preparedness plans and practice those plans with simulated extreme weather conditions and warnings for older adults to practice disaster response and develop relevant knowledge and skills as well as test and revise their emergency preparedness plans. Overall, this symposium emphasizes the uniqueness of older adults' needs, vulnerability, and resilience to disasters.

AGE DIFFERENCES IN PREPAREDNESS FOR THE CONTINUATION OF COVID-19: IMPORTANT ROLES OF SOCIAL SUPPORT

Zhirui Chen,¹ Zhen Cong,¹ Daan Liang,² and Guofeng Cao,³ 1. *University of Texas at Arlington, Arlington, Texas, United States*, 2. *University of Alabama, Tuscaloosa, Alabama, United States*, 3. *University of Colorado Boulder, Boulder, Colorado, United States*

This study examined the association between age and preparedness for the continuation of COVID-19. The moderation effects of three types of social support, namely, emotional, financial, and instrumental assistance were also

tested. Using a sample of 443 adults in Dallas county which has the most confirmed cases in Texas, results of multiple linear regressions showed that compared to those aged between 18 and 64, older adults aged 65 and reported better preparedness for the continuation of COVID-19. Receiving emotional, financial, and instrumental assistance were respectively more important for older people to get better prepared than for younger adults, which is consistent with the socioemotional selectivity theory. Our findings directed attention to the strengths and resilience of older adults during COVID-19 from a life course perspective and highlighted the importance of social support and social relationship in their post-disaster recovery and ongoing preparedness.

THE COVID-19 PANDEMIC AND INTERGENERATIONAL SUPPORT: RESULTS BASED ON THE HEALTH AND RETIREMENT STUDY COVID-19 MODULE

Guanggang Feng,¹ and Zhen Cong,² *1. University of Texas at Arlington, School of Social Work, Texas, United States, 2. University of Texas at Arlington, Arlington, Texas, United States*

This study examined relationships between COVID-19 exposure and intergenerational support patterns. The data was from the 2020 Health and Retirement Study (HRS) COVID-19 Module (N=3266). The latent class analysis (LCA) was used to identify the types of intergenerational support based on respondents' reports on whether they provided and received financial and instrumental support from either coresident children or non-coresident children. Two classes were identified, namely, the high interaction group and the low interaction group. Logistic regression showed that respondents who had COVID-19 and had increased spending as a result of COVID-19 were more likely to be in the high interaction group. Other types of COVID-19 exposure, i.e., knowing someone being diagnosed or knowing someone who died from COVID-19 were not significant.

RESPONSE EFFICACY AND ACTION TO PREPARE FOR DISASTERS WITH DIFFERENT LEAD TIME: AGE DIFFERENCES

Zhirui Chen, and Zhen Cong, *University of Texas at Arlington, Arlington, Texas, United States*

This study investigated how disaster types, namely those with short and longer warning lead time, contextualized individuals' preparatory action, especially as associated with their response efficacy and age. The working sample included 1,467 respondents from the 2017 U.S. National Household Survey. Logistic regressions showed that individuals with higher levels of response efficacy were more likely to prepare after learning information about how to prepare. Respondents in areas prone to short lead-time disasters were less likely to prepare than those in longer lead-time disaster areas. Response efficacy was more important for action taking for short lead-time disasters, which was observed only among older adults when older and younger adults were examined separately. These findings revealed the impacts of disaster types and response efficacy on disaster preparedness and older adults' unique vulnerability and resilience, which could guide policymaking and interventions to promote national disaster preparedness tailored to regional peculiarities.

DEVELOPMENT OF A VIRTUAL REALITY PLATFORM TO PROMOTE DISASTER PREPAREDNESS AMONG OLDER ADULTS

Zhen Cong, Chen Kan, Aaron Hagedorn, Sam Thomas, and Reid Yeager, *University of Texas at Arlington, Arlington, Texas, United States*

This project develops a tailored and adaptive virtual reality platform to innovatively promote older adults' disaster preparation in a socially engaging environment. The platform serves the following purposes: 1) assist older adults to develop tailored household emergency preparedness plans, 2) simulate extreme weather conditions and warnings for older adults to practice disaster response and develop relevant knowledge and skills as well as test and revise their emergency preparedness plans, 3) use the process as a social engagement tool to reduce social isolation and promote a sense of community. The virtual environments are designed in Unity to simulate extreme weather conditions/natural disasters and older adults are guided to use the HTC VR headset and experience the selected disaster scenario. The pilot VR platform will be tested among community-dwelling older adults in the Dallas-Fort Worth Metropolitan Area.

Session 3360 (Symposium)

DISRUPTING OTHERING: A CONTINUUM OF AGE-INTEGRATED STRATEGIES FOR GERONTOLOGY EDUCATION

Chair: Lisa Borrero

Co-Chair: Lisa Borrero

Given the extensive negative impacts of ageism, it is incumbent upon institutions of higher education to lead the charge in promoting age inclusivity and dismantling ageism, particularly in the classroom. Traditional teaching approaches are insufficient to meet the needs of our increasingly diverse student population or our aging post-COVID society. Gerontology classrooms require new, innovative, and purposeful ways of engaging students in course content. This symposium brings together faculty who intentionally promote age inclusivity by immersing students in age-integrated experiences to varying degrees and in different ways. These approaches fundamentally reject the idea of older adults as "other" by promoting an age-inclusive reality in which individuals of all ages are equally valued. Dr. Lyn Holley will describe a new course which requires projection of a future, older self and two systematic life interviews – one of a real US elder and one of an imagined counterpart in a different country; comparative analysis reveals how aging is shaped by society. Dr. Skye Leedahl will discuss challenging ageism by examining existing age-focused policies and programs and having students engage in six intergenerational discussions and reflective writing. Dr. Tina Newsham will describe a newly revised practicum in which immersive, real-world experiences with older adults are incorporated, along with meaningful reflection and the development of an e-portfolio. Finally, Drs. Laura Donorfio and Lisa Borrero will explain the ways "othering" is disrupted when students imagine themselves as older adults, and use creative approaches that demonstrate how to negotiate key aspects of the aging process.

USING VISUAL DEMONSTRATIONS OF LEARNING TO PROMOTE AGE-INTEGRATED PROBLEM SOLVING

Lisa Borrero, *University of Indianapolis, Indianapolis, Indiana, United States*

Working to dismantle the “othering” of older adults requires active effort to reverse deeply ingrained cultural perceptions and attitudes. As gerontology educators, we are uniquely positioned to “move the needle” on this issue by providing students with the opportunity to engage with older adults in meaningful ways and to see the world from their perspective. In this presentation, visual demonstrations of student learning will be shared that allow students to demonstrate their mastery of course concepts in a creative way and to problem-solve a particular issue by engaging with their own future selves. This approach also allows for a deviation from the routine of written demonstrations of learning by appealing to a different set of student skills. Approaches discussed will include concept maps to deconstruct community collaboration; book bents to explore optimal aging; multimedia presentations on meaning-making in older adulthood; and a photo elicitation project to address outdoor fall hazards.

VISUALIZING INCLUSIVITY: AGING LIFELONG AND WORLDWIDE THROUGH THE LENS OF GERONTOLOGY AS SOCIAL SCIENCE

Lyn Holley, *University of Nebraska at Omaha, Omaha, Nebraska, United States*

A new course actively engages students in applying social science to examine their own prospective aging and the aging of others. This Grand Project begins with self-assessment of their expectations for the “Future Self” at age 67, then conducting two structured interviews each followed by writing a “life story” – one of an US older adult and the other an imagined older adult from a different county. Comparative analysis of these three stories highlights the impacts of society, heredity, and choice on shaping the experience of old age. Each project is presented to the class. Seeing life from this personal “tour” of the “other” informs beliefs about differences. Students gain knowledge about gerontology as a social science and develop personal understanding of their own and others’ aging, a good step toward becoming comfortable with diversity and inclusivity. Ageism is the only “ism” guaranteed to include all who survive long enough.

EMBRACING AGE-INCLUSIVITY THROUGH MULTIMODAL, ACTIVE STUDENT LEARNING IN A HEALTH AND AGING POLICY COURSE

Skye Leedahl, *University of Rhode Island, Kingston, Rhode Island, United States*

One of the goals for an upper-level undergraduate seminar course is for students to identify and discuss existing policies, programs, and resources for meeting the needs of the aging population. To encourage active student learning, the course provides a mix of readings and assignments, six intergenerational discussions, and reflective writing. The idea is that these varying experiences help foster a deep understanding of how these policies and related issues pertain and matter to everyone, not only older individuals, and how their future career and family experiences will benefit from the knowledge gained in the course regardless of their next

career steps. This course model has been effective for challenging ageism, and has been taught four times, each time with modifications based on student numbers, current issues, and the pandemic. The presenter will discuss assessment methods, identify best practices, and offer suggestions for others interested in utilizing a similar model.

DISRUPTING OTHERING BY FOSTERING LIGHT-BULB MOMENTS IN IMMERSIVE PRACTICAL EXPERIENCES

Tina K. Newsham, *University of North Carolina Wilmington, University of North Carolina Wilmington, North Carolina, United States*

Fully immersive experiences (i.e., practica, internships, clinicals) with older adults are one successful strategy to reduce ageist beliefs among students, as long as the experiences are high quality and students are given an opportunity to reflect on their observations, feelings, and application of classroom knowledge. Representing a more intensive level of engagement than single-session interviews or multisession intergenerational activities, such experiences are not without challenges. Instructors are not present on-site continually (or at all) to observe what the student is seeing or doing, therefore providing limited opportunity to recognize and reframe situations that may reinforce the “othering” of older adults. Through creating carefully curated reflection prompts and assessment strategies (such as eportfolios), this presenter will discuss how instructors can ensure students completing practica, internships, and clinicals recognize the breadth and diversity of aging experiences, engage ethically and appropriately with older adults in non-ageist ways, and avoid reinforcing “othering” and ageism.

GETTING TO KNOW YOURSELF ACROSS THE LIFESPAN

Laura Donorfio, *University of Connecticut, Waterbury, Connecticut, United States*

New teaching and learning methods must be developed to accommodate exclusive online environments. The utilization of experiential learning in an aging course is a key teaching method that helps tap into the affective domain of learning (i.e., feelings, values, and attitudes). In a society where ageist attitudes abound and are often internalized, purposeful challenges to the “othering” of older adults is needed to disrupt this cycle. This presentation will share an experiential/age inclusivity activity that can be utilized in any teaching environment. Over a semester, students are required to write themselves four separate letters from their older selves at varying ages to their younger selves. They must research and provide a snapshot of what their life will be like at these ages in predetermined areas (i.e., health, mobility, family/friends, policy, and cultural variables, etc.) Worksheets will be provided capturing this “Getting to Know Yourself Across the Lifespan” experiential learning activity.

Session 3365 (Symposium)

DISRUPTING THE STATUS QUO: THE NEW NORMAL OF FAMILY CAREGIVERS' SERVICE USE

Chair: Karen Moss

Co-Chair: Verena Cimarolli

Discussant: Karen Rose

Family caregivers are essential partners in chronic disease management for older adults. However, being a family caregiver can have negative mental and physical health consequences, making it important for some caregivers to rely on supportive services, either for themselves (e.g. support groups) or to get help with caregiving tasks (e.g. home care). Supportive service use by family caregivers is well documented; yet, this research has often not included specific subgroups of caregivers (e.g. the racially/ethnically, or geographically diverse). Hence, the purpose of this symposium is to share new findings from research on supportive service use in understudied caregiving populations. First, Dr. Cimarolli presents findings from a study on the types of supportive services long-distance caregivers use for themselves and the factors associated with supportive service use in this caregiver population. Then, Dr. Wyman reports findings from a survey on the use of home and community-based resources by family caregivers in a Native American community. Dr. Wright will share the results of a systematic review of self-care interventions designed for caregivers of African Americans living with dementia. Finally, Dr. Mavandadi presents the results of a study examining the effectiveness of a telephone-based, collaborative dementia care program for improving outcomes in caregivers of military veterans living with dementia. Dr. Karen Rose will discuss the implications of each of these study findings for the development and evaluation of supportive interventions for these specialized family caregiver groups.

CARING FROM AFAR: LONG-DISTANCE CAREGIVERS' USE OF SUPPORTIVE SERVICES FOR THEMSELVES

Verena Cimarolli,¹ Molly Wylie,² Jillian Minahan Zucchetto,³ Francesca Falzarano,⁴ and Amy Horowitz,⁵ 1. *LeadingAge, Washington, District of Columbia, United States*, 2. *University of Massachusetts Boston, University of Massachusetts boston, Massachusetts, United States*, 3. *Fordham University, Psychology Department, Bronx, New York, United States*, 4. *Weill Cornell Medicine, Douglaston, New York, United States*, 5. *Fordham University, Graduate School of Social Service, New York, New York, United States*

Although long distance caregivers (LDCs) are starting to be recognized as a subgroup of care partners experiencing unique challenges and stresses, it is unknown 1) what types of supportive services LDCs use for themselves and 2) what factors are associated with supportive service use in this understudied caregiving population. In our sample of 304 LDCs (Mage=56.9), the most frequently utilized service was video phone/webcam systems to monitor the care recipient (CR). Guided by Andersen's Model of Health Care Utilization and using multiple hierarchical regression analysis, younger age of the LDC (a predisposing factor) and need-related characteristics (greater caregiving burden and depressive symptoms, more time spent helping the CR, and worse CR functional status) were associated with greater use of supportive services. Enabling factors were not associated with service use. These study findings can help inform how to engage LDCs in supportive service utilization.

A SYSTEMATIC REVIEW OF SELF-CARE INTERVENTIONS FOR AFRICAN AMERICAN FAMILY CAREGIVERS

Kathy Wright,¹ Eunjung Ko,¹ Karen Moss,¹ Tara O'Brien,² Loren Wold,³ and Karen Rose,¹ 1. *The Ohio State University, Columbus, Ohio, United States*, 2. *The Ohio State University, Center for Healthy Aging, Self-Management, and Complex Care College of Nursing, Columbus, Ohio, United States*, 3. *The Ohio State University, College of Nursing and Department of Physiology and Cell Biology, Columbus, Ohio, United States*

African Americans (AA) family caregivers provide the bulk of unpaid care to persons living with dementia (PLWD). This role leaves little time for the adoption of self-care behaviors—critical to the prevention and management of chronic diseases. In this systematic review, we appraise caregiver self-care interventions that include AA caregivers of PLWD. PubMed, CINAHL, PsycINFO, Cochrane, and Embase databases were searched. Terms included AA/Black, self-care, caregiving, lifestyle, intervention, psychological stress, and faith/community. We initially found 250 references and after application of exclusion criteria and removal of redundant references, 18 articles were analyzed. Most interventions focused on impacting levels of caregiver burden, depression, physical activity, anxiety, or wellbeing. Psychoeducation, physical activity, and spiritually-focused interventions were most effective in improving outcomes in caregivers. Future studies should examine the impact of interventions on the prevention and management of chronic disease in AA caregivers of PLWD.

UTILIZATION OF HOME AND COMMUNITY-BASED RESOURCES BY FAMILY CAREGIVERS IN A NATIVE AMERICAN COMMUNITY

Mary Wyman,¹ Debra Miller,² Sunshine Wheelock,³ Florence Petri,³ Elijah Metoxen,⁴ Nickolas Lambrou,⁵ and Carey Gleason,⁶ 1. *Madison VAMC/UNIVERSITY OF WISCONSIN, Madison, Wisconsin, United States*, 2. *Oneida Comprehensive Health Division, Oneida, Wisconsin, United States*, 3. *Oneida Alzheimer's Community Advisory Board, Oneida, Wisconsin, United States*, 4. *Oneida Aging & Disability Services, Oneida, Wisconsin, United States*, 5. *University of Wisconsin, Madison, Madison, Wisconsin, United States*, 6. *University of Wisconsin, Madison, Wisconsin, United States*

Family caregiving is uniquely significant for elder care within American Indian/Alaska Native (AI/AN) communities. Compared to other populations, AI/AN older adults are disproportionately impacted by chronic conditions and AI/AN are more likely to be family caregivers. However, AI/AN are underrepresented in aging research. We describe a successful research partnership with the Oneida Nation of Wisconsin and report results of a recent survey of tribal members and affiliates (N=405), covering demographics of caregiving, awareness and use of home and community-based resources, and perceptions of factors impacting service use. Approximately 42% of respondents were current caregivers; of these, roughly one-third knew how to access various resources. Most common sources of knowledge were a health care/social worker or finding information on

their own. Traditional cultural values were viewed as variably supportive of resource utilization, depending on service type. Implications for efforts to address disparities for AI/AN aging and support caregivers will be discussed.

THE EFFECTIVENESS OF A CAREGIVER SUPPORT AND EDUCATION INTERVENTION DESIGNED FOR CAREGIVERS OF VETERANS

Shahrzad Mavandadi,¹ April Eaker,² Katherine Van Treese,² Brenda Jeffries-Silmon,² and Laura Wray,³ 1. *Corporal Michael J Crescenz VA Medical Center, Philadelphia, Pennsylvania, United States*, 2. *VA Center for Integrated Healthcare, VA Western New York Healthcare System, Buffalo, New York, United States*, 3. *VA Center for Integrated Healthcare, Buffalo, New York, United States*

Veterans are at increased risk for dementia and multiple comorbid conditions, often making the family caregiving experience particularly challenging. The objective of this study was to examine the effectiveness of a telephone-based, collaborative dementia care program for improving caregiver (CG) outcomes in CGs of veterans with dementia. All CGs (n=107) received individual care management and were randomized to either individual intervention alone or individual plus group education and social support. CGs were on average 72.5 (+/-11.0) years old, and the majority were female, spouses/partners of the care recipient (CR), and providing care for ≥1 year. Pre-post analyses indicate that CGs experienced a significant reduction in both the frequency of CRs' dementia-related symptoms (e.g. memory difficulties, disruptive behaviors, depressive affect) and their own distress in response to these symptoms. Our study adds to the literature on the development and evaluation of understudied CG populations, such as CGs of veterans with dementia.

Session 3370 (Paper)

Economics and Financial Well-Being in Aging

DISPARITIES IN FINANCIAL STRAIN FOR OLDER ADULTS AND PEOPLE WITH DISABILITIES IN CALIFORNIA

Lei Chen,¹ Kathryn Kietzman,² and Rebecca Allen,³ 1. *University of California, Los Angeles, Los Angeles, California, United States*, 2. *University of California, Los Angeles, Center for Health Policy Research, UCLA Center for Health Policy Research, California, United States*, 3. *California State University, Long Beach, Long Beach, California, United States*

This study examines disparities in the experience of financial strain among older adults and people with disabilities by age, gender, race/ethnicity, poverty, and disability type. People with disabilities refer to those who report cognitive impairment, difficulties performing activities of daily living (ADLs) and/or instrumental activities of daily living (IADLs). Financial strain includes challenges that participants incurred during the last 12 months in acquiring food, housing, health care, or income. This study uses the data from the 2019 California Long-Term Services and Supports (LTSS) survey that was merged with data from the omnibus California Health Interview Survey (CHIS) (N=1097). This is the most

comprehensive population-level dataset to examine LTSS needs, unmet needs, and uses of LTSS in California. Initial findings show that 50% of participants report spending less on food, while 40% report cutting down on saving for retirement, receiving and borrowing money from others, and experiencing a decline in household income. More than 20% note that they could not make rent or mortgage payments, had debt due to medical bills, and had to spend less on prescription medications or medical care. We also find significant disparities in financial strain by age, gender, poverty, and disability type; however, no significant disparities by race/ethnicity. This study is among the first to examine disparities in various financial strain types for people who need LTSS in California. The findings have policy implications for the Master Plan for Aging (MPA), which serves as a blueprint to build environments that promote an age-friendly California.

DOES THE HEALTH INSURANCE PROGRAM REDUCE HEALTH-INDUCED POVERTY?: NEW EVIDENCE FROM THE CHINA HOUSEHOLD INCOME PROJECT

Yalu Zhang,¹ and Qin Gao,² 1. *Peking University, Beijing, Beijing, China (People's Republic)*, 2. *Columbia University, New York, New York, United States*

The growing cost of healthcare services has been a concern for many countries in the world. In China, medical expenditures can account for as much as 65% of per capita income in some low-GDP counties in 2011. One of the primary goals of the New Rural Cooperative Medical Insurance (NRCMI) is to provide financial protection and alleviate the financial burdens of rural residents in China. This paper examined whether NRCMI participation impacted the incidence of catastrophic health expenditure (CHE) among middle-aged and older adults (45 years old and above) using the China Household Income Project 2007 rural data and an instrumental variable estimation method in two provinces where there was heterogeneity in NRCMI implementation schedule. The results show that NRCMI enrollment could not impact the likelihood of experiencing CHE among middle-aged and older adults. However, NRCMI participation increased the actual amount of medical expenses in one province but not in the other. Although none of the prior studies have used instruments and village fixed effects or take endogeneity issues into account to investigate the impact of NRCMI on relative financial burden among recipients, the results found in this study are generally aligned with the prior findings, especially with those using quasi-experimental studies. Findings from this study provide empirical evidence to the policymakers that the effect of NRCMI participation on financial protections is limited despite its broad population coverage. The limited effects are probably due to the low reimbursement rate and more utilization of expensive healthcare services.

HEALTH, QUALITY OF LIFE, AND ECONOMIC IMPACTS OF HOME CARE VOUCHERS FOR MIDDLE-INCOME ADULTS

Joanne Spetz, Laura Wagner, Jacqueline Miller, Susan Chapman, and Connie Kwong, *University of California, San Francisco, San Francisco, California, United States*

The Support at Home pilot program provided financial support for home care services by middle-income adults

with disabilities in San Francisco to support aging in place. This presentation reports the results of the mixed-methods evaluation of the program, which incorporated administrative records, surveys of clients and comparison group members, surveys of informal caregivers of clients, surveys of the care providers hired by clients, and focus groups with clients and with informal caregivers. Outcome measures included the Older People's Quality of Life Questionnaire, Patient Health Questionnaire-2, an adapted Burden Scale for Family Caregivers, and self-reported falls, emergency department visits, and hospitalizations. Analyses included pre-post chi-squared and t-test comparisons and comparisons of changes between the client and comparison groups. Multivariate regression analyses were conducted to control for demographic differences between the groups. An economic analysis was conducted to learn whether changes in costs associated with medical appointments, emergency department visits, and hospitalizations were greater than the costs of the program, including both voucher and administrative costs. Results indicated statistically significant positive changes in personal stress and financial stress, but not in the composite quality of life score. There also were statistically significant reductions in attendance at medical appointments, falls, emergency department visits, and hospitalizations. The focus group data supported the findings regarding personal and financial stress, and also indicated that clients and their caregivers perceived positive quality of life benefits. The economic analysis indicated substantial cost savings from the program due to reduced use of medical services.

THE INFLUENCE OF MARITAL STATUS AND GENDER ON FINANCIAL WELL-BEING

Jing Geng, *Virginia Tech, Blacksburg, Virginia, United States*

Research consistently documents gender differences in financial status in later life, and some also examine marital status in this regard. However, the subjective aspects of financial well-being are less well-explored, especially as this relates to both gender and marital status in the U.S. Using a gender-sensitive approach, this study examines the extent to which gender and marital status affect the financial well-being of older American adults. Different from previous studies that use only objective measures of financial well-being, this study also takes a subjective assessment in terms of financial satisfaction into account so that the role of marital status and gender in both objective measures and subjective assessments can be identified. This study uses the 2014 Health and Retirement Study and employs ordinary least squares regressions and ordinal logistic regression analyses. Examining those aged 65 and over, the sample varies from N=10,325 (financial well-being) to 4,280 (financial satisfaction). Differences in gender and marital statuses across all objective measures of financial well-being show up, with women being disadvantaged while the married (regardless of gender) being advantaged. Concerning financial satisfaction, being divorced and separated were negatively related to financial satisfaction for both men and women. These findings indicate that both marital status and gender are important indicators of financial well-being in later life.

WHOM CAN I RELY ON? THE IMPACT OF CHINA'S PUBLIC PENSION PROGRAM EXPANSION ON THE EXPECTATIONS FOR OLD-AGE SUPPORT

Qian Zhang, *Beijing Normal University, Beijing, Beijing, China (People's Republic)*

Aging is a global trend and China is no exception. Older people in China mostly rely on their adult children for old-age support. This traditional provision pattern of old-age support, however, is challenged by hundreds of millions of internal migrant workers. They relocate from rural to urban regions for better employment and are no longer able to provide old-age support to their older parents in rural areas. The aim of this study was to determine the impacts of China's public pension program expansion in rural areas on older people's expectations for old-age support. Utilizing the natural experiment of program expansion, this study identified an instrumental variable as the county adoption of the pension program. In addition, the study analyzed a nationally representative longitudinal dataset CHARLS with fixed effects model. Results from the statistical model showed that given the participation in the pension program, older adults reported more reliance on pension for old-age support financially and less reliance on children. Heterogeneous effects were found for older adults living together with children and older adults living independently. These important findings suggest that the government partially assumes the responsibility for the old-age support of adult children in the traditional sense. The potential benefits of this study provide a policy implication for developing countries to alleviate old-age support problems and enable internal migration for economic development.

Session 3375 (Paper)

End of Life

ASSOCIATION BETWEEN ADVANCE CARE PLANNING FOR OLDER ADULTS AND FAMILY CAREGIVERS' SENSE OF SECURITY

Masumi Shinohara,¹ Mariko Sakka,² Asa Inagaki,² Taisuke Yasaka,² Chie Fukui,² Maiko Noguchi-Watanabe,² Ayumi Igarashi,² and Noriko Yamamoto-Mitani,²
 1. *University of Tokyo, Bunkyo, Tokyo, Japan*, 2. *The University of Tokyo, Bunkyo, Tokyo, Japan*

Family caregivers' (FCs') sense of security benefits older adults who receive homecare. Advance care planning (ACP) is reported to have positive effects on FCs' experience, but it might differ depending on FCs' kin relationships with the older adults. We examined whether ACP for older adults in homecare settings is associated with FCs' sense of security. Further, we assessed whether such an association depends on their status as spouses or as adult children. We conducted a secondary analysis of data from a prospective cohort study in Japan. The participants were older adults who used home-visit nursing services, their FCs, and the nurses who cared for them. The FCs were asked to answer a sense of security questionnaire, and nurses were asked whether ACP was conducted. Multivariate logistic regression analyses were performed to examine the association between ACP implementation and positive changes in the sense of security scores

after three months. Data from 169 cases were analyzed. Of the FCs, 28.1% were men and 55.6% were spouses. ACP was performed in 53.8% of the cases. The results of the multivariate analyses showed an interactive effect between ACP implementation and FC kin relationships. For spouses, ACP was significantly associated with a positive change in their sense of security. For adult children, such an association was not found. ACP might have a positive effect on caregiving spouses' sense of security. Adult child caregivers, who often have multiple responsibilities and have difficulties facing their parents' physical decline, may need support, in addition to ACP.

PREFERENCES AND DETERMINANTS OF END-OF-LIFE CARE AMONG OLDER CHINESE AMERICANS

Dexia Kong,¹ Elissa Kozlov,² and XinQi Dong,³ 1. *The Chinese University of Hong Kong, Hong Kong, Hong Kong*, 2. *Rutgers University, Piscataway, New Jersey, United States*, 3. *Rutgers University, Rutgers Institute for Health, New Jersey, United States*

End-of-life (EOL) care awareness and practice remain particularly low among older Chinese Americans. More empirical evidence regarding EOL is needed to develop culturally-relevant interventions to promote EOL engagement in this minority population. Using population-specific data, this study investigates preferences and associated sociodemographic and health determinants related to EOL among older Chinese Americans. Data were from the Population-based Study of Chinese Elderly in Chicago (collected 2017-2019, N=3,124). Linear and logistic regressions were conducted. Of the sample, 46.1% considered EOL care planning as important or somewhat important. Nearly 22% had EOL discussions with families. The most preferred EOL locations were home (43.7%), hospital (35.5%), nursing home (10.1%), and hospice (4.3%). Overall, 47.1% perceived EOL care as family decisions, 39.6% regarded EOL care as personal decisions, 7.5% preferred children to make EOL decisions, and 3.3% preferred a spouse to make EOL decisions. Chinese older adults who were female ($B=0.10$, $p<0.01$), married ($B=0.11$, $p<0.01$), had higher education ($B=0.02$, $p<0.001$), acculturation level ($B=0.02$, $p<0.001$), and religiosity ($B=0.12$, $p<0.001$), and more chronic conditions ($B=0.05$, $p<0.001$) were more likely to consider EOL as important. Those with older age [Odds Ratio (OR)=1.02, 95% Confidence Interval (CI)=1.01-1.03], female gender (OR=1.44, 95% CI=1.18-1.77), higher levels of education (OR=1.02, 95% CI=1.01-1.04), acculturation (OR=1.04, 95% CI=1.01-1.06), and religiosity (OR=1.11, 95% CI=1.02-1.21), longer U.S. residence (OR=1.02, 95% CI=1.01-1.03), and more chronic conditions (OR=1.13, 95% CI=1.06-1.21) were more likely to have discussed EOL preferences with their families. Study findings underscore low engagement in EOL planning in this population and the need for culturally-appropriate interventions.

THE BURDEN OF HAVING TO WONDER: MINORITY STRESS EXPERIENCES OF LGBTQ+ HOSPICE FAMILY CAREGIVERS

Kristin Cloyes,¹ Miranda Jones,² Marilisa Vega,² Megan Thomas Hebdon,³ Casiede Thompson,² Susan J. Rosenkrantz,² Maija Reblin,⁴ and Lee Ellington,² 1. *University of Utah, Portland, Oregon, United States*, 2. *University of Utah, Salt Lake City, Utah, United States*,

3. *University of Texas at Austin, University of Texas at Austin, Texas, United States*, 4. *Moffitt Cancer Center, Tampa, Florida, United States*

Home hospice care relies heavily on informal caregivers, often patients' family and close others. Hospice family caregivers report stress, burden, and unmet support needs associated with poor health and bereavement outcomes. These outcomes are sensitive to the quality of interactions with professional hospice providers, especially for historically marginalized groups, yet little research examines experiences of LGBTQ+ hospice family caregivers. Informed by minority stress theory, we conducted in-depth interviews with LGBTQ+ home hospice family caregivers across the U.S. (N=20). Participants reported demographics and described their caregiving experiences including interactions with hospice providers. Interviews were audio-recorded, transcribed, and content-analyzed. Participants were mostly white (n=15, 75%), non-Hispanic (n=19, 95%), cisgender (n=19, 95%), gender binary (n=19, 95%), lesbian (n=10, 50%), women (n=12, 60%); average age was 52.3 (range 25-67, SD=13.84). Along with known end-of-life caregiving stressors, participants experienced minority stress that complicated caregiver-provider communication. Distal stressors included lack of LGBTQ+ competent resources, inadequate legal protections, providers' assumptions about relationships, and difficult dynamics with unaccepting relatives. Proximal stressors included perceived risks of disclosure, expectation of poor treatment, feeling the need to modify presentation of self or home, and wondering whether negative provider interactions were due to being LGBTQ+. This generated a background level of uncertainty, caution, and concern that was particularly distressing in the home setting. Minority stress affects LGBTQ+ people across the lifespan and generates added burdens and support needs for hospice family caregivers. Providers who understand these effects are better positioned to deliver safe, effective care to all families at end of life.

UNMET FAMILY NEEDS IN HOSPICE AND RESEARCH PRIORITIES: PERSPECTIVES FROM A NATIONAL SAMPLE OF HOSPICE AGENCIES

Todd Becker, and John Cagle, *University of Maryland, Baltimore, Baltimore, Maryland, United States*

Although hospice cares for nearly 1.5 million patients and families annually, little is known about practitioners' opinions of current gaps in care and research. To this end, we posed two open-ended questions to hospice representatives to identify practice-relevant research priorities. Data stem from two optional questions (Q1: N = 72; Q2: N = 73) appended to Cagle et al.'s (2020) national survey of 600 randomly selected hospices, stratified by state and profit status. Most participants provided the majority of care in-home (84.7%; 79.5%) and worked at a medium-sized hospice (50.0%; 49.3%). Responses to Q1 ("What is the biggest unmet need for hospice patients and families?") and Q2 ("In your opinion, what is the most pressing topic that hospice researchers need to study?") were analyzed for content and then synthesized. Analyst triangulation and peer debriefing improved trustworthiness. Emerging domains included: access to hospice, hospice services and workforce issues, and education. The access to hospice domain contained a subtheme regarding the need for earlier referrals. Participants noted that

short lengths of stay undermine the clinical benefits to patients and families, and that hospice enrollment criteria may contribute to inadequate lengths of stay. The hospice services and workforce issues domain largely focused on burnout prevention. Participants acknowledged that provider self-care was linked to the quality of patient care. The education domain contained subthemes related to improving physician knowledge regarding prognostication and referral, and to patients and families regarding misconceptions about hospice care. Findings highlight critical needs for future hospice research and policy change.

Session 3380 (Paper)

Family Caregiving I (SRPP Paper)

CARING AGAIN: PARENT CAREGIVERS FOR THEIR WOUNDED ADULT CHILDREN VETERANS

Linda Nichols,¹ Jeffrey Zuber,² Robert Burns,³ and Jennifer Martindale-Adams,² 1. VA Medical Center 11H, Memphis, Tennessee, United States, 2. University of Tennessee Health Science Center, Memphis, Tennessee, United States, 3. University of Tennessee Health Science Center, University of Tennessee Health Science Center, Tennessee, United States

With military personnel in Iraq and Afghanistan surviving what were previously fatal injuries, there is ongoing discussion about how to provide care for them and support their families. Parents frequently provide care for their unmarried, injured adult children, especially those returning with polytraumatic injuries, PTSD, or Traumatic Brain Injury (TBI). Parents (n=160) of combat injured adult children who participated in a DoD-funded behavioral intervention study are described. Parents were mainly mothers, average age 60.2 years, with ages ranging from 45 to 79. The veterans had functional limitations, and only 9.2% were employed. Parents, on average, had been caregivers for 6.6 years and daily spent 7.7 hours providing care and 17.2 hours on duty, primarily focused on supervision and daily life management rather than physical care. Average caregiver burden score approached high and was related to veteran TBI diagnosis, aggressive behavior toward others, and functional limitations. Few parents (22.7%) worked full-time; 85.3% had decreased personal spending, 84.0% dipped into personal savings, and 58.9% reduced retirement saving. These findings are similar to those of aging parent caregivers of adult children with serious mental illness or developmental disabilities in amount of care provided to their adult children, their level of burden, financial and career cost to themselves, and concern about their future and their children's future. As these parents and their adult children age, providing care and resources will present greater challenges for them, for the military and veteran care systems they rely on for support, and for society.

THE MODERATING EFFECT OF CAREGIVER ENGAGEMENT IN TRANSITIONAL CARE INTERVENTION OUTCOMES: A META-ANALYSIS

Kristin Levoy,¹ Eleanor Rivera,² Molly McHugh,³ Alexandra Hanlon,⁴ Karen Hirschman,³ and Mary Naylor,³ 1. University of Indiana School of Nursing (IUPUI

Campus), Indianapolis, Indiana, United States, 2. University of Illinois Chicago, Chicago, Illinois, United States, 3. University of Pennsylvania, Philadelphia, Pennsylvania, United States, 4. Virginia Tech, Roanoke, Virginia, United States

As chronically ill adults age, increased fluctuations in health status result in frequent care transitions. Caregiver engagement is often a core component of evidence-based transitional care interventions, yet little is known about the relative contribution of this element to observed outcomes. This meta-analysis aimed to synthesize evidence of caregiver engagement in randomized control trials (RCT's) of transitional care interventions, estimate the overall intervention effects on all-cause hospital readmissions, and test caregiver engagement as a moderator of interventions' effects. Relative risk was the effect size, and the overall effect was estimated using inverse variance weighting. Fifty-four studies met criteria, representing 31,399 participants and 65 effect sizes. The weighted sample mean age was 64 years. The majority (64%) of interventions targeted participants with specific diagnoses, such as heart disease, but more than half (54%) lacked caregiver engagement components. Among all reviewed studies of transitional care interventions, the overall effect on all-cause readmissions at 1 month was non-significant (p=.123, k=28). However, intervention effects at 2 or more months were significant (RR=0.89, 95% CI: 0.82, 0.97, p=.007, k=26), indicating a 12% reduction in the relative risk of all-cause readmissions among intervention participants compared to controls. Caregiver engagement was found to moderate intervention effects (p=.05). Specifically, interventions that included caregiver engagement produced more robust effects (RR=0.83, 95% CI: 0.75, 0.92, p=.001), than those without such engagement (RR=0.97, 95% CI: 0.87, 1.08, p=.550). Findings suggest that transitional care interventions need to more explicitly engage caregivers as active partners in order to optimize patient outcomes.

VIETNAMESE FAMILIES' STRENGTH AND RESILIENCE AND HEALTHCARE PROFESSIONALS' ROLE DURING THE PANDEMIC

Christina Miyawaki,¹ Minhui Liu,² and Kyriakos Markides,³ 1. University of Houston, Houston, Texas, United States, 2. Central South University, Changsha, Hunan, China (People's Republic), 3. University of Texas Medical Branch, Galveston, Texas, United States

Traumatic escape from Vietnam in 1975 brought 1.3 million Vietnamese refugees to the U.S. Today, Vietnamese are the largest Asian subethnic group in Houston, Texas (81,000+), making Houston the 3rd largest Vietnamese-populated city in the U.S. Despite these numbers, health research on Vietnamese population is limited. To address this gap, we developed the Vietnamese Aging and Care Survey and collected data on Vietnamese older adults (≥65 years) and their caregivers (N=199). The purpose of this study was to examine the association between caregivers' caregiving characteristics and care recipients' mental health (N=58 dyads). Descriptive statistics and logistic regression models were used. Caregivers were on average 53 years-old, Vietnam-born (97%), and working (66%). The majority (84%) lived with their care recipients and provided care for 20+ hours/week (69%) in good/excellent health (76%). Care recipients were on average 75 years-old,

Vietnam-born (100%) in fair/poor health (81%). Regression results showed stressed caregivers with more-depressed care recipients (OR=1.47, 95%CI:1.02, 2.13) but positive caregiving experiences (OR=0.85, 95%CI:0.74, 0.97) and burdened caregivers (OR=0.79, 95%CI:0.65, 0.96) with less-depressed care recipients. We found the association between stressed caregivers and depressed care recipients (Life Stress Paradigm), but care recipients becoming a “helpful company” reduces caregiver burden and care recipients’ depression (Social Exchange Theory). Vietnamese families live in multigenerational households within ethnic enclaves and remain a tightly-knit family unit showing resilience to their low socioeconomic status ($\leq 25K$, 91%). Leveraging a family as their strength, healthcare professionals should take a caregiver-care recipient dyad approach when planning COVID-19 pandemic interventions in Vietnamese communities.

WORKING FAMILY CAREGIVER WELL-BEING: WORK IMPACT, WORKPLACE SUPPORTS, AND FAMILY DISCORD

Jiayun Xu,¹ Pi-Ju Liu,¹ Yisheng Peng,² and Scott Beach,³

1. *Purdue University, West Lafayette, Indiana, United States,*

2. *George Washington University, Washington, District of Columbia, United States,* 3. *University of Pittsburgh, University of Pittsburgh, Pennsylvania, United States*

A recent study by our team showed that family discord about care provision among multiple family caregivers was a significant predictor of caregiver burden, anxiety, depression, and activity restrictions. This study examined the combined effects of family discord, work impacts (missed work, caregiving affects work), and workplace supports (flexible hours, caregiver benefits) on caregiver well-being. We conducted a secondary analysis using cross-sectional survey data from the Western Pennsylvania Family Caregiving Project 2017-2018. Participants were family caregivers who worked outside the home and shared older adult (i.e. over age 50) caregiving responsibilities with family (n=364, mean age: 52.59 years, female: 71.7%, White: 79.7%, cared for a parent: 69.5%, mean work hours/week: 37.30). Hierarchical regression analyses were conducted testing for main effects of family discord, work impacts, and workplace supports; and interactions between discord and work impacts/workplace supports. The presence of family discord negatively impacted all caregiver well-being outcomes ($p < 0.05$). Having more work impacts increased the risk for anxiety ($p < 0.04$), activity restrictions ($p < 0.01$) and burden ($p < 0.01$). No main effects were found for workplace support. Moderating effects were found, such that anxiety was high when family discord and work impacts were higher ($p = 0.025$). Additionally, more activity restrictions occurred when caregivers had low workplace support and higher family discord ($p = 0.020$). Results suggest having less family discord, more workplace support, and less negative work impacts may improve caregiver well-being. Future work is needed to determine which work supports are most beneficial to this population and how family discord and negative work impacts can be reduced.

Session 3385 (Symposium)

FRIENDSHIP AND LONELINESS AMONG PEOPLE LIVING WITH DEMENTIA: SOCIAL PRACTICES AND IDENTITY

Chair: Pamela Saunders

Co-Chair: Daniel R. Y. Gan

Discussant: John Swinton

More people living with dementia (PLWD) are aging in place in the community. The number of PLWD aging in community is estimated to comprise 61-81% of the total number of PLWD in North America. Since most PLWD do not drive (Foley et al., 2000), many may (or may not) spend much of their time closer to home, barring occasional visits out of town. Yet, one’s everyday environment may not always provide “ways of being in the world that are more accepting and embracing” (Hillman & Latimer, 2017) and kind, to the varied socio-cognitive struggles of PLWD. Meaningful relationships are required to support continued social participation and citizenship (Bartlett & O’Connor, 2007; Swinton, 2020). In addition to dementia diagnosis, these everyday experiences in community may significantly alter PLWD’s self-perception and confidence. PLWD may feel more or less comfortable forging relationships depending on their past experiences. In other words, the identity of PLWDs are often challenged and (re)constructed (Saunders et al., 2011). Amid persistent power imbalances, malignant social practices may reshape one’s identity such that social isolation, whether self-imposed and/or due to restrictions from others, appear the best way to tide over overwhelming loneliness. This symposium explores how community and friendships may intercept the formation of such lonely self-identity among PLWD. We use advanced qualitative methods to elucidate the varied experiences and challenges of PLWD in community. Findings from three perspectives, namely sociolinguistics, sociology, and social work, will be discussed identify new social practices to undo stigma and support PLWD in community.

COMMUNICATIVE COPING AND FRIENDSHIP AMONG PERSONS LIVING WITH DEMENTIA: FINDINGS FROM LONG-TERM CARE

Pamela Saunders, *Georgetown University, WASHINGTON, District of Columbia, United States*

The study of identity is central to many disciplines, however there is a special link that connects language and discourse to identities. The way people speak reveals a lot about who they are. Through discourse and communication individuals convey and negotiate their sense of self (de Fina, 2020). Regardless of cognitive status, persons living with dementia (PLWD) use language to construct for themselves a social identity of being included in friendship networks (de Medeiros et al., 2011). This paper uses data from the Friendship Study to examine the use of such communicative coping behavior (CCB) for friendship formation. Ethnographic observations of PLWD were conducted in a Long-Term Care residential setting. Sociolinguistic discourse analysis of verbatim transcripts with reference to the CCB Checklist (Saunders et al., 2016) reveal evidence of CCB use. Results suggest that different types of CCBs were used to construct identity and negotiate friendship challenges in different contexts.

UNSPOILED IDENTITIES OF PEOPLE LIVING ALONE WITH DEMENTIA: RESISTING STIGMA BY HELPING OTHERS

Kate de Medeiros,¹ and Laura Girling,² 1. *Miami University, Oxford, Ohio, United States,* 2. *University of Maryland, Baltimore County, Baltimore, Maryland, United States*

Goffman (1963) described stigma as the shift from being viewed as a whole and usual person to one with a spoiled identity. People living with dementia (PLWD) often report feeling stigmatized. Many dementia stereotypes highlight losses (e.g., loss of self) and negatively position the person as a passive, dependent care recipient. Here, we present findings from a qualitative study of people living alone with dementia (N=10) in the community that challenge these stereotypes. Analysis of in-depth interviews revealed that many participants resisted the spoiled identity label through active engagement in the community such as participating in paid employment, providing care for neighbors and family members, and volunteering. Overall, findings underscore the need to rethink and challenge common perceptions of PLWD that are focused solely on care, to recognize their active and valuable role in the lives of others. How PLWD negotiate these identities should inform policies of dementia in community.

ADDRESSING STIGMA IN THE COMMUNITY: A RIGHTS-BASED APPROACH TO COMMUNITY-BUILDING

Deborah O'Connor, *University of British Columbia, Vancouver, British Columbia, Canada*

Article 12 of the United Nations Convention of Rights of Persons with Disabilities (CRPD) affirms the rights of persons with physical and mental disabilities to be treated as equal, and deserving of state support to realize their full human potential. This focus on a 'positive' right to support (as opposed to the 'negative' right to non-interference) has established an important set of expectations around societal responses to people living with dementia (PLWD). This presentation examines the contributions of a rights-based approach to build community with and for PLWD. Data is drawn from Participatory Action Research (PAR) and bi-weekly online action groups with N=10 PLWD in urban and rural British Columbia. Two thematic targets were identified. First, it is important to bring together PLWD in ways that create a sense of solidarity and inclusion. Second, fostering community requires addressing the stigma and discrimination which often leave PLWD feeling isolated, excluded, and marginalized.

Session 3390 (Symposium)

GLOBAL PUBLISHING OPPORTUNITIES IN GERONTOLOGY: A VIEW FROM THE EDITOR'S DESK

Chair: Edward Miller

Co-Chair: Elizabeth Simpson

Global aging has proceeded at an unprecedented and accelerating rate. The aging of the population creates both opportunities and challenges for elders, their families, and society in general. Importantly, there is substantial variation in the effects of and response to global aging both within and across nations depending, in part, on prevailing cultural expectations and values, political and economic imperatives, and social and demographic characteristics. Thus, while some regions and countries have responded with innovative policies and programs to better enable the growing cohort of older adults to remain active and engaged in the community, other regions and countries have struggled with their response or barely begun to plan for the rising population of elders. This symposium assembles editors at five leading gerontological

journals to demonstrate the role that peer-reviewed scholarship can play in disseminating knowledge that informs gerontological research, policy, and practice internationally. Editors include: Kyungmin Kim, PhD, *Research on Aging*; Jessica Kelley, PhD, *Journal of Gerontology: Social Sciences*; Edward Alan Miller, PhD, *Journal of Aging & Social Policy*; Julie Hicks Patrick, PhD, *International Journal of Aging & Human Development*; and Julie Robison, PhD, *The Journal of Applied Gerontology*. Each presenter will review the scope, content, and focus of their journals and the role and opportunities for international scholarship.

THE ROLE OF GLOBAL SCHOLARSHIP IN THE JOURNAL OF AGING & SOCIAL POLICY

Edward Miller,¹ Elizabeth Simpson,² Michael Gusmano,³ and Pamela Nadash,² 1. *University of Massachusetts Boston, Boston, Massachusetts, United States*, 2. *University of Massachusetts Boston, University of Massachusetts Boston, Massachusetts, United States*, 3. *Rutgers University School of Public Health, Rutgers University School of Public Health, New Jersey, United States*

Policymakers, practitioners, and researchers need a balanced, thoughtful, and analytical resource to meet the challenge of global aging at a rate that's historically unprecedented. The *Journal of Aging & Social Policy (JASP)*, which was founded in 1989, serves this role by drawing contributions from an international panel of policy analysts and scholars who assume an interdisciplinary perspective in examining and analyzing critical phenomena that affect aging and the development and implementation of programs for elders from a global perspective. Study settings extend beyond the United States to include Europe, the Middle East, Australia, Latin America, Asia, and the Asia-Pacific rim. This presentation will document the scope, content, and focus of JASP, including the rise of international submissions, which now account for approximately half of articles published. Opportunities for publishing in JASP will be discussed; so too will strategies for navigating the peer-review process successfully.

RESEARCH ON AGING: THE INTERNATIONAL VIEW FROM THE EDITORS' DESKS

Kyungmin Kim,¹ Jeffrey Burr,² and Changmin Peng,³ 1. *Seoul National University, Seoul, Seoul-t'ukpyolsi, Republic of Korea*, 2. *McCormack Graduate School, Boston, Massachusetts, United States*, 3. *University of Massachusetts Boston, Boston, Massachusetts, United States*

We review the scope, content, and focus of the peer-reviewed journal, *Research on Aging (SAGE)*, publishing its 422nd volume this year. We will discuss how scholarship produced from researchers around the globe has changed over the years. Data on submissions, acceptance rates, and the important role of an international editorial board will be presented. The review process will be described, along with suggestions on how to increase chances of success when submitting original research. Although *Research on Aging* is sometimes considered to focus primarily on social gerontology, the scope in recent years has widened considerably, with manuscripts in aging studies published from such fields as economics, psychology, demography, public health, and public policy, as well as from sociology, and social work,

among others. One of several special issues forthcoming in the journal will be described to demonstrate the possibilities for international impact.

JOURNAL OF GERONTOLOGY: SOCIAL SCIENCES—GLOBAL SCHOLARSHIP CHALLENGES AND OPPORTUNITIES

Jessica Kelley, *Case Western Reserve University, Cleveland, Ohio, United States*

The Social Sciences section of The Journals of Gerontology, Series B: Psychological Sciences and Social Sciences aims to publish the highest quality social scientific research on aging and the life course in the U.S. and worldwide. The disciplinary scope is broad, encompassing scholarship from demography, economics, psychology, public health, and sociology. A key substantive focus is identifying the social, economic, and cultural contexts that shape aging experiences worldwide. In the coming decade, social gerontology research is poised to present many opportunities for cross-national and cross-cultural scholarship – driven in part by the proliferation of large parallel data sets from many nations in Europe, Latin America, and Asia. I will discuss the role that peer-reviewed cross-national scholarship can play in disseminating knowledge that informs gerontological research, policy, and practice internationally. I will also identify under-researched areas that will be of great interest to scholars in the coming decade, including LGBT older adults, aging in the Global South, reconfigured families, and centenarians.

THE JOURNAL OF APPLIED GERONTOLOGY: AN INTERNATIONAL FORUM FOR INFORMATION

Julie Robison, *University of Connecticut, University of Connecticut, Connecticut, United States*

The mission of applied gerontology is to bridge science and practice to benefit the health and well-being of older persons, their families, their communities, and other contexts. This presentation will provide insights from the Journal of Applied Gerontology and its attempts to publish and disseminate scholarship that has international application. Following an overview of the growing internationalization of peer-reviewed submissions to the Journal of Applied Gerontology on a variety of topics and from a range of perspectives, the presentation will highlight key achievements as well as ongoing concerns and opportunities to better achieve the goals of applying gerontological scholarship to aging contexts worldwide. Concluding comments will examine how outlets for dissemination and authors themselves can better position their work to enhance their influence on aging in an international context.

TIPS FOR TIMELY (AND POSITIVE) REVIEWS: THE INTERNATIONAL JOURNAL OF AGING & HUMAN DEVELOPMENT

Julie Hicks Patrick, *West Virginia University, Morgantown, West Virginia, United States*

For more than 40 years, under the leadership of four editors and two publishers, The International Journal of Aging and Human Development (IJAHHD) has featured multidisciplinary scholarship related to aging processes and older

adults. With the publication of eight issues a year, with over 800 pages of scientific content, the IJAHHD places emphasis upon psychological and social studies of aging and the aged. However, the Journal also publishes research that integrates observations from other disciplines that illuminate the "human" side of gerontology. A more recent focus includes midlife development, as well. About half (47%) of the publications in the IJAHHD are from international colleagues. This presentation will discuss tips for both international and US-based scholars for ensuring timely reviews and positive decisions for manuscript submissions, including such areas as key words, suggesting unbiased reviewers, formatting, writing mechanics, clearly-articulated methods, and a sound theoretical basis.

Session 3395 (Paper)

Health Care and Aging in Place

CHRONIC DISEASE AMONG MEDICAID BENEFICIARIES OVER 50: THE POTENTIAL IMPACT OF MEDICAID WORK REQUIREMENTS

Rodlescia Sneed,¹ Graham Gardner,²

Alexander Stubblefield,³ and Briana Mezuk,⁴ 1. *Michigan State University, Flint, Michigan, United States*, 2. *Michigan State University, Michigan State University, Michigan, United States*, 3. *Michigan State University, East Lansing, Michigan, United States*, 4. *University of Michigan, Ann Arbor, Michigan, United States*

Since 2018, several states have proposed requiring work or other community engagement activities as a condition of receiving Medicaid; however, there has been little inquiry into the impact of such policies on Medicaid recipients over 50. Here, we describe the prevalence and burden of chronic disease among Medicaid beneficiaries over 50 who might be impacted by Medicaid work requirements. We used data from the 2016 wave of the Health and Retirement Study, a large-scale population-based study of adults aged >50. Our sample included individuals over 50 who were not Medicare-eligible (<65 years old) and not receiving Social Security Income. We used logistic regression models to compare those working <20 hours per week (the minimal community engagement/work cutoff) to those working ≥20 hours per week, adjusting for age, race/ethnicity, sex, education, and marital status. Individuals working <20 hours per week had greater prevalence of chronic health conditions, including greater odds of diabetes (OR: 2.06; 95% CI: 1.37-2.46), hypertension (OR:2.56; 95% CI: 1.69-3.89), arthritis (OR: 2.96; 95% CI: 2.06-4.62, and lung disease (OR: 4.11; 95% CI: 2.31-7.32). Further, among those with chronic health conditions, those working <20 hours per week reported more, medication use, more worsening of their conditions in the past 2 years, and more hospitalization than their counterparts. Taken together, these findings suggest that Medicaid work requirements in this population would have the most impact on the most medically vulnerable individuals. Policymakers should consider this as they propose policies impacting Medicaid coverage in this population.

CONNECTICUT'S VETERANS-DIRECTED CARE PROGRAM OUTCOMES COMPARED TO HCBS WAIVER PARTICIPANTS: HCBS CAHPS RESULTS

Kathy Kellett,¹ Martha Porter,¹ Dorothy Wakefield,¹ and Julie Robison,² 1. *UConn Health, Farmington, Connecticut, United States*, 2. *University of Connecticut, University of Connecticut, Connecticut, United States*

Connecticut (CT) Veterans Directed Home and Community Based Services Program (VDC) is an innovative Veterans Administration (VA) services option providing veterans at risk of institutionalization with person-centered consumer-directed long-term services and supports at home. Funded by an Administration for Community Living grant, the CT Department of Aging and Disability Services partnered with the VA, the five CT Area Agencies on Aging, and UConn Health Center on Aging (UConn). UConn researchers conducted the Consumer Assessment of Healthcare Providers and Systems in Home and Community Based Services (HCBS CAHPS) survey with VDC participants (n=36) from October 2019 through March 2020. The standardized, validated HCBS CAHPS survey, which Connecticut administers to individuals in most CT Medicaid HCBS programs, is a universal, cross-disability tool to assess/improve the quality of HCBS programs. Analyses compared VDC participants' program experiences to survey results from individuals in the Connecticut Home Care Program (CHCP) (for older adults) (n=629), Personal Care Assistance (PCA) (n=282), and Acquired Brain Injury (ABI) (n=327) waiver programs. Notably, more VDC participants (91%) knew who their support broker was, compared to CHCP, ABI, and PCA (82%, 79%, and 72%, respectively) who knew their case manager; 91% of VDC participants gave their support broker the highest rating, compared to 66% to 74% of participants in other programs who rated their case manager. This study provides strong evidence that the CT VDC program is positively impacting veterans and that the AAAs and support brokers are effectively helping them receive the HCBS they need in a consumer-directed way.

OLDER BREAST CANCER SURVIVORS: PERSPECTIVES ON HEALTHCARE ENCOUNTERS AND UNMET NEEDS

Victoria Raveis,¹ Anita Nirenberg,² Yumeng Liu,³ and Simona Kwon,⁴ 1. *New York University, New York University, New York, United States*, 2. *Hunter College, Hunter College, CUNY, New York, United States*, 3. *New York University, New York, New York, United States*, 4. *NYU School of Medicine, New York University School of Medicine, New York, United States*

Breast cancer treatment advances have lengthened the survivorship period. Limited attention has focused on the myriad issues breast cancer survivors experience related to their cancer and other health conditions as they age. Focus groups, conducted Fall 2019 – Spring 2020 with a diverse sample of breast cancer survivors from the New York metropolitan region (N=28) explored survivors' healthcare encounters and goals, quality of life, survivorship lifestyle, other health conditions and risks, e.g. emergence of COVID-19. Participants were 40-82 years old (57% were 56 or older); racially diverse (57% White, 18% Black, 14% Hispanic, 11% Bi-racial); 32% were married/partnered and 57% were parents. Mean diagnosis age was 51. Treatments

received included lumpectomy (64%), chemotherapy (57%), radiation (46%), hormonal therapy (39%), and single/bilateral mastectomy (36%). Survivors expressed the importance of restoring normality in their life and the necessity to be pro-active in ensuring their health issues were addressed in medical encounters. Person-centered care and clinician engagement was valued, but not routinely experienced. Survivors evaluated treatment options not just on being cancer-free, but on how it would impact their whole life. They expressed concerns about the future and anxiety over long-term survival. Long term survivors, recipients of early experimental and/or extensive treatments, worried about an emergence of long-delayed adverse health consequences and complications managing other health issues in the future, particularly as they grew older. COVID-19 raised additional health concerns, particularly among those with high risk health conditions due to prior cancer treatments; various self-mandated protective activities were integrated into their self-care practices.

THE COSTS AND BENEFITS OF CHOICE: FAMILY MANAGERS IN DIRECTLY FUNDED HOME CARE

Lisette Dansereau,¹ Christine Kelly,¹ Katie Aubrecht,² Amanda Grenier,³ and Allison Williams,⁴ 1. *University of Manitoba, Winnipeg, Manitoba, Canada*, 2. *St. Francis Xavier University, St. Francis Xavier University, Nova Scotia, Canada*, 3. *University of Toronto and Baycrest Hospital, Toronto, Ontario, Canada*, 4. *McMaster University, Hamilton, Ontario, Canada*

Directly funded (DF) home care, or consumer directed home care, gives program users a budget to choose their own services. Set in the Canadian province of Manitoba, our study examines the local DF program "Self and Family Managed Care", which does not allow program users to hire and pay a family member. Incorporating a disability lens into care and aging studies, we share findings from a qualitative study based on 24 semi-structured interviews with DF users. We focus on the experiences of family managers, that is, representatives acting as a decision maker for an older adult. About half of the family managers in this study care for people living with dementia or cognitive decline. We identify two main themes: 1) service flexibility in DF reduces caregiver strain, 2) family managers tend to hire agencies rather than individuals to avoid administrative burden. Our discussion highlights the costs of DF from the perspective of caregivers as administrative burden (financial paperwork, finding workers, choosing a 'good' agency), and the benefits as flexibility (choosing workers, trusting workers, setting schedules, assigning work). We also consider the goals of family managers to enhance quality of life and avoid long-term residential care, in contrast to younger self-managers who desire control and autonomy. We recommend that DF programs need to reduce administrative work for users, support users in making informed choices, and find better ways to support, acknowledge and value the work of family managers and substitute decision makers.

THEY HAVE THE ABILITY TO SAY YES OR NO: PROVIDERS' PERSPECTIVES ON VETERANS' SERVICE REFUSAL AS A CAUSE OF READMISSIONS

Nyasia Hicks,¹ Polly Noel,² Lauren Penney,³ and Jacqueline Pugh,⁴ 1. *GRECC - STVHCS Department of*

Veterans Affairs, San Antonio, Texas, United States, 2. South Texas Veterans Health Care system, South Texas Veterans Health System, Texas, United States, 3. South Texas Veterans Health Care System, San Antonio, Texas, United States, 4. South Texas Veterans Health Care system, San Antonio, Texas, United States

Service refusal, where patients actively refuse clinicians' recommendations for additional services needed to achieve safe and full recovery after discharge, is a key but often overlooked cause of readmissions. There is a dearth of literature on the extent of service refusal and providers' (e.g. clinicians, nurses, social workers) observations regarding how to deal with these situations. As part of a larger, 10 VA site organizational case study of readmission, semi-structured interviews exploring causes of readmission were conducted with 21-41 staff members at each site (n=314). 41 providers identified Veteran service refusal and decision-making as causes of readmission. Providers acknowledged the need to honor patient autonomy/self-determination in decisions while at the same time worrying about potential adverse outcomes. Incongruence between Veterans' and providers' perceptions (especially for capacity for self-care), goals, and discharge plans was also cited as a factor in service refusal. Frustration was also raised about initial acceptance of service followed by refusal at time of service delivery. Providers also felt readmissions increased even further when combined with lack of or inadequate caregiving arrangements/family support, lack of cognitive capacity, homelessness, or home care affordability. Findings point to the need for interventions to evaluate congruence between provider and patient assessment of self-care capabilities and provide more in-depth goal setting and motivational interviewing techniques to help patients reach more realistic post-discharge care goals.

Session 3400 (Symposium)

HEALTH DISPARITIES RESEARCH WITH THE NATIONAL INSTITUTE ON AGING (NIA)

Chair: Cerise Elliott

Co-Chair: Patricia Jones

Discussant: Patricia Jones

The National Institute on Aging has taken special efforts to support research endeavors that explore ways to address health disparities. For example, the NIA Health Disparities Research Framework was developed in 2015 to provide a visualization of priority areas in Aging Research. The Framework can help researchers assess advances and potential opportunities for stimulating and supporting rigorous methods to address health disparities in Aging Research among the phases of research. The goal of this symposium is to highlight the different resources and research opportunities that NIA offers to support aging researchers, centers, and institutions for health disparities-related research or programs. Dr. Ron Kohanski will present a concept piece on how laboratory animals might be leveraged to mimic the impact of early life disparities on aging over the life-course, based on research in the hallmarks of aging support by NIA's Extramural Division of Aging Biology. Dr. Damali Martin will identify the different resources focused on health disparities related research within the Division of Neuroscience. Dr. Lyndon Joseph will discuss the different health disparities

research opportunities that are available from the Division of Geriatrics and Clinical Geriatrics. Dr. Frank Bandiera will highlight the different resources and research opportunities that are available to address health disparities within the Division of Behavior and Social Research. These presentations, taken together, will provide important information that bolsters knowledge of resources and research opportunities to address health disparities over the lifecourse and in late life.

CRITICAL THOUGHTS ABOUT HEALTH DISPARITIES WITH THE NIA DIVISION OF NEUROSCIENCE

Damali Martin,¹ and Cerise Elliott,² 1. NIA, NIH, Bethesda, Maryland, United States, 2. National Institute on Aging, Bethesda, Maryland, United States

Population-based health disparities studies requires improved research design and appropriate research questions for investigation that will inform evidenced-based interventions and prevention strategies. The NIA Division of Neuroscience is committed to supporting new studies that 1) invests in health priorities as reflected by needs of minoritized populations (e.g. Race/Ethnic minorities; Rural or Sexual Gender Minorities); 2) examines Alzheimer's Disease and cognitive changes across the individual lifespan; and 3) understands intersectionality of cohorts and minimize potential biases in participant selection. This brief session will outline updated steps to permit critical thought about the use of the NIA's Health Disparities Framework to examine relevant biological, sociocultural, behavioral and environmental across multiple levels of influence.

THE DIVISION OF AGING BIOLOGY ON BASIC RESEARCH IN HEALTH DISPARITIES

Stacy Carrington-Lawrence,¹ and Ronald Kohanski,² 1. Division of Aging Biology/ NIA/ NIH, 2. National Institute on Aging, Bethesda, Maryland, United States

The core mission of the Division of Aging Biology is to explore the molecular and cellular mechanisms of aging. Work supported by the Division is best known for research using laboratory animals, but we have a less well-recognized program of research engaging human participants. With a goal expanding our presence in clinical research and the hope that we can have an impact on health disparities, this talk will provide an overview of how our grantees approach basic mechanistic questions of aging in human communities. In addition, a forward-looking but speculative presentation will be made on ways in which laboratory animals might be used to study health disparities from the perspective of hallmarks of aging.

HEALTH DISPARITIES SCIENTIFIC RESEARCH IN THE DIVISION OF GERIATRICS AND CLINICAL GERONTOLOGY

Lyndon Joseph, NIA, Bethesda, Maryland, United States

The Division of Geriatrics and Clinical Gerontology (DGCG) supports clinical and translational research on health and disease in the aged, and research on aging over the human lifespan, including its relationships to health outcomes. Key areas include development of new interventions for age-related conditions and pathologies, prevention and treatment of multiple chronic conditions, geriatric palliative

care, factors influencing the progression of chronic diseases over the life span, and predictive markers of aging that may inform potential interventions for extension of health span. Population diversity and health disparities are critical aspects of science that cut across DGCG research areas. This presentation will highlight several examples of DGCG-supported studies related to health disparities and discuss potential future research directions. One potential upcoming research area of interest involves leveraging large data sets to examine disparities in risks and benefits of long-term osteoporosis drug therapy and drug holidays according to racial and ethnic groupings

NIA DIVISION OF BEHAVIORAL AND SOCIAL RESEARCH PRIORITIES IN HEALTH DISPARITIES

Frank Bandiera, *National Institute on Aging, Bethesda, Maryland, United States*

This presentation will include priority research areas in health disparities in the NIA Division of Behavioral and Social Research (BSR). It will include a portfolio analysis and description of BSR program and research in health disparities. Specifically, the 2019 BSR National Advisory Committee on Aging (NACA) recommended BSR's number one research priority in health disparities. In 2020 BSR held a workshop on structural racism. BSR supports funding announcements in health disparities in Alzheimer's Disease and Related Dementias, sleep, Native American Health, and immigration among others. Key themes for BSR include racial disparities that often center on context and resources, that is, factors such as residential segregation, rurality, individual and neighborhood SES, and access to health care; persistent racial differences in chronic health conditions; disparities in health systems; immigration and nativity closely linked with race and health outcomes; and racial discrimination linked to poorer mental health and psychological stress.

Session 3405 (Paper)

Healthy Aging and Health Promotion

DYNAMIC ASSOCIATIONS BETWEEN LIFESTYLE FACTORS AND POSITIVE AND NEGATIVE AFFECT IN MIDDLE-AGED AFRICAN AMERICANS

Raheem Paxton,¹ Chuong Bui,² Rebecca Allen,¹ and Edward Sazonov,² *1. University of Alabama, Tuscaloosa, Alabama, United States, 2. University of Alabama, University of Alabama, Alabama, United States*

Purpose: The purpose of this study was to examine the dynamic association between lifestyle factors and both positive and negative affect in middle-aged African Americans. **Methods:** Study participants (N = 69, Mean age=51 years, 80% female) were recruited from two African American churches in the Deep South. Participants completed daily surveys on positive and negative affect, physical activity, sedentary behavior, diet quality, and sleep quality daily for up to 10-days. Mixed-effect models were used to examine associations between the variables of interest. **Results:** On days that participants were more active, they experienced higher mean positive affect (P = .015) and lower mean negative affect (P = .028) scores. Conversely, more time spent sitting in

lagged models (i.e., T-1) was associated with higher mean negative effect (P = .001) and lower mean positive effect (P = .040) scores. In lagged models, better sleep quality was associated with higher positive effects (P = .007) scores but reported lower negative effects (P < .0001) scores on the same day. Lastly, on days where diet quality was higher, positive effect scores were higher (P < 0.05). Association between diet quality and positive effect was moderated by age (P = .025). **Conclusion:** The data suggest that same and previous day health behaviors may have a significant impact on the health and well-being of middle-aged African Americans. More research is needed to determine whether these behaviors can be targeted in real-time as a means of improving mental health outcomes in this population.

INTRINSIC CAPACITY AND ITS RELATIONSHIP WITH LIFE SPACE AREA (INCREASE) IN COMMUNITY-DWELLING OLDER ADULTS

Jia Qi Lee,¹ Yew Yoong Ding,² Laura Tay,³ Aisyah Latib,³ and Yee Sien Ng,⁴ *1. Duke-NUS Graduate Medical School, Singapore, Singapore, 2. Geriatric Education and Research Institute, Singapore, Singapore, 3. Sengkang General Hospital, Singapore, Singapore, 4. Singapore General Hospital, Singapore, Singapore*

Intrinsic capacity (IC), defined as 'the composite of all physical and mental capacities of an individual', is of increasing interest in geriatrics as a potential multidimensional measure of health in older adults. According to the International Classification of Functioning, Disability and Health (ICF) framework, IC, through its interactions with environmental factors, determines a person's participation in the community. However, there is lack of empirical evidence demonstrating this association. The primary aim of this study was to examine the association of IC with Life Space Area (LSA; a measure of participation) among community-dwelling older adults. The secondary aim was to determine whether age and gender modify this relationship. Cross sectional analysis was performed on data from the Individual Physical Proficiency Test for Seniors (IPPT-S) study conducted in the Northeastern region of Singapore. Standardized IC factor scores were calculated through confirmatory factor analysis using variables that represented the 5 IC domains. Association of IC with LSA and its effect modification by age and gender were examined with regression analyses. The study included 751 participants with mean age of 67.6 and mean LSA score of 88.6. IC showed a positive and significant association with LSA (B=6.33, P<0.001) and the effect remained significant even after controlling for potential confounders (B=4.76, P<0.001). Age and gender did not show significant modification on this relationship. Our findings support the empirical rigour of the ICF framework and provide guidance for healthcare providers who aim to enhance life space mobility and promote healthy aging in older adults.

PERCEPTIONS OF HEALTHY AGING AMONG COMMUNITY-DWELLING OLDER PERSONS IN AN URBAN SLUM IN IBADAN, NIGERIA

Olubukola Omobowale, *University of Ibadan, Nigeria, Ibadan, Oyo, Nigeria*

Background: Healthy Ageing is the process of the development and maintenance of functional capacity which allows

well-being at an older age. This understanding is comprehensive and relevant for all older persons. Despite the global attention being given to healthy ageing, there is limited information on the perceptions of this concept among older persons in low resource settings like Nigeria, hence the need for this study. **Methods:** In depth interviews were conducted among older persons aged 60 years and above residing in Idikan Community, an urban slum area in Ibadan, Nigeria. Using an interview guide, perceptions of older persons on meanings of healthy ageing, factors related to healthy ageing and experience of ageing were explored. **Results:** A total number of 24 interviews were conducted. Slightly more than half of the respondents were females. The majority of the respondents were of the opinion that healthy ageing is about being “strong” and able to move around, without being dependent on anyone for mobility and activities of daily living. In their opinion, healthy ageing is related to different health dimensions: biological (adoption of healthy habits and behaviors with self-responsibility, psychological (feelings of optimism and happiness), spiritual (faith and religiosity) and family and social support (healthy and well children, friends and family). **Conclusion:** Urban Community dwelling older persons’ perception of healthy ageing was positive and incorporating their opinions on healthy aging from the perspective of the older persons can support the activities of professionals who work with this population group.

REDUCING ASPIRATION PNEUMONIA RISK FOR OLDER PEOPLE: EFFECT OF EVIDENCE-BASED ORAL CARE

Lynette Goldberg,¹ Leonard Crocombe,² Silvana Bettioli,³ Anna King,⁴ and Sangeeta Khadka,³ 1. *University of Tasmania, Hobart, Tasmania, Australia*, 2. *Latrobe University, Latrobe University Melbourne, Victoria, Australia*, 3. *University of Tasmania, University of Tasmania, Hobart, Tasmania, Australia*, 4. *University of Tasmania, University of Tasmania, Tasmania, Australia*

Poor oral health increases the risk of aspiration pneumonia for older people. This is due primarily to six pathogens found in the mouth: five bacteria and one fungus. With a cohort of older people who were dependent on others for their oral care, we analyzed the load and type of bacteria and fungi from swabs of cheek, gum, and tongue mucosa. There were no significant differences between the three sites for load of bacteria ($H(2) = .89$; $p = .64$); there were significant differences between the sites for type of bacteria ($F(2,78) = 11.97$; $p < .001$) with the tongue showing the greatest diversity. There were no significant differences between the three sites for load ($H(2) = 2.94$; $p = .23$) or type ($F(2,77) = .46$; $p = .63$) of fungi. We then investigated the effect of regular compared to evidence-based oral care over a six-week period, and whether evidence-based oral care could significantly reduce the absolute count of the six oral pathogens specifically related to aspiration pneumonia. Participants self-selected into Regular Care ($n = 10$) and Evidence-based Care ($n = 17$) Groups. Evidence-based oral care resulted in significant decreases ($p = .02$ to $p < .001$) in the load of four potentially pathogenic bacterial species, including *E. coli*, gut-based bacteria, and in an increased load of *Lactobacillus reuteri*, a host-protective normal flora in the mouth, compared to baseline. There were no significant

differences between groups for the abundance and type of fungi.

USING IMPLEMENTATION SCIENCE STRATEGY MAPPING ON THE AGE-FRIENDLY HEALTH SYSTEM'S 4MS JOURNEY

Mary Dolansky,¹ Anne pohnert,² and Sherry Greenberg,³ 1. *Case Western Reserve University, Cleveland, Ohio, United States*, 2. *CVS Minute Clinic, Woonsocket,, Rhode Island, United States*, 3. *Seton Hall University College of Nursing, Seton Hall University College of Nursing, New Jersey, United States*

Background: Implementation science is the study of methods to promote the adoption and integration of evidence-based practices into routine health care to improve the quality of care. The purpose of this study was to use Implementation Mapping to guide the implementation of The John A. Hartford evidence-based Age-Friendly Health Systems (AFHS) 4Ms Framework: What Matters, Medications, Mentation, and Mobility. **Methods:** Implementation Mapping, a systematic process for planning implementation strategies, guided the 9-month integration of the 4Ms Framework in the 1,100 MinuteClinics across the US. Implementation Mapping includes five tasks: (1) conduct an implementation needs assessment and identify program adopters and implementers; (2) state adoption and implementation outcomes and performance objectives, identify determinants, and create matrices of change objectives; (3) choose theoretical methods (mechanisms of change) and select or design implementation strategies; (4) produce implementation protocols and materials; and (5) evaluate implementation outcomes. **Results:** The implementation plan, developed by the implementation mapping method, was carried out over 9-months. Seven implementation strategies were identified from the Expert Recommendations for Implementing Change (ERIC) project including the provision of education, electronic health record integration, internal champion facilitation, cues to action, and a dashboard to monitor progress. To date, the implementation mapping has resulted in the adoption of the 4Ms by 1145 providers (37%). Monitoring of the adoption of the 4Ms Framework and consideration of future implementation strategies is ongoing. **Conclusions:** Implementation Mapping provided a systematic process to develop strategies to improve the adoption, implementation, sustainment, and scale-up of the evidence-based 4Ms Framework.

Session 3410 (Paper)

Intergenerational Teaching, Learning, and Engagement

EFFECTIVENESS OF AN INTERGENERATIONAL SERVICE-LEARNING PROGRAM TO CHANGE ATTITUDES ON AGING

Sara Bartlett,¹ Sky Bergman,¹ Phyllis Solomon,² and Zvi Gellis,² 1. *Cal Poly, San Luis Obispo, San Luis Obispo, California, United States*, 2. *University of Pennsylvania, Philadelphia, Pennsylvania, United States*

This study evaluated the efficacy of a 10-hour intergenerational service-learning program administered to

undergraduates to determine if it would increase knowledge about aging, improve attitudes about older adults, and reduce ageism more than a course with less service-learning activity. Making maximum impact on students in these areas in a short amount of time is particularly relevant in short, quarter-based university programs. A quasi-experimental design using a convenience sample compared pre-test and post-test scores between an experimental intervention (N=68) and a comparison (N=71) group on The Facts on Aging Quiz Multiple Choice version, Aging Semantic Differential, and Fabroni Scale on Ageism. Qualitative data via open-ended survey questions was also collected. The experimental intervention, the Lives Well Lived project, was based on a documentary film by the same name, which incorporates themes of successful aging. During the project students and older adults interviewed one another about living a life well lived, participated in a photo shoot, and created a Memoir for the older adult. The comparison group included two social visits to a congregate meal program. Results from multiple regression analysis showed that students in the intervention group had less ageist stereotypes and less negative bias about aging at post-test and qualitative data indicated they were more inclined to participate in intergenerational relationships in the future. Programs like this one that are longer and more relational may be useful for consideration in undergraduate gerontology courses in reducing ageism and promoting intergenerational relationships which benefit those of all ages.

FACULTY PERCEPTIONS OF ENGAGING OLDER ADULTS IN HIGHER EDUCATION: THE NEED FOR INTERGENERATIONAL PEDAGOGY

Jason Dauenhauer, Afeez Hazzan, and Kristin Heffernan,
State University of New York, Brockport, Brockport, New York, United States

Institutions of higher education need to become more age friendly. Creating an on-campus lifelong learning program can offer older adults opportunities to audit classes and engage in multigenerational classrooms, but can also promote intergenerational learning when instructors consciously use pedagogy that fosters engagement between learners from various generations. Promoting intergenerational learning to facilitate reciprocal sharing of expertise between generations is also the fourth principle of the Age Friendly University framework. This qualitative interview study examines the perspectives of 27 faculty members who have opened their face to face classrooms to older adult auditors to 1) Explore perceived benefits and challenges associated with having older adults in the college classroom and to 2) Determine what levels of intergenerational learning may be taking place. Compared to lecture-based courses, faculty whose pedagogy promotes discussion, sharing, and small group work reported detailed examples of older adult learners and traditionally-aged college students engaging in course-related discussion. The unique, historical and diverse perspectives of older adults improved the quality of education for students, and fostered in-depth learning. Challenges related to older adult auditors included poor/limited attendance, sharing of strong opinions/dominating class discussion, sensory/mobility and technology accessibility. Recommendations include training to promote intergenerational engagement in college classrooms.

GOVERNMENT AND UNIVERSITY PARTNER FOR VIRTUAL SERVICE-LEARNING TO SUPPORT INTERGENERATIONAL SOCIAL INTERACTION

Betsy Kemeny,¹ Adelle Williams,¹ and Stephanie Cole,²
1. Slippery Rock University, Slippery Rock, Pennsylvania, United States, 2. State of Pennsylvania, Harrisburg, Pennsylvania, United States

Pre-pandemic, evidence existed that intergenerational service-learning programs support knowledge of aging and positive attitudes and perceptions (Monahan et al., 2020). As spring 2020 COVID-19 lock downs and public health warnings urged physical distancing of community dwelling older adults, growing concern about the unintended consequences of increased social isolation on mental and physical health prompted the Secretary's Office of Pennsylvania Department of Aging to design a pilot project with university faculty for virtual intergenerational social interaction. The Department identified older adults at the highest risk for social isolation (live alone, in poverty, with a disability). The resulting pilot project is fully integrated as a high impact practice into eight sections of recreational therapy and gerontology courses with participation by 210 undergraduate students and 210 older adults for 9 weeks of both the fall and spring semesters. Students, who received extensive classroom instruction aimed at avoiding negative stereotypes of older adults as helpless and dependent, called their assigned partner several times a week for at least an hour of communication. Using the UCLA loneliness scale, community-dwelling older adults reported frustration with isolation due to the pandemic. Those with low and moderate loneliness reported positive feelings about program and looking forward to interactions with students. Students gained virtual communication skills that may contribute to telehealth competencies, intervention skills such as assessment, life review/reminiscence, mindfulness techniques, and leisure education. Moreover, an analysis of student reflections revealed positive changes in attitudes toward older adults and the ability to enjoy common interests despite age differences.

PROMOTING INTERGENERATIONAL ENGAGEMENT WITHIN THE COLLEGE CLASSROOM: FACULTY TRAINING NEEDS

Afeez Hazzan,¹ Kristin Heffernan,² and Jason Dauenhauer,³
1. State University of New York at Brockport, Brockport, New York, United States, 2. State University of New York, Brockport, State University of New York, Brockport, New York, United States, 3. State University of New York, Brockport, Brockport, New York, United States

As population aging accelerates worldwide, institutions of higher education are increasing efforts to focus on ways to meet the growing needs of older adult learners. Many institutions are addressing these needs by joining the Age-Friendly University (AFU) Global Network. Affiliated institutions are required to promote intergenerational learning to facilitate the reciprocal sharing of expertise between learners of all ages, including older adults. However, these institutions will need to provide instructors with the training to ensure that intergenerational engagement is being actively fostered in the classrooms. In this study, we examine the perspectives of faculty members who have opened their classrooms to older adult auditors. The research question was:

What types of training do faculty recommend to promote intergenerational engagement in the classroom? In-depth face to face interviews were conducted with 27 faculty members. Qualitative content analysis of the data yielded the following four themes: 1) Provide accessible training to teach faculty their role 2) Educate faculty about the importance of becoming aware of generational time periods/context 3) Learn to approach auditors with a mindset that they are adults and have had careers/experiences, and 4) Train faculty on how to foster discussion. Overall, these findings point to a need for training that focus on intergenerational curricular design and multigenerational classroom management.

STUDENTS' ATTITUDE CHANGE: VIRTUAL VS. IN-PERSON INTERGENERATIONAL, ARTS-BASED COURSES

Meghan Young,¹ Elizabeth Lokon,² and Yue Li,² *1. Scripps Gerontology Center, Miami University, Oxford, Ohio, United States, 2. Miami University, Oxford, Ohio, United States*

When higher education classes went virtual at the start of the COVID-19 pandemic, converting an in-person, arts-based, service-learning course into a meaningful, virtual experience seemed impossible. However, the Opening Minds through Art (OMA) program developed online courses where students met older adults weekly over Zoom to create and discuss art. Undergraduate and graduate students at Miami and Marian Universities (n=47) came from more than 20 different areas of study and had varying knowledge of gerontology and dementia. Pre- and post-assessments were administered at the start and end of the academic semester. Paired-samples t-tests were conducted to examine pre-post changes in students' attitudes toward people living with dementia (PLWD) using the Dementia Attitude Scale (DAS) (O'Connor & McFadden, 2010) and the extent students actually like PLWD using the Allophilia scale (Pittinsky et al, 2011). Students in virtual OMA courses showed significant improvement in overall DAS and Allophilia scores and all subdomain scores (i.e., general knowledge about dementia, affection, social comfort level, kinship, and engagement and enthusiasm when interacting with PLWD), with moderate to high effect sizes (Cohen's d range between 0.39 and 1.10). The magnitudes of these effect sizes for virtual OMA are comparable to previous studies examining students' participation in face-to-face OMA sessions, where Cohen's d on DAS and Allophilia scales ranged between 0.48 and 1.07 (Lokon et al, 2017, 2018). Overall, we found that it is possible to design virtual service-learning courses that improve students' attitudes toward PLWD as effectively as face-to-face courses.

Session 3415 (Symposium)

KUAKINI HHP CENTER FOR TRANSLATIONAL RESEARCH ON AGING: AIMS AND PRELIMINARY FINDINGS

Chair: Bradley Willcox

Co-Chair: Richard Allsopp

Discussant: Peter Martin

Kuakini Medical Center (Kuakini) is creating an interdisciplinary Hawai'i-based Center for translational research on

aging. This Center will build upon Kuakini's five-decades of NIH-funded research, its 420,000-specimen biorepository, and existing strengths in aging research, notably, the 56-year ongoing Kuakini Honolulu Heart Program cohort study (Kuakini HHP), Kuakini Honolulu-Asia Aging Study (Kuakini HAAS), and Kuakini HHP Offspring Study. The overall goal is to find practical means to enhance healthy human lifespan (healthspan). Four research project leaders (RPLs) have been selected from various disciplines for mentorship in translational aging research. The first RPL presentation will introduce a novel mouse model, enabling controlled expression of the pro-longevity gene FoxO3, and assess the impact on lifespan and healthspan phenotypes in mice. These phenotypes will be compared to similar phenotypes in humans with/without the FOXO3 longevity genotype. The second RPL presentation will assess the relation between leukocyte telomere attrition rates (from banked blood collected at three time points over 20-plus years) in older Kuakini HHP men with/without the FOXO3 longevity genotype. The third RPL presentation will assess whether FOXO3 genotype, peripheral leukocyte telomere dynamics (attrition rate, telomerase activity) and inflammatory cytokines mediate the human brain integrity and function with age. This project will utilize structural and functional MRI data from male and female Kuakini HHP Offspring Study participants. The fourth RPL presentation will assess whether APOE e2, e4, and FOXO3 longevity-associated alleles impact 34-year incidence of intracerebral hemorrhage. We will summarize the findings, address the healthspan implications and provide future directions. Supported by NIH 5P20GM125526.

KUAKINI HHP CENTER FOR TRANSLATIONAL RESEARCH ON AGING: AN INTRODUCTION

Bradley Willcox,¹ Kamal Masaki,² Tim Donlon,³ Donald Willcox,⁴ Brian Morris,⁵ and Richard Allsopp,² *1. Kuakini Medical Center, Kuakini Medical Center/ Honolulu, Hawaii, United States, 2. Kuakini Medical Center, Honolulu, Hawaii, United States, 3. JABSOM, Honolulu, Hawaii, United States, 4. Department Of Gerontology And Public Health, Okinawa International University, Okinawa, Japan, 5. University of Sydney, Sydney, New South Wales, Australia*

Kuakini Medical Center (Kuakini) is establishing an interdisciplinary Hawai'i-based Center of Biomedical Research Excellence (COBRE) for clinical and translational research on aging. - Specific Aim 1: Create a world class, innovative, interdisciplinary Center for Translational Research on Aging by building on the existing rare and valuable Kuakini Honolulu Heart Program (Kuakini HHP) and its related studies and research infrastructure. - Specific Aim 2: Advance the genomic, biological and clinical science of aging, and enhance the world class character of our Center, by enlisting accomplished senior scientists to mentor promising Hawai'i-based new investigators in interdisciplinary aging research and career development. - Specific Aim 3: Elevate the capacity of our Center by: i) creating a state-of-the-art Clinical and Translational Core, and ii) collaborating with other Centers of Biomedical Research Excellence. This presentation will briefly introduce the Center and discuss its aims, research strategy, and future plans.

ASSESSING LIFESPAN AND AGING PHENOTYPES RESULTING FROM FOXO3 INDUCTION USING MOUSE MODELS

Jesse Owens,¹ Brian Hew,¹ Christopher Tran,¹ Kristal Xie,¹ and Bradley Willcox,² 1. *Kuakini Medical Center, Honolulu, Hawaii, United States*, 2. *Kuakini Medical Center, Kuakini Medical Center/Honolulu, Hawaii, United States*

Environmental signals, including caloric restriction and oxidative stress, trigger FoxO3 to upregulate genes involved in stress resistance, metabolism, cell cycle arrest, and apoptosis that may help mitigate age-related diseases. Activation of FoxO3 has been shown to have a profound life-extending effect on model organisms. Protective SNPs in FOXO3 are strongly associated with exceptional longevity in humans. The objective of this study is test the relation between FoxO3 and longevity using mouse models. We generated a mouse line containing an extra copy of FoxO3 that can be induced at any age. In our model, FoxO3 remains driven by its natural promoter to avoid mis-expression in inappropriate cells and to maintain the gene's ability to respond to signals such as stress. We are utilizing this new model to assess survival endpoints and test a panel of aging phenotypes reflecting healthspan throughout the mouse lifespan and compare these to similar human phenotypes.

ANALYSIS OF CELL AND MOLECULAR PHENOTYPES OF A HIGHLY REPLICATED LONGEVITY-ASSOCIATED FOXO3 VARIANT IN OLDER ADULTS

Philip Davy,¹ Randi Chen,¹ Richard Allsopp,¹ and Bradley Willcox,² 1. *Kuakini Medical Center, Honolulu, Hawaii, United States*, 2. *Kuakini Medical Center, Kuakini Medical Center/Honolulu, Hawaii, United States*

Aging demographics in the US, and other industrialized nations, are resulting in rapidly increasing health care costs from age-related diseases. New therapeutic interventions to extend healthspan in older adults requires understanding connections between basic aging biology and human longevity factors. Using clinical samples from the Kuakini Honolulu Heart Program (HHP) and their Offspring, we are examining potential links between molecular and cellular mechanisms of aging and the longevity associated FOXO3 genotype (carriage of SNP rs2802292 "G" allele). Telomere dynamics in leucocytes (LTL) have shown strong correlation with multiple lifestyle and health factors. We previously demonstrated a significant protective relation between FOXO3 longevity genotype and LTL in a cross-sectional study. Now we are assessing a longitudinal relation, at three time points over 20+ years, in older men. We are also exploring stem cell frequency and differentiation capacity in neurological and peripheral blood samples to assess FOXO3 genotype and human cell dynamics.

FOXO3, TELOMERE DYNAMICS, AND HEALTHY BRAIN AGING: A COBRE STUDY

Kalpna Kallianpur,¹ Bradley Willcox,² Kamal Masaki,¹ and Richard Allsopp,¹ 1. *Kuakini Medical Center, Honolulu, Hawaii, United States*, 2. *Kuakini Medical Center, Kuakini Medical Center/Honolulu, Hawaii, United States*

Human longevity is linked to genetic, cellular, and other complex biological and psychosocial traits. Aging is typically accompanied by gradual brain atrophy and cognitive decline,

but the mechanisms are unclear. Cellular aging, characterized by telomere shortening and altered telomerase activity, is related to mortality and brain aging. Decelerated brain aging is associated with greater peripheral blood leukocyte telomere length (LTL) and, we hypothesize, may be linked to FOXO3 genotype. We will use MRI to assess brain structure and function cross-sectionally in 100 Kuakini Honolulu Heart Program Offspring. Atrophy and disrupted functional connectivity, markers of brain aging, will be examined in relation to FOXO3 and LTL. Associations between brain structural and functional differences, FOXO3 genotype and LTL will be investigated over a wide range of ages, controlling for other biological and psychosocial factors. Results may provide insight into mechanisms influencing the rate of brain aging, and may eventually extend human healthspan.

THE IMPACT OF APOE AND FOXO3 GENOTYPE ON THE RISK OF INTRACEREBRAL HEMORRHAGE AMONG AMERICAN MEN OF JAPANESE ANCESTRY

Kazuma Nakagawa,¹ Randi Chen,² Steven Greenberg,³ G. Ross,⁴ Bradley Willcox,⁵ and Kamal Masaki,² 1. *University of Hawaii and Kuakini Medical Center, Honolulu, Hawaii, United States*, 2. *Kuakini Medical Center, Honolulu, Hawaii, United States*, 3. *Massachusetts General Hospital, Boston, Massachusetts, United States*, 4. *VA Pacific Islands Health Care System, Honolulu, Hawaii, United States*, 5. *Kuakini Medical Center, Kuakini Medical Center/Honolulu, Hawaii, United States*

This study assessed the impact of APOE e2, e4 minor alleles and the FOXO3 longevity-associated genotype (carrier of SNP rs2802292 "G" allele) on 34-year incidence of intracerebral hemorrhage (ICH). Cox regression models were performed to assess the impact of the APOE e2, e4 and FOXO3 G alleles on the incidence of ICH. A total of 6483 participants were eligible for the analyses. 213 participants developed ICH. Cox-regression model showed neither APOE minor allele vs. common genotype (APOE e3/e3: RR 0.89, 95% CI: 0.64-1.22, p=0.46) nor FOXO3 G carrier status (RR 0.97, 95% CI: 0.72-1.29, p=0.82) was associated with incident ICH. Conversely, both hypertension (RR: 1.46, 95% CI: 1.07-2.00, p=0.02) and low cholesterol level (RR: 0.99, 95% CI: 0.99-1.00, p=0.001) were associated with incident ICH. Carriage of APOE e2 or E4 alleles and the FOXO3 G allele do not appear to impact risk of ICH over 34 years in this cohort.

Session 3420 (Symposium)

LEVERAGING ACL FUNDING TO IMPLEMENT AN EVIDENCE-BASED FALLS PREVENTION PROGRAM IN THREE GWEPS

Chair: Ellen Flaherty

Discussant: Nina Tumosa

Primary care practices have a robust capacity to screen older adults for falls risk and refer them to evidence-based falls prevention programs delivered by Community Based Organizations (CBOs). However, due to a difference in the culture and nature of the work done in these two systems of care, there is often a lack of coordination and communication. Dartmouth has worked to bridge this gap for the past five years through our Health Resources and Services

Administration (HRSA)-funded Geriatric Workforce Enhancement Program (GWEP). GWEP goals include the promotion of Age-Friendly Health Systems by focusing on the 4 Ms: What Matters Most, Medication, Mentation and Mobility. GWEPs commonly operationalize the Mobility component via falls risk screening and prevention programs. Though CBOs are well suited to deliver falls prevention programs, implementing, disseminating and sustaining community-based falls prevention programs in an environment of cost containment, limited funds for community-based services and workforce issues is challenging. Previous Administration for Community Living (ACL) grant funding enabled us to develop the Dartmouth Falls Prevention Training Center (D-TC) using our expertise in training and community-based implementation of evidence-based interventions. The D-TC offers training and implementation support to primary care and CBOs on screening, referring and capacity-building for falls prevention programs. We will discuss challenges and successes implementing the Dartmouth falls prevention model with two additional GWEP grantees, Baystate and the University of Rhode Island. Benefits of leveraging ACL and HRSA funding to achieve synergistic goals to reduce falls in older adults will be explored.

THE DARTMOUTH FALLS PREVENTION TRAINING PROGRAM: PRIMARY CARE AND COMMUNITY-BASED ORGANIZATION COLLABORATION

Dawna Pidgeon, *Dartmouth Centers for Health and Aging, Lebanon, New Hampshire, United States*

Falls are a leading cause of fatal and non-fatal injuries in older adults. Older adult participation in community-based falls prevention programs can significantly reduce falls risk, however, identifying and referring individuals to appropriate programs can be challenging. Through Administration for Community Living (ACL) funding, we have developed a comprehensive Dartmouth Falls Prevention Training Program for healthcare and community based organizations that includes (1) Falls screening in primary care; (2) “Balance Days”, a community-based education and balance screening event encompassing falls risk stratification and coaching into programs; (3) Instructor Training for Tai Ji Quan: Moving for Better Balance®, a highly effective falls prevention program; and (4) Implementation Training, a research informed workshop shown to enhance community-based program sustainability through participant retention. We will share strategies for sustainable collaborations between primary care and CBOs to reach at-risk individuals and improve lives and decrease costs associated with falls.

ADOPTING AND ADAPTING A FALLS PREVENTION PROGRAM: LESSONS LEARNED FROM IMPLEMENTING A MODEL FROM A DIFFERENT CONTEXT

Alexandra Morelli, Carol Petrie, Christine Ferrone, and Phillip Clark, *University of Rhode Island, Kingston, Rhode Island, United States*

Geriatric Workforce Enhancement Programs (GWEPs) are ideally suited to develop and implement educational programs to transform the geriatric care system. They link academic programs, clinical partners, and community-based organizations to bridge care system gaps to improve the

health and social care of older adults. Such a collaboration is especially important in falls prevention, where primary care assessments generate referrals to community programs that enroll older adults to reduce their risk of falling. However, exporting an evidence-based model developed in one context for implementation in another is not without its perils and pitfalls. This paper explores the challenges of applying a model developed elsewhere to the Rhode Island context, including the need to understand how structural differences in academic, primary care, and community-based systems require flexibility, innovation, and persistence in overcoming the networking challenges in these different settings. Recommendations for implementing program models in a variety of settings are explored.

ADAPTING TO CREATE INNOVATIVE VIRTUAL FALLS PREVENTION PROGRAMS FOR AT RISK OLDER ADULTS DURING A GLOBAL PANDEMIC

Dawna Pidgeon,¹ Rebecca Dobert,² and Maura Brennan,²
1. *Dartmouth Centers for Health and Aging, Lebanon, New Hampshire, United States*, 2. *Baystate Health, Springfield, Massachusetts, United States*

Baystate Health’s Geriatrics Workforce Enhancement Program (GWEP) postponed implementation of Group Medical Visits focused on falls reduction for older adults in Springfield, Massachusetts due to COVID-19 and quickly shifted efforts to participate in Dartmouth’s Falls Prevention Training Program. Long standing GWEP Community Based Organizations (CBOs) were consulted, and all believed that the virtual Tai Ji Quan Moving for Better Balance® (TJQMBB) program would combat social isolation and improve older adults’ comfort with technology in addition to reducing falls during the COVID-19 pandemic. Baystate’s GWEP was able to reallocate grant dollars to support the purchase of equipment for CBOs to deliver TJQMBB virtually. While many challenges continue to arise, the innovative and collaborative approach between the two GWEPs and Baystate’s CBOs leveraging Administration for Community Living falls prevention funding has led to high level engagement and rapid implementation. Dartmouth’s model capitalizes on and strengthens existing GWEP partnerships with its CBOs.

Session 3425 (Symposium)

LEVERAGING PROMISING POLICIES TO SUPPORT LONG-TERM CARE RESIDENTS' QUALITY OF LIFE POST-PANDEMIC

Chair: Deanne Taylor

Co-Chair: Janice Keefe

Discussant: Heather Cook

Long-term care (LTC) is highly regulated and often the policy language is complex and in tension with residents’ quality of life goals. Prior to COVID-19, LTC policy levers prioritized safety over other quality domains such as privacy, dignity, spirituality, and comfort. During the pandemic, this focus on safety regulations, while important, intensified in ways that often negatively impacted residents’ overall quality of life. In this symposium, we share findings from a five-year research project where we conducted a unique and expansive review of regulatory policy across four Canadian

jurisdictions. We highlight how 11 different quality of life domains are supported and which texts offering promising policy language to enhance a well-rounded quality of life for residents. These are timely insights to offer as policy-makers look to the future and consider the lessons learned from the pandemic. We contend that creating more LTC policy is not a timely pathway forward to LTC reform. Instead, we suggest that existing policy can be leveraged when applied within a resident-centred quality of life lens. We will guide attendees through examples of existing promising policies highlighting how they might leveraged in planning for a better LTC system. The discussion will be rooted in our unique resident-centred approach to policy analysis using specific domains of quality of life and then applied to four different perspectives: residents, families, staff and volunteers. Our discussant a Ministry of Health decision-maker will address the implications of our research for post-pandemic planning to improve resident quality of life

FAMILIES AS VALUED CONTRIBUTORS TO LTC RESIDENTS' QUALITY OF LIFE: POLICY PERSPECTIVES

Janice Keefe, *Mount Saint Vincent University, Halifax, Nova Scotia, Canada*

Family members are essential contributors to QOL of LTC residents. This paper analyzes how the system views family's role in residents' QoL and enables or inhibits family involvement. Our analysis of 21 policies that regulate LTC in four Canadian Provinces reveal differences in their portrayal of residents' families. In many policies, family roles are characterized procedurally (task-oriented) or relationally (interactive) by policy type. Operational standards (regulatory policies) linked to licensing employ more formal terminology, while LTC program guidelines use facilitative language to engage families and build relationships through voluntary means. Specific examples of orientation and admission procedures, care protocols including use of restraints, right to live at risk, and end-of-life care are presented to reveal inter-provincial variations. We argue there are opportunities to further engage families within the current regulatory framework.

PROMISING LONG-TERM RESIDENTIAL CARE POLICY GUIDANCE FOR STAFF TO SUPPORT RESIDENT QUALITY OF LIFE

Mary Jean Hande, *Mount Saint Vincent University, Halifax, Nova Scotia, Canada*

This paper reviews 63 policy documents in four Canadian jurisdictions that guide long term residential care staff on how to enhance 11 resident quality of life in Canada. We found guidance in each jurisdiction that provide clear language to support staff discretion and flexibility to navigate regulatory tensions and enhance resident quality of life. Newer policies tend to reflect more interpretive approaches to staff flexibility and broader quality of life concepts. We argue that if interpreted through a resident quality of life lens and with the right structural supports, these promising texts offer important counters to the rigidity of long term residential care policy landscape and can be leveraged to effectively broaden and enhance quality of life for residents in long term residential care.

TRACING THE EXPRESSION OF RESIDENT QUALITY OF LIFE POLICIES IN CANADIAN LONG-TERM CARE SETTINGS

Janice Keefe, and Pamela Irwin, *Mount Saint Vincent University, Halifax, Nova Scotia, Canada*

Policies favouring safety, security, and order are expressed in preference to those oriented towards person-centred resident quality of life in Canadian long-term care settings. Factors impacting the expression of these latent (under-utilised) rules were uncovered through an analysis of long-term care related policies in four provinces. 84 policies relating to resident quality of life in long-term care were analysed in three sequences, incorporating jurisdictions, policy types, and quality of life domains, over time. The analysis revealed three policy levers: situations—providing explicit and implicit examples of resident oriented quality of life policy suppression in each jurisdiction; structures—identifying which types of policy and quality of life expressions are more vulnerable to dominance by others; and trajectories—confirming the cultural shift towards more person-centredness in Canadian long-term care related policies over time. Although these policies exist, their potentiality remains dormant in the dominant policy discourse, thereby signaling a positive post-pandemic possibility.

DOES LONG-TERM CARE POLICY ENABLE OR LIMIT VOLUNTEERS' ROLES IN ENHANCING RESIDENT QUALITY OF LIFE?

Emily Hubley, and Mary Jean Hande, *Mount Saint Vincent University, Halifax, Nova Scotia, Canada*

This paper examines how volunteer roles are represented in Canadian long term care (LTC) policy in four Canadian jurisdictions, attending to how these regulated roles might impact resident quality of life. Overall, we found that policies define volunteer roles narrowly, which may limit residents' quality of life. This happens through (1) omitting volunteers from most regulatory policy, (2) likening volunteers to supplementary staff rather than caregivers with unique roles, and (3) over-emphasizing residents' safety, security and order. We offer insights into promising provincial policy directions for LTC volunteers, yet we caution against further regulating volunteers. Instead, we argue, addressing the cultural, social and structural changes required for volunteers to enhance LTC residents' quality of life effectively.

Session 3430 (Symposium)

MAINTAINING ENERGY: A POTENTIAL TRANSFORMATIVE POWER TO ADAPT TO THE CHALLENGES OF OLDER AGE?

Chair: Rebecca Ehrenkranz

Reduced energy is a hallmark feature of aging. Maintaining higher energy late in life may be a key adaptive strategy to the challenges that accompany older age and ultimately promote resilience. Perceived lack of energy is often construed as synonymous with fatigue, and energy and fatigue are frequently considered opposite aspects of the same phenomenon. However, evidence suggests that energy and fatigue have distinct underlying neurobiology. Further exploration of the energy/fatigue dichotomy is needed in community-dwelling

older adults free of neuropathologies and clinically overt conditions. This symposium will first present clinical and epidemiologic justifications for operationalizing energy as a separate construct from fatigue and then will provide evidence on the underlying neurobiological correlates. Taken together, our results suggest perceived energy: a) overlaps with but is distinct from lower fatigability (Katz); b) may signal resilience against age-related declining mood and gait speed despite self-reported tiredness (Ehrenkranz); c) appear negatively influenced by Alzheimer's neuropathology (Dougherty); and d) may reflect a distinct spatial distribution of brain functional connectivity (Hengenius). Thus, this symposium will explore energy as a mechanism related to yet distinct from fatigue and its implications for both healthy aging and neuropathological processes.

ENERGY AND FATIGUE PREDICT GAIT SPEED AND MOOD DECLINE: RESULTS FROM THE HEALTH, AGING AND BODY COMPOSITION STUDY

Rebecca Ehrenkranz,¹ Xiaonan Zhu,² Nancy W. Glynn,³ and Caterina Rosano,² 1. *University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania, United States*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 3. *University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania, United States*

Older adults may report high energy alongside tiredness or vice versa; little is known about whether discordant self-reported energy (SEL) and tiredness predict trajectories of mood, cognition, or gait speed. SEL (0-10 scale dichotomized at median) and tiredness (present/absent) were obtained in 2,613 older adults (aged 74.6 ± 2.87 years) and used to create four groups (energized/not tired, low energy/tired, energized/tired, low energy/not tired). Center for Epidemiologic Studies Depression Scale (CES-D) and gait speed were measured over 10 years; mixed effect models compared trajectories in these domains across each group with low energy/tired group as referent. Each group was significantly associated with CES-D and gait. Adjusting for demographics, the high SEL/not tired group showed the least decline in mood ($\beta = -0.17$, $p < 0.01$); the high SEL/tired group showed the least decline in rapid gait ($\beta = 0.008$, $p = 0.02$). High SEL may indicate resilience for mood and gait speed decline.

ENERGY AND EXHAUSTION MAY EXPLAIN DIFFERENT SUBDOMAINS OF PERCEIVED FATIGABILITY

Rain Katz,¹ Rebecca Cohen,¹ Theresa Gmelin,¹ Kyle Moored,² Yujia (Susanna) Qiao,³ Maggie Slavin,¹ and Nancy W. Glynn,⁴ 1. *University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania, United States*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 3. *University of Pittsburgh, University of Pittsburgh, Pennsylvania, United States*, 4. *University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania, United States*

Fatigability is a more sensitive measure of one's perception of fatigue. To identify an appropriate fatigue question when a fatigability measure is unavailable, we examined associations between widely used global fatigue questions and perceived physical and mental fatigability. Participants ($N=896$, age= 74.7 ± 6.6 , 58.1% women) from two aging

research registries completed the valid Pittsburgh Fatigability Scale (PFS, 0-50) and five global fatigue questions: energy level (0-10), running out of energy (0-5), feeling energetic (0-6), feeling tired (0-6), and feeling exhausted (0-6) over past four weeks. All fatigue measures were correlated ($p < 0.0001$) with physical (rl range=0.48-0.57) and mental fatigability (rl range=0.31-0.39). "Energy level" and "feeling exhausted" had strongest associations with physical and mental fatigability, respectively, in age, sex, BMI-adjusted regression models (p 's < 0.001), suggesting older adults can distinguish between physical and mental domains. Future work will explore how these constructs are distinct but related, and confirm the optimal proxy for the two fatigability subdomains.

ASSOCIATION OF WALKING ENERGETICS WITH AMYLOID STATUS: FINDINGS FROM THE BALTIMORE LONGITUDINAL STUDY OF AGING

Ryan Dougherty,¹ Fangyu Li,¹ Amal Wanigatunga,¹ Qu Tian,² Eleanor Simonsick,³ Murat Bilgel,² and Jennifer Schrack,¹ 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 2. *National Institute on Aging, Baltimore, Maryland, United States*, 3. *National Institute on Aging/NIH, Baltimore, Maryland, United States*

Higher energetic costs for mobility are associated with slow and declining gait speed. Slow gait is linked to cognitive decline and Alzheimer's disease (AD), but the physiological underpinnings are not well-understood. We investigated the cross-sectional association between the energetic cost of walking and amyloid status (+/-) in 174 cognitively unimpaired men and women (52%) aged 78.5 ± 8.6 years. The energetic cost of walking was assessed as the average oxygen consumption (VO₂) during 2.5 minutes of customary-paced overground walking. Amyloid status was determined from 11C-Pittsburgh compound B (PiB) positron emission tomography (PET) imaging. Average energetic cost of walking was $.169 \pm .0379$ ml/kg/m and 30% of the sample was PiB+. In logistic regression adjusted for demographics, APOE-ε4, body composition and comorbidities, each 0.01ml/kg/m higher energy cost was associated with 12% increased odds of being PiB+ (OR=1.12; 95% CI:1.01-1.24). Inefficient walking may be a clinically meaningful physiological indicator of emerging AD-related pathology.

CORTICO-STRIATAL FUNCTIONAL CONNECTIVITY REFLECTS CHANGES IN SUBJECTIVE ENERGY AND TIREDNESS

James Hengenius,¹ Rebecca Ehrenkranz,² Theodore Huppert,¹ and Caterina Rosano,¹ 1. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2. *University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania, United States*

Subjective feelings of energy and tiredness may reflect different neural processes. Functional connectivity (FC) was measured in 272 HealthABC participants via resting state functional MRI in striatal-associative, striatal-limbic and striatal-sensorimotor networks. Subjective energy level (scored 1-10) and tiredness (tired/not-tired) during the prior month were collected via self-report from year 2 to year 10 (mean energy follow-up=8 years, tiredness follow-up=7 years). Participants who never reported being

tired during follow-up (N=119) had significantly lower FC in the striatal-limbic network (mean difference [95%CI]: -0.055 [-0.1020,-0.00879], $p=0.02$). Participants with stable energy level over time (N=94, defined as decline <1.0 SD below the mean) had significantly higher FC in the striatal-associative network (mean difference [95% CI]: 0.041 [0.00192,0.0807], $p=0.04$). Associations were similar when adjusted for brain atrophy, demographics, and education. Although based on subjective measures, the distinct spatial patterns of these associations support our hypothesis that neural basis of energy and fatigue may differ.

Session 3435 (Symposium)

MULTISCALE BRAIN AGING IN THE CONTEXT OF NEURODEGENERATION AND ALZHEIMER'S DISEASE

Chair: Kyra Thrush

Co-Chair: Yaroslav Markov

The brain, with a diverse array of specialized cells, regional substructures, and a relatively isolated microenvironment, represents a uniquely challenging organ system for aging research. The brain can experience physical trauma, interact with the periphery, and is responsible for cognitive and behavioral modifications that can feed back into the molecular processes of aging both within and external to the brain. Advances to our understanding and ability to intervene in the complexity that personifies brain aging and associated neurodegeneration will require integrated, multiscale approaches operating in tandem. Therefore, we have organized this symposium to highlight promising new approaches to study brain aging through the lens of multiple biological levels of organization. We will provide insight not only into normal brain aging, but will also suggest key spurious processes that may drive neurodegeneration and functional decline.

DEEP LEARNING METHODS CAPTURE NON-LINEAR BRAIN AGING PATTERNS UNDERLYING ALZHEIMER'S DISEASE AND RESILIENCE

Kyra Thrush, Albert Higgins-Chen, Yaroslav Markov, Raghav Sehgal, and Morgan Levine, *Yale University, New Haven, Connecticut, United States*

The current era of multi-omics data collection has enabled researchers to obtain exceptionally comprehensive profiling of disease subjects. However, exceptionally high dimensionality can ultimately be an obstacle to biological insight. Previously, we presented a method in which penalized regression of methylation principal components reduces noise and improves prediction of age, disease, and Alzheimer's Disease (AD) pathophysiology. However, strictly linear methods may overly simplify the complex epigenetic aging landscape. We hypothesized that non-linear deep learning methods could identify molecular signatures that better reflect individual resilience to AD. Through the use of an autoencoder to represent high dimensional methylation array data, and supplemental machine learning methods, we connect latent nonlinear representations of the brain to aging, resilience, and indications of AD. In particular, resultant age-predicting representations of methylation were correlated with enrichment of methylation regions and biological pathways. Contextualized within AD pathology, this work provides valuable, ongoing insight into resilience in AD.

THE ARC OF ASTROCYTE AGING: INSIGHTS FROM SCRNASSEQ

Margarita Meer,¹ Christopher Minteer,² and Morgan Levine,³ *1. Yale School of Medicine, Yale University, Connecticut, United States, 2. Yale University, Yale University, Connecticut, United States, 3. Yale University, New Haven, Connecticut, United States*

There is an urgent need to increase our understanding of brain aging and its role in neurodegeneration. While, evidence suggest that many hallmarks of aging, including epigenetic alterations and cellular senescence may be implicated in dementia, studying these and other progressive molecular changes in the brain remains extremely challenging. We asked whether something as simple as artificially aging cells in culture could recapitulate the changes that occur during organismal aging. To test this, we passaged human primary astrocytes and performed single-cell RNA sequencing (scRNAseq) of cells at passages 2-10. We observe that the sequential passaging—that terminates with a cluster of senescent cells—can be captured by manifolds and used to quantify a pseudo-time measure of progressive transcriptional changes. We identify genes underlying this transition and apply this signature of in vitro astrocyte passaging to scRNAseq from human and mouse brain aging studies, demonstrating associations with aging and neuropathology.

NEURONAL EXCITATORY STATE IS LINKED TO STRESS RESILIENCE

Joseph Zullo, and Bruce Yankner, *Harvard Medical School, Boston, Massachusetts, United States*

The aging human brain is a study in both the importance and limitations of human stress response factors. Individual neurons can maintain functionality for 80 or more years, testifying to the potency of their stress response pathways. However, failure of these pathways during aging drastically increases the risk of neurodegenerative diseases. The transcriptional repressor REST is induced in the brains of long-lived humans but is lost in neurodegenerative disease. Here, we explore one modality of REST's protective effects: regulation of neuronal excitability. We show that excitatory capacity and stress response are inversely correlated in the human brain. We find that REST and its *C. elegans* orthologs repress neuronal excitation in response to stressful conditions. Further, exogenously suppressing neuronal excitation restores stress resistance to REST-deficient animals, while enhancing stress response in wildtype ones. Thus, regulation of neuronal activity is an important aspect of neuronal stress response and a potential therapeutic modality.

EARLY PREDICTION OF COGNITIVE DEFICITS AFTER TRAUMATIC BRAIN INJURY BASED ON AD-LIKE PATTERNS OF NEURODEGENERATION

Andrei Irimia,¹ Alexander Maher,² Kenneth Rostowsky,¹ Nikhil Chaudhari,² Nahian Chowdhury,² Elliot Jacobs,² David Robles,² and Ammar Dharani,² *1. University of Southern California, University of Southern California, California, United States, 2. University of Southern California, Los Angeles, California, United States*

Traumatic brain injuries (TBIs) are frequently followed by persistent brain alterations and by cognitive sequelae, especially in older adults. Although mild TBI (mTBI) is a risk

factor for Alzheimer's disease (AD), the extent to which the two conditions are related remains largely unexplored. Using structural, functional and diffusion magnetic resonance imaging (MRI), we have identified AD-like post-traumatic neurodegeneration patterns that accurately prognosticate cognitive decline after geriatric mTBI. Our results indicate that these features involve cortical regions and circuitry mediating memory and executive function, and that AD neurodegeneration has key structural and functional similarities to post-traumatic neurodegradation. Using machine learning of such similarities, we have accurately forecast the severity of chronic cognitive deficits after geriatric mTBI based on acute neuroimaging measures. Our findings demonstrate that AD-like alterations in brain structure and function observed early after injury can predict post-traumatic mild cognitive impairment, which is itself strongly associated with AD risk.

EXERCISE-ASSOCIATED PATHWAYS AS NOVEL NEUROPROTECTANTS AGAINST CNS AGING AND ALZHEIMER'S DISEASE

Constanza Cortes, *University of Alabama at Birmingham, University of Alabama at Birmingham, Alabama, United States*

Skeletal muscle has recently arisen as a novel regulators of Central Nervous System (CNS) function and aging, secreting bioactive molecules known as myokines with proteostasis and metabolism-modifying functions in targeted tissues. We have recently generated a novel transgenic mouse with enhanced muscle proteostasis via moderate overexpression of Transcription Factor E-B (TFEB), a powerful master regulator of cellular clearance and proteostasis. We have discovered that the resulting enhanced skeletal muscle proteostasis function can significantly ameliorate proteotoxicity in the aging CNS and improve cognition and memory in aging mice. These neuroprotective benefits are markedly reminiscent of those observed in the aging CNS post-exercise, suggesting enhancing muscle proteostasis may be sufficient to replicate the local and systemic effects of exercise. Identification of pathways regulating crosstalk between skeletal muscle and CNS may yield targets with high therapeutic potential for diseases of the aging CNS.

Session 3440 (Paper)

Nursing Home Staff

COVID-19 IMPACT ON ALBERTA NURSING HOME WORKERS: AN INTERPRETIVE DESCRIPTIVE STUDY WITH DIRECT CARE PROVIDERS

Jude Spiers,¹ Heather Titley,¹ Amber Savage,¹ Trina Thorne,¹ Sandra Young,² Neda Asadi,³ Corinne Schalm,⁴ and Carole Estabrooks,¹ 1. *University of Alberta, Edmonton, Alberta, Canada*, 2. *University of Alberta, University of Alberta, Alberta, Canada*, 3. *University of Alberta, University of Alberta/Edmonton, Alberta, Canada*, 4. *Alberta Health, Alberta Health, EDMONTON, Alberta, Canada*

COVID-19 has devastated the LTC sector, but we lack systematic information on the impact on frontline staff. Our

research, a partnership with the continuing care branches of Alberta Health and Alberta Health Services, was aimed at assessing COVID-19 impacts on staffs' well-being and quality of work-life and quality of care and life among residents. Here we report on staff. Using an interpretive descriptive approach, we interviewed 140 staff from January through April 2021, in 34 nursing homes. Facilities selected varied in ownership (public/private) and COVID-19 status (high, moderate, or low incidence). Virtual interviews focused on three key areas of impact: (a) staff mental and physical health, well-being, and work-life, (b) the facility, and (c) on residents. Interviews were analyzed using inductive content analysis. Dominant themes included a commitment of staff to resident wellbeing; a norm of stoicism in which accumulative stress of COVID-19 is recognized in participants' private lives but not their work; the critical role of teamwork in managing extra workload associated with COVID-19 protocols; role flexibility, particularly managers', enables workers to minimize interruptions to care activities; governmental wage subsidies and the restriction of workers to only one facility benefits residents and workers in terms of time and familiarity, but some health care aides faced a wage reduction of 30-40%. Alongside the research component, we regularly met with stakeholders and end-users to discuss emerging findings and potential areas needing urgent intervention, as well as longer-term programming as the impact of COVID-19 will persist for many years.

FACTORS INFLUENCING RESIDENT RESPONSIVE BEHAVIORS TOWARD STAFF IN NURSING HOMES: A SYSTEMATIC REVIEW

Lori Weeks,¹ Abubakar Mohamed Nassur,² Fajr Haq,³ Viraji Rupasinghe,⁴ Carole Estabrooks,⁵ and Yuting Song,⁵ 1. *Dalhousie University, Dalhousie University, Nova Scotia, Canada*, 2. *University of Alberta, University of Alberta, Alberta, Canada*, 3. *University of Calgary, Calgary, Alberta, Canada*, 4. *Dalhousie University, Halifax, Nova Scotia, Canada*, 5. *University of Alberta, Edmonton, Alberta, Canada*

When staff experience various types of resident responsive behaviors, this can lead to decreased quality of work-life and lower quality of care. We synthesized empirical quantitative and qualitative evidence on factors associated with resident responsive behaviors directed towards staff in nursing homes. We searched 12 bibliographic databases and "grey" literature with two key words: long-term care and responsive behaviors resulting in 7671 sources. Pairs of reviewers independently completed screening, data extraction, and risk of bias assessment. Based on extracted data, we developed a coding scheme of factors utilizing the ecological model as an organizational structure. We then applied the coding scheme to quantitative and qualitative articles and prepared narrative summaries for each factor. From 86 included studies (57 quantitative, 28 qualitative, 1 mixed methods), multiple factors emerged, such as staff training about responsive behaviors (individual level); staff approaches to care (interpersonal level); leadership, staffing resources, and physical environment (institutional level); and racism and patriarchy (societal level). Quantitative and qualitative results each provided key insights, such as qualitative results pertaining to leadership responses to reports of responsive behaviors, and quantitative

findings on the impact of staff approaches to care on responsive behaviors. By synthesizing both quantitative and qualitative evidence, this review provides a comprehensive overview of factors associated with resident responsive behaviors towards staff. Our findings offer insights into promising factors for long-term care system and nursing home managers to address to strive to reduce responsive behaviors of residents toward staff in nursing homes.

LONGITUDINAL CHANGES IN LEADERSHIP AND PERSON-CENTERED CARE OVER 5 YEARS IN SWEDISH NURSING HOMES

Annica Backman,¹ Karin Sjögren,¹ Hugo Lövheim,¹ Marie Lindkvist,¹ and David Edvardsson,² 1. *Umeå University, Umeå, Västerbottens Län, Sweden*, 2. *La Trobe University, La Trobe University Melbourne, Victoria, Australia*

Nursing home leadership has been described as crucial for person-centred care and psychosocial climate, but longitudinal data are lacking. The significance of manager educational qualifications and operational model of nursing homes for perceived leadership, person-centred care and psychosocial climate also needs further exploration. This study aimed to explore changes in nursing home managers' leadership, person-centred care and psychosocial climate comparing matched units in a five-year follow-up. Also, to explore changes in leadership characteristics' and the significance of manager qualifications for perceived leadership, person-centred care and climate. Repeated cross-sectional, valid and reliable, measures of leadership, person-centred care, psychosocial climate and demographic variables were collected from managers and staff $n=3605$ in 2014 and $n=2985$ staff in 2019. Descriptive and regression analyses were used. Leadership remained significantly associated to person-centred care in a five-year follow-up, but no changes in strength of associations were seen. Leadership also remained significantly associated to psychosocial climate, with stronger associations at follow-up. Also, certain leadership characteristics significantly increased over time, thus, partly confirms previous findings. It was also shown that a targeted education for managers was significantly associated to person-centred care.

SUSTAINABILITY OF INFORM: A COMPLEX TEAM-BASED IMPROVEMENT INTERVENTION IN LONG-TERM CARE

Matthias Hoben,¹ Liane Ginsburg,² Whitney Berta,³ James Dearing,⁴ Peter Norton,⁵ Malcolm Doupe,⁶ Janice Keefe,⁷ and Jude Spiers,⁸ 1. *University of Alberta at Edmonton, Edmonton, Alberta, Canada*, 2. *York University, York University, Alberta, Canada*, 3. *University of Toronto, University of Toronto, Ontario, Canada*, 4. *Michigan State University, Michigan State University, Michigan, United States*, 5. *University of Calgary, University of Calgary, Alberta, Canada*, 6. *University of Manitoba, Winnipeg, Manitoba, Canada*, 7. *Mount Saint Vincent University, Halifax, Nova Scotia, Canada*, 8. *University of Alberta, Edmonton, Alberta, Canada*

Improving Nursing Home Care Through Feedback On performance Data (INFORM) was a complex,

theory-based, three-arm, parallel cluster-randomized trial. In 2015–2016, we successfully implemented two theory-based feedback strategies (compared to a standard approach to feedback) to increase nursing home (NH) care aides' involvement in formal communications about resident care (formal interactions [FI], the primary outcome). Here, we report the extent to which FI was sustained 2.5 years following withdrawal of intervention supports. We also report on several determinants of sustainability. We analyzed data from 18 NHs (46 units, 529 care aides) in the control group, 19 NHs (60 units, 731 care aides) in the basic assisted feedback group (BAF), and 14 homes (41 units, 537 care aides) in the enhanced assisted feedback group (EAF). We assessed sustainability of FI, using repeated measures, hierarchical mixed models, adjusted for care aide, care unit and facility variables. In EAF, FI scores increased from T1 (baseline) to T2 (end of intervention) (1.30–1.42, $p=0.010$), remaining stable at T3 (long-term follow-up) (1.39 $p=0.065$). FI scores in BAF increased from T1 to T2 (1.33–1.44, $p=0.003$) and continued to increase at T3 (1.49, $p<0.001$). In the control group, FI did not change from T1 to T2 (1.25–1.24, $p=0.909$), but increased at T3 (1.38, $p=0.003$). Better culture, evaluation and fidelity enactment significantly increased FI at long-term follow-up. Theory-informed feedback provides long lasting benefits in care aides' involvement in FI. Greater intervention intensity neither implies greater effectiveness nor sustainability. Modifiable context elements and fidelity enactment may facilitate sustained improvement.

THE RELATIONSHIP BETWEEN LEADERSHIP STYLES, JOB SATISFACTION, AND TENURE AMONG NURSING HOME ADMINISTRATORS

Carey Peerman, *Radford University, Elliston, Virginia, United States*

Long-term care is considered a subset of health care administration as the characteristics and leadership skills needed differ from other areas of health care. Leadership style directly relates to organizational development, success, and effectiveness. For study purposes, specific focus was placed upon determining the degree to which nursing home administrators (NHAs) perceived styles of leadership determined job satisfaction with tenure as an NHA. Perceptions of leadership style and levels of job satisfaction were determined using a non-experimental, quantitative design, specifically employing a survey research approach. The research instrument in this study, the MLQ, provided the data essential to addressing the research questions and accompanying hypotheses. The effect of study participant response to items on the MLQ associated with the research questions was assessed using univariate analysis of descriptive factors and inferential statistical techniques for statistical significance testing purposes. A total of 87% of study participants indicated that they perceived their leadership style as Nursing Home Administrators (NHA's) was reflective of Transformational Leadership. However, findings indicated that participants who had a Transactional Leadership style were more likely than other types of leadership styles to select an NHA as a career path if given the opportunity to choose this line of work in the future.

Session 3445 (Symposium)

PARTNERSHIP WITH FAMILIES DURING HOSPITALIZATION OF PERSONS WITH DEMENTIA: INTERVENTION AND MEASUREMENT STRATEGIES

Chair: Marie Boltz

Co-Chair: Barbara Resnick

Discussant: JUDITH TATE

Persons with dementia have high rates of hospitalization and are at risk for complications including psychological distress, and functional and cognitive decline. In turn, their family caregivers often face increased stress related to lack of preparedness to meet the complex needs of the patient during hospitalization and in the post-acute period. Hospitalization provides an opportunity to reframe the role of family caregivers from the traditional passive one to that of partners with the hospital team. The aim of the Family-centered, Function-focused Care (Fam-FFC) clinical trial is to test a nurse-family partnership model that incorporates a four step approach to optimize behavioral, functional, and cognitive outcomes in hospitalized persons with dementia and increase preparedness of caregivers to continue to optimize these outcomes in the acute and post-acute recovery period. In this symposium we provide a description of the intervention with regard to theoretical support, four step process, and cultural appropriateness of the process. Two presentations describe, among Black and white dyads, evidence to support the psychometric properties of major outcome measures, caregiving preparedness and neuropsychiatric symptoms, in hospitalized dyads living with dementia. The final presentation describes a strategy to engage the dyad in goal development and evaluation, and its effect upon hospital readmissions. Findings from this symposium will help to identify intervention and measurement resources for those working with hospitalized persons with dementia and their family caregivers, and guide ongoing research needs in this area. Our discussant will synthesize the research findings and discuss implication for research, policy, and practice.

ENGAGEMENT OF FAMILY IN A GOAL SETTING STRATEGY: IMPACT UPON 30-DAY HOSPITAL READMISSIONS

Marie Boltz,¹ Ashley Kuzmik,¹ Barbara Resnick,² Irene Best,¹ and Jacqueline Mogle,³ 1. *Pennsylvania State University, University Park, Pennsylvania, United States*, 2. *University of Maryland School of Nursing, Baltimore, Maryland, United States*, 3. *Penn State University, University Park, Pennsylvania, United States*

Family-centered Function-focused Care (Fam-FFC) works with family caregivers as care partners in the assessment, function-promoting goal setting, implementation, and evaluation of goal attainment during hospitalization and immediate post-acute period. ANCOVA technique examined the preliminary impact of Fam-FFC upon 30-day hospital readmissions and logistic regression tested the association of goal attainment, measured with the Goal Attainment Scale (GAS) with 30-day hospital readmissions. The majority of the patients were Black (50%), female (62%), had a mean age of 81.6 (SD=8.4), mean Barthel Index of 60.29 (SD=27.7), and mean MoCA of 10.67 (SD=7.0). Goals represented six main categories: mobility, cognition, self-care, toileting, sleep, and pain management. Patients in the intervention group had less

30-day hospitalizations ($F=4.6, p=.033$) and goal attainment was significantly associated with less recidivism ($B=-.179, Wald=2.8(1), p=.045$). FamFFC shows promise in reducing 30-day hospital readmissions; results support the contribution of family engagement and use of GAS

CULTURAL APPROPRIATENESS OF AN INTERVENTION TO PROMOTE FUNCTIONAL RECOVERY FROM HOSPITALIZATION: CAREGIVER VIEWS

Rhonda BeLue,¹ and Marie Boltz,² 1. *St. Louis University College for Public Health and Social Justice (CPHSJ), St. Louis University, Missouri, United States*, 2. *Pennsylvania State University, University Park, Pennsylvania, United States*

The Fam-FFC model includes caregiver education and care pathway to promote physical function, wellbeing, and cognition. The Ecological Model (EM) provided a framework to assess the cultural appropriateness of the Fam-FFC intervention, through interviews with family caregivers, patients, and nurse champions, and focus groups with staff. Findings are described within the eight dimensions of the EM: 1) language: perceptions of the dyads' comfort level with intervention information; (2) persons: representation of dyads' ethnic /racial group within the nurse champions' ethnicity/race; (3) metaphors: use of cultural terms equivalent to those used by participants; (4) content: integration of participants' values, customs, and traditions in the intervention; (5) concepts: congruence of caregiving concepts with cultural norms; (6) goals: congruence of the intervention goals with participants' cultural norms and goals; 7) methods: the cultural appropriateness of the delivery of the intervention; and (8) context: alignment of the intervention with the participant's socio-community context.

THE PREPAREDNESS FOR CAREGIVING SCALE IN AFRICAN AMERICAN AND WHITE CAREGIVERS OF HOSPITALIZED PERSONS WITH DEMENTIA

Ashley Kuzmik, *Pennsylvania State University, University Park, Pennsylvania, United States*

This study evaluated the Preparedness for Caregiving Scale (PCS) upon discharge from the hospital. The caregivers reported a mean age of 60.5 years (SD=13.9). The majority of caregivers were female (72%), married (59%), non-Hispanic/Latino (98%) and either white (52%) or African American (48%). Fifty percent were employed outside of the home and averaged 40.7 (SD= 14.4) hours of outside work per week. The average PCS was 24.4 (SD=6.9, 0-32). One-factor structure of the PCS and measurement invariance by race was fully supported. Predictive validity revealed significant association between the PCS and anxiety ($\beta=-.41, t=-7.61(287), p<.001$), depression ($\beta=-.44, t=-8.39(287), p<.001$), and strain ($\beta=-.48, t=-9.29(287), p<.001$). The PCS is a valid and meaningful tool to measure preparedness in African American and white family caregivers of persons with dementia during post-hospitalization transition.

RELIABILITY AND VALIDITY OF THE NEUROPSYCHIATRIC INVENTORY QUESTIONNAIRE IN DYADS WITH DEMENTIA AT HOSPITALIZATION

Barbara Resnick, *University of Maryland School of Nursing, Baltimore, Maryland, United States*

This study expanded on the limited psychometric testing of the Neuropsychiatric Inventory-Questionnaire (NPI-Q), and extended testing to include hospitalized persons with dementia upon admission to the hospital, with reports from family caregivers. Using data from 318 dyads in the ongoing Fam-FFC trial, a Rasch analysis was conducted. Most patients were female (62%), non-Hispanic (98%), and Black (50%) with a mean age of 81.62 (SD=8.43). There was evidence of internal consistency for all subscales (behavior, severity, caregiver distress); a DIF analysis showed invariance across race and gender. The items on the NPI-Q fit with each subscale. Hypothesis testing showed a significant association between the AD8 ($F=30.04$, $p=.001$) and MoCA ($F= 5.05$, $p=.03$) with behaviors; the AD8 ($F =27.91$, $p=.001$) and MoCA ($F = 6.65$, $p=.01$) with severity; and the AD8 ($F = 29.23$, $p=.001$) with caregiver distress. Findings provide support for the NPI-Q use in persons with dementia during acute illness.

Session 3450 (Symposium)

PROMOTING SELF-CARE IN CAREGIVERS OF OLDER ADULTS LIVING WITH CHRONIC ILLNESS: THE ICARE4ME STUDY

Chair: Lauren Massimo

Co-Chair: Karen Hirschman

Discussant: Harleah Buck

Informal caregivers provide a substantial amount of social support to older adults which can be stressful and lead to poor self-care. When stressed, caregivers of persons living with chronic illness are less vigilant and less motivated to engage in self-care behaviors that are important for maintaining their own physical and emotional health. Support interventions can encourage self-care by helping caregivers to focus on values, solve problems, and transform their goals into action. In this symposium, we will discuss the iCareMe study, a randomized controlled trial (RCT) (NCT03988621) that tests a virtual support intervention which utilizes health coaching to increase self-care behaviors in caregivers of older adults living with chronic illnesses, such as heart failure and dementia. The first session will discuss the translation of self-care theory to the basis for the "Virtual Caregiver Coach for You" (ViCCY) intervention and will provide an overview of the iCare4Me randomized control trial designed for caregivers of persons living with advanced heart failure. The second session will describe the adaptation of the iCare4Me RCT to caregivers of persons living with dementia. The third session will highlight findings from a qualitative descriptive study examining the characteristics of effective health coaching used in these two RCTs. Finally, the last session will share findings from a cross-sectional analysis examining moderators of self-care in heart failure caregivers. Together, these presentations will illustrate the unique and innovative approach that iCare4Me has taken to improve self-care in caregivers of older adults living with chronic illness.

SELF-CARE THEORY AND TRANSLATION TO INTERVENTION

Karen Hirschman, and Barbara Riegel, *University of Pennsylvania, Philadelphia, Pennsylvania, United States*

Self-care is defined as a process of maintaining health through health promoting practices and managing illness

when it occurs. Self-care is integral in the management of chronic conditions, but even those without illness engage in some level of self-care daily. In our on-going study we promote self-care as a means to control the stress associated with caregiving. We acknowledge the burden of caregiving for a loved one experiencing a serious chronic illness. That responsibility is typically associated with significant stress for the caregiver. We use stress theory to address the caregivers' appraisal of events and coping responses. Three experienced health coaches were hired to provide 10 sessions of coaching over a 6-month period to each of the caregivers randomized to the intervention group. The emphasis of the iCare4Me coaching sessions is to address primary and secondary appraisal and coping as a means to improve self-care and thereby decrease stress.

IMPROVING SELF-CARE OF INFORMAL CAREGIVERS OF ADULTS WITH FRONTOTEMPORAL DEGENERATION

Lauren Massimo,¹ Michelle Sharkey,² and Lauren Fisher,¹

1. University of Pennsylvania, Philadelphia, Pennsylvania, United States, 2. University of Pennsylvania, Philadelphia, Pennsylvania, United States

Frontotemporal degeneration (FTD) is a common cause of young-onset dementia that results in progressive deterioration in executive functioning and social comportment. A tremendous burden is placed on young caregivers, typically spouses, who often sacrifice their own self-care needs in order to manage the cognitive decline and subsequent functional impairments of their loved one, contributing to extraordinarily high levels of stress and depression in caregivers of individuals with FTD. Very few interventions have been tested specifically in FTD caregivers, and those that exist have generally focused on education around patient behavior management. In this session, we will discuss how we adapted the iCare4Me study, originally designed for heart failure caregivers, for caregivers of persons with FTD and we will share initial findings from iCare4Me for FTD, a randomized controlled trial which evaluates the efficacy of a virtual health coach intervention aimed at increasing self-care behaviors and reducing stress in FTD caregivers.

A QUALITATIVE STUDY OF CHARACTERISTICS OF AN EFFECTIVE HEALTH COACH: PERSONAL, PROFESSIONAL, AND PROGRAM BASED

Caitlin Clason,¹ Frances Barg,² and Barbara Riegel,¹

1. University of Pennsylvania, Philadelphia, Pennsylvania, United States, 2. University of Pennsylvania Perelman School of Medicine, Philadelphia, Pennsylvania, United States

Health coaching continues to grow in popularity as an effective intervention to empower and engage patients and their caregivers. However, little is known about what characteristics contribute to the success of health coaches in implementing evidence-based interventions. This study examines the characteristics that contribute to effective health coaches. Semi-structured interviews were conducted with health coaches and an interdisciplinary research team of an ongoing study examining a virtual health coaching intervention. Interviewees identified three discrete themes of characteristics that contribute to the success of health coaches: personal (e.g. compassion), professional (e.g. transferability

of soft skills) and program based (e.g. training regimen). We conclude that it is not just innate personality attributes that make a health coach effective in their role, but training and program design intended to support health coaches are also important in implementing interventions.

SUPPORT QUALITY MODERATES THE IMPACT OF TOTAL HOUSEHOLD OCCUPANCY ON SELF-CARE NEGLECT IN INFORMAL CAREGIVERS

Austin Matus, and Barbara Riegel, *University of Pennsylvania, Philadelphia, Pennsylvania, United States*

Caregiver self-care may be impacted by the household environment. We evaluated the impact of support quality (e.g., ratings of quality of emotional support, information, material help, errands performed by others) and total household occupancy on a validated measure of self-care neglect in caregivers of patients with heart failure. Multivariate regression modeling was used to examine predictors of self-care neglect and we introduced an interaction term between support quality and household occupancy. The main effects model included terms for years of caregiving experience, hours caregiving daily, support quality, and total household occupancy (R^2 : 0.31; $p < 0.05$). The interaction term between support quality and household occupancy contributed significantly ($p < .05$) to the respecified model (R^2 : 0.41; $p < 0.05$). We suggest that the potential benefit of total household occupancy on caregiver self-care depends on perceived support quality. Clinicians should assess quality of household resources with caregivers during interactions.

Session 3455 (Symposium)

REINVENTING HOUSING CARE: ENVIRONMENTAL NEGOTIATIONS MADE IN CONGREGATE SETTINGS DURING COVID-19

Chair: Ian Johnson

Discussant: Terri Lewinson

The COVID-19 pandemic prompted an urgent reconsideration of space and place within congregate housing. Research has only underscored the need for health-promoting physical alterations to residential environments (Peters & Halleran, 2020), but also generated lasting questions about the relationships between congregate environments and their residents, visitors, and workforce —among them, what ways can environments be negotiated to reduce risk (Dosa et al., 2020)? How can environments enact care for formal caregivers (Chen & Chavalier, 2021)? Who might be challenged by this care which may question the dangers associated with proximity (Lynn, 2020)? This symposium focuses on the ways stakeholders within congregate housing observed, related to, and negotiated changes to space and place during the pandemic. Paper 1 presents an organizational case study investigating provider perspectives of how housing and healthcare responses to COVID have shaped palliative care with unhoused patients during the pandemic. Paper 2 highlights the collaborative work of a multi-sector coalition working to address timely needs of residents in low-income senior buildings. Paper 3 reflects on the formation of a cross-national senior housing network and the interdisciplinary exchange of best practices and policy recommendations

that emerged. The collective findings of these papers challenge previous notions of care in congregate environments, illuminate how provider networks respond to crises and share emergent knowledge, and consider how institutional decisions about the pandemic have re-placed and re-spaced provider and patient experiences. This symposium offers observations and strategies that may assist in envisioning successful congregate care during COVID-19 and beyond.

EFFECTS OF THE COVID-19 PANDEMIC ON PLACE IN END-OF-LIFE CARE: INSIGHTS FROM A HOMELESS MOBILE PALLIATIVE CARE TEAM

Ian Johnson, *University of Washington, SEATTLE, Washington, United States*

The effects of the COVID-19 pandemic on both those experiencing homelessness (Tsai & Wilson, 2020) and those with life-limiting illnesses (Abbott et al., 2020) is of great public health concern. This presentation details the findings from an organizational case study (Yin, 2014) aimed at investigating COVID-related changes to the service environments in which unhoused palliative care patients receive care. Through ethnographic field observation (Phillippi & Lauderdale, 2017) and interviews with a homeless palliative care team and their community partners (Turner, 2005), findings included 1) decreased staff capacity due to de-congregated care; 2) efforts to extend care in community settings due to relocation barriers; 3) conflict between reducing viral risk and honoring unique population needs; and 4) provider perceptions of COVID-19 as an “equalizer.” Findings illustrate the impact of emergency response within housing and healthcare systems on unhoused patients’ care and offer potential pathways to quality end-of-life care for homeless populations.

THE ENACTMENT OF CARE: LESSONS LEARNED FROM A MULTISECTOR COALITION ADVOCATING FOR THOSE LIVING IN SENIOR HOUSING

Tam Perry,¹ Claudia Sanford,² Dennis Archambault,³ Michele Waktins,⁴ Zach Kilgore,⁵ and Michael Appel,⁶

1. *Wayne State University, Detroit, Michigan, United States*, 2. *United Community Housing Coalition, Detroit, Michigan, United States*, 3. *Authority Health, Detroit, Michigan, United States*, 4. *Volunteers of America-Michigan, Southfield, Michigan, United States*, 5. *CSI Support & Development, Warren, Michigan, United States*, 6. *Develop Detroit, Detroit, Michigan, United States*

This presentation explores how a coalition, Senior Housing Preservation-Detroit, considered and planned for “care” in senior buildings in Detroit, Michigan. Detroit was one of the American cities affected in the early days of the pandemic; the coalition pivoted its work in creative, collaborative ways which included understanding the rapidly changing context for those living in low-income senior buildings. Older minority adults have been shown to be disproportionately affected by COVID-19; the coalition successfully advocated for testing to be brought to senior buildings (and now vaccine distribution) and addressed mask distribution and food insecurity in several senior buildings (see Archambault, Sanford and Perry, 2020). Without the long-established partnerships, “care” could not have been as coordinated, multi-sector and trusted. The presentation will discuss lessons learned that can

be applied to future challenges in supporting the well-being of residents as they negotiate their residential spaces.

PLANNING FOR SENIORS HOUSING IN CHANGING CITIES: LESSONS LEARNED FROM A CROSS-NATIONAL EXCHANGE

Christine Sheppard,¹ Tam Perry,² Karen Kobayashi,³ Denise Cloutier,³ Yasir Mehmood,⁴ Emma Helfand-Green,⁵ and Sander Hitzig,¹ 1. *Sunnybrook Research Institute, Toronto, Ontario, Canada*, 2. *Wayne State University, Detroit, Michigan, United States*, 3. *University of Victoria, Victoria, British Columbia, Canada*, 4. *Wayne State University, Wayne State, Michigan, United States*, 5. *City of Toronto, Toronto, Ontario, Canada*

Across North America, a growing number of older adults have a core housing need and lack access to affordable, suitable or adequate housing. Although federal, state/provincial and local backdrops vary across Canadian and American contexts, seniors' housing providers in both countries face similar challenges and must develop innovative policy and program responses to help older adults age in place. We hosted an international seniors' housing conference to create a platform for cross-national collaboration among multidisciplinary seniors housing experts. This event offered an opportunity to exchange best practices, emerging research, and policy solutions, and establish a set of shared priorities for advancing seniors housing that were applicable to two nations with different social systems. This paper will reflect on the exchange of knowledge and best practices related to housing preservation, eviction prevention, and access to supports during COVID-19, and the lessons learned fostering a cross-national collaborative network of seniors housing experts.

Session 3460 (Paper)

Sleep: Older Adults and Caregivers

DAY AND NIGHT, NIGHT AND DAY: ASSOCIATIONS OF SLEEP AND ACTIVITY VARIABILITY AND MORTALITY

Jade Benson,¹ Elena Jauregui,² and Diane Lauderdale,² 1. *University of Chicago, Chicago, Illinois, United States*, 2. *The University of Chicago, Chicago, Illinois, United States*

Self-reported sleep duration has been repeatedly found to predict mortality. Actigraphy has recently been added to population-based studies to provide more accurate sleep measures. Actigraphy sleep duration has not consistently predicted mortality, but actigraphy measures of sleep disruption measures are generally found to be predictive of mortality for older adults. A few studies have more fully used actigraphy data and constructed variables to summarize 24-hour activity patterns, which have also predicted mortality. In this study, we use a nationally representative study of Americans aged 61–91 to examine the associations between mortality and actigraphy-derived measures of variability, for both sleep and 24-hour activity patterns. We use 72-hour wrist actigraphy data from a substudy of the 2010/11 round of the National Social Life, Health and Aging Project (NSHAP) linked to the National Death Index (NDI) to establish

5-year mortality. Sleep variability was represented by sleep fragmentation and the standard deviation of wake and bed times. Intraday variability and between day (interday) variability described the 24-hour activity patterns. Cox proportional hazards models were adjusted for sociodemographic confounders and average daytime activity. In general, more variability was associated with increased death hazard for all measures. Fragmentation (HR: 1.04, 95% CI: [1.01, 1.07], $p = 0.01$), standard deviation of bedtimes (HR: 1.16, 95% CI: [1.02, 1.31], $p = 0.02$), and intraday variability (HR: 1.19, 95% CI: [0.98, 1.43], $p = 0.07$) showed the strongest associations. This study suggests that both consistent sleep and 24-hour activity patterns are associated with better prospective health.

OBJECTIVE SLEEP QUALITY AND THE UNDERLYING FUNCTIONAL NEURAL CORRELATES AMONG OLDER ADULTS WITH PROBABLE MCI

Chun Liang Hsu,¹ Ryan Falck,² Daniel Backhouse,² Patrick Chan,² Elizabeth Dao,² Lianne ten Brinke,² Brad Manor,³ and Teresa Liu-Ambrose,² 1. *Hinda and Arthur Marcus Institute for Aging Research, Harvard Medical School, Burnaby, British Columbia, Canada*, 2. *University of British Columbia, Vancouver, British Columbia, Canada*, 3. *Hinda and Arthur Marcus Institute for Aging Research, Harvard Medical School, Boston, Massachusetts, United States*

Poor sleep is a strong risk factor for dementia and is commonly reported among older adults with mild cognitive impairment (MCI). However, the neural underpinnings of poor sleep among older adults with MCI remains equivocal. The goal of this cross-sectional analysis was to explore the relationship between resting-state functional connectivity in the brain and sleep quality as measured by actigraphy. We hypothesize lower sleep efficiency and higher sleep fragmentation may be associated with aberrant functional connectivity of brain regions involved in somatosensory, somatomotor, and attentional processing. Thirty-six community-dwelling older adults with probable MCI between 65–85 years (mean=71.8 years) were assessed for sleep quality using a motion watch to quantify sleep efficiency and fragmentation over 14 days. All participants completed resting-state functional magnetic resonance imaging (fMRI) within 14 days of sleep monitoring. Independent associations between network connectivity and sleep quality were determined using general linear models. Examined networks included the somatosensory network (SMN), dorsal attention network (DAN), ventral attention network (VAN), frontoparietal network (FPN), and default mode network (DMN). Mean Montreal Cognitive Assessment score was 22.5 (SD=2.7) and Mini-Mental State Examination score was 28.3 (SD=1.5). Mean sleep efficiency and fragmentation index was 80.1% and 31.8 respectively. Higher sleep fragmentation correlated with increased connectivity between the SMN and insula, the SMN and posterior cingulate, as well as FPN and primary motor area ($Z=3.1$; $p<0.05$). These results suggest aberrant functional connectivity between brain regions involved in attentional and somatosensory processes may be associated with disrupted sleep mechanisms in older adults with MCI.

SLEEP DISTURBANCES AND THE SPEED OF MULTIMORBIDITY DEVELOPMENT IN OLD AGE

Amaia Calderón-Larrañaga,¹ Laura Pérez,² Davide Vetrano,¹ Federico Triolo,¹ Linnea Sjöberg,¹ Alexander Darin-Mattsson,¹ Marco Inzitari,² and Shireen Sindi,¹ 1. *Karolinska Institutet, Solna, Stockholms Lan, Sweden*, 2. *Parc Sanitari Pere Virgili, Barcelona, Catalonia, Spain*

Sleep disturbances are prevalent among older adults and are associated with various individual diseases. The goal of this study was to investigate whether sleep disturbances are associated with the speed of multimorbidity development among older adults. Data were gathered from the Swedish National study of Aging and Care in Kungsholmen (SNAC-K), an ongoing population-based study of subjects aged 60+ (N=3363). The study included a subsample (n=1189) without multimorbidity at baseline (<2 chronic diseases). Baseline sleep disturbances were assessed using the Comprehensive Psychiatric Rating Scale, and categorized as none, mild, moderate-severe. The number of chronic conditions throughout the nine-year follow-up was obtained from clinical examinations. Linear mixed models were used to study the association between sleep disturbances and the speed of chronic diseases accumulation, adjusting for sex, age, education, physical activity, smoking, alcohol consumption, depression, pain, and psychotropic drug use. We repeated the analyses including only cardiovascular, neuropsychiatric, and musculoskeletal diseases as the outcome. Moderate-severe sleep disturbances were associated with a higher speed of chronic disease accumulation (β /year=0.142, $p=0.008$), regardless of potential confounders. Significant positive associations were also found between moderate-severe sleep disturbances and neuropsychiatric (β /year=0.041, $p=0.016$) and musculoskeletal (β /year=0.038, $p=0.025$) disease accumulation, but not with cardiovascular diseases. Results remained stable when participants with baseline dementia, cognitive impairment, or depression were excluded. The finding that sleep disturbances are associated with faster chronic disease accumulation points towards the importance of early detection and treatment of sleep disturbances as a possible strategy to reduce chronic multimorbidity among older adults.

SLEEP PHENOTYPES OF CAREGIVERS FOR PERSONS LIVING WITH DEMENTIA

Glenna Brewster,¹ Christina Pierpaoli,² Fayron Epps,³ Kalisha Bonds Johnson,³ and Kate Yeager,³ 1. *Emory University, Stonecrest, Georgia, United States*, 2. *University of Alabama, Tuscaloosa, Alabama, United States*, 3. *Emory University, Atlanta, Georgia, United States*

Sleep disturbance is prevalent among caregivers of people living with dementia. Gaps exist regarding when caregivers begin to experience sleep disturbance along their caregiving trajectory. This study aimed to identify and describe phenotypes of current caregivers' sleep patterns before and during caregiving and describe caregivers' perception of their current sleep quality relative to their pre-caregiving sleep. We conducted semi-structured interviews with 19 caregivers participating in a larger, randomized controlled trial. Interviews were about caregivers' sleep patterns and were conducted after caregivers completed the first 6 months of

the study. Interviews were audio-recorded using a video-conferencing platform and ranged from 20 to 45 minutes. We conducted thematic analysis of the interview transcripts. Four distinct caregiver-sleep phenotypes emerged from the qualitative data: Changed and Dissatisfied, Changed and Satisfied, Unchanged and Dissatisfied, and Unchanged and Satisfied. Caregivers whose sleep was categorized as Changed experienced a difference in their pre-caregiving sleep, usually from good to poor sleep. Caregivers whose sleep was Unchanged had poor sleep pre-caregiving and continued to have poor sleep during caregiving. Caregivers also reported being Satisfied or Dissatisfied with their current sleep pattern, defined in terms of daily distress and impairment. These 4 subtypes highlight the heterogeneity of caregivers' sleep experiences and debut a useful clinical framework with which to identify, categorize, and target caregivers at risk for sleep disturbance. Identifying caregivers' sleep phenotypes will enable healthcare providers to determine caregivers' needs and readiness for interventions.

Session 3465 (Symposium)

SOCIAL DETERMINANTS OF COGNITIVE HEALTH: STUDIES ON PHYSICAL AND SOCIAL ENVIRONMENTS AND COGNITION

Chair: Kexin Yu

Co-Chair: Ted Ng

Discussant: Patricia Heyn

Living environments profoundly influence the aging process. This symposium presents research on two main aspects of the living environment and their relationships with cognitive health. The living environment is broadly defined, including both physical and social aspects. The physical environment is the characteristics of the built environment, such as tripping hazard in the home, cleanliness of the community streets, and presence of deserted buildings, etc. The social environment is the cohesiveness with other people living in the neighborhood. Living environments have multiple layers; the physical environments encompass both in-home and in-community domains, whereas the social environment can be categorized as domestic versus community cohesiveness. This symposium includes studies with investigation scopes spanning from the micro to mezzo levels. The first presentation scrutinizes the buffering effect of marital relationships, as a form of domestic social environments, on cognition among older adults with vision and hearing impairments. Using the NHATS dataset, the second presentation examines social isolation as a potential mediator for the association between physical, social environments and global cognitive functioning. The third presentation evaluates the impact of living environments on cognition among Canadian older adults with multimorbidity. The last presentation examines how the physical environment affects sleep quality and thus influences older adults' cognition. All four presentations are closely linked to the overarching theme of evaluating the environmental impact on cognition and provide possible explanations mediating the association observed. This symposium contributes to advancing gerontological knowledge by offering new perspectives on the social determinants of cognitive health.

EXAMINING SOCIAL ISOLATION AS A MEDIATOR FOR THE ENVIRONMENTAL INFLUENCE ON COGNITIVE FUNCTIONING

Kexin Yu, USC, LA, California, United States

Environments serve as one of the most pervasive stimuli to the brain, shaping cognitive functionality through neuroplasticity. Both the physical and social environments of living could affect the cognitive functioning of older adults. Nonetheless, the mechanisms on how the environments “get under the skin” are unknown. This study examines the potential mediating effect of social isolation on the relationships between environment and cognitive health. Wave 9 data from the National Healthy Aging Trend Study was employed. The working sample includes 2,313 older adults. Path analysis results showed that in-home disorder was positively related to social isolation. A more cohesive social environment was negatively related to social isolation. Higher social isolation scores were associated with worsen global cognitive functioning. In-home disorder, community disorder, and social environment had significant direct effects on cognitive health after adjusting for the mediating effect. Social Isolation partially mediates the environmental influence on cognitive functioning.

AT-HOMENESS INFLUENCES THE COGNITION OF MULTIMORBID OLDER ADULTS: LONGITUDINAL PATH ANALYSIS THROUGH LONELINESS

Daniel R. Y. Gan, John Best, and Andrew Wister, Simon Fraser University, Vancouver, British Columbia, Canada

Approximately two-thirds of older adults' experience multimorbidity in North America. Challenges of symptoms management and reduced mobility often coincide with late-life depression which is associated with a 2 to 5-fold increased dementia risk. Loneliness and depression are connected in the prodromal phases. We examine the effects of physical environment (e.g., housing and neighborhood factors) and social environment (e.g., social support) on loneliness, depression, and cognition using path analysis, controlling for baseline. Data ($n=15,087$) was drawn from the Canadian Longitudinal Study on Aging. Measures of housing, neighborhood and life satisfaction were used to construct an index of “at-homeness” based on theory. We found good model fit (TLI=.989; CFI=.999; RMSEA=.026; SRMR=.006). At-homeness ($B=-.20$, $p<.001$) rivaled the effect of social environment ($B=-.19$, $p<.001$) on loneliness. Together, physical environment and loneliness had as much effect on cognition as depression. If causality is supported, modifying older adults' satisfaction with their home environment may reduce loneliness and cognitive decline.

WAKE AFTER SLEEP ONSET MEDIATES THE LINK BETWEEN NEIGHBORHOOD SOCIAL ENVIRONMENT AND COGNITION IN OLDER ADULTS

Bernadette Fausto,¹ Kexin Yu,² and Paul Duberstein,³

1. Rutgers University–Newark, Newark, New Jersey, United States, 2. USC, LA, California, United States, 3. Rutgers University School of Public Health, Piscataway, New Jersey, United States

Cognition is influenced by the neighborhood social and physical environment, but the underlying mechanisms by which neighborhood environment affects cognition are unclear. We tested the hypothesis that sleep mediates the

effects between environmental exposures and cognition. We employed structural equation modeling to examine inter-relationships among neighborhood social and physical environment, actigraphic sleep characteristics, and global cognition in a sample of older adults ($N=3,196$) from Round 2 of the National Social Life, Health, and Aging Project. Results indicated that participants with better cognition lived in salutary (e.g., cohesive, safe) social environments ($est.=0.03$, $p<.001$) and less disruptive (e.g., noisy, polluted) physical environments ($est.=-0.04$, $p<.001$). The mediation hypothesis was partially supported. Time spent awake after sleep onset mediated the social environment-cognition relationship, but sleep characteristics did not mediate the physical environment-cognition relationship. Future work should identify other environmental influences on sleep and cognition in aging to inform public health intervention priorities.

MARITAL QUALITY AS A MODERATOR OF THE ASSOCIATION BETWEEN SENSORY IMPAIRMENTS AND COGNITIVE FUNCTIONING

Jeremy Yorgason,¹ Corinna Tanner,² Avalon White,³ Stephanie Richardson,³ Melanie Hill,³ Shaylee Bench,² Brian Stagg,⁴ and Joshua Ehrlich,⁵ 1. Brigham Young University, Provo, Utah, United States, 2. College of Nursing, Brigham Young University/Provo, Utah, United States, 3. School of Family Life, Brigham Young University/Provo, Utah, United States, 4. University of Utah Moran Eye Center, University of Utah/Salt Lake City, Utah, United States, 5. University of Michigan, University of Michigan, Michigan, United States

Research suggests that marital quality may buffer the impact of sensory impairments in later life, and that marital quality relates to cognitive functioning. This study explored how marital quality moderated links between sensory impairments and cognitive functioning. We used data from 723 paired marital dyads from two cohorts in the NHATS and NSOC studies across three-year periods ($n=340$ dyads from waves 1, 2, 3; $n=383$ dyads from waves 5, 6, 7). Growth curve models of executive functioning indicated that marital quality moderated effects of both hearing and vision impairment on changes in cognitive functioning longitudinally. Specifically, higher marital quality was associated with higher executive functioning across time. Results suggested no improvement in executive functioning among those with average or lower marital quality. Although cognition declines with advanced age and with sensory impairments, results suggest that older adults with higher marital quality may improve in some aspects of cognition longitudinally.

Session 3470 (Paper)

Social Determinants of Mental Health

A NEW AND WORRISOME PREDICTOR OF ATTITUDES TOWARD SUICIDE: SELF-RATED HEALTH

Julene Cooney, Syracuse University, Manlius, New York, United States

Do people have the right to end their own lives? The General Social Survey has monitored the attitudes of

Americans towards suicide since 1977 using four questions: Do you think a person has the right to end his or her own life if this person has an incurable disease, has gone bankrupt, has dishonored his or her family, or is tired of living and ready to die? These four responses can be combined into a reliable index representing an individual's attitude toward suicide. As average population education levels have increased and religiosity has fallen, attitudes favoring the right to suicide have increased across the population. This research project introduces a previously understudied predictor of attitudes toward suicide: self-rated health. Using logistic and ordinal logistic regression, and controlling for age, education level, religiosity, marital status, survey year, race, and sex, I find that, over time, self-rated health has become a significant predictor of attitudes toward suicide. Since 2002, respondents who perceived themselves to be in poor health are significantly more likely to favor the right to end one's life, especially if the individual has an incurable disease. After stratifying by age and race, I find that the relationship between self-rated health and attitudes toward suicide is strongest among individuals in the mid-life and is equally significant as a predictor for White and Black Americans after 2010. These findings provide further evidence that mental health screening is an increasingly vital component of physician/patient interactions and highlight the importance of continuity of care.

COVID-19 OUTBREAKS AND CONTROL MEASURES ARE ASSOCIATED WITH DEPRESSION RISK AMONG OLDER ADULTS

Man-Man Peng,¹ Tianyin Liu,² Walker Siu Hong Au,² Terry YS Lum,² and Gloria HY Wong,² 1. *Beijing Normal University at Zhuhai, China, Zhuhai, Guangdong, China (People's Republic)*, 2. *The University of Hong Kong, Hong Kong, Hong Kong*

Local COVID-19 outbreaks and infection control measures may affect mental health in older persons. This study aims to investigate the effects of COVID-19 outbreaks and control measures on depression risk in community-dwelling older adults in Hong Kong. With rolling cross-sectional design, telephone screenings for depressive risk were conducted among 8163 older people using Patient Health Questionnaire-2 (PHQ-2) from February to September 2020. COVID-19 outbreaks across thirty weeks were measured using real-time effective reproductive number (Rt), infected new cases, and change of infected new cases by week. Infection control measures were assessed using four policy indices, including government response, government stringency, containment and health, and economic support. Linear regressions were used to test the associations of depression risk with COVID-19 outbreaks and control measures. We found that being female and higher Rt were associated with higher depression risk in the overall sample. In older adults without pre-existing mental health issues, higher depression risk were related to older age ($t=-1.974$, 95%CI[-0.006, 0.000], $p<0.05$), a higher level of government stringency ($t=2.954$, 95%CI[0.007, 0.033], $p<0.01$), and less stringent containment and health-related policy ($t=-2.599$, 95%CI[-0.041, -0.006], $p<0.01$). In older adults with pre-existing mental health issues, greater changes in newly infected cases were related to higher depression risk ($t=2.813$,

95%CI[0.002, 0.010], $p<0.01$). In conclusion, the effects of COVID-19 infection risk and control measures on depression risk differ among older Chinese by pre-existing mental health issues. Future public health communication could build on resilience to balance awareness of infection risks and mental health risks in older persons.

EXPLAINING GENDER DIFFERENCES IN DEPRESSIVE SYMPTOMS AMONG CAREGIVERS OF OLDER PATIENTS WITH CRITICAL ILLNESS

Wenhao Fu, and Jiajia Li, *Shandong University, Jinan, Shandong, China (People's Republic)*

The aging of baby boomers makes caring for the elderly an increasingly important topic. As rising cost of health care, the care for seriously ill patients has gradually shifted from hospitals to families, particularly in the countryside. Along with growing demand for informal care, informal caregivers are at increased risk of depression. The aim of this study was to explore the potential protective factors or risk factors associated with depressive symptoms of caregivers for patients with critical illness (45 to 93 years of age) across gender groups, explain their different pathways of influence, and elucidate targeted measures to improve their outcomes (N=518). Results from the statistical model showed that the paths of effect from care needs to caregiver depressive symptoms differed between male and female informal caregivers. Care needs were not significantly associated with depression symptoms among informal caregivers, for either men or women. Care hours of more than 12 hours per day and financial difficulties at home are risk factors for depressive symptoms in caregivers, with significance of OR=3.42; 95%CI,1.97 to 5.94; $P=0.000$ and OR=2.98; 95%CI, 1.46 to 6.05; $p=0.003$, respectively. For male caregivers, years of caregiver education and the feel relied upon by relative's were both protective factors, whereas Job-Caregiving conflict, was a risk factor ($P<0.05$). For female caregivers, caregiver burden and higher caregiver age were its risk factors ($P<0.05$). These important findings demonstrate that to be effective in reducing depressive symptoms among informal caregivers, both cointerventions and triage interventions by gender are warranted.

Session 3475 (Symposium)

THE EXPERIENCE OF HEALTH CARE WORKERS CARING FOR OLDER ADULTS DURING THE COVID-19 PANDEMIC

Chair: Tiffany Washington

Co-Chair: Terri Lewinson

Discussant: Jennifer Craft Morgan

Older adults are at increased risk for COVID-19 illness, hospitalization, and mortality. Essential health care workers became the backbone of their care during the pandemic, and their experiences are worthy of discussion. This symposium will highlight the emotional impact of COVID-19 on health care workers, and their scope of practice in various health settings. Using data from a cross-sectional survey, presenter one will describe concerns and coping strategies among nursing home social workers during COVID-19. Next, presenter two will present findings on the emotional health and wellbeing of home care workers. Then, presenter three will

describe the experience of the VA's strike teams sent into 82 Florida nursing homes most impacted by COVID. Presenter four will describe findings from a qualitative study on emotional distress experienced by hospital-based medical directors, nurse practitioners, and other health care workers. Finally, presenter five will describe findings from a scope of practice among health care social workers study, with an emphasis on how policies in their respective settings impacted their work. Taken together, the presenters' findings in this symposium have implications for practice and policy recommendations to improve the experience of health care workers during pandemics.

POLICY CONSIDERATIONS FOR GERIATRIC SOCIAL WORKERS IN HEALTHCARE SETTINGS DURING COVID-19

Tiffany Washington,¹ and Terri Lewinson,² 1. *University of Georgia, Athens, Georgia, United States*, 2. *The Dartmouth Institute for Health Policy and Clinical Practice, Geisel School of Medicine, Lebanon, New Hampshire, United States*

Social workers are essential to the delivery of health care with older adults during the COVID-19 pandemic. This paper focuses on the impact of policies in health care systems that affect geriatric social work practice. Semi-structured interviews were conducted with 55 social workers from a variety of health care settings. Data were analyzed to identify the scope of social work practice in health care settings during the COVID-19 pandemic, and how policies in their respective settings impacted their work. Conditions that impeded participants' ability to provide quality care and work within their scope of practice included inconsistent expectations of interdisciplinary team members, disparate access to resources, restriction of opportunities to address emotional distress experienced by workers. Recommendations for policy enhancements in health care settings include interprofessional education on effective team communication, protocol development for the equitable distribution of resources among essential workers, and trauma-informed in-service trainings for health care administrators.

WORK DOES NOT END WHEN YOU LEAVE: CONCERNS AND COPING STRATEGIES AMONG NURSING HOME SOCIAL WORKERS DURING COVID-19

Noelle Fields,¹ Vivian Miller,² Keith Anderson,¹ and Nancy Kusmaul,³ 1. *University of Texas at Arlington, Arlington, Texas, United States*, 2. *Bowling Green State University, Bowling Green, Ohio, United States*, 3. *University of Maryland, Baltimore County, Baltimore, Maryland, United States*

Nursing home social workers (NH SW) at the frontline during COVID-19 are faced with many challenges in meeting the psychosocial needs of residents while balancing their own well-being needs. In order to explore the experiences of NH SW during COVID-19, the study utilized a cross-sectional survey distributed to social media sites (e.g., Reddit, Facebook) and professional networks. The survey asked participants (N = 63) open-ended questions which were analyzed using the rigorous and accelerated data reduction (RADaR) method. Themes suggested that fear for self, lack of administrative support, and overall stress were notable concerns

among NH SW. Findings also suggested that support from family/friends and self-care were most personally helpful to NH SW. Lastly, themes related to coping strategies included talking with co-workers, mindfulness, and boundary setting. Findings suggest the need for increased supports for NH SW. Implications related to stress and coping during COVID-19 are offered.

GET IN AND GET OUT: THE IMPACT OF COVID-19 ON THE EMOTIONAL HEALTH OF HOME CARE WORKERS

Leah Janssen, *Scripps Gerontology Center, Oxford, Ohio, United States*

This research explores the emotional health of home care workers (HCWs) during the coronavirus pandemic. In-depth, qualitative interviews were conducted with 17 home care workers in the fall of 2020. Thematic analysis revealed important connections between emotional health and success on the job. Perception of time and appreciation emerged as key elements that impacted emotional health. HCWs expressed the pressure to perform as usual while simultaneously taking on extra tasks as distracting from direct client care and reinforcing a task-oriented care approach. As a result of these tensions, HCWs experienced a loss of appreciation by the client, who prioritized personal safety and a "get in and get out" attitude, leaving the HCW feeling less fulfilled in their work. Implications of this research highlight the importance of HCW emotional health needs when retaining HCWs as valuable members of the long-term care workforce is paramount.

THE VA'S LONG-TERM CARE STRIKE TEAM SUPPORTING FLORIDA'S NURSING HOMES WORKFORCE

Adam Golden, *Orlando VA Healthcare System, Orlando, Florida, United States*

In coordination with the Florida Department of Health, the VA Sunshine Healthcare Network (VISN 8) established Long-Term Care Strike Teams to provide services to the LTC facilities most affected by the COVID-19 pandemic across the state of Florida. Between April 2020 through September 2020, the Strike Teams provided direct patient care to community residents, infection control/ prevention education, and patient/staff COVID-19 swabbing. We encountered facilities with large numbers of staff infected with COVID-19 and agency staff that were refusing to come to "COVID-infected" facilities. Remaining staff, including the administrators, were under much psychological distress. However, our experience supporting the long-term care facilities also had a major impact on our own perceptions of nursing home care. The bravery, dedication, and caring that we witnessed reinforced that the health care workers in long-term care facilities are true heroes.

THE PSYCHOLOGICAL IMPACT OF COVID-19 ON HOME BASED PRIMARY CARE PROVIDERS IN NEW YORK: A QUALITATIVE STUDY

Ksenia Gorbenko,¹ Emily Franzosa,² Sybil Masse,¹ Abraham Brody,³ Jonathan Ripp,⁴ Katherine Ornstein,¹ and Alex Federman,¹ 1. *Icahn School of Medicine at Mount Sinai, New York, New York, United States*, 2. *Icahn School*

of Medicine at Mount Sinai, Icahn School of Medicine at Mount Sinai, New York, United States, 3. NYU Hartford Institute for Geriatric Nursing, New York, New York, United States, 4. Mount Sinai Health System, New York, New York, United States

Research on professional burnout during the pandemic has focused on hospital-based health care workers. This study examined the psychological impact of the pandemic on home-based primary care (HBPC) providers. We interviewed 13 participants from six HBPC practices in the New York including medical/clinical directors, program managers, nurse practitioners, and social workers and analyzed the transcripts using inductive qualitative analysis approach. HBPC providers experienced emotional exhaustion and a sense of reduced personal accomplishment. They reported experiencing grief of losing many patients at once and pressure to adapt to changing circumstances quickly. They also reported feeling guilty for failing to protect their patients and reduced confidence in their professional expertise. Strategies to combat burnout included shorter on-call, regular condolence meetings to acknowledge patient deaths, and peer support calls. Our study identifies potential resources to improve the well-being and reduce the risk of burnout among HBPC providers.

Session 3485 (Symposium)

UNDERSTANDING AND MEASURING FRAILITY: INSIGHTS FROM THE CANADIAN NUAGE AND CLSA COHORTS

Chair: Pierrette Gaudreau

Co-Chair: Alan Cohen

Frailty is one of the most central concepts in geriatrics; nonetheless, multiple definitions and operationalizations abound, and the underlying biology remains a topic of much discussion. Here, we bring together four talks that join questions of understanding with questions of measurement, in order to explore how answering each is necessary to make progress on the other. We cannot measure frailty if we have not understood and defined it, but we cannot understand if we cannot measure it and study it. Turcot et al. present work on operationalizing frailty in the NuAge cohort. Mayo et al. establish a scale to test the extent to which frailty can be operationalized as a ladder rather than a condition, again using the NuAge cohort. Mendo et al. use mediation analyses to understand how grip strength and other aspects of frailty may play a role in the relationship between diabetes and atherosclerosis. Ghachem et al. test the relationship between physiological dysregulation of different systems and different criteria of the Fried model, in order to assess the evidence for frailty as an emergent physiological state. Together, these talks will push the boundaries of how we think about frailty at levels ranging from biological to clinical to operational.

COMPARISON OF DIFFERENT APPROACHES TO OPERATIONALIZE FRIED'S PHENOTYPIC FRAILITY IN THE NUAGE COHORT

Valerie Turcot,¹ Alan Cohen,² Pierrette Gaudreau,³ Véronique Legault,⁴ José Morais,⁵ Nancy Presse,⁴ and Stéphanie Chevalier,⁶ 1. CIUSSS de l'Estrie-CHUS,

Sherbrooke, Quebec, Canada, 2. Université de Sherbrooke, Sherbrooke, Quebec, Canada, 3. Université de Montréal, Montreal, Quebec, Canada, 4. Université de Sherbrooke, Sherbrooke, Quebec, Canada, 5. McGill University, Montreal, Quebec, Canada, 6. McGill University, Ste-Anne-de-Bellevue, Quebec, Canada

Many operationalization approaches were proposed to identify frailty in older adults. The common use of Fried's original criteria or other cut-offs based on cohort distribution may not apply in every cohort leading to potential bias in the identification of frail individuals. We thus aimed to apply different Fried's phenotypic frailty operationalization approaches in the Quebec NuAge cohort of generally healthy community-dwelling older adults (n=1,753; aged 67-84 years), and longitudinally compare prevalence, incidence and predictive strength on outcomes, such as functional autonomy, falls, hospitalization and mortality. Significant variability in prevalence, classification agreement and predictive strengths were observed between approaches, notably using different types of distribution cut-offs, variables, or ways to handle missing data. This strategy helped us to prioritize a specific Fried's phenotypic frailty operationalization in NuAge, which could then be used in secondary research projects aiming to study determinants of Fried's phenotypic frailty and its role in health outcomes.

VALIDATION OF A FRAILITY LADDER USING RASCH ANALYSIS: IF THE SHOE FITS

Nancy Mayo,¹ Mylène Aubertin-Leheudre,² Kedar Mate,¹ Sabrina Figueiredo,¹ Julio Fiore,¹ Mohammad Auais,³ Susan Scott,⁴ and José Morais,¹ 1. McGill University, Montreal, Quebec, Canada, 2. Université du Québec à Montreal, Montreal, Quebec, Canada, 3. Queen's University, Kingston, Ontario, Canada, 4. McGill University Health Centre Research Institute, Montreal, Quebec, Canada

The current measurement approach to frailty is to classify people on frailty status, rather than measure the degree to which they are frail. Here, we test the extent to which a set of items identified within the frailty concept fits a hierarchical linear model (Rasch model) and form a true measure reflective of the frailty construct and confirm the model using the NuAge dataset. The development sample included 234 individuals (aged 57 to 97) drawn from three sources: at-risk seniors (n=141); post-colorectal surgery (n=47); and post-rehabilitation hip fracture (n=46). We defined our frailty construct based on items commonly used in frailty indices, self-report measures, and performance tests. Of the 68 items, 29 fit the Rasch Model: 19 self-report items on physical function and 10 performance tests including one for cognition. Items typically identified as reflecting the frailty concept fit the Rasch model. The Frailty Ladder would facilitate personalized intervention.

CARDIOVASCULAR RISK FACTORS AND CAROTID INTIMA MEDIA THICKNESS: MEDIATION AND INTERACTION BY GRIP STRENGTH

Christian Mendo,¹ Mark Keezer,² and Marie-Pierre Sylvestre,³ 1. Université de Montreal, Montreal, Quebec, Canada, 2. McGill University, Montreal, Quebec, Canada, 3. Université de Montréal, Montreal, Quebec, Canada

Frailty is often described as being an increased vulnerability to the effects of stressors. There is little research investing how frailty may act as either a mediator or participate in interactions in the associations between risk factors and chronic disease. We will present novel analyses of the Canadian Longitudinal Study on Aging, focusing on the 30,000 study participants who underwent serial physical evaluations at one of 11 data collection sites between 2011 and 2018. Using the 4-way decomposition method elaborated by Vanderweele, we investigate the role of grip strength, as a component of physical frailty, in the effect of cardiovascular risk factors on the atherosclerotic burden of individuals (measured using carotid intima media thickness). Our findings clarify the mechanisms underlying of grip strength in the associations between cardiovascular risk factors and carotid intima media thickness.

THE FRAILTY SYNDROME: AN EMERGENT PROPERTY OF PARALLEL DYSREGULATION IN MULTIPLE PHYSIOLOGICAL SYSTEMS?

Alan Cohen,¹ Ahmed Ghachem,¹ Linda Fried,² Véronique Legault,³ Karen Bandeen-Roche,⁴ Nancy Presse,³ and Pierrette Gaudreau,⁵ 1. *Université de Sherbrooke, Sherbrooke, Quebec, Canada*, 2. *Mailman School of Public Health, New York, New York, United States*, 3. *Université de Sherbrooke, Sherbrooke, Quebec, Canada*, 4. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 5. *Université de Montréal, Montreal, Quebec, Canada*

Despite its widespread presence in older adults, frailty etiology is still unclear, being associated with dysregulation in diverse physiological systems. Here, we show evidence that frailty emerges from broad loss of homeostasis integrated through complex systems dynamics. Using the NuAge and WHAS cohorts, we calculated Mahalanobis distance-based physiological dysregulation in six systems and tested the breadth, diffuseness, and nonlinearity of associations between frailty and system-specific dysregulation. We found clear support for breadth of associations, but only partial support for diffuseness and nonlinearity: 1) physiological dysregulation is positively associated with frailty in many or all systems, depending on analyses; 2) the number of dysregulated systems or the total amount of dysregulation are more predictive than individual systems, but results only partially replicated across cohorts; 3) dysregulation trends are exponential, but not always significant. These results suggest, but do not fully prove, that frailty is an emergent property of complex systems dynamics.

Session 3490 (Symposium)

EAST MEETS WEST: HOME AND COMMUNITY BASED CARE TO ENHANCE AGING IN PLACE

Chair: Takashi Amano

Co-Chair: Megumi Inoue

Although the magnitude and rate of aging in Japan and the United States differ, the drastic change in population structure has resulted in common challenges in both countries. One challenge is assisting older people in staying in the community. Enhancement of home- and community-based care allows older people to remain in their homes or spaces

of their choice without moving into an institution to receive necessary care. This symposium includes four presentations (two from Japan and two from the U.S.) examining various efforts surrounding home- and community-based care designed to strengthen older people's abilities to stay in the community. The presenters will cover a wide range of strategies that have been implemented in both countries. The first presenter will describe the development and delivery of a project to expand Arizona's dementia capable system. The second presenter will describe initiatives of a professional association of geriatrics to promote the concept of aging in place. The third presenter will discuss the Home Hazard Removal Program (HARP), a new home hazard removal and fall risk self-management program delivered in the home by occupational therapists. The fourth presenter will discuss Japan's national policy priority of promoting the use of home health care within the community-based integrated care system. The symposium will conclude with a review of similarities and differences of various efforts, summarize common goals and challenges, and identify best practices.

EXPANDING ARIZONA'S DEMENTIA CAPABLE SYSTEM

DAVID Coon, *Arizona State University, Phoenix, Arizona, United States*

Currently, 5.8 million US adults live with Alzheimer's disease (ADRD); the number is expected to double by 2050. Arizona will experience the greatest percent increase in ADRD by 2025. This project targeted three underserved groups in order to expand Arizona's dementia capable system: people living alone with ADRD; people with Down Syndrome or another intellectual/developmental disability (DS/IDD) aging with ADRD and their family caregivers; and people with ADRD and their caregivers in the Latino community. This presentation describes the development and delivery of the project's educational workshops, case management services, and evidence-based programs. Over 2,220 participants have participated in workshops to date with the largest percentage being case managers, care coordinators, and discharge planners. Evaluations have been extremely positive with 86.1% being "very likely" to recommend the project to others. The presentation concludes with findings and lessons learned regarding the delivery of the project's evidence-based programs and case management services.

GERIATRICS PERSPECTIVES FROM JAPAN

Masahiro Akishita,¹ and Satoru Mochizuki,²

1. *The University of Tokyo, Bunkyo-ku, Tokyo, Japan*,
2. *Hino-Nozomi Clinic, Hino, Tokyo, Japan*

In 2025, Japan's baby boomers will cross the threshold of 75 years of age; a phenomenon that has been referred to as "the 2025 crisis", resulting in a significant burden on the healthcare system. To address this issue, the Japanese government is establishing the Integrated Community Care System, to provide comprehensive medical and long-term care services in each community. In cooperation with government and affiliated organizations, the Japan Geriatrics Society (JGS) has been working to develop the Integrated Community Care System. As a result of this effort, geriatric medicine is being integrated into the health care system through incentives for practitioners. For instance, medical

facilities can be reimbursed if they perform comprehensive geriatric assessments (CGA) and CGA-based management/care. Additionally, home care medicine and polypharmacy are emerging issues of interest to the government. In this symposium, I will discuss how JGS has been trying to achieve "Aging in Place" in Japan.

A HOME HAZARD REMOVAL PROGRAM TO REDUCE FALLS IN COMMUNITY-DWELLING OLDER ADULTS

Susy Stark, *Washington University, St Louis, Missouri, United States*

The majority of falls experienced by older adults occur in the home with home hazards associated with an increased risk of falling. Low-income older adults, who have more disability and live in substandard housing, need feasible interventions to help them safely age in place. The Home Hazard Removal Program (HARP) is a new home hazard removal and fall risk self-management program delivered in the home by occupational therapists to prevent falls. To evaluate the program, a randomized control trial was conducted with 310 community-dwelling older adults receiving aging services in the community. HARP had high acceptability with older adults and was feasible to deliver in the community. Adjusted for fall risk, individuals in the HARP group fell 1.4 times versus 2.2 times in the control group over 12 months. This low-cost home hazard removal program demonstrated acceptability, feasibility, and a significant reduction in falls for at-risk community-dwelling older adults.

JAPAN'S NEW FRAMEWORK ON DEMENTIA CARE

Kenji Toba, *Tokyo Metropolitan Institute for Geriatrics and Gerontology, Tokyo Metropolitan Institute for Gerontology, Tokyo, Japan*

The number of people with dementia in Japan is ever-increasing. In 2020, 6 million people lived with dementia. The number is expected to increase to 9 million in 2040. This means that a person with dementia will be supported by three working people. To prepare for the big wave of dementia, Japan released the New Orange Plan in January 2015. In 2019, the Framework for Promoting Dementia Care was issued by the Japanese cabinet in which prevention and the opportunity for persons with dementia to age in place were set as the main goals. This framework requires all ministries to promote people's awareness about individuals with cognitive impairment. The educational targets include taxi drivers, retail shop clerks, bankers, police, and people working in the criminal justice system. I will discuss the New Framework which has potential to assist the country in supporting people living with dementia.

Session 3495 (Symposium)

IRVING S. WRIGHT AWARD OF DISTINCTION LECTURE, VINCENT CRISTAFALO AWARD LECTURE, AND TERRIE FOX WETLE AWARD LECTURE

Chair: Nir Barzilai Co-Chair: Terrie Fox Wetle

The Irving S. Wright Award of Distinction Lecture will feature an address by the 2021 recipient Malene Hansen, PhD of the Buck Institute for Research on Aging. The Vincent Cristofalo Rising Star Award in Aging Research lecture will feature an address by the 2021 recipient, Morgan Levine, PhD, of Yale University. The Terrie Fox Wetle Award lecture

will feature an address by the 2020 recipient, Kali Thomas, PhD, FGSA of Brown University and an address by the 2021 recipient, Andrea Gilmore-Bykovskiy of the University of Wisconsin, Madison. These awards are given by the American Federation for Aging Research, Inc.

TERRIE FOX WETLE AWARD (2021): ADVANCING MULTIDISCIPLINARY HEALTH SERVICES SCIENCE: DEVELOPMENTS IN A DEMENTIA-FOCUSED PROGRAM OF RESEARCH

Andrea Gilmore Bykovskiy, *University of Wisconsin-Madison, Madison, Wisconsin, United States*

The Terrie Fox Wetle Rising Star Award in Health Services and Aging Research is an award named in honor of Fox Wetle, PhD, who is internationally recognized for her contributions to aging, public health, and health care research. The award recognizes health services researchers in early or middle-career phases who have made significant contributions that embody the value of multidisciplinary health services science and are likely to have a sustained, high impact on practice and research. This award lecture will be presented by the 2021 Award Recipient, Andrea Gilmore-Bykovskiy, PhD, RN, and will highlight emergent findings and foci in her dementia-focused health services research program. In particular, the award lecture will discuss progress in investigating social and behavioral communication patterns among individuals with moderate to advanced dementia; and the role of temporally situated observational measures and inclusion of persons with dementia and their caregivers in this line of research. The lecture will conclude with a discussion of next steps for this area of investigation surrounding assessment of episodes of lucidity in advanced dementia; and considerations for strengthening progress in outcome evaluation among persons living with dementia through multidisciplinary and community-informed health services research.

IRVING S. WRIGHT AWARD: CELLULAR RECYCLING IN AGING AND DISEASE: THE IMPORTANCE OF TAKING OUT THE TRASH

Malene Hansen, *Sanford Burnham Prebys Medical Discovery Institute, La Jolla, California, United States*

Aging is greatly influenced by quality-control processes that keep the materials inside our cells in proper shape and function. One of these processes is called autophagy, which means "self-eating". This cellular recycling process can digest damaged components to provide new and better parts for the cell. Autophagy plays important roles in many age-related diseases and has been directly linked to aging. In our laboratory, we use the microscopic soil-dwelling round worm *C. elegans* to understand how autophagy is linked to aging and disease. In this Wright Award seminar, I will discuss our progress on understanding how autophagy is regulated during normal aging and how it may promote a long and healthy lifespan.

TERRIE FOX WETLE AWARD (2020): THE ROLE OF HOME-DELIVERED MEALS PROGRAMS IN IMPROVING HEALTH AND PROMOTING COMMUNITY INDEPENDENCE FOR OLDER ADULTS

Kali Thomas, *Brown University, Brown University/ Providence, Rhode Island, United States*

Dr. Terrie “Fox” Wetle is internationally recognized as a leader who conducts and advocates for multi-disciplinary and multi-method investigations centered on aging, public health and health care with direct implications for shaping policy and practice. This award lecture, given in Dr. Wetle’s name, will be presented by the 2020 award recipient, Kali Thomas, PhD. Dr. Thomas will present a line of multi-disciplinary and multi-method research focused on the impact of home-delivered meals as it relates to the health outcomes of homebound, food insecure older adults. Findings will include results from observational and intervention studies conducted at both the local and national levels. Examples of how this evidence has influenced policy and practice, including greater integration with healthcare, will be provided. The lecture will conclude with discussion about future opportunities for collaboration with community partners to measure and understand the impact of these vital social services on the lives of older adults.

VINCENT CRISTOFALO “RISING STAR” AWARD: DNA METHYLATION LANDSCAPES IN AGING

Morgan Levine, *Yale University, New Haven, Connecticut, United States*

The epigenetic code can be thought of as the operating system of the cell. It controls the most basic and critical cellular processes including differentiation, replication, metabolism, and signaling. Yet, with age, the epigenetic landscape is remodeled, bringing about widespread consequences for cellular and tissue identity, integrity, and functioning. But, what if like computer programmers, we could discover how to recode or restore the original program? The revolutionary discoveries by Yamanaka and Takahashi suggests this may be possible. While early experiments showed that Yamanaka factors could be used to convert somatic cells into induced pluripotent stem cells, more recent work by us and others have shown that signatures of epigenetic aging are also wiped clean during this process. What’s more, epigenetic age reversal appears to take place early in the process and thus can be achieved without the cell needing to dedifferentiate. Building off of this discovery, our lab is combining novel experiments and advanced bioinformatic techniques to decipher the epigenetic code and determine how it is remodeled during aging, development, and reprogramming. In our recent work, we have made advancements in mapping the epigenetic alterations observed in aging and linking them to both cellular processes and disease etiology. We have identified specific age changes in mouse and human cells that reflect mitotic history, cellular senescence, oxidative damage, and mitochondrial dysfunction. We have also demonstrated that these changes inform differences in organismal lifespan and/or disease etiology at the tissue level. Overall, this work has sweeping implications for our basic understanding of epigenetic aging and reprogramming, and will help provide the foundation for potent therapeutics that extend healthspan and lifespan.

Session 3500 (Symposium)

ADVANCING AGE INCLUSIVITY IN A PANDEMIC: AGE-FRIENDLY UNIVERSITY (AFU) CAMPUSES TAKE ACTION

Chair: Joann Montepare

Co-Chair: Kimberly Farah

The COVID-19 pandemic presented extraordinary challenges for professionals in the aging field across campuses and communities, calling for rethinking and redesigning how their work was structured, their programs were delivered, and their connections were sustained. The pandemic also made clear the value of being an age-friendly institution of higher education, especially as we experience historic changes in age demographics. This symposium features campus leaders representing institutional partners of the Age-Friendly University (AFU) global initiative (endorsed by GSA’s Academy for Gerontology in Higher Education) who will discuss how their age-friendly programs were adapted during the pandemic to continue to advance age inclusivity. These diverse responses exemplify the vast potential of age-friendly opportunities. June and Andreoletti (Central Connecticut State University) will discuss how the Scholars for Life! program supported the engagement of older learners in the neighboring community through the engagement of faculty. Elfenbein (University of North Georgia) will describe how learning experiences for older learners and intergenerational exchange were created beyond the classroom through the Personal Enrichment, Action and Knowledge (PEAK) program. Terhune (Northern Kentucky University) will describe how student support practices and services were adapted to provide working adult students with guidance for navigating their educational needs during the pandemic. Kheirbek (University of Maryland, Baltimore) will describe how age-friendly collaborations with the institution’s medical school leveraged intergenerational connections and technology to foster social connection for hospitalized older adults. Gautam and Melillo (UMass Lowell) discuss how a campus partnership with the Learning in Retirement Association (LIRA) adapted efforts around healthy aging.

SCHOLARS FOR LIFE! BUILDING FACULTY AND COMMUNITY CONNECTIONS ON AN AGE-FRIENDLY UNIVERSITY CAMPUS

Andrea June,¹ and Carrie Andreoletti,^{2,1} *Central Connecticut State University, Central Connecticut State University, Connecticut, United States, 2. Central Connecticut State University, New Britain, Connecticut, United States*

Central Connecticut State University’s Scholars for Life! supports the engagement of older learners in the community through faculty guest lectures. During the COVID-19 pandemic, participation in the virtual format frequently swelled to over 100 attendees, which is five times the number participating pre-pandemic. Moreover, faculty engagement increased. This presentation will share results of a study that used an Age-Friendly University (AFU) lens to explore this expanded connection to community members with the intention to build on its successful faculty-community engagement. 132 participants responded to the survey (M age = 69), mostly identifying as local retired alumni and community members. Participants reported high satisfaction with the lectures, connection to the university, interest in joining future travel abroad experiences, and utilizing campus resources when safe. Indeed, 84% are now aware of CCSU’s AFU status and 61% expressed interest in the 62+ course tuition waiver. Implications and future directions will be addressed.

TAKING AGE-FRIENDLY CAMPUS EFFORTS TO NEW PEAKS

Pamela Elfenbein, *University of North Georgia, Gainesville, Georgia, United States*

The University of North Georgia's Personal Enrichment, Action, Knowledge Series (PEAKS) was developed as a monthly series of engaging and seasonally appropriate presentations and activities designed to expressly meet the needs of the region's large and quickly growing older adult population during the Covid-19 pandemic and resultant isolation. The PEAKS programs are available virtually to allow for broad participation throughout the 30 county UNG service region. While we developed PEAKS to specifically reach-out to older adults in our region, we have found that our audience is actually multi-generational, actively engaging with our speakers and one another. AFU underpinnings for PEAKS include Principle #8 - To enhance access for older adults to the university's range of health and wellness programs and its arts and cultural activities; and #9 - To engage actively with the university's own retired community.

SUPPORTING EDUCATIONAL NEEDS OF OLDER ADULT LEARNERS: STRATEGIES FOR VIRTUAL TRANSITIONING AND STUDENT ENGAGEMENT

Katherina Terhune,¹ Sara Conwell,² Amy Danzo,² Allyson Graf,² and Suk-Hee Kim,² 1. *Northern Kentucky University, Lexington, Kentucky, United States*, 2. *Northern Kentucky University, Highland Heights, Kentucky, United States*

The pandemic has revealed a multitude of challenges disproportionately impacting older adults, including older adult learners. Institutions of higher education are uniquely positioned to respond to various challenges using the guiding framework of the Age-Friendly University global initiative. This presentation highlights how preexisting university student support practices and services were adapted to provide older adult learners with guidance for navigating their educational needs during the pandemic. Specifically, it expands on strategies utilized by Adult Learner Programs and Services to effectively pivot to virtual services to support the advising and programming needs of older adult learners. Survey data identifying areas of interest for virtual programming for older adult students will be explored. Recommendations will be discussed for promoting effective transitioning to virtual support systems, preserving student engagement and intergenerational learning, and advocating for aging to remain central to university diversity and inclusion initiatives.

AN AGE-FRIENDLY CAMPUS PARTNERSHIP FOR HOSPITALIZED OLDER ADULTS IN THE COVID ERA AND BEYOND

Raya Kheirbek,¹ Heavner Mojdeh,² Marjorie Fass,³ Christina Cafeo,² Giora Netzer,² Mangla Gulati,⁴ Nicole Brandt,⁵ and Barbara Resnick,⁶ 1. *University of Maryland School of Medicine, University of Maryland School of Medicine, Maryland, United States*, 2. *University of Maryland, Baltimore, Maryland, United States*, 3. *University of Maryland School of Nursing, Baltimore, Baltimore, Maryland, United States*, 4. *University of Maryland Medical Center, Baltimore, Maryland, United States*, 5. *University of Maryland School of Pharmacy,*

University of Maryland School of Pharmacy, Maryland, United States, 6. *University of Maryland School of Nursing, Baltimore, Maryland, United States*

As hospitals isolate COVID-19 patients to prevent the spread of this highly contagious disease, patients and family are separated during times of critical illness. For many older adults inflicted with coronavirus it is not the fear of dying that matters the most, it is the fear of dying alone. Utilizing the 4Ms approach, University of Maryland, Baltimore (UMB) and University of Maryland Medical Center (UMMC) responded with several initiatives including intergenerational programs designed to shape and inform the development of future healthcare clinicians in addressing what matters the most to patients and leveraging technology to connect them with families, provide mobility opportunities, monitor medications, and reduce errors.

A STEP BACKWARD AND FORWARD IN AN AGE-FRIENDLY UNIVERSITY INITIATIVE: ADAPTING A CAMPUS LEARNING PARTNERSHIP

Ramraj Gautam, Karen Devereaux Melillo, and Carol McDonough, *UMass Lowell, Lowell, Massachusetts, United States*

The 5-campus UMass system received designation as an Age-Friendly University (AFU) in 2019. AFU Principle 1 highlights the importance of involving older adults in University activities. UMass Lowell's Center for Gerontology Research and Partnerships collaborated with the Learning in Retirement Association (LIRA) in Spring 2020 to offer aging-related courses around healthy aging. However, due to COVID-19, these were canceled and are re-scheduled for Spring 2021 via Zoom. The paper will describe the process of selecting course offerings with LIRA and the subsequent cancellation/rescheduling process and adaptation needed. A course will focus on AFU initiative and the opportunities and challenges at UMass Lowell. Likewise, the other course will offer a session on technology and aging where age-based digital divide and strategies for reducing it will be discussed. This paper will reflect on how the collaboration with LIRA and course selection process relates to the AFU principles 1, 5 and 9.

Session 3505 (Symposium)

POLICY SERIES: COVID-19: HOW IT SHAPED NURSING HOME CARE AND ELDER JUSTICE

Chair: Brian Lindberg

This session will provide updates on how the pandemic led to horrific situations in long-term care facilities and how the pandemic influenced major federal efforts to address elder abuse, neglect, and exploitation.

THE ELDER JUSTICE ACT AND THE PANDEMIC

Robert Blancato, *Elder Justice Coalition, Washington, District of Columbia, United States*

This session will provide updates on how the pandemic led to horrific situations in long-term care facilities and how the pandemic influenced major federal efforts to address elder abuse, neglect, and exploitation.

THE PANDEMIC AND NURSING HOME CARE

Lori Smetanka, *The National Consumer Voice for Quality Long-Term Care*, Washington, District of Columbia, United States

This session will provide updates on how the pandemic led to horrific situations in long-term care facilities and how the pandemic influenced major federal efforts to address elder abuse, neglect, and exploitation.

PANDEMIC LESSONS FROM A LONG-TERM CARE OMBUDSMAN

Mairead Painter, *Long-Term Care Ombudsman Program*, Hartford, Connecticut, United States

This session will provide updates on how the pandemic led to horrific situations in long-term care facilities and how the pandemic influenced major federal efforts to address elder abuse, neglect, and exploitation.

Session 3510 (Symposium)

DOING AGING RESEARCH TOGETHER: INNOVATIVE PERSPECTIVES ON PARTICIPATORY APPROACHES

Chair: Anna Wanka

Co-Chair: Anna Urbaniak

The symposium aims to take a closer look at what it means to involve older participants in ageing research - beyond the role of research subjects. By discussing projects that deploy different participatory approaches we investigate the manifold ways in which older adults can become co-creators of the research process. We do so comparing such approaches in different domains, with different outcomes and in different stages of the research process. Consequently, this symposium (1) looks at the research process through the lens of benefits and challenges resulting from involving older adults as co-creators; (2) showcases projects across different domains and different jurisdictions that applied participatory approach in ageing research to discuss benefits and challenges, and (3) advances scientific insights into participatory approaches involving older adults. After an introductory contribution outlining theories, concepts and developments of participatory approaches in ageing research, we present insights from three empirical studies in different cultural and thematic settings. In our first presentation, Anna Wanka and Anna Urbaniak open the symposium by presenting an overview of participatory approaches that involve older adults. In the first empirical presentation, Julia Nolte and Hamid Turker discuss the process of involving older adults in data analysis and therefor present data from the US. In the third presentation, Lillian Hunn highlights how the recent COVID-19 pandemic impacted patient involvement in research in Canada. Finally, Anna Urbaniak discusses the process of planning participatory research with hard to reach population among older adults in Austria, namely those who are socially excluded.

OLDER ADULTS AS CO-CREATORS IN THE RESEARCH PROCESS: AN OVERVIEW OF CONCEPTS, METHODS, AND APPROACHES

Anna Wanka, *Goethe University Frankfurt, Frankfurt, Hessen, Germany*

Participatory approaches have a long-standing tradition in the social sciences and approaches have diversified across multiple research domains. Also in ageing, there is a growing interest in involving older adults, particularly in fields like gerontechnology development, environmental gerontology or patient involvement. In this contribution, ask what participatory approaches and co-creation means in the context of ageing research. What are the benefits and challenges of involving older adults in different research domains, stages of the research process and deploying various participatory methods and approaches? To approach this question, we present preliminary results of a comprehensive scoping review of the literature and provide examples of how older adults can be involved in developing research questions together with researchers, collecting and analysing the data, as well as validating and disseminating study results.

DESIGNING PARTICIPATORY AGING RESEARCH ON EXCLUSION FROM SOCIAL RELATIONS: A CITIZEN SCIENCE PROJECT

Anna Urbaniak, *University of Vienna, Wien, Wien, Austria*

Many policies and initiatives aim at enhancing the social participation of older adults. Despite this growing interest in increasing social inclusion and combating social exclusion in older age, the voices of socially-excluded older adults and their experiences remain underrepresented in research. Based on data from the Austrian research project “Socially Excluded Older Adults: Voices and Experiences” (SEVEN), I reflect on what it means to co-create research with the hard-to-reach populations of socially excluded older adults. Data discussed is derived By inviting this group to participate in each stage of the research, the project develops an innovative approach that, on the one hand, facilitates and advances ways for socially-excluded older adults to express their voices, thereby empowering them and their self-advocacy, and, on the other hand, creates research insights that are able to grasp the life worlds of older, socially excluded adults more accurately.

INVOLVING OLDER ADULTS IN THE DATA ANALYSIS PROCESS

Julia Nolte, and Hamid Turker, *Cornell University, Ithaca, New York, United States*

Because involvement of older adults in the research process continues to be low, we review existing approaches to engaging older adults in qualitative and quantitative data analysis. In doing so, we examine in which contexts older adults have or could serve as analysis consultants, collaborators, or even leaders. We also discuss the benefits and challenges associated with inviting older adults into the analysis process: On the one hand, this age group can contribute unique viewpoints and draw on a lifetime of experience and expertise. On the other hand, involving older adults in data analyses typically requires resources and time while bearing the risks of health-related attrition, tokenistic treatment, and power imbalances between researchers and older adults. As a result, we close with recommendations on how to navigate this process effectively and respectfully (e.g., building trust, reducing hierarchies, being mindful of older adults' needs, and assessing their satisfaction throughout the collaboration).

RELATIONAL APPROACHES IN PATIENT-ORIENTED RESEARCH DURING THE COVID-19 PANDEMIC

Lillian Hung, *University of British Columbia, Vancouver, British Columbia, Canada*

The COVID-19 pandemic has exposed the fragile state of patient involvement in research. The involvement of the most vulnerable population (older people with dementia) in research was even more challenging. This presentation outlines challenges my research team encountered in patient-led projects (older people with dementia) and describes how we found creative strategies to set up and complete research during the time of pandemic. I will describe how the team applied collaborative participatory principles to engage a team with diverse backgrounds in the lockdown time to maintain research progress. Patient partners in my research team actively led recruitment, research planning and decision-making, team analysis and knowledge exchange. University students in our research team helped to make technology easy to use for our patient partners. The friendly, flexible and accessible exchange between students and patient partners reinforced the importance of a respectful relational approach in patient-oriented research.

Session 3515 (Paper)

Education and Training (SRPP Paper)

CHALLENGES TO ENGAGE LOW-SKILLED ADULTS IN EDUCATION AND TRAINING: AN INTERNATIONAL PERSPECTIVE

Sydney Shadovitz,¹ Abigail Helsinger,² and Phyllis Cummins,¹ *1. Miami University, Oxford, Ohio, United States, 2. Scripps Gerontology Center, Miami University, Oxford, Ohio, United States*

The demand for adult education and training (AET) opportunities throughout the life course is substantial as labor markets often require workers to obtain advanced skills. AET opportunities are more often pursued by high-income and high-skilled workers than low-skilled or low-income workers. With the increased prominence of job automation and technological advances in the workforce, low-skilled workers are at risk for fewer opportunities within the labor market. These factors emphasize the importance of providing learning opportunities throughout the life course. In this mixed-methods study, we analyzed 2012/2014 data from the Program for the International Assessment of Adult Competencies (PIAAC) for the U.S., Canada, the Netherlands, Norway, and Sweden to compare participation rates in non-formal education (NFE) by high and low-skilled adults. Countries were selected based on qualitative findings that inform best practices. Additionally, to gain insights of policies and programs that promote NFE, international key informant interviews (n = 33) were conducted. AET policies and programs, along with barriers such as cost, motivation, and time, were explored with key informants. Findings include (1) aging and skills are negatively correlated in all nations of interest; (2) low-skilled adults are less likely to participate in NFE than their high-skilled counterparts; (3) low-skilled workers in Norway and the Netherlands are more likely to participate in NFE than their U.S. counterparts; and

(4) NFE is often more acceptable to low-skilled adults due to previous negative experiences with formal education. Using these findings, we discuss successful AET programs in Nordic countries for overcoming barriers.

DOMESTIC AND INTERNATIONAL PERSPECTIVES ON FINANCING ADULT EDUCATION AND TRAINING

Abigail Helsinger,¹ Oksana Dikhtyar,¹ Phyllis Cummins,² and Nytasia Hicks,³ *1. Scripps Gerontology Center, Miami University, Oxford, Ohio, United States, 2. Miami University, Oxford, Ohio, United States, 3. GRECC - STVHCS Department of Veterans Affairs, San Antonio, Texas, United States*

Adult education and training (AET) over the life-course is necessary to participate in economic, social, and political activities in the time of globalization and technological advancement. However, little research has been done to identify mechanisms to fund AET opportunities among middle-aged and older adults from a comparative international perspective. Our study aimed to identify strategies to finance AET opportunities for middle-aged and older adults through an international lens, to help identify barriers and facilitators in effort to best support adult learners regardless of education background or socioeconomic characteristics. We carried out a descriptive qualitative study to facilitate an in-depth understanding of funding mechanisms available to adult learners in the selected countries, from the perspective of adult education and policy experts. Data were collected using semi-structured interviews with 61 international adult education experts from government agencies, non-governmental organizations, and education institutions. Our informants represented 10 countries including Australia, Canada, Germany, Italy, the Netherlands, Norway, Singapore, Sweden, the United Kingdom, and the United States. Data included at least one in-depth phone or web-based qualitative interview per informant in addition to information gathered from written materials (e.g., peer-reviewed publications and organizational reports). We identified three financing options that arose as themes: government-sponsored funding; employer-sponsored funding; and self-funding. We found that government-sponsored funding is especially important for low-skilled, low-income older adults for whom employer-sponsored or self-funding is not available. Our results have implications for lifelong AET policy changes, such as adaptations of successful AET funding programs across global communities.

REDUCING PESSIMISM ABOUT SOCIAL SECURITY'S FUTURE THROUGH GERONTOLOGICAL EDUCATION

Catheryn Koss, *California State University, Sacramento, Sacramento, California, United States*

A recent Pew Research Center poll found less than half of non-retired U.S. adults believe they will receive Social Security benefits when they retire. Pessimism about Social Security's future is even stronger among people under 50, raising concerns about political support for the program. The current study examined to what extent education about how Social Security functions and strategies to address program funding shortfalls could increase optimism about Social

Security's future. In Fall 2020, twenty-two undergraduate students enrolled in an on-line aging and social policy course were asked how likely they would receive Social Security income when they retired. Consistent with national polling data, only 38% believed they would probably or definitely receive Social Security retirement income. Students were also asked to briefly explain why they answered the way they did. Common reasons given for pessimism about receiving Social Security retirement income included having heard Social Security will run out of money and believing only U.S. citizens are eligible for Social Security benefits. Over a two-week period, students completed asynchronous on-line activities covering Social Security retirement eligibility, worker and spousal benefits, current funding, and proposed changes to address funding shortfalls. Upon completion, 67% of students stated they would probably or definitely receive Social Security retirement income when they retired ($p = .07$). These preliminary results suggest that education about the program can reduce pessimism about Social Security's future. Additional data will be collected from 45 students enrolled in the same course in Spring 2021.

SOCIAL WORK GRADUATES ENTERING THE FIELD OF GERONTOLOGY DURING COVID-19: EXPLORING PERCEIVED READINESS AND NEEDS

Susanny Beltran,¹ and Vivian Miller,² *1. University of Central Florida, Orlando, Florida, United States, 2. Bowling Green State University, Bowling Green, Ohio, United States*

Gerontological social workers (GSW) are on the frontlines supporting the biopsychosocial needs of older adults in hospitals, communities, and long-term care settings. However, it is unclear whether social workers (SW) are trained to meet the emerging needs of older adults during COVID-19. This study describes training received, perceived readiness, and training needs of GSWs new to the field during 2020. A cross-sectional online survey was conducted with recent graduates from U.S. SW programs. Survey questions explored training received and ongoing needs, perceived self-efficacy (adapted from the Geriatric Social Work Competency Scale), demographics, and confidence in ability to work with populations 55+. A total of 15 recent SW graduates specializing in gerontology completed the survey. Fifty-three percent of the sample held MSWs and over half (53.3%) were licensed social workers or registered interns. Nearly all participants (73.3%) reported taking an introductory aging course, and almost half (46.7%) completed coursework in aging and diversity, aging policy, and end-of-life care/bereavement; 80% completed fieldwork in aging. Participants report moderate skill in assessing issues related to losses or transitions (46.7%), and physical functioning (53.3%), and advanced skill in assessing cognitive functioning (60.0%), and caregiver stress/needs (53.3%). Nearly half of respondents who rated their training as good-excellent indicate being very-extremely confident (42.8%) in their ability to practice with older adults. Training needs among participants include disaster preparedness, telehealth, and coordination of scarce resources. Curriculum development and continuing education are necessary to support emerging gerontological social workers in their practice during COVID-19 and other emergencies.

TRAINING SAVVY CAREGIVER PROGRAM GROUP LEADERS THROUGH AN ONLINE COURSE

Kenneth Hepburn,¹ Carey Sherman,² John Hobday,³ and Lai Reed,¹ *1. Emory University, Atlanta, Georgia, United States, 2. Family Care Strategies, LLC, Ann Arbor, Michigan, United States, 3. Healthcare Interactive, inc, St. Louis Park, Minnesota, United States*

A significant factor limiting organizations' implementation of the Savvy Caregiver program, a widely disseminated dementia caregiver psychoeducation course, is the need to provide training to program leaders to ensure their understanding of Savvy core principles and strengthen their teaching and coaching skills. Such training has typically been provided through in-person group sessions led by the Savvy developers. To facilitate broader availability, we have embarked on an NIA-supported program to develop a fully online self-paced Savvy train-the-trainer course. The course, delivered individually on a widely used teaching platform, is in seven sections: the first introduces Savvy principles and the trainer role; the next six cover the content and teaching strategies of each of Savvy's six sessions. In the first development phase, 33 individuals from 13 organizations across the country took part in training (average age 49.5; almost all college level or professional women). Qualitative interviews with 11 trainees and debriefing sessions with others yielded consistently positive responses: the training enhanced their own appreciation for caregiving; they endorsed the self-paced learning and; and it established expectations for positive benefits of Savvy for caregivers. Trainees' feedback has led to several improvements, including resolving reported technical glitches (e.g., navigating the course). New videos illustrating group delivery methods have been added. Fidelity monitoring strategies are supported as organizations have been encouraged to augment the online training by convening meetings of trainees while in training to enable role playing, and greater personalization is achieved via post-training Zoom meetings with trainees and the Savvy training team staff.

Session 3520 (Symposium)

EVALUATING HOW AND WHY THE ENVIRONMENTAL CONTEXT SHAPES THE COURSE OF DEVELOPMENT ACROSS THE ADULT LIFESPAN

Chair: Omar Staben

Co-Chair: Frank Infurna

Discussant: Eileen Crimmins

There is a long-standing literature that has documented the importance of both the immediate and distal context in impacting mental and physical health across the adult lifespan. The goal of this symposium is to bring together a collection of papers that target the extent to which the immediate and distal context as measured through objective and subjective indicators relate to pertinent outcomes of mental and physical health. Staben and colleagues use an intensive longitudinal design in middle-aged adults to show that objective and subjective indicators of the neighborhood are associated with higher levels of and are protective against the impact of monthly adversity on mental health and well-being. Munoz and colleagues evaluate associations between objective and subjective early-life neighborhood contexts and whether they

play a role in cognitive function at midlife. They find that poorer age-five self-report conditions were associated with lower working memory. Osuna and colleagues examine how both neighborhood and housing conditions play a role on psychological well-being. They find that housing and neighborhood safety conditions are associated with depressive symptoms over time. Piazza and colleagues examine associations between daily financial thoughts, SES, and indices of emotional and physical health. They find that individuals who reported more daily financial thoughts also reported more negative affect and physical symptoms. The discussion by Crimmins will integrate the four papers by highlighting the importance of how different forms of context can impact development in adulthood and old age, particularly in relation to health and well-being and consider future routes of inquiry.

DO OBJECTIVE OR SUBJECTIVE NEIGHBORHOOD INDICATORS PROTECT AGAINST ADVERSITY ON MENTAL HEALTH AND WELL-BEING?

Omar Staben, Frank Infurna, Kevin Grimm, and Suniya Luthar, *Arizona State University, Tempe, Arizona, United States*

The neighborhood context through which individuals interact is shown to be associated with mental and physical health across adulthood. Much less is known regarding potential underlying reasons why, such as protecting against the deleterious effects of stress. This study explores whether objective and subjective neighborhood factors are associated with maintenance of mental health and well-being in the context of monthly adversity. We use longitudinal data from a sample of midlife ($N = 362$) who completed monthly questionnaires for two years. Results show that experiencing a monthly adversity was associated with poorer mental health and well-being. Living in a neighborhood with more disorder was associated with stronger declines in mental health and well-being when a monthly adversity was reported. Our discussion focuses on why the neighborhood context is relevant for middle-aged adults and the various ways through which neighborhood context has the potential to shape the course of development in adulthood.

THE EFFECT OF EARLY NEIGHBORHOOD CONTEXTS ON COGNITIVE FUNCTION IN MIDLIFE

Elizabeth Munoz,¹ Heewon Yoon,² Jean Choi,³ Giancarlo Pasquini,⁴ Alexa Allan,⁵ Martin Sliwinski,⁶ and Stacey Scott,⁴ 1. *The University of Texas at Austin, The University of Texas at Austin, Texas, United States*, 2. *University of Texas at Austin, Austin, Texas, United States*, 3. *The University of Texas at Austin, Austin, Texas, United States*, 4. *Stony Brook University, Stony Brook, New York, United States*, 5. *Pennsylvania State University, University Park, Pennsylvania, United States*, 6. *The Pennsylvania State University, University Park, Pennsylvania, United States*

We evaluated associations between objective and subjective early-life neighborhood contexts and cognitive function at midlife. Study participants grew up in different addresses but resided in the same urban zip code at the time of data collection thus controlling for concurrent neighborhood contexts. Participants provided their home address

when they were five-years-old and recalled their age-five neighborhood conditions (Mage = 40.59 (7.91); $n = 130$). Age-five addresses were geocoded and linked with harmonized longitudinal Census tract boundaries and variables. Predictive models with a self-reported neighborhood conditions score, an objective neighborhood deprivation indicator, and other sociodemographic covariates indicated that poorer age-five self-reported neighborhood conditions were significantly associated with lower baseline (Cohen's $d = -.24$) and average daily ($d = -.21$) working memory performance. There were no associations with objective age-five neighborhoods. Results contribute to a growing literature on the role of psychosocial neighborhood contexts on cognition that may extend back to childhood neighborhoods.

DAILY FINANCIAL THOUGHTS AND INDICES OF MENTAL AND PHYSICAL HEALTH: THE IMPORTANCE OF SOCIOECONOMIC STATUS

Jennifer Piazza,¹ Jonathan Rush,² Eric Cerino,³ Jacqueline Mogle,⁴ Robert Stawski,⁵ Susan Charles,⁶ and David Almeida,⁷ 1. *California State University, Fullerton, California, United States*, 2. *University of Victoria, Victoria, British Columbia, Canada*, 3. *Northern Arizona University, Flagstaff, Arizona, United States*, 4. *Penn State University, University Park, Pennsylvania, United States*, 5. *Oregon State University, Corvallis, Oregon, United States*, 6. *University of California, Irvine, Irvine, California, United States*, 7. *Pennsylvania State University, University Park, Pennsylvania, United States*

The current study examined the associations between daily financial thoughts, socioeconomic status (SES), and indices of emotional (positive and negative affect (PA/NA)) and physical health (physical symptoms and cortisol). Participants ($N = 782$) from the National Study of Daily Experiences, a subsample of the Midlife in the United States Refresher survey, completed daily diary interviews and provided saliva samples, from which cortisol was assayed. Participants who, on average, reported more daily financial thoughts also reported more NA, less PA, more physical symptoms, and had higher cortisol AUCg (all p 's < .05). These effects were more pronounced among people reporting lower SES. Daily fluctuations in financial thoughts also predicted daily fluctuations in NA, PA, and physical symptoms (all p 's < .01). Again, these associations were more pronounced among people reporting lower SES. Results indicate that intrusive, daily financial thoughts may be one pathway explaining the link between SES and health outcomes.

IMPACT OF HOUSING AND NEIGHBORHOOD ON DEPRESSION AMONG OLDER ADULTS IN THE HEALTH AND RETIREMENT STUDY

Rachel Wilkie,¹ Margarita Osuna,² and Jennifer Ailshire,³ 1. *Spatial Sciences Institute, USC, University of Southern California, California, United States*, 2. *USC, University of Southern California, California, United States*, 3. *University of Southern California, Los Angeles, California, United States*

Prior research has suggested that poor neighborhood and housing conditions can lead to worse psychological wellbeing. Most studies examine either neighborhood or housing conditions, but not both. Since neighborhood and

housing conditions may be correlated it raises the question of whether one is a proxy for the other. We use data from the 2006 and 2008 waves of the Health and Retirement Study to examine associations between perceived neighborhood and housing conditions in 2006 and depressive symptoms (CES-D 8) score in 2008. We find that worse housing conditions and neighborhood safety are associated with more depressive symptoms two years later, even when controlling for prior depressive symptoms. Furthermore, housing and neighborhood conditions are independently related to increased depression symptoms over time. Our research contributes to a deeper understanding of the relationship between home and neighborhood environments and psychological wellbeing in older adults.

Session 3525 (Symposium)

FAMILY AND AGING IN CROSS-NATIONAL CONTEXTS

Chair: Jennifer Ailshire

Discussant: Jennifer Ailshire

The global aging of the population, combined with shifts in the structure and composition of families, has led to increased attention to the role of family and social relationships in the aging experience. The importance of family in determining healthy aging, however, may largely depend on the social, political, and economic context in which individuals are embedded. Cross-national investigations offer a unique opportunity to understand how family relationships and family caregiving influence health and well-being among older adults by comparing family dynamics across different sociocultural contexts. The HRS-family of surveys, which have been harmonized within the Gateway to Global Aging, provides remarkable opportunities for cross-national comparative analysis. The papers in this session use harmonized data from the Gateway to compare the influence of family on health across different social dimensions in multiple countries from around the world, including examinations of: 1) the impact of grandparenting on health of older adults in Europe and China; 2) psychological well-being among European older adults whose partners receive formal care; 3) the influence of parent-child relationships on health and well-being of older adults in China and the U.S.; and 4) how loneliness among older adults is patterned according to their living arrangements and relationship quality. The discussion will highlight the promises and challenges of cross-national research on families and aging and how harmonized aging data facilitates international comparisons.

GRANDCHILD CARING AND LATE-LIFE DEPRESSION: A COMPARATIVE LONGITUDINAL STUDY IN CHINA AND EUROPE

Yazhen Yang, *University of Southampton, Southampton, England, United Kingdom*

The impact of grandparenting on the grandparents' health has been relatively under-studied, and international comparisons can provide useful lessons for grandparents and policymakers. This study examined country differences in the effects of grandchild care provision on the grandparents' depression in Italy, Spain, China, Denmark and Sweden using the longitudinal Harmonised CHARLS and SHARE

data collected between 2010-5. Controlling for the grandparents' depression in 2011, grandparents providing non-intensive grandparental care in China, Sweden and Denmark in 2013 were less likely to report depression in 2015 compared to those who did not provide any care in 2013. Such effects were more pronounced among grandmothers compared to grandfathers. The results indicate that the effects of grandchild caring on the grandparents' depression in China was comparable to Denmark and Sweden. Future research can focus on identifying the causal pathways between grandparenting and wellbeing, and the implications of such pathways for older persons' wellbeing worldwide.

PARTNER CARE ARRANGEMENTS AND OLDER EUROPEANS' WELL-BEING: VARIATIONS BY GENDER AND CONTEXT

Ginevra Floridi,¹ Nekehia Quashie,² Karen Glaser,³ and Martina Brandt,² 1. *Nuffield College, University of Oxford, Oxford, England, United Kingdom*, 2. *Technische Universität Dortmund, Dortmund, Nordrhein-Westfalen, Germany*, 3. *King's College London, London, England, United Kingdom*

Across Europe, partners are often primary caregivers to older adults with care needs. Yet, a variety of partner care arrangements may arise. Little is known about the interrelations between partners' care arrangements, (potential) caregivers' gender, and the context in which care is embedded. We use 2015 SHARE data from 17 countries on 3,465 couples aged 50+ where one partner receives care. We examine how life satisfaction and depressive symptoms of (potential) caregivers vary across five care arrangements: solo-care; shared formal; shared informal; outsourced formal; and outsourced informal. We explore heterogeneity by gender and across four contexts: Northern, Western, Southern, and Eastern Europe. Outsourcing partners' care to formal or informal providers is linked with higher well-being among Northern and Western European women, but with lower well-being among women in Southern Europe, where traditional female caregiving responsibilities are stronger. Among men, outsourcing partner care is linked to higher well-being regardless of context.

CHILD-PARENT RELATION AND OLDER ADULTS' HEALTH: A CROSS-CULTURAL COMPARISON BETWEEN CHINA AND THE UNITED STATES

Peiyi Lu,¹ Dexia Kong,² and Mack Shelley,³ 1. *Columbia University, Fort Lee, New Jersey, United States*, 2. *The Chinese University of Hong Kong, Hong Kong, Hong Kong*, 3. *Iowa State University, Ames, Iowa, United States*

Western culture emphasizes independence in the child-parent relationship while Chinese culture values interdependence between adult children and older parents. This study compared the association of child-parent relationships with older adults' multidimensional health over time in the U.S. and China. Two waves of data (2012-2015) from HRS and CHARLS were used (n=6,641, aged ≥65). Linear regression models were estimated. Results showed that, compared to Chinese older adults, fewer older Americans co-resided with or lived nearby their children, had less weekly contact, and fewer financial transfers from/to their children. Most child-parent relationship variables were nonsignificant predictors of older Americans' health. However, a closer child-parent

relationship was linked to fewer depressive symptoms and better cognition among older Chinese. Co-residence was associated with poorer health among Chinese parents. The associations of child-parent relationships with older adults' health exhibited cross-cultural differences. A cultural perspective is recommended in understanding how family relations affect older adults' health.

OLDER ADULTS' SOCIAL STRESS PROFILES: A CROSS-COUNTRY COMPARISON OF THE UNITED STATES AND MEXICO

Stephanie Wilson,¹ and Christina Marini,² 1. *Southern Methodist University, DALLAS, Texas, United States*, 2. *Adelphi University, Garden City, New York, United States*

Older adults face heightened risks for loneliness due to social isolation. Low-quality relationships also fuel loneliness. Because living arrangements and family norms differ between countries, cultural differences may arise in the stress of isolation, loneliness, and difficult relationships. To examine social stress profiles in the US and Mexico, HRS (N=17,878) and MHAS (N=15,001) participants rated their loneliness, whether they lived alone, and relationship quality with their spouse, children, and friends. Five latent classes emerged in both samples: lonely and isolated; lonely with poor relationships; moderately lonely with ambivalent relationships; moderately lonely and unhappily married; and low social stress. Lonely isolation was most common among Americans (23.4%), but least common among Mexicans (14.0%). The highest risks for loneliness coincided with living alone in the US, but with low-quality relationships in Mexico. Results reveal undercurrents of older adults' social stress that were common to both countries, as well as important cultural differences.

Session 3530 (Paper)

Family and Intergenerational Relationships II

ALL IN THE FAMILY? AGE, PERIOD, AND COHORT DIFFERENCES IN KINSHIP TIES AMONG OLDER U.S. ADULTS

Ellen Compernelle,¹ Khoa Phan Howard,² and Eric Hedberg,³ 1. *NORC at the University of Chicago, Chicago, Illinois, United States*, 2. *Northwestern University, Evanston, Illinois, United States*, 3. *Abt Associates, Chicago, Illinois, United States*

In general, older adults' social networks—characteristics of which (e.g., size, type, frequency) have been linked to important health and well-being outcomes—tend to be kin-centered, although this has changed over time. Disentangling these changes, however, is difficult given typical mobility decline and shrinking networks in old age (age), the rapid social and demographic changes that occurred during the 20th century (cohort), and, in recent decades, the 2008 Recession and technological advances (period). This study uses data from the National Social Life, Health, and Aging Project (NSHAP), a nationally representative sample of older adults (ages 57-85; 2005-2016), to examine patterns in older adults' social networks, with particular emphasis on the role that family plays. Specifically, we ask: 1) Have older adults' social

networks become less kin-centered over the past decade (2005-2016)? 2) Are they less kin-centered among younger cohorts? And 3) Does the recession explain part of these period effects? We find that, between 2005 and 2016, family still comprises the majority of older adults' social networks, although their network size and range have grown larger and become less family-centric. They also report fewer close family members and friends, living with fewer family members, and less frequent interaction with network ties. Results from multi-level regression models suggest that age, and to a much lesser extent, cohort, plays a key role in many of these changes, although this varies between the first and second 5-year intervals of data collection, underscoring older adults' adaptivity to current social and economic circumstances.

COSTS OF RAISING GRANDCHILDREN ON GRANDMOTHER-ADULT CHILD RELATIONS IN BLACK AND WHITE FAMILIES

Yifei Hou,¹ J. Jill Sutor,² Megan Gilligan,³ Destiny Ogle,² Catherine Stepniak,¹ and Yufu Jiang,¹ 1. *Purdue University, West Lafayette, Indiana, United States*, 2. *Purdue University, Purdue University, Indiana, United States*, 3. *Iowa State University, Iowa State University, Iowa, United States*

The cost of raising grandchildren on grandmothers' mental and physical health has been well-documented; however, little is known about whether raising grandchildren also has a cost on grandmothers' relationships with the adult children whose children the grandmothers have raised. Drawing from theories of exchange and affect, stress process model, and racial differences in intergenerational solidarity, we tested how raising grandchildren affects grandmother-adult child relations. Further, we explored the extent to which these patterns differed by race. To address this question, we used mixed-methods data collected from 553 older mothers regarding their relationships with their 2,016 adult children; approximately 10% of the mothers had raised one or more of their grandchildren "as their own." Data were provided by the Within-Family Differences Study-I. Multilevel analyses showed that raising grandchildren was associated with greater closeness in grandmother-adult child relationship in Black families; however, in White families, raising grandchildren was associated with greater conflict in the grandmother-adult child relationship. Further, the differences by race in the effects of raising grandchildren on closeness and conflict were statistically significant. Qualitative analyses revealed that race differences in the association between raising grandchildren and relationship quality could be explained by mothers' reports of greater family solidarity in Black than White families. Our findings highlight the ways in which race and family solidarity interact to produce differences in the impact of raising grandchildren on Black and White mothers' assessment of the quality of their relationships with their adult children, consistent with broader patterns of racial differences in intergenerational cohesion.

DOES RELIGIOSITY IN THE TRANSITION TO ADULTHOOD PREDICT FILIAL NORMS IN MIDLIFE?

Jeung Hyun Kim,¹ Woosang Hwang,² Maria Brown,² and Merrill Silverstein,² 1. *Syracuse University, Syracuse, New*

York, United States, 2. Syracuse University, Syracuse, New York, New York, United States

Objective: This study aims to identify multiple dimensions of religiosity among young adults at the beginning and end of the transition to adulthood, and describe how transition patterns of religiosity in early adulthood are associated with filial elder-care norms in midlife. **Background:** There is a broad consensus that religiosity is multidimensional in nature, but less is known regarding transitions in multiple dimensions of religiosity from early to middle adulthood and predicted filial eldercare norms as a function of those religiosity transitions. **Methods:** The sample consisted of 368 young adults participating in the Longitudinal Study of Generations in 2000 (mean age = 23 years) and 2016 waves. We conducted a latent class and latent transition analyses to address our aims. **Results:** We identified three religious latent classes among young adults in both 2000 and 2016 waves: strongly religious, weakly religious, and doctrinally religious. Staying strongly religious young adults between 2000 to 2016 waves reported higher filial elder-care norms in the 2016 Wave than those who were in staying weakly religious, staying doctrinally religious, and decreasing religiosity transition patterns between 2000 to 2016 waves. **Conclusion:** Our findings suggest that religiosity is still an important value for young adults shaping their intergenerational relationships with their aging parents. **Keywords:** religiosity, filial eldercare norms, young adults, transition to adulthood

STRESSFUL FAMILY CONTEXTS AND HEALTH IN DIVORCED AND MARRIED MOTHERS

Eric Klopach,¹ and Kandauda Wickrama,² 1. *University of Southern California, Los Angeles, California, United States*, 2. *University of Georgia, Athens, Georgia, United States*

Using prospective data over 25 years from a sample of 416 women, the first objective of the current study was to investigate the biopsychosocial process over the second-half of the life course comparing mothers with different marital histories. The second objective was to investigate this biopsychosocial process for 296 married mothers focusing on their marital quality over middle years. The results suggested that, compared to being married, divorcing in early-midlife launched an adverse biopsychosocial process for women leading to physical pain, physical limitations, and depressive symptoms over their mid-later years, largely through early-midlife financial stress, regardless of later recoupling. However, subsequent financial stress did not influence divorced mothers' later-life health problems, suggesting their development of resilience. For consistently married mothers, both marital stress and financial stress uniquely influenced all three health problems throughout their mid-later years. For all mothers, these health problems progressed over mid-later years, as indicated through their stabilities and mutual influences, and these health problems also selected mothers into further escalating financial and marital stress over their mid-later years. Elucidating differential short- and long-term health influences of marital and financial stressors for divorced and married mothers provides a potentially useful information for targeted early preventive intervention efforts and policy formation. Such interventions can promote and develop resiliency factors, thereby aiding middle-aged mothers to prevent from adverse biopsychosocial processes.

WHY DO PEOPLE DIVORCE LATE IN LIFE? SWEDISH GRAY DIVORCE NARRATIVES

Peter Öberg,¹ and Torbjorn Bildtgard,² 1. *University of Gävle, Gävle, Gavleborgs Lan, Sweden*, 2. *Stockholms University, Stockholm, Stockholms Lan, Sweden*

Divorce rates for people 60+ has increased in many parts of the Western world in what has been described as a "grey divorce revolution". In Sweden these divorce rates have more than doubled since the millennium. But why do people choose to divorce late in life and what is the impact of life phase typical transitions? Qualitative interviews with 37 Swedish men and women (aged 62-81) divorced after the age of 60 were collected, covering themes regarding the divorce process: motives for and experiences of divorce, and life as grey divorcee. The results by thematic analysis show that motives for divorcing earlier in the life-course, such as abuse, unfaithfulness and addiction are prevalent also among older people. However, they tend to be framed differently in later life and be integrated into divorce narratives informed by age. We identified four life phase typical narratives for divorce: 1) Lack of a common project for the third age. 2) Partners personality change due to age related disease. 3) Increased freedom after empty-nest allowing emancipation from a dominant partner. 4) A final romantic adventure as a form of rejuvenation. All these life-phase typical narratives are related to the third age as a time of self-fulfillment, where the partner can either be part of or an obstacle to that project. The results will be used to discuss current older cohorts' views of family norms and later life from the perspective that current older cohorts participated in the divorce revolution in the 1970s as young adults.

Session 3535 (Paper)

Family Caregiving Interventions

A SYSTEMATIC REVIEW OF EFFECTS OF PHYSICAL ACTIVITY OF FAMILY CAREGIVERS OF OLDER ADULTS WITH CHRONIC DISEASE

Dawon Baik,¹ Jiyoun Song,² Aluem Tark,³ Heather Coats,⁴ and Catherine Jankowski,⁴ 1. *University of Colorado, Aurora, Colorado, United States*, 2. *Columbia University, Columbia University, New York, United States*, 3. *University of Iowa, University of Iowa, Iowa, United States*, 4. *University of Colorado, University of Colorado, Colorado, United States*

More than 17 million family caregivers (FCGs) provide care for older adults with chronic illness in the US. Caregiving for older adults with chronic disease places a considerable burden on FCGs and they tend to neglect their personal health. Generally, physical activity (PA) programs benefit the physical and psychological health of FCGs. However, no review of PA randomized clinical trials (RCTs) focused on FCGs of older adults with chronic disease. In this systematic review, we analyzed the most recent trends (2010-2020) in RCTs identifying the effects of PA in this population. This review followed the Preferred Reporting Items for Systematic Reviews and Meta-Analyses guidelines. Electronic databases (PubMed, CINAHL, Embase, PsycInfo, Cochrane Library) were searched for publications dated from 2010 to 2020.

All studies included were appraised for quality using the Cochrane Collaboration Risk of Bias Tool. Of the resulting 16 studies, most studies (n=11) targeted FCGs of older adults with dementia or cancer. Most FCGs were non-Hispanic white. PA interventions with mixed modes (e.g., aerobic and resistance exercise), mixed delivery methods (e.g., in-person and telephone) and mixed settings (e.g., supervised gym- and unsupervised home sessions) were used most frequently. PA interventions significantly improved psychological health but had inconsistent effects on physical health. Tailored PA programs, designed based on FCGs' goals, preferences and limitations, may improve upon physical health outcomes. Future PA studies should include samples of racially and ethnically diverse FCGs of older adults representing a broader range of chronic diseases.

CHARACTERIZING SUPPORTIVE SERVICES USE BY CAREGIVING RELATIONSHIP STATUS

Jasmine Travers,¹ and Chaneé Fabius,² 1. *New York University, New York, New York, United States*, 2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

Informal caregivers of aging older adults experience a high degree of burden and strain. These emotional experiences often stem from stressful tasks associated with caregiving. Caregiving supportive services that target the provision of support for stressful tasks are instrumental in alleviating caregiving burden and strain. Research is limited on what types of caregiving supportive services caregivers are accessing by relationship status and their source of information. We sought to characterize caregiving supportive services use by caregiving relationship status. We analyzed cross-sectional data from the 2015 National Study of Caregiving limited to caregivers of older adults ≥ 65 years. Caregiver relationship status (i.e., spouse, child, other relative/non-relative) was the independent variable. Bivariate analyses were performed to examine the association with caregiver relationship status and 1) any use of supportive services, 2) type of supportive service used among users, and 3) source of information about supportive services. Our sample consisted of 1,871 informal caregivers, 30.7% reported using supportive services. By caregiver relationship status, children had the greatest use of supportive services compared to spouses and other relatives/non-relatives (33.3% vs. 22.5% vs. 22.1%, $p=.02$, respectively). Among users of services, there were no differences in type of services used. Spouses primarily received their information about services from a medical provider or social worker (73.8%, $p=.004$). Our findings highlight the need to ensure that other caregiving groups such as spouses have access to important supportive services such as financial support. Medical providers and/or social workers should be better leveraged and equipped to provide this information.

DESIGN THINKING AS A METHOD FOR DEVELOPING CAREGIVER (AND OTHER) INTERVENTIONS

Leila Aflatoony,¹ Molly Perkins,² Drenna Waldrop,³ and Kenneth Hepburn,³ 1. *Georgia Tech, Atlanta, Georgia, United States*, 2. *Emory University of Medicine, Atlanta, Georgia, United States*, 3. *Emory University, Atlanta, Georgia, United States*

“Design Thinking,” an innovative, human-centric approach to problem-solving, seeks to ensure that design efforts “solve the right problem.” This presentation describes the Design Thinking process and illustrates its use in the context of three design studio sessions with of family caregivers of patients at the Integrated Memory Care Clinic (IMCC), a comprehensive medical home for persons living with dementia. The Design Thinking process entails five steps – Empathize, Define, Ideate, Prototype, Test – that engage consumers/end-users to identify, as precisely as possible, the issues or concerns that are most important to them and to further identify the possible solutions that seem to most fully address these concerns. The process can be described as one of divergent and convergent thinking. In the first session, the Empathize phase, IMCC caregivers were asked to think as broadly as possible about needs not being met by IMCC. These topics were reviewed more convergently in the second session, the Define phase; here the participants agreed on a shorter, prioritized list of needs to be addressed. In the third session (that combined the Ideate and pre-Prototype stages), participants identified 14 topics (interventions) they felt should be included in this program. Finally, in the Test phase, they assessed the topics and agreed that the most important need IMCC could address would be to provide a comprehensive orientation program for new caregivers. IMCC clinicians concurred with the salience of the problem to be solved and saw addressing it as contributing substantially to the improvement of IMCC clinical care.

ETHICAL AND METHODOLOGICAL CONSIDERATIONS INTERVIEWING DEMENTIA CAREGIVERS

Quinton Cotton,¹ Laura Block,² Clark Benson,² Amanda Friz,³ Britta Chelgren,⁴ Brady Stroik,² Emily Ploch,⁴ and Andrea Gilmore Bykovskyi,² 1. *University of Wisconsin - Medicine & Public Health, Fitchburg, Wisconsin, United States*, 2. *University of Wisconsin-Madison, Madison, Wisconsin, United States*, 3. *University of Washington, University of Washington, Washington, United States*, 4. *University of Wisconsin-Madison, University of Wisconsin-Madison, Wisconsin, United States*

Greater inclusion of people living with dementia (PLWD) and their caregivers in research is a global research priority and an expressed priority of dementia advocacy organizations. Absent inclusion of PLWD and caregivers, our understanding of dementia-related experiences and optimization of care and caregiving interventions is stymied. Qualitative interviewing techniques constitutes a primary method for obtaining PLWD and caregivers' perspectives. Yet, there is little guidance on use of qualitative interviewing techniques among PLWD and caregivers or discussion of potential challenges encountered, despite unique vulnerabilities faced throughout the research process, which may be further heightened among historically excluded groups. Meaningful progress toward inclusion of PLWD and their caregivers in dementia research necessitates broader examination of associated methodological and ethical considerations that arise in the conduct of interviews. Drawing from a large multi-site qualitative study of dementia caregivers with exposure to high levels of social disadvantage, we used a multiple-triangulation qualitative approach across

interview transcripts, memos, and interviewer discussions to identify methodological and ethical challenges that arose during the interviewing process. Challenges were identified across all phases of research, and included relational concerns with PLWD and family members due to disclosure of sensitive information, risk of re-traumatization in discussing past experiences, multiple roles of caregivers with conflicting perspectives, variable recall capacity, limited prior appraisal of caregiving, and request of interviewers for medical advice or selecting services. We outline events evidencing these challenges and proposed strategies (i.e. use of research consults, interview debriefing) to strengthen research capacity to anticipate and respond to them.

PREDICTORS OF PARTICIPATION RESTRICTION IN MIDLIFE CAREGIVERS: AN EXPLORATORY STUDY

Tara Klinedinst,¹ Scott Beach,² Heidi Donovan,¹ and Grace Campbell,¹ 1. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2. *University of Pittsburgh, University of Pittsburgh, Pennsylvania, United States*

Mid-life family caregivers (CGs) are at risk for participation restrictions (reduced engagement in valued roles and activities) due to competing demands of work, parenting, and family caregiving responsibilities. When CGs experience participation restrictions, quality of care for care recipients (CR) decreases, yet CG burden and risk for poor health increases. The purpose of this study was to identify the factors contributing to decreased participation in mid-life CGs. Participants were CGs aged 45-64 years ($n = 677$) from the National Study of Caregiving/National Health and Aging Trends Study. We used multivariate logistic regression to determine attributes of CGs, CRs, and the care situation that independently contribute to participation restrictions. We found that negative aspects of caregiving ($OR = 1.51$, 95% $CI = 1.33, 1.71$) and CR depression and anxiety ($OR = 0.90$, 95% $CI = 0.83, 0.99$) significantly predicted participation restrictions ($p < 0.05$). Positive aspects of care ($OR = 0.87$, 95% $CI = 0.74, 1.01$), frequency of helping with chores ($OR = 1.30$, 95% $CI = 0.98, 1.70$), frequency of providing personal care ($OR = 1.24$, 95% $CI = 0.97, 1.59$), and frequency of providing help getting around the home ($OR = 1.30$, 95% $CI = 0.97, 1.75$) showed trends for association with participation restrictions ($p < 0.10$). We identified factors that are related to participation restriction in mid-life CGs. Some of these factors (e.g., positive and negative aspects of caregiving, frequency of assistance provided) are potentially modifiable intervention targets that could bolster participation in this at-risk group.

Session 3540 (Symposium)

FRIENDSHIP AND LONELINESS AMONG PEOPLE LIVING WITH DEMENTIA: TOWARD COMMUNITY AND SHARED HUMANITY

Chair: Daniel R. Y. Gan

Co-Chair: Habib Chaudhury

Discussant: Jim Mann

An increasing number of people living with dementia (PLWD) age in community. In North America, this number ranges from 61-81% of the total number of PLWD. As many

as one in three PLWD do not live with a care partner. Since most PLWD do not drive, many may spend a significant proportion of time within half a mile of their homes. Yet, the neighbourhood may or may not provide “ways of being in the world that are more accepting and embracing of the kinds of disruptions that dementia can produce” (Hillman & Latimer, 2017). To support continued social participation, meaningful everyday networks are required. PLWD and care partners may identify more or less strongly with a community depending on their position in the network, its spaces, and activities. According to Nancy (1991), “community” has been conjured as an antidote to the loneliness of the human condition, which explains its allure. In response, Costello (2014) argued that “community” requires one to constantly try and “fall short” in caring for another’s changing experiences. The value of a community thus depends on the quality of its friendships – the ability of otherwise lonely individuals to empathize – which may be threatened by challenges to PLWD’s personhood. This symposium brings together expertise in community gerontology, philosophy, and neuropsychology to advance current conceptualizations of personhood in community amid cognitive decline. These will be discussed in relation to lived experiences, with the aim to inform future research and practice of dementia care and prevention in community.

AT-HOMENESS: RETHINKING PERSONHOOD-IN-COMMUNITY THROUGH THE LENS OF SOCIAL IDENTITY

Daniel R. Y. Gan,¹ Graham Rowles,² and Habib Chaudhury,¹ 1. *Simon Fraser University, Vancouver, British Columbia, Canada*, 2. *University of Kentucky, Lexington, Kentucky, United States*

Since Chaudhury’s seminal work (2008), spatial ethnographies of the everyday lives of people living with dementia (PLWD) have proliferated. From an experiential perspective, geographies of home (Blunt & Varley, 2004) and geographies of dementia may overlap significantly. We conducted a meta-ethnographic synthesis of $n=28$ articles to identify points of convergence and divergence in these literatures using comparative thematic analysis with NVivo 12. Whereas geographies of home highlight at-homeness (e.g., ontological safety and daily activities), geographies of dementia underscore communal and civic participation (e.g., social relationships). These themes converge around “social identity” which may be an important construct that helps PLWD feel at home. The quality of life of PLWD in the community may be influenced by prior (and present) experiences of at-homeness. These become more pertinent as older adults shelter in place. We discuss the implications of these findings in relation to relational models of personhood-in-community (Swinton, 2020) and community gerontology.

MUTUAL RECOGNITION: EMPATHY AS THE FOUNDATION OF COMMUNITY IN DEMENTIA

Peter Costello, *Providence College, Providence, Rhode Island, United States*

This paper explores the challenges of developing a healthy, genuine community as some of its members experience cognitive decline or dementia. I draw upon philosophical discussions on community (Stein, 2000) and Husserlian empathy

(1931;1939) to identify these challenges. First, community is organic; it relies on the differentiated roles of individual members to remain healthy. The ability to recognize the contribution of each member is essential for its health. Second, dyadic relationships may similarly be healthy or waning depending on the presence or absence of mutual empathy. Empathy is embodied. Persons living with dementia (PLWD) need to experience being recognized as persons, in person, in order for dyadic relationships and communities to thrive. As such, some communities may become unhealthy in the absence of mutual recognition. In these instances, careful interventions, e.g., through shared experiences and embedded memories, may be required to promote the well-being of the community and its members.

SHARED HUMANITY: ADVANCING THE PERSONHOOD OF PEOPLE LIVING WITH DEMENTIA

Steven Sabat, *Georgetown University, Georgetown University, District of Columbia, United States*

During the past three decades, the idea of personhood, and the degree to which people living with dementia (PLWD) possess it and ought to be treated as such, has been discussed by a number of important scholars such as Tom Kitwood and John Swinton. Although both asserted that PLWD ought to be treated as persons, their notions of personhood appear to be quite different. Kitwood noted that personhood was a status “bestowed” on another individual, whereas Swinton asserted that personhood was endemic to human beings. Yet, these approaches are complementary. I show, using case studies, how supportive communities are required for PLWD to teach us about our humanity, so long as we remain “finely aware and richly responsible” (Nussbaum, 1990). Our humanity is shared, in the Zulu concept of “Ubuntu” (Tutu, 1981;1989), when each individual’s humanity is ideally expressed in relationship with others. This has important implications for clinical practice.

Session 3545 (Symposium)

FROM MARGIN TO CENTER: INTERSECTIONALITY AND THE POLITICS OF ENVIRONMENTAL GERONTOLOGY

Chair: Austin Oswald

Co-Chair: Jarmin Yeh

Discussant: Jarmin Yeh

As the population becomes increasingly older and culturally diverse, so too does the need for critical scholarship that examines the complex lives of differently positioned older adults in relation to their social and physical ecologies. This innovative symposium reflects the importance of putting intersectional frameworks (Collins & Bilge, 2016) in conversation with environmental gerontology to critically examine structures of power in assessing who matters and who benefits from place-based initiatives that intend to support healthy aging (Phillipson, 2004). Perry et al.’s paper addresses the politics of responsibility, asking who is responsible for keeping older people safe in light of Covid-19 though a citywide senior housing coalition in Detroit. The second paper, authored by Johnson, speaks to the politics of access and structural inequalities that create disparities

in end-of-life care for unhoused older adults. The third and fourth papers, by Stinchcombe and colleagues and Oswald, critically examine dominant paradigms of age-friendliness in Canada and the United States though a politics of representation that highlights who is (in)visible in these initiatives. The final paper by Reyes, on the civic participation of Latinx and African American older adults, illustrates how structural change cannot happen without engaging these populations in the political process. Together, these papers exemplify the politics of environmental gerontology and demonstrate that without acknowledgment of multi-layered identities and the structures contributing to their inequities, environmental gerontology is inadequate, as it may overlook important social and environmental factors that connect older people to the places where they live and die.

CRITICAL AGE-FRIENDLY RESEARCH AND REPRESENTATIONAL ETHICS

Austin Oswald, *CUNY Graduate Center, New York, New York, United States*

As the efforts of the Global Age-friendly Cities and Communities movement mature and continue to grapple with society’s shifting dynamics, blind spots and knowledge gaps are exposed. This research applies critical discourse analysis to examine the evolution of Age-friendly NYC using an intersectional lens committed to an ethics of representation. Over 1,000 pages of public records were analyzed to trace the history of this movement in relation to age, race, sexuality, gender, ability, and class. Findings suggest that Age-friendly NYC is a global leader of the age-friendly movement, yet social identities are represented neither equally nor universally in its initiatives. Discussions of race, sexuality, and gender are subtle. They also overlook how these identities may intersect and shape the aging experience for differently positioned older adults. A comprehensive understanding of the aging experiences of those with multiple intersecting identities is needed to inform future age-friendly policies and programs.

A CRITICAL EXAMINATION OF SENIOR HOUSING: PROMOTING EQUITY THROUGH ENSURING SAFE SPACES

Tam Perry,¹ Zach Kilgore,² Michael Appel,³ Michele Waktins,⁴ Claudia Sanford,⁵ and Dennis Archambault,⁶ 1. *Wayne State University, Detroit, Michigan, United States*, 2. *CSI Support & Development, Warren, Michigan, United States*, 3. *Develop Detroit, Detroit, Michigan, United States*, 4. *Volunteers of America-Michigan, Southfield, Michigan, United States*, 5. *United Community Housing Coalition, Detroit, Michigan, United States*, 6. *Authority Health, Detroit, Michigan, United States*

As affordable senior housing communities aimed to address the health and well-being concerns of residents in the COVID-19 pandemic, special attention to safety during renovation had to be addressed. This paper offers case studies from members of a city-wide advocacy group, Senior Housing Preservation-Detroit. Eighty one percent of covid deaths in the City of Detroit are those 60 and above; 81.2% of deaths have been among African Americans (Detroit Health Department, 2021). With the grief and challenge in a city hit early on in the 2020 pandemic, these case studies

will highlight how Covid-19 affected planned projects in senior buildings, how stakeholders such as developers, staff and residents responded and key considerations for future emergencies affecting senior housing communities. This paper offers critical perspectives applicable to many urban landscapes in order to raise awareness to policy makers, and practitioners.

INVESTIGATING BARRIERS AND FACILITATORS TO CONGRUENCE IN PLACE OF CARE AMONG UNHOUSED PALLIATIVE CARE PATIENTS

Ian Johnson,¹ and Michael Light,² 1. *University of Washington, SEATTLE, Washington, United States*, 2. *Harborview Medical Center, Seattle, Washington, United States*

An important quality marker for end-of-life services is congruence with patient's preferred place of care, but this congruence in place of care is less likely for those facing structural inequalities (Grunier et al., 2007). As homelessness among older adults in the United States grows (Culhane et al., 2013), the urgency in understanding place of care in palliative care with unhoused patients grows. This presentation illustrates results from an organizational case study (Yin, 2014) of a novel homeless palliative care team and focuses on a qualitative content analysis of charts of patients over 50 receiving care both before and during the COVID-19 pandemic (n=27). Findings highlight (1) the interplay between environmental factors, psychosocial resources and constraints, and medical acuity in determining where care can take place, (2) facilitators for care in marginal settings such as emergency shelters and encampments, and (3) where opportunities for more equitable age-friendly healthcare system interventions exist.

CIVIC PARTICIPATION AMONG LATINX AND AFRICAN AMERICAN OLDER ADULTS, AN INTERSECTIONALITY LIFE-COURSE PERSPECTIVE

Laurent Reyes, *Rutgers University, Rutgers University, New Jersey, United States*

Older adults' civic participation has received considerable attention, but most scholarship has focused on formal volunteering and voting. The literature shows that rates of voting and volunteering have been consistently lower among African Americans and Latinx older adults compared to their White counterparts. However, little research has explored civic participation in the context of historical structures of inequality that exclude these populations from participating in formal civic activities and continue to do so today. In addition, other civic activities are going unrecognized. To understand civic participation through the lens of Latinx and African American older adults I draw from intersectional life course perspective to contextualize participants' lived experiences across the life course and within historical and current socio-political space in which they live and participate. Study's findings could improve conceptualizations and measurements of civic participation for future studies, and inform efforts to support civic participation among these populations.

AGE-FRIENDLY AND LGBTQ2+ FRIENDLY COMMUNITY INITIATIVES IN CANADA: PRELIMINARY FINDINGS

Arne Stinchcombe,¹ Emma Whitehouse,² and Kimberley Wilson,² 1. *Brock University, St. Catharines,*

Ontario, Canada, 2. *University of Guelph, Guelph, Ontario, Canada*

Age-Friendly Communities (AFC) initiatives are gaining momentum in Canada and around the globe with many communities making commitments to becoming age-friendly. Aging lesbian, gay, bisexual, transgender, queer, and two-spirit (LGBTQ2+) Canadians are a diverse subpopulation whose social histories and contexts may not have been considered in such initiatives. In response, many community-level organizations have created programs and supports for older LGBTQ2+ persons. Through a survey and environmental scan, we sought to identify and profile such initiatives. In addition, in-depth interviews were held with representatives from community groups to ascertain how community leaders construct and define communities that are both age and LGBTQ2+-inclusive. Participants were also asked to reflect on how their sense of community and support was impacted by the Covid-19 pandemic. The findings indicated that many supports for LGBTQ2+ older adults emerged outside of formal AFC initiatives and in response to a perceived normativity among services for older adults.

Session 3550 (Paper)

Health of Older Black Adults

DISCRIMINATION, CHURCH SUPPORT, PERSONAL MASTERY, AND PSYCHOLOGICAL DISTRESS AMONG BLACK PEOPLE IN THE UNITED STATES

James Muruthi,¹ Bertranna Muruthi,² Reid Thompson Cañas,³ Lindsey Romero,² Abiola Taiwo,² and Peter Ehlinger,⁴ 1. *University of Oregon, Eugene, Oregon, United States*, 2. *University of Oregon, University of Oregon, Oregon, United States*, 3. *university of oregon, University of Oregon, Oregon, United States*, 4. *University of Oregon, 97402, Oregon, United States*

Objective: This study used the stress process model to test the mediating effects of personal mastery and moderating effects of church-based social support on the relationship between everyday discrimination and psychological distress across three age groups of African American and Afro-Caribbean adults. Methods: Using a national sample of 5008 African Americans and Afro-Caribbean adults from the National Survey of American Life Study, this study employs structural equation modeling to investigate the relationships between everyday discrimination, personal mastery, church-based social support, and psychological disorders. Results: Everyday discrimination was an independent predictor of psychiatric disorders across all groups. Group- and age-specific comparisons revealed significant differences in the experience of everyday discrimination and psychiatric disorders. Mastery was a partial mediator of the relationship between discrimination and psychiatric disorder among Afro-Caribbeans while church support was a significant moderator only among the young and older African Americans. Implications: Together, our study findings provide useful first steps towards developing interventions to reduce the adverse psychological impacts of everyday discrimination on African Americans and Afro-Caribbeans. Intervention efforts such as individual psychotherapy aimed to improve Afro-Caribbean individuals' sense of mastery would be a partial solution to

alleviating the adverse effects of discrimination on their psychological health.

EDUCATIONAL MOBILITY AND AGE-RELATED DECREMENTS IN KIDNEY FUNCTION ACROSS ADULTHOOD AMONG BLACK AND WHITE ADULTS

Agus Surachman,¹ Alexis Santos,² Jonathan Daw,³ Lacy Alexander,³ Christopher Coe,⁴ and David Almeida,²

1. *University of California San Francisco, San Francisco, California, United States*, 2. *Pennsylvania State University, University Park, Pennsylvania, United States*, 3. *The Pennsylvania State University, University Park, Pennsylvania, United States*, 4. *University of Wisconsin - Madison, Madison, Wisconsin, United States*

This paper examines the association between educational mobility and age-related decrements in kidney function. Data from the main survey and the Biomarker Project of the Midlife in the United States (MIDUS) Wave 2 and Refresher samples were combined, resulting in 1,861 adults (54.5% female; age 25-84, Mage=53.37) who self-identified as non-Hispanic Black (n=326) and non-Hispanic white (n=1,535). The estimated glomerular filtration rate (eGFR) was based on serum creatinine, calculated using the CKD-EPI formula. Intergenerational educational mobility was based on the comparison between parental education (no high school/HS degree versus HS degree or higher) and participant's education level (HS degree or lower versus some college versus bachelor's degree or higher). Results from regression analysis indicated that Black participants in the moderate upward mobility group (parental education = no HS degree, participant's education = some college) showed significantly steeper age-related decrements in eGFR across adulthood compared to Black adults with higher stable high status (parental education = HS degree or higher, participant's education = bachelor's degree or higher), $B=-0.70$, $SE=0.26$, $p=.008$, or white adults with higher stable high status, $B=0.58$, $SE=0.29$, $p=.044$. A steeper age-related decrement in eGFR is known as a reliable risk factor for chronic kidney disease and cardiovascular disease. These findings support the notion of skin-deep resilience among Black adults who experience upward socioeconomic mobility. We explored multiple psychosocial factors that may explain these findings, including lifetime and daily discrimination, social status and financial strains, and perceived stress and depressive symptoms.

LOOKING BEYOND FAMILY FOR SUPPORT AND INTIMACY: HOW OLDER SINGLE AND WIDOWED BLACK WOMEN COPE WITH LONELINESS

Margaret Salisu, *SUNY@Downstate, Brooklyn, New York, United States*

Older adults are at risk of depression and higher rates of suicide due to loneliness. Loneliness is even more pronounced for single and bereaved older adults. Although loneliness is one of the benchmarks for measuring well-being, little is known about how older Black women understand and cope with loneliness. The aim of this qualitative phenomenological study is to explore how older Black women understand and cope with loneliness. Fourteen older single and/or widowed Black women in New York City participated in this study. The application of the Black feminist standpoint theory helped to

understand the loneliness of the participants in the context of their Blackness. Three themes emerged from the study: loneliness increasing with age, looking beyond the family for intimacy, and balance. All the participants expressed feeling some degree of loneliness, regardless of whether they lived alone or with family. Although they had robust social circles, they experienced loneliness, feelings of isolation, and a loss of emotional connection and intimacy. However, these losses went unexpressed, as the participants struggled to balance their position as Black matriarchs—which they considered an important familial role due to their identity as older Black women—with their emotional needs. These two roles did not converge for the women, as the role of Black matriarch posed an expectation they would not experience emotional loss in old age. The implications of this study for policy and practice pertain to the intersection of race, age, gender, and sexuality in assessing the risk of loneliness.

SELF-MANAGEMENT OF DIABETES IN BLACK MEN: THE FLINT MANUP INTERVENTION STUDY

Dana Carthron,¹ Wayne McCullough,² Samir Chatterjee,³ Kent Key,² Kelsey Lemke,⁴ David Gordon,⁵ Gretchen Piatt,⁶ and Harold Neighbors,^{2,1} 1. *North Carolina Central University, North Carolina Central University, North Carolina, United States*, 2. *Michigan State University, Flint, Michigan, United States*, 3. *Claremont Graduate University, Claremont, California, United States*, 4. *University of Michigan-Flint, Flint, Michigan, United States*, 5. *University of Michigan-Flint, Ann Arbor, Michigan, United States*, 6. *University of Michigan, University of Michigan, Michigan, United States*

The story of John Henry, the “steel-drivin’ man”, is well known to Black men in the United States. John Henry is considered a hero because he demonstrated tremendous strength and self-determination. The MANUP diabetes program used the John Henryism, defined as high-effort active coping in the face of adversity, as the basis of a diabetes intervention for Black men. MANUP conducted four community-based focus groups identifying topics of concern to Black men with type 2 diabetes (T2D). Interestingly, the men reported that high-effort active coping was crucial for successful diabetes self-management. MANUP then developed and implemented a longitudinal culturally targeted self-management program for 33 Black men with T2D in Flint, Michigan. MANUP included discussion groups, physical activity, and an app incorporating text-messaging, group-chat, and a blood glucose monitoring dashboard to improve glycemic control (A1c). This single-group, repeated measures intervention assessed A1c three times over a six-month period. Improvements in A1c were observed at: baseline – time 2: 8.9% vs 8.6%, $p=0.14$; time 2 – time 3: 8.6% vs 8.1%, $p=0.21$; and baseline – time 3: 8.9% vs 8.1%, $p=0.005$. After controlling for age and insulin use, the significant reduction in A1c over 6 months remained ($p=0.01$). These findings demonstrate that combining mobile health technology and moderate physical activity with culturally targeted discussion topics can improve T2D self-management and reduce A1c in Black men. More community-driven longitudinal intervention studies that improve diabetes self-management among Black men are needed to achieve gender and racial health equity..

TESTING THE JOHN HENRYISM HYPOTHESIS ON CARDIOMETABOLIC HEALTH AMONG OLDER AFRICAN AMERICANS

Yanping Jiang,¹ Jennifer Gómez,²

Jacqueline Rodriguez-Stanley,³ and Samuele Zilioli,⁴

1. Rutgers University, New Jersey, United States, 2. Wayne State University, Wayne State University, Michigan, United States,

3. Wayne State University, Detroit, Michigan, United States,

4. Wayne State University, Detroit, Michigan, United States

In the context of racism, the John Henryism Hypothesis posits that prolonged high-effort coping, which is referred to as John Henryism, may take a toll on physical health among individuals from low socioeconomic status (SES) backgrounds, particularly low SES African Americans. This study aimed to test the John Henryism Hypothesis among older African Americans by examining the combined effect of John Henryism and childhood SES on cardiometabolic health indexed by metabolic syndrome and systemic inflammation. Data were drawn from a sample of 170 urban older African Americans (Mage = 67.4 years, 75.9% female), who completed questionnaires assessing John Henryism and childhood SES (i.e., parental education). Blood pressure, waist circumference, and fasting blood were also collected to assess metabolic syndrome and systemic inflammation. Results indicated that John Henryism was significantly associated with elevated metabolic syndrome symptoms among older African Americans reporting low childhood SES ($b = 0.42$, 95%CI = [0.02, 0.83]), but not among those with high childhood SES ($b = -0.33$, 95%CI = [-0.78, 0.13]). This result was robust to a variety of demographic variables, lifestyle behavioral factors, and health conditions that are known to be associated with metabolic syndrome. A similar pattern of results, however, did not emerge for systemic inflammation. Our findings highlight the importance of considering the joint impact of early childhood socioeconomic backgrounds and individual psychological proclivities in explaining the elevated cardiovascular disease risk among older African Americans.

Session 3555 (Paper)

Innovations in Gerontological Pedagogy and Practice

AN INTEGRATIVE APPROACH TO PROMOTING WELLNESS IN OLDER ADULTS: AN ONLINE UNDERGRADUATE COURSE

Robin Majeski, *University of Maryland, Baltimore County, Catonsville, Maryland, United States*

As gerontology and geriatric programs look to grow their connections with health and allied health areas, examining emerging health care areas is important. Thus, this session will present key concepts and pedagogical strategies from an innovative online undergraduate course, An Integrative Approach to Promoting Wellness in Older Adults, that is taught in the Erickson School at the University of Maryland at Baltimore County. The course brings together a conventional western allopathic approach and a holistic, patient-centered, integrative approach which includes complementary therapies, to promote wellness in older adults. Specifically, the

session will present a comparison of the philosophical premises of conventional western and integrative approaches to health promotion. It will present a holistic model of health, an overview of the effectiveness and safety of different complementary therapies, and examples of how an integrative approach with conventional western and complementary therapies can be used in to promote health in older adults with particular chronic conditions. Also, a discussion of the incorporation of diversity content in the course, an integrative approach to health promotion for underserved populations, and specific pedagogical strategies used to facilitate learning in synchronous and asynchronous online learning environments are included. Session presentation techniques include a PowerPoint presentation, demonstration of examples of conventional western and integrative approaches to health promotion in older adults through case studies, and audience participation.

CREATIVE ARTS INTERVENTIONS AS A WAY TO COMBAT AGEISM AND INCREASE STUDENT INTEREST IN GERONTOLOGY

Emily Ihara, Catherine Tompkins, Megumi Inoue, and Kendall Barrett, *George Mason University, Fairfax, Virginia, United States*

Despite the continuous, growing need for health professionals who are trained to work with older adults living with Alzheimer's disease and related disorders (ADRD), research shows that recruitment and retention of gerontological health care professionals remains low. Ageism plays an important role in this resistance and continues to have societal impact, even proliferating in disturbing ways during the COVID-19 pandemic via stereotypes, discrimination, and framing in the media. Gerontologists in various health professional educational settings continue to address the need to infuse aging content in creative ways and increase the competency of all health professionals to combat ageism and understand the importance of specialized care for this population. Our gerontological research team has engaged students in various ways to increase interest in aging issues and ADRD. Current research projects involve the implementation of non-pharmacological, creative arts interventions, including Mason's Music & Memory Initiative (M3I) and TimeSlips, both which have the potential to appeal to intergenerational partnerships and provide students with tools to communicate better with those living with ADRD. We examined attitudes about aging among undergraduate and graduate students (N=78) who have completed our training modules and/or participated in these two projects. The asynchronous trainings provide content on ADRD and the implementation of non-pharmacological, creative arts interventions. We examined students' attitudes about aging and ADRD and analyzed their open-ended responses regarding their experiences with someone living with ADRD. Various levels of education, relationships with older adults, and life experience influenced their responses regarding their attitudes about aging.

DESIGNING SOCIALLY ASSISTIVE ROBOTS FOR PEOPLE WITH ALZHEIMER'S AND RELATED DEMENTIA

Kimberly Mitchell,¹ Xiaopeng Zhao,² Jinxiao Yu,³ and Luke MacDougall,⁴ 1. *University of Tennessee, Knoxville,*

Tennessee, United States, 2. University of Tennessee, University of Tennessee, Tennessee, United States, 3. University of Tennessee, Knoxville, Knoxville, Tennessee, United States, 4. University of Tennessee - Knoxville, Knoxville, TN, Tennessee, United States

Alzheimer's disease (AD) is the most common form of dementia and is associated with memory loss and cognitive impairments that affect daily life. Approximately 5.8 million older adults in the U.S. are living with AD. People with AD often require high levels of care and assistance to maintain daily activities. The majority of care provided to a person living with AD or other forms of dementia is from a family caregiver, representing 18.6 billion hours of unpaid care valued at \$244 billion. The long duration, time-intensive nature of caregiving imposes high burdens on caregivers. We designed a socially assistive robot to engage in conversation with people with AD, by engaging in conversation, helping them conduct simple daily tasks, and relieving caregivers of some of their responsibilities. Using design-thinking methodology, a prototype social robot has been created using 3-d printing technology and a single board computer based on raspberry Pi. Interaction between human and robot is implemented using the Mycroft open source voice assistant. The authors demonstrated that the robot is able to have natural conversations with human users. The overall cost of the robot is estimated to be less than \$300, rendering it possible for wide distribution among the public. Future research includes further implementation of various cognitive assessment and cognitive training programs using the social robot to improve the quality of life for people living with AD.

GENERATIONAL VIEWS OF LIFE CHALLENGES AND THE AGING PROCESS: INFLUENCE OF RELATIONSHIP TYPE, FREQUENCY, EXPERIENCE
Mary Pagan, *SUNY Oswego, Baldwinsville, New York, United States*

This study, conducted within a higher education setting, examines and compares views of younger adults (age 20-24) and older adults (age 65-97) in two major areas; life challenges and aging processes. Are they complimentary, neutral, or opposing? We investigate views and the potential association to relationship type (family relation, close contact, casual), frequency (times interacting per month) including mode of communication (face-to-face, phone, visual technology), and narrative of overall experience. A mixed-method approach incorporated convenience survey data and extensive in-depth interviews. Data collection instruments were designed and conducted by students in an upper-division wellness and aging course at SUNY Oswego. Students partnered with older adult study participants. Participant (n=80) inquiries centered on life challenges (COVID, adversity, loss, discrimination/bias, regrets) and aging processes (views on aging, life expectancy, changes in health). The study also examines the impact of the 3-credit course on aging views; specifically did they change their life expectancy choice (years) from the week one by the end of the course.

INNOVATIONS IN WORKFORCE EDUCATION FOR FAMILY CAREGIVING

Kathryn Sexson,¹ Jennifer Mongoven,² Lisa Badovinac,¹ and Theresa Harvath,¹ *1. University of California, Davis, UC*

Davis, California, United States, 2. University of California, Davis, Sacramento, California, United States

The number of adults providing care to a family member in the US is estimated at more than 50 million, with nearly half of those individuals providing complex care. National organizations, such as AARP, and federal programs, such as the Geriatric Workforce Enhancement Program, have identified the family caregiver as an integral member of the health care team, yet there is a paucity of clinical workforce education programs for how best to partner and support family caregivers. A virtual summit was held in September 2020 to highlight existing educational programs designed to prepare undergraduate and graduate health professional students or practicing clinicians in their efforts to support family caregivers. The meeting consisted of a keynote, 6 podium presentations and 12 poster presentations. Primary themes emerged around target learners, curricula topics, and outcomes. Programs targeted learners from across the workforce, from undergraduate students to continuing professional education programs, with the majority targeting graduate (masters and doctoral) learners. Several programs were interprofessional in development, delivery and target learner. Curricula topics varied across programs and included caregiver assessments, multicultural considerations, communication, care plan development and risk screening. Education outcomes primarily focused on assessment of participants' confidence and knowledge. The summit highlighted that the topic of family caregiving is included in clinical education inconsistently, if at all. The summit helped identify gaps in education, curriculum development, and the need for common learning outcomes to strengthen a clinician's ability to support family caregivers as part of the care team.

Session 3560 (Symposium)

INTERGENERATIONAL PROGRAMMING DURING THE PANDEMIC: TRANSFORMATION DURING (CONSTANTLY) CHANGING TIMES

Chair: Shannon Jarrott

Co-Chair: Skye Leedah

Discussant: Donna Butts

Implementing intergenerational programming amidst the COVID-19 pandemic has required creativity, partnership, and dedication to the work. Most intergenerational programs involving in-person meetings or events are accompanied by guidelines to protect participant health and safety. Programming is routinely cancelled or postponed due to poor weather or contagious illness, particularly when a vulnerable population is involved. The needs for safety precautions and continued intergenerational contact were both amplified during the pandemic, leading many to modify or innovate ways to engage generations rather than eliminate contact for extended periods. Technology has afforded new approaches to engage young people and older people with each other; non-technological ways have also proven effective. This symposium will address strategies used to implement intergenerational programs during the pandemic. Authors will highlight lessons learned and strategies they expect to retain in the future. The first paper describes a pivot in nutrition programming designed for a shared site

with preschool children and frail older adults. In paper two, authors discuss their partnership-based approach shifting to remote offerings of Cyber-Seniors programming. Paper three addresses how MentorUp Service-Learning expanded its reach by adaptations to virtual programming for older adults in retirement communities. The final paper presents evaluation data comparing arts programming delivered in-person pre-pandemic and again virtually during the pandemic. In each case, researchers and community partners learned techniques to maintain their programmatic foci. Some projects developed strategies they plan to maintain post-pandemic. Donna Butts, Executive Director of Generations United serves as the symposium discussant.

RESPONDING TO INTERGENERATIONAL FOOD SECURITY AND NUTRITION EDUCATION NEEDS WITH REMOTE PROGRAMMING

Jill Juris Naar,¹ Rachel Scrivano,² and Shannon Jarrott,²
 1. *Appalachian State University, Boone, North Carolina, United States*, 2. *The Ohio State University, Columbus, Ohio, United States*

In-person intergenerational programming focused on nutrition education and healthy food access among older adults and preschool children in care settings was abandoned last year when COVID forced center closures. Food for a Long Life (FLL), a 5-year community-based participatory research (CBPR) project, re-oriented programming in response to heightened community food insecurity and social isolation during COVID. With county Extension agents, FLL modified and initiated new partnerships to expand food pantry services for several hundred families and deliver nutrition programming to youth (n=28) and older adult (n=130) participants in two states. In this presentation we share how the CBPR method supported adaptive programming and evaluation while continuing to advance project goals, including to promote the sustainability of an intergenerational food pantry and nutrition programming delivery after funding ends in summer 2021.

KEEPING INTERGENERATIONAL PROGRAMMING ALIVE DURING THE PANDEMIC THROUGH COLLABORATION AND TECHNOLOGY

Skye Leedahl,¹ Erica Estus,¹ and Catherine Taylor,²
 1. *University of Rhode Island, Kingston, Rhode Island,*

United States, 2. *Age-Friendly Rhode Island, Providence, Rhode Island, United States*

The University of Rhode Island Cyber-Seniors' in-person intergenerational programming was quickly shut down during the Spring 2020 semester due to the pandemic. Since then, we have worked diligently and collaboratively with partners to offer creative intergenerational options for university students and older adults living in the community. We partnered with Age-Friendly RI and the Census Outreach to provide phone-based wellness checks to 11,500 older adults, and this evolved into a statewide weekly call with partners (n=34 calls) focused on reducing social isolation for older adults. Our students moved to offering phone or Zoom-based appointments with 21 community organizations across Rhode Island and became mentors for the new Cyber-Seniors® organization digital offerings (n=90 students). In this presentation, we will share our experiences with the pivot from in-person to mostly technology-based interactions. We will discuss challenges and lessons learned, some of which will be retained regardless of the pandemic situation.

INTERGENERATIONAL SERVICE-LEARNING DURING COVID-19

Tamar Shovali, *Eckerd College, Eckerd College, Florida, United States*

Mentor Up is a technology training program designed to reduce loneliness through technology training and intergenerational relationships. The program, which has similarities to Cyber Seniors, has been held at Eckerd College for four years and has traditionally been held in-person at a local Continuing Care Retirement Community (CCRC). During the pandemic we partnered with AARP to re-think the program and offer a modified version of Mentor Up on Zoom. Five one-hour one-on-one virtual technology training sessions led by 16 students were scheduled. Participants joined to ask questions about how to use features on their smartphones or how to navigate the Zoom virtual platform more effectively. The remote nature of programming allows for expanded 2021 participation, including AARP members across Florida and all three Westminster Communities of Florida in the area (CCRC, ALF, SNF). Participation rates, strategies to implement intergenerational programs on a virtual platform, and lessons learned will be highlighted.

THE PHOTOGRAPHY AND MEMORY PROJECT: ADAPTING AN INTERGENERATIONAL PROGRAM DURING A GLOBAL PANDEMIC

Carson De Fries,¹ Roddy MacInnes,¹ Anne Walker,¹ Amy DelPo,² Leslie Hasche,¹ Andrew Steward,³ and Matthew Schilz,¹ 1. *University of Denver, Denver, Colorado, United States*, 2. *Denver Public Library, Denver, Colorado, United States*, 3. *University of Denver, Lone Tree, Colorado, United States*

Since 2019, a university-community partnership has connected undergraduate students with older adults from independent living and community-based settings (i.e., library, art museum) for a photography-based intergenerational program. This study compares the implementation and impacts of this photography-based intergenerational program both in an in-person format before the COVID-19 pandemic (n=34) and an online format during the COVID-19 pandemic (n=25). Pre- and post- results from older adult and undergraduate student participants regarding social connection and evaluation comments from program participants and staff were compared between the pre-pandemic, in-person format, and the same program's offering the next year in a virtual format. Results indicate that the benefits of this intergenerational photography program were experienced at a similar level during and before COVID-19. Findings demonstrate that intergenerational programs could effectively continue in remote formats, while also identifying potential challenges in implementation for staff regarding managing logistics and maintaining engagement among participants.

Session 3565 (Paper)

Interventions With Persons With Dementia and Their Caregivers

INTERVENTION DESIGN WITH COGNITIVELY IMPAIRED POPULATIONS: THE OPTIMIZE DEPRESCRIBING INTERVENTION

Orla Sheehan,¹ Elizabeth Bayliss,² Ariel Green,³ Melanie Drace,² Jonathan Norton,⁴ Emily Reeve,⁵ Kathy Gleason,⁶ and Cynthia Boyd,⁴ 1. *Johns Hopkins University School of Medicine, Johns Hopkins University, Maryland, United States*, 2. *Kaiser Permanente Colorado, Denver, Colorado, United States*, 3. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*, 4. *Johns Hopkins University, Baltimore, Maryland, United States*, 5. *University of South Australia, Adelaide, South Australia, Australia*, 6. *Kaiser Permanente, Kaiser Permanente Institute for Health Research, Colorado, United States*

Older adults with cognitive impairment and multiple other chronic conditions often have polypharmacy which increases their risks of medication related cognitive effects, adverse drug events, hospitalization and death and leads to higher health care costs. Deprescribing, the process of reducing or stopping potentially inappropriate medications may improve outcomes for those older adults with cognitive impairment and multiple chronic conditions. The OPTIMIZE trial examined whether a primary care-based, patient- and

family-centered intervention educating and activating patients, family members, and clinicians about deprescribing reduces numbers of chronic medications and potentially inappropriate medications for older adults with dementia or mild cognitive impairment and multiple chronic conditions. We explored the mechanisms of intervention effectiveness through post hoc qualitative stakeholder interviews and surveys with 15 patients, 7 family caregivers, and 28 clinicians. All stakeholder groups endorsed the acceptability of the intervention. Success of the intervention was affected by contextual factors including prior knowledge and openness to deprescribing, cognition and prognosis. Positive outcomes included patients and care partners scheduling specific appointments to discuss deprescribing and providers remembering to consider deprescribing in cognitively impaired older adults. Recollection of intervention materials was inconsistent over time but highest shortly after intervention delivery. The time required to mail intervention materials to patients prior to a scheduled appointment limited the reach of the intervention by excluding persons with rapidly scheduled appointments. Our work identifies key learnings in intervention roll out which can guide future translation of our intervention to other settings and other pragmatic intervention studies in this vulnerable population.

PERSON- AND TASK-CENTERED MEALTIME CARE: IMPACT ON POSITIVE, NEUTRAL, AND CHALLENGING BEHAVIORS IN PEOPLE WITH DEMENTIA

WEN LIU,¹ Kristine Williams,² Melissa Batchelor,³ Yelena Perkhounkova,⁴ and Maria Hein,⁴ 1. *The University of Iowa College of Nursing, Iowa City, Iowa, United States*, 2. *University of Kansas School of Nursing, Kansas City, Kansas, United States*, 3. *George Washington University, Washington, D.C., District of Columbia, United States*, 4. *University of Iowa, Iowa City, Iowa, United States*

Mealtime is an important daily activity to ensure intake. Person-centered and task-centered care may influence individual positive, neutral, and challenging mealtime behaviors. Yet, little work has fully examined their relationships. This study aimed to examine the association between person-centered and task-centered care approaches and individuals' positive, neutral, and challenging mealtime behaviors. This secondary analysis of 110 videotaped mealtime observations involved 29 staff and 25 residents with dementia (42 unique staff-resident dyads) in 9 nursing homes. Videos were coded using the refined Cue Utilization and Engagement in Dementia mealtime video-coding scheme. Logistic regression models were fit to four dependent variables representing resident mealtime behaviors: 1) positive/neutral behaviors (nonverbal), 2) positive utterances (verbal), 3) functional impairments (nonverbal), and 4) resistive behaviors (verbal and nonverbal). Independent variables were staff person-centered care modifications (nonverbal), person-centered utterances (verbal), and task-centered behaviors (verbal and nonverbal). Covariates included resident age, gender, eating function, and video duration. Resident positive utterances were associated with staff person-centered care utterances (OR =1.38, 95% CI = 1.09,1.76). Resident functional impairments were associated with staff person-centered care

modifications (OR=1.33, 95% CI=1.02, 1.74) and fewer staff person-centered utterances (OR=0.81, 95% CI=0.66, 1.00). Resident resistive behaviors were associated with more staff person-centered utterances (OR=1.65, 95% CI=1.18, 2.31). Findings provided preliminary information supporting the role of staff person-centered care on resident positive and challenging mealtime behaviors. Findings inform use of verbal and nonverbal person-centered care strategies to improve positive communication and reduce challenging behaviors during mealtime in people with dementia.

RESULTS OF OPTIMIZE: A CLUSTER RANDOMIZED TRIAL OF PATIENT, FAMILY, AND PROVIDER EDUCATION IN PRIMARY CARE

Ariel Green,¹ Elizabeth Bayliss,² Susan Shetterly,² Melanie Drace,² Jonathan Norton,³ Emily Reeve,⁴ Orla Sheehan,⁵ and Cynthia Boyd,³ 1. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*, 2. *Kaiser Permanente Colorado, Denver, Colorado, United States*, 3. *Johns Hopkins University, Baltimore, Maryland, United States*, 4. *University of South Australia, Adelaide, South Australia, Australia*, 5. *Johns Hopkins University School of Medicine, Johns Hopkins University, Maryland, United States*

Individuals with cognitive impairment frequently have multiple chronic conditions (MCC), increasing their risk for polypharmacy and associated adverse outcomes. Optimizing medications through deprescribing (reducing or stopping the use of inappropriate medications or medications unlikely to be beneficial) may improve outcomes for this population. Optimize was a pragmatic, 12-month cluster-randomized trial of deprescribing in primary care within a not-for-profit integrated delivery system. Participants were age 65+ with dementia or mild cognitive impairment (MCI), 2+ chronic conditions, and 5+ chronic medications. The intervention consisted of a deprescribing educational brochure for patients/caregivers, and Tip Sheets for primary care clinicians. Outcomes were the number of chronic medications and presence of potentially inappropriate medications (PIM). In total, 1,433 patients received, and 1,579 control clinic patients would have been eligible to receive, the intervention (N=3,012). After 6 months, mean estimates of chronic medications were 6.23 in the intervention group and 6.33 in the control group adjusting for baseline counts, age, and gender (p=0.13). Excluding those without complete 90 days follow-up increased the adjusted effect size to 0.14 (p=0.08). In sub-analyses of individuals with 7+ medications at baseline (N= 1,434), the adjusted effect size was 0.19 (p=0.07) at 6 months and 0.21 (p=0.045) when excluding those without complete 90 days' follow-up. Change in proportions of PIM did not differ between intervention and control groups. An educational intervention for patients, caregivers and clinicians may prompt reductions in chronic medications. The relatively small effect size highlights the complexity of medication management for individuals with dementia or MCI and MCC.

VOICE YOUR VALUES, TAILORED ADVANCE CARE PLANNING IN PERSONS LIVING WITH MILD DEMENTIA: A FEASIBILITY STUDY

Shirin Vellani,¹ Martine Puts,² Katherine McGilton,³ and Andrea Iaboni,⁴ 1. *McMaster University, Toronto, Ontario,*

Canada, 2. *University of Toronto, University of Toronto/ Toronto, Ontario, Canada*, 3. *KITE-Toronto Rehabilitation, University Health Network, Toronto, Ontario, Canada*, 4. *Toronto Rehabilitation Institute, University Health Network, Toronto, Ontario, Canada*

Older adults diagnosed with mild dementia can identify their wishes, values and goals of care with a high degree of accuracy and reliability. However, there is a paucity of research to guide best practices on how to incorporate Advance Care Planning (ACP) in the care of older adults living with mild dementia. Thus, only a minority of them participate in any ACP discussions. We developed an intervention called Voice Your Values (VYV) that healthcare professionals can implement to identify and document values of older adults. This single group pretest and posttest design aimed to determine the feasibility, acceptability and preliminary efficacy of the intervention. A convenience sample of 20 dyads of older adults and their trusted individuals were recruited from 4 geriatric clinics. Tailored VYV intervention was delivered to dyads on a one-on-one basis over two sessions using video-conferencing. Feasibility was determined through recruitment and retention rates, and intervention fidelity. Acceptability was assessed using modified Treatment Evaluation Inventory. Primary outcome was the Surrogate Decision-Making Confidence Scale. Secondary outcomes included an ACP engagement survey to assess older adults' engagement in ACP; Dementia Knowledge Assessment Tool for trusted individuals; and the Kessler Psychological Distress Scale for all participants. The recruitment rate was 45%, retention rate was 100% and 92% participants rated VYV as highly acceptable. Trusted individuals showed statistically significant improvement in decision-making confidence (p=.02) and psychological distress (p=.02); but no improvement in dementia knowledge (p=.47). Older adults demonstrated statistically significant improvement in ACP engagement (p=<.01). Initial feasibility of VYV was demonstrated.

Session 3570 (Symposium)

LGBTQIA+ CAREGIVING AND CARE NEEDS OF PERSONS LIVING WITH ALZHEIMER'S DISEASE AND RELATED DEMENTIAS

Chair: Jason Flatt

Co-Chair: Whitney Wharton

Discussant: Joel Anderson

Lesbian, gay, bisexual, transgender, queer, intersex, and/or asexual (LGBTQIA+) older adults are a growing population. LGBTQIA+ persons living with Alzheimer's disease and related dementias (ADRD) face unique challenges in terms of accessing care and support compared with their non-LGBTQIA+ counterparts. The care challenges faced by LGBTQIA+ people living with ADRD may be compounded by the fact they are more likely to be single, more likely to live alone, and less likely to have children. Several studies have started to explore the unique needs of LGBTQIA+ caregivers and persons living with ADRD. In this symposium, we highlight current research addressing the psychosocial and health-related needs of LGBTQIA+ caregivers and persons living with ADRD. Two presentations address psychosocial factors and health among LGBTQIA+ caregivers of persons with ADRD. Krystal Kittle will present analyses

using population-based data on LGBTQIA+ caregivers in terms of caregiving burden and mental health. Shana Stites will present results from the Health and Retirement Study highlighting differences among same-sex spouses in terms of caregiving patterns and research participation. Next, Ethan Cicero will present prevalence estimates of care needs and challenges among diverse transgender adults living with memory problems. Finally, we will highlight a promising intervention for LGBTQIA+ caregivers of persons with ADRD. Jason Flatt will describe the adaptation and feasibility of the Savvy Caregiver program for LGBTQIA+ caregivers. Joel Anderson, an expert in LGBTQIA+ caregiving for persons with ADRD, will facilitate a conversation about these results and place them in the context of current LGBTQIA+ and ADRD research.

HEALTH CONCERNS FOR LGBTQ+ CAREGIVERS OF PEOPLE WITH ALZHEIMER'S DISEASE AND RELATED DEMENTIAS

Krystal Kittle,¹ Joel Anderson,² Jennifer Pharr,³ Sheniz Moonie,³ and Jason Flatt,³ 1. *University of Nevada, Las Vegas, Las Vegas, Nevada, United States*, 2. *University of Tennessee at Knoxville, Knoxville, Tennessee, United States*, 3. *University of Nevada Las Vegas, Las Vegas, Nevada, United States*

We examined four states with data on LGBTQ+ identity and the ADRD caregiving modules from the 2019 Behavioral Risk Factor Surveillance System. Multivariable regression models examined the associations between LGBTQ+ identity and health outcomes. Among the ADRD caregivers, 55,920 (4.7%) identified as LGBTQ+. Compared with non-LGBTQ+ caregivers, LGBTQ+ caregivers were younger and more likely to live in rural counties. Half of LGBTQ+ caregivers spent 20+ hours per week providing care, and nearly 72% reported helping with personal care. LGBTQ+ caregivers reported more days when their mental health was not good than non-LGBTQ+ caregivers ($B = 8.01; 95\% \text{ CI} = 2.32-13.75$). Female caregivers overall were twice as likely than males to experience depression ($\text{OR} = 2.11; 95\% \text{ CI} = 1.29-3.45$). These findings provide insight into characteristics of LGBTQ+ caregivers and their health concerns. Interventions that promote mental health and reach diverse LGBTQ+ caregivers in rural communities are crucial in supporting LGBTQ+ caregivers of people with ADRD.

PATTERNS AMONG SAME-SEX SPOUSAL COUPLES: DIVERSE SOCIOCULTURAL REPRESENTATION IN ALZHEIMER'S RESEARCH

Shana Stites, *University of Pennsylvania, Philadelphia, Pennsylvania, United States*

Emerging evidence shows that understanding characteristic patterns between study partners (SP) and subjects can inform initiatives to diversify representation of sociocultural groups in ADRD research. This study examined same-sex spousal dyads with the goal of identifying bellwethers of opportunities to build diversity in ADRD research. Descriptive analysis of The Aging, Demographics and Memory Study (ADAMS), which enrolled a subset of subjects from the Health and Retirement Study and a SP for each subject. Eight same-sex spousal couples were among 718 SP-subject dyads (1.1%). Gay men were 3 times as likely to be spousal

SPs ($n=6$) than lesbians ($n=2$), even though women far outnumber men overall. Patterns in caregiving and other characteristics also differed. Same-sex couples are underrepresented in ADRD research. Patterns among those enrolled suggest masculine and feminine norms may drive research engagement. This is discussed in the context of increasing sociocultural diversity in ADRD research across key social groups.

MEMORY-RELATED LIMITATIONS AND CARE NEEDS OF GENDER MINORITY BIPOC ADULTS

Ethan Cicero,¹ Nickolas Lambrou,² Whitney Wharton,³ and Jason Flatt,⁴ 1. *Emory University School of Nursing, Atlanta, Georgia, United States*, 2. *University of Wisconsin, Madison, Madison, Wisconsin, United States*, 3. *Emory University, Atlanta, Georgia, United States*, 4. *University of Nevada Las Vegas, Las Vegas, Nevada, United States*

Limited research exists investigating cognitive impairment and Alzheimer's disease and related dementias (ADRD) among gender minority (GM) adults (transgender/non-binary), including examining memory-related challenges among GMs who also identify as Black, Indigenous, or People of Color (BIPOC). 2015-2019 Behavioral Risk Factor Surveillance System data were used to explore care needs of GM and cisgender (CG) adults with subjective cognitive decline (SCD, $N=441$), which may be the first clinical manifestations of ADRD. Regression models examined SCD-associated functional limitations and care needs among GM-BIPOC, GM-White, CG-BIPOC, and CG-White adults. GM-BIPOC and GM-White were 2-4x more likely to have SCD-related limitations, require assistance with daily tasks, be unable to do day-to-day or social activities when compared to CG-White. GM-BIPOC were 2-5x more likely to be uninsured and experience cost-related healthcare barriers compared to GM-White and CG-White/BIPOC. Additional research is needed to improve care and well-being for this understudied population.

EVALUATION OF THE SAVVY CAREGIVER PROGRAM FOR LGBTQIA ADULTS LIVING WITH ALZHEIMER'S DISEASE AND RELATED DEMENTIAS

Jason Flatt,¹ Kiera Pollock,² Yeonsu Song,³ Whitney Wharton,⁴ and Joel Anderson,⁵ 1. *University of Nevada Las Vegas, Las Vegas, Nevada, United States*, 2. *Los Angeles LGBT Center, Los Angeles, California, United States*, 3. *UCLA, Los Angeles, California, United States*, 4. *Emory University, Atlanta, Georgia, United States*, 5. *University of Tennessee at Knoxville, Knoxville, Tennessee, United States*

Approximately 350,000 LGBTQIA+ older adults in the U.S. currently have Alzheimer's disease and related dementias (ADRD), with projections nearing 1 million by 2030. LGBTQIA+ older adults face challenges in receiving adequate and inclusive care and caregiving support due to the inability to rely on traditional family networks, greater disability, and discrimination when seeking aging services. Working with the Los Angeles LGBT Center Aging in Community Initiative, we evaluated the: 1) Adaptation of the Savvy caregiver training program for care providers of LGBTQIA+ persons living with ADRD; and 2) Feasibility and acceptability of the program. Care providers were very satisfied with the program, strategies, information, and activities

of the tailored Savvy program. For psychosocial outcomes, there were trends in greater care planning, increases in asking friends/family for support, and decreased loneliness. Additional research is needed on culturally-relevant aging services and behavioral interventions for care providers of LGBTQIA+ persons living with ADRD.

Session 3575 (Symposium)

MARGRET M. AND PAUL B. BALTES AWARD LECTURE: OPTIMISM AND HEALTH: RESOURCE OR DELUSION?

Chair: Eileen Crimmins

The lecture will be given by the 2020 Baltes Award recipient, William Chopik, PhD, of Michigan State University. The recipient of the 2021 Baltes Award is Laura B. Zahodne, PhD, of the University of Michigan. The Margret M. and Paul B. Baltes Foundation Award in Behavioral and Social Gerontology recognizes outstanding early-career contributions in behavioral and social gerontology. The award is generously funded by the Margret M. and Paul B. Baltes Foundation.

OPTIMISM AND HEALTH: RESOURCE OR DELUSION

William Chopik, *Michigan State University, East Lansing, Michigan, United States*

There is a general, widely-held belief that optimism is always a good thing. While there is much previous research suggesting that optimists enjoy several health and wellness benefits, there is also a large body of research suggesting that optimism is not always advantageous. Examining how optimism develops and changes across the lifespan may give us insight into how we use optimism and allow us to determine if and when optimism is helpful or maladaptive. In this talk, I will review evidence debating the efficacy of optimism, as well as examine how optimism develops across the lifespan. I also discuss how life events may or may not impact the developmental trajectory of optimism. Lastly, I address currently unanswered questions and emphasize the contextual nature of optimism's advantages. Ultimately, being persistently optimistic about the future is a nearly universal human trait. But the exact contexts in which this positive thinking is helpful--if ever--is an intriguing question that speaks to how we think about ourselves, how we think about others, and how we think about our many possible futures.

Session 3580 (Paper)

Marriage and Health

MARITAL QUALITY AND HEAVY ALCOHOL USE AMONG OLDER COUPLES

Angela Curl, Jennifer Bulanda, and
Amy Restorick Roberts, *Miami University, Oxford, Ohio, United States*

Supportive marital relationships may reduce partners' problematic health behaviors, whereas unhappy relationships may lack efficacious spousal monitoring of health and increase the likelihood of using maladaptive coping

strategies, such as heavy alcohol use, to deal with relationship problems. We used pooled data from the 2014 and 2016 waves of the Health and Retirement Study to examine how both partners' perceptions of marital quality were associated with heavy drinking. Our analytic sample included married couples in which both spouses were over age 50, completed the leave-behind psychosocial questionnaire, and provided non-missing data on marital quality and alcohol use ($n=2,095$ couples). Measures included both positive and negative dimensions of marital quality and controls for sociodemographic, economic, health, household and marital characteristics. Using Proc Glimmix, we estimated a dual-intercept Actor-Partner Interdependence Model (APIM), in which separate equations were computed simultaneously for husbands and wives. For husbands, higher negative marital quality was associated with an increase in the odds of their own heavy drinking ($OR=1.27$), but there was no significant association between wives' marital quality and husbands' heavy drinking behavior. For wives, marital quality was not significantly associated with their own heavy drinking, but husbands' higher ratings of both negative and positive marital quality increased the risk of wives' heavy drinking ($OR=1.60$ and $OR=1.75$, respectively). Results suggest that marital quality is associated with heavy drinking in later life: self-ratings of marital quality matter for men, whereas spousal perceptions of marital quality are more important for women.

MARITAL STATUS, MARITAL TRANSITIONS, AND SLEEP QUALITY IN MID TO LATE LIFE

Kristin August, *Rutgers University, Camden, Camden, New Jersey, United States*

Sleep is an important behavior in the prevention and management of chronic conditions in later life. Marital status may account for variability in sleep quality, but little is known about this association in the later part of life or how transitions into and out of marriage are related to changes in sleep quality. This study used the resource model and crisis model as frameworks to understand how marital status and marital transitions were related to sleep quality in mid to late life and whether these findings differed by gender. Interview data from 2,872 participants 50-74 years old ($M=59.77$ years; 63.7% women) from the ORANJ BOWL, a longitudinal panel study in New Jersey, were used. Marital status and sleep quality were examined in two waves approximately 10 years apart. All analyses controlled for health and sociodemographic characteristics. Weighted regressions revealed that individuals in committed romantic relationships and women had worse sleep quality than those in other marital status groups and men ($p<.005$). Weighted fixed effects regressions revealed that compared to individuals who remained married, individuals who remained divorced or widowed or who became widowed had better sleep quality, whereas those who became divorced had worse sleep quality ($ps<.05$); individuals who transitioned into marriage had better sleep quality than those who remained divorced or widowed ($ps<.03$). Findings differed depending on the index of sleep quality examined. Efforts to understand which middle-aged and older adults are most vulnerable to sleep disturbances can inform the design of interventions to promote better sleep quality.

MARITAL STRAIN AND SUPPORT AND SUBJECTIVE WELL-BEING IN LATER LIFE: ASCRIBING A ROLE TO EARLY-LIFE CONDITIONS

Laura Upenieks,¹ and Yingling Liu,² 1. *University of Texas at San Antonio, San Antonio, Texas, United States*,
2. *Baylor University, Waco, Texas, United States*

Decades of research have the beneficial effects of marital support and the detrimental consequences of marital strain on health and well-being. However, we know relatively less about how circumstances in childhood—a key developmental period of the life course—influence the relational structure in which later life is embedded and any implications this may hold for well-being. We integrate the life course perspective with the stress process model to offer a framework for how childhood conditions (childhood happiness, family structure, and financial strain) moderate the relationship between marital support/strain and subjective well-being in older adulthood in potentially different ways for men and women. The consequences of marital strain may be more severe and the benefits of marital support may not be as strongly felt for those adults who experienced greater adversity during childhood. Drawing on longitudinal data from Waves 2 (2010-2011) and 3 (2015-2016) of the NSHAP project (N = 1,376), results from lagged dependent variable models suggest that marital support buffers the effect of not living with both parents in childhood on subjective well-being for men. Meanwhile, women raised in families that experienced financial hardship reported lower subjective well-being in the context of marital strain in later life. No significant interaction effects were obtained for childhood happiness. Taken together, our findings suggest that adverse experiences in childhood can be scarring, particularly in the context of strained intimate relationships. However, a supportive marriage can, in some cases, offset the effects of childhood hardship on subjective well-being in later life.

VALIDATION STUDY OF THE SPANISH VERSION OF THE MARITAL SATISFACTION QUESTIONNAIRE FOR OLDER PERSONS

José Adrián Fernandes-Pires,¹ Andrés Losada-Baltar,² María del Sequeros Pedroso-Chaparro,¹ Laura Gallego-Alberto,³ Isabel Cabrera,³ Lucía Jiménez-Gonzalo,¹ María Márquez-González,³ and Jorge González Guardia,¹ 1. *Rey Juan Carlos University, Alcorcón, Madrid, Spain*, 2. *Universidad Rey Juan Carlos, Madrid, Madrid, Spain*, 3. *Universidad Autónoma de Madrid, Madrid, Madrid, Spain*

Interpersonal relationship quality is relevant for older adults' well-being and mental health. Studies focused on methods to evaluate marital satisfaction in older adults and the relationship of this variable with psychological correlates are scarce. This study examined the psychometric properties of the Spanish version (Castro-Díaz et al., 2012) of the Marital Satisfaction Questionnaire For Older Persons (MSQFOP; Haynes et al., 1992) in a sample of middle-aged and older adults from Spain. Participants were 130 individuals (60.8% women) 40 years or older (M= 60.31, SD=11) involved in a marital/partner relationship. The assessed variables were marital satisfaction (MSQFOP), marital warmth, positive emotions, frequency of arguments, perceived stress associated with the COVID-19 pandemic, and anxiety and depressive

symptoms. The results from the exploratory factor analysis yielded a three factor structure (compatibility, communication, and sex) explaining 77.8% of the variance. Even though the factor structure was the same as that of the original version, some items loaded on other factors. The internal consistency (Cronbach's alpha) was 0.97. The results revealed significant ($p < .001$) positive associations between marital satisfaction, marital warmth, and positive emotions. In addition, significant negative associations were found between marital satisfaction and frequency of arguments, stress associated with the COVID-19 pandemic, and anxious and depressive symptomatology ($p < .05$). The findings suggest that Spanish version MSQFOP has good psychometric properties that recommend its use with middle-aged and older adults. Marital satisfaction seems to be a relevant construct for understanding stress, well-being, and mental health in middle-aged and older adults.

Session 3585 (Symposium)

MEETING THE CHALLENGES OF COVID-19 IN LONG-TERM CARE: LESSONS LEARNED FROM AN INTERNATIONAL PERSPECTIVE

Chair: Karin Wolf-Ostermann

Discussant: Marie Boltz

The outbreak of COVID-19 is a major challenge for health care systems all over the world. Older residents of long-term-care facilities (LTCF) such as nursing homes (NH) are among those at highest risk for COVID-19 and comprise a population with dramatically higher rates of morbidity and mortality than the general community. NH staff are also affected by the pandemic as they are challenged by increased workloads, emotional burden caused by the loss of resident life, and the fear of becoming infecting themselves or infecting family members. Finally, the pandemic places emotional and practical demands upon informal carers who are involved in the life of the NH resident. Therefore, research should investigate different perspectives on LTCF during the pandemic and discuss major challenges and possible support structures and strategies. Such an understanding is necessary to optimize care, support post-pandemic recovery, and prepare for future public health challenges. This international symposium will therefore provide four presentations to address these issues. The first presentation will report on global mortality data associated with COVID-19 in LTCF. The second presentation reports on the situation in German NHs addressing the complex situation of morbidity, care dependency, and social isolation. The third presentation will describe the effects of the pandemic upon NH staff in Poland. The final presentation examines the impact and guidelines of allowing visitors in NHs in the Netherlands for residents, family caregivers and staff. Our discussant, Marie Boltz, will synthesize the research findings and lead a discussion of future directions for policy and practice.

COVID-19 IN GERMAN NURSING HOMES: A PANEL STUDY ON MORBIDITY, BURDEN OF CARE, AND SOCIAL ISOLATION

Kathrin Seibert,¹ Dominik Domhoff,² Franziska Heinze,³ Benedikt Preuss,⁴ Heinz Rothgang,⁴ and Karin Wolf-Ostermann,⁵ 1. *Institute for Public Health and Nursing Research, University of Bremen, Bremen, Germany*, 2. *Institute for Public Health and Nursing*

Research, University of Bremen, Bremen, Germany,
 3. Research Center on Inequality and Social Policy (SOCIUM), university of Bremen, Bremen, Germany,
 4. Research Center on Inequality and Social Policy (SOCIUM), University of Bremen, Bremen, Germany,
 5. University of Bremen, University of Bremen, Bremen, Germany

Germany was hit by the second wave of the pandemic much harder than by the first wave. The study aims to describe the extent to which nursing homes (NH) are affected by COVID-19. About 8,000 NHs were invited to participate in two waves of an online survey, with a share of 5-10% participating. The share of all deceased NH-residents with COVID-19 is about 50% (04/2020-02/2021). Factors that increase the risk of an outbreak in NH are the spread of the virus in the population, the size of the institution and staff-resident-ratio. The initial lack of protective equipment has decreased during the second wave, but the facilities have to cope with massive additional care needs with reduced staff. NHs have partly banned contacts between residents and relatives. As a conclusion the support of NH in their attempt to fight the impact of this and further pandemic situations requires highest attention.

THE IMPACT OF VISITATION GUIDELINES DURING COVID-19 ON WELL-BEING AND DAILY LIFE IN NURSING HOMES

Debby Gerritsen,¹ Ramona Backhaus,² Bram de Boer,² Judith Urlings,³ Raymond Koopmans,¹ Jan Hamers,² and Hilde Verbeek,² 1. Radboud University Medical Centre, Nijmegen, Gelderland, Netherlands, 2. Maastricht University, Maastricht, Limburg, Netherlands, 3. Living Lab in Ageing and Long-Term Care, Maastricht, Limburg, Netherlands

Nursing homes across the world have taken very restrictive measures, including a ban for visitors, to prevent and control COVID-19 infections. This study reports on findings of a study investigating guidelines on allowing visitors in nursing homes and the impact on residents' well-being, family caregivers and staff. In total, 76 nursing homes in the Netherlands were followed using a survey study, including three waves of data collection in (May 2020, September 2020, March 2021). Results indicated a negative impact of a visitation ban for residents' overall well-being. There was a variety in guidelines of allowing visitors in nursing homes, and showed that safe visiting was possible during the COVID-19 pandemic. Staff perceived a fragile balance between infection prevention and the impact of restriction on residents. In conclusion, a general ban for visitors is not necessary and may do more harm than good for residents living in nursing homes.

MENTAL HEALTH CONSEQUENCES OF SARS-COV-2 PANDEMIC ON LONG-TERM CARE FACILITY SOCIAL CARE PROVIDER IN POLAND

Dorota Szcześniak,¹ Adrianna Senczyszyn,¹ Maria Maćkowiak,¹ Marta Ciulkowicz,¹ Katarzyna Lion,² and Joanna Rymaszewska,¹ 1. Department of Psychiatry, Wrocław Medical University, Poland, Wrocław Medical University, Dolnoslaskie, Poland, 2. Menzies Health Institute Queensland, Griffith University, Australia, Menzies Health Institute Queensland, Queensland, Australia

During the pandemic long-term care facilities (LTCF) social health providers constantly remain in a dilemma between

loyalty to people with dementia and concerns for their own families. All of these factors could contribute to the mental burden, burnout, and increased chance of depression, anxiety and post-traumatic symptoms. In our study we aimed to provide a window on psychopathological consequences (somatic symptoms, anxiety and insomnia, social dysfunction, and depression) associated with the exposure of LTCF employees to the risk of the SARS-CoV-2 contagion in Poland. Moreover, we investigated if institutional factors, such as personal protection equipment availability, safety guidelines or access to psychiatric and psychological support at the workplace, contribute to the decrease of psychological distress of the LTCF personnel. The results can serve as ready-made guidelines for mitigating the SARS-CoV-2 impact on dementia care and constitute the basis for further analysis of long-term consequences of this precedential situation.

INTERNATIONAL EVIDENCE ON THE COVID-19 DEATHS OF PEOPLE WHO LIVE IN LONG-TERM CARE FACILITIES

Joseba Zalakain,¹ Elizabeth Lemmon,² David Henderson,³ Amy Hsu,⁴ Andrea Schmidt,⁵ Greg Arling,⁶ Florian Kruse,⁷ and Adelina Comas-Herrera,⁸ 1. SIIS Centro De Documentación Y Estudios, Donostia San Sebastián, País Vasco, Spain, 2. University of Edinburgh, Edinburgh, Scotland, United Kingdom, 3. University of Edinburgh, NINE Edinburgh BioQuarter, Scotland, United Kingdom, 4. Bruyère Research Institute, Ottawa, Ontario, Canada, 5. Austrian National Public Health Institute (Gesundheit Österreich GmbH, GÖG), Vienna, Wien, Austria, 6. Purdue University, West Lafayette, Indiana, United States, 7. Radboud University Medical Center, Nijmegen, Gelderland, Netherlands, 8. London School of Economics and Political Science, London School of Economics and Political Science, England, United Kingdom

The COVID-19 pandemic has had a disproportionate impact, in terms of mortality, on people who live in Long-Term Care Facilities (LTCFs). This study involved compiling data on number of deaths of people who live in LTCFs and analyzing the extent to which differences between countries could be attributed to measures taken to control the spread of COVID-19 to LTCFs or to other factors. The study found that differences in how the data is collected make international comparisons difficult but that there is a clear correlation between number of COVID-19 deaths of residents in LTCFs and number of COVID-19 deaths of people living in the community. The study also found that countries that experienced a particularly high number of deaths in LTCFs during the first COVID-19 wave tended to have lower relative mortality in LTCFs in the subsequent waves, which potentially could be attributed to learning from the initial shock.

Session 3590 (Paper)

Mental Health Impact of the COVID-19 Pandemic

FOOD INSECURITY AND MENTAL HEALTH TRAJECTORIES DURING THE COVID-19 PANDEMIC: LONGITUDINAL EVIDENCE

Dexia Kong,¹ Peiyi Lu,² Elissa Kozlov,³ and Mack Shelley,⁴ 1. The Chinese University of Hong Kong, Hong Kong, Hong Kong

Kong, 2. *Columbia University, Fort Lee, New Jersey, United States*, 3. *Rutgers University, Piscataway, New Jersey, United States*, 4. *Iowa State University, Ames, Iowa, United States*

The extent to which food insecurity impacts changes in mental health outcomes over time in the context of Covid-19 remains unknown. Using longitudinal data from a nationally representative survey, the objectives of the present study were to: (1) assess the prevalence of food insecurity among U.S. adults amid the Covid-19 pandemic; and (2) investigate the relationships between food insecurity statuses and changes in mental health outcomes over time as the pandemic unfolds. Longitudinal data from the Internet-based Understanding Coronavirus in America survey collected bi-weekly between April and December 2020 were used ($n=4,068$, 15 repeated measures). Adult respondents (aged ≥ 18) were asked about their food insecurity experiences and stress/anxiety/depressive symptoms. Linear mixed-effect models examined changes in mental health outcomes over time among groups with various food insecurity statuses. Overall prevalence of food insecurity was 8%. Food insecurity was consistently associated with higher levels of stress/anxiety/depressive symptoms ($p < 0.001$). Stress/anxiety/depressive symptoms declined over time among food-secured U.S. adults. However, mental health trajectories of respondents with various food insecurity categories, including food insecurity status, persistent food insecurity, and food insecurity of higher severity and longer duration, remained stable or worsened over time. Moreover, the mental health gap between food-secured and food-unsecured participants widened over time. Food insecurity represents a pressing public health problem during the Covid-19 pandemic with substantial mental health implications. Persistent and severe food insecurity may contribute to mental health disparity in the long term. Food insecurity reduction interventions may alleviate the estimated alarming mental health burden as the pandemic unfolds.

GLOBAL RISE OF DEPRESSION PREVALENCE AMID THE COVID-19 PANDEMIC

Anna Egbert,¹ Stephen Karpiak,² Richard Havlik,³ Sadiye Cankurtaran,⁴ and Sirinnaz Ozturk,⁵ 1. *Ronin Institute, Montclair, New Jersey, United States*, 2. *GMHC, National Resource Center on Aging and HIV, New York, New York, United States*, 3. *National Institutes of Health, National Institute of Aging, New York, New York, United States*, 4. *Jagiellonian University, Kraków, Malopolskie, Poland*, 5. *University of Warsaw, Warsaw, Mazowieckie, Poland*

The immense burden of depressive disorders is on the rise, with global prevalence estimates in 2017 ranging from 4% to 13%. The novel coronavirus SARS-CoV-2 is likely to impact the established risk factors for depressive disorders. Thus, a rapid increase in depression prevalence can be expected amid the COVID-19 pandemic. Using epidemiologic data ($N=111,225$) derived from an extant online survey "Measuring Worldwide COVID-19 Attitudes and Beliefs" (launched by Fetzer and colleagues, March-April 2020) in 178 countries, we examined age-dependent global prevalence of depression and assessed the impact of social factors caused by the COVID-19 pandemic on depressive symptomatology. Point prevalence of depression was measured using

the PHQ8 standard cut-off score (i.e., ≥ 10). Correlates of depressive symptoms were analyzed with hierarchical regression modeling separately in three age groups, i.e., 18-34, 35-54 and 55+ years. We found that nearly 20% of individuals globally revealed significant symptoms of depression, including 27% of young, 15% middle-aged, 9% adults aged 55+. These data suggest that the prevalence of depression is 2-5 times higher than global estimates preceding the COVID-19 pandemic. Regression modeling explained approx. 50% variability in depressive symptoms across the three age groups. Increased risk of depression was found in females, single or divorced individuals, and those who presented poorer health and higher anxiety. Social restrictions amid the COVID-19 pandemic were marginal risks for depression. Together, this study highlights the impact of the COVID-19 pandemic on the mental health of people of different ages and urges the development of increased access to psychological interventions.

MENTAL HEALTH AND WELL-BEING AMONG INDIVIDUALS WITH A SENSORY LOSS DURING COVID-19 LOCKDOWN MEASURES

Natascha Merten,¹ Amy Schultz,² Matthew Walsh,² Suzanne van Landingham,² Paul Peppard,² Carol Ryff,² and Kristen Malecki,² 1. *University of Wisconsin - Madison, Madison, Wisconsin, United States*, 2. *University of Wisconsin-Madison, Madison, Wisconsin, United States*

Hearing and vision impairment are highly prevalent chronic conditions and are associated with poorer mental health and well-being. Mental health problems may be exacerbated by COVID-19-related lockdown measures and limitations of in-person contacts may affect those with sensory impairments more severely. We aimed to determine whether hearing and/or visual impairment were associated with worse mental health and psychological well-being during lockdown measures in Spring/Summer 2020 in Wisconsin. We included 1341 (64% women, aged 20-92 years) Survey of the Health of Wisconsin participants of a COVID-19 survey (May-June, 2020). We assessed self-reported current mental health and psychological well-being and vision and hearing impairment. Logistic regression models with vision and hearing impairments as determinants and multiple mental health and well-being outcomes were used and adjusted for age, gender, race, education, heart disease, hypertension, hyperlipidemia and diabetes. In preliminary analyses, we found associations of vision impairment with increased odds of generalized anxiety disorder (odds ratio=2.10; 95% confidence interval=1.32-3.29) and depression (2.57; 1.58-4.11). Individuals with a vision impairment were more likely to be taking medication for depression (1.75; 1.13-2.68), report being lonely (1.65; 1.00-2.64) and report hopelessness (1.45; 1.01-2.08). Individuals with a hearing impairment were more likely to be taking depression medications (1.72; 1.07-2.73) and to report being lonely (1.80; 1.05-2.98). Sensory impairment was not associated with stress levels or sense of purpose in life. Individuals with sensory impairment may represent a particularly vulnerable population during the COVID-19 pandemic. Future research should determine underlying reasons and interventions to mitigate this populations' disadvantages.

PREDICTORS OF MENTAL HEALTH DURING THE COVID PANDEMIC

Helen Lach,¹ Devita Stallings,² Rebecca Lorenz,³ John Taylor,⁴ and Janice Palmer,⁵ 1. *Saint Louis University, Saint Louis, Missouri, United States*, 2. *Saint Louis University, St. Louis, Missouri, United States*, 3. *University at Buffalo, Buffalo, New York, United States*, 4. *Saint Louis University, Hillsboro, Missouri, United States*, 5. *Webster University, St. Louis, Missouri, United States*

Health professionals have been concerned about mental health of older adults during the COVID pandemic. To explore their experiences, we conducted an online survey of community-dwelling older people to examine their mental health related to stress, based on Pearlin's Stress Process Model. A snowball approach was used; we sent recruitment e-mails through senior organizations and contacts with e-mail lists of potential participants; there were 504 respondents. We used regression analysis to explore predictors of mental health based on Pearlin's model. Background characteristics included age ($m = 75.7$, $SD 4.95$), gender (77.4% female) and race (White = 93.4%). The CESD-10 provided a measure of mental health. Scores indicated 62.3% of the sample scored in the low range for depressive symptoms and 37.7% in the moderate to high range. Stressors were measured using the Perceived Stress Scale that includes subscales of perceived helplessness and perceived self-efficacy. We also measured perceived social isolation, and current life space as predictor variables. Results of regressing the CESD-10 onto the set of theoretical predictors revealed that the inclusion both subscales of the Perceived Stress Scale, social isolation, and current life space jointly accounted for approximately 63.0% of the variability in the outcome beyond the baseline model ($F_{\text{Change}}[4, 449] = 211.15$, $p < .01$), which included age, race, and gender. The model overall, accounted for approximately 66.5% ($R^2_{\text{adjusted}} = 66.0\%$) of the variability in CESD-10 scores, ($F[7, 449] = 127.473$, $p < .01$). Addressing stress among older adults is important to help them maintain positive mental health.

SOCIAL CONNECTIVITY IN THE CONTEXT OF COVID-19 AND LONG-TERM CARE

Anna Garnett,¹ Hannah Pollock,² Natalie Floriancic,³ Lorie Donelle,² Yolanda Babenko-Mould,² Abe Oudshoorn,² Carri Hand,² and Cheryl Forchuk,² 1. *University of Western Ontario, London, Ontario, Canada*, 2. *Western University, London, Ontario, Canada*, 3. *Western University, Western University, Ontario, Canada*

The COVID-19 pandemic has disproportionately impacted older adults, particularly those residing in long-term care homes (LTCHs), causing immense loss of life and resulting in overall health declines in LTCH residents. These vulnerable older adults have also experienced extreme loneliness, anxiety and depression. Social connectedness is an important contributor to well-being and quality of life of older adults in LTCHs and family members are an essential component to this. However, restrictions driven by policies to protect resident safety, have constrained family members' access to long-term care homes and limited in-person contact between residents and their families. In their absence, health providers have been integral to supporting connections between residents and their families within LTCHs.

This study aimed to understand the experiences of social connectedness between residents and family members who have been physically separated due to the current pandemic and, to examine LTCH health providers' experiences and responses to support social connectedness. Using a qualitative descriptive design, in-depth semi-structured interviews were conducted with 21 family members and 11 healthcare providers. Emergent themes from qualitative content analysis are: (a) all-encompassing impacts of separation; (b) advocacy became my life; (c) the emotional toll of the unknown; 4) the burden of information translation; 5) precarious balance between safety and mistrust for the healthcare system; and (d) a formulaic approach impedes connectivity. A more comprehensive understanding of the experiences and support needs of LTCH residents and their family members within the context of a pandemic can inform practice approaches to support social connections going forwards.

Session 3595 (Paper)

Mental Health of Older Adults

ASSOCIATION BETWEEN POST-TRAUMATIC STRESS AND DEPRESSION AMONG OLDER PUERTO RICANS: HOW DOES LONELINESS MATTER?

Kaipeng Wang,¹ Adolfo Cuevas,² Anao Zhang,³ Carson De Fries,¹ Ladson Hinton,⁴ and Luis Falcón,⁵ 1. *University of Denver, Denver, Colorado, United States*, 2. *Tufts University, Medford, Massachusetts, United States*, 3. *University of Michigan, Ann Arbor, Michigan, United States*, 4. *University of California, Davis, Sacramento, California, United States*, 5. *University of Massachusetts Lowell, Lowell, Massachusetts, United States*

Puerto Ricans have a significantly higher prevalence of post-traumatic stress disorder (PTSD) than other racial and ethnic groups. PTSD can lead to co-morbid depression, which exacerbates the risk for compromised mental and physical health among older adults. Loneliness, a robust indicator of poor social support, is likely to worsen the dysphoric symptoms of PTSD and increase the risks of depression. However, few studies have focused on the moderating role of loneliness on the association between post-traumatic stress and depression. This study examines the association between post-traumatic stress and depression and whether such an association differs by loneliness among older Puerto Ricans. Data were collected from 304 Puerto Ricans aged 60-81 living in the Greater Boston area who responded to questionnaires in a survey. We used ordinary least squares regression to examine the association between post-traumatic stress, loneliness, and depression. We found that post-traumatic stress was significantly associated with higher levels of depression; however, the association was contingent on experiences of loneliness. The association between post-traumatic stress and depression was stronger for those experiencing a higher degree of loneliness. Findings underscored the role that loneliness plays in exacerbating the risk of developing co-morbid PTSD and depression among older Puerto Ricans. In working with older Puerto Ricans experiencing post-traumatic stress, it is important for mental health professionals to incorporate the assessment of loneliness and

to prevent and reduce co-morbid depression by addressing loneliness through improving social skills, enhancing social support, and reducing maladaptive social cognition.

DISPARITIES OF MENTAL HEALTH SERVICE NEEDS AND UTILIZATION AMONG OLDER ADULTS

Yuanyuan Hu,¹ and Qingwen Xu,² *1. New York University, Elmhurst, New York, United States, 2. New York University, New York University, New York, United States*

Prior studies have examined mental health disparities, however, without adequate attention to the older adult population. Framed by the Andersen Behavioral Model of Health Service Use, this study was to examine the prevalence of depression and anxiety and the mental health service use among older adults of different race/ethnicity; and to investigate factors associated with mental health services use (counseling and psychotropic medication). Data from the National Health Interview Survey 2019 were analyzed by bivariate tests and logistic regression analyses. Hispanic older adults have the highest rates of depressive and anxious symptoms, followed by Whites, Blacks, and Asians. Non-Hispanic Asians and Blacks reported significantly lower rates of taking medication. The severity of depression and anxiety was consistently associated with mental health service use across all groups. Education was positively associated with counseling use in white and black groups. For older whites, better general health, male and foreign-born were significantly predicting less medication use. Older blacks with better general health were significantly less likely to use medication. For Hispanic older adults, female and being single were associated with anxiety medication use. Results suggest that older adults, despite different perceptions and cultural understandings of mental health, use mental health services for severe conditions. This study also highlights the important role that education and health literacy could have played in the use of counseling services. For the medication use, the result—that general health status was important for both black and white older adults, but not Hispanics—could suggest a few directions for further exploration.

FEASIBILITY PILOT: PROBLEM ADAPTATION THERAPY FOR EMOTION REGULATION IN COMMUNITY-DWELLING OLDER ADULTS

Julia Sheffler,¹ Melissa Meynadasy,² Dimitris Kiosses,³ and Natalie Sachs-Ericsson,² *1. Florida State University College of Medicine, Tallahassee, Florida, United States, 2. Florida State University, Tallahassee, Florida, United States, 3. Weill-Cornell Medicine, White Plains, New York, United States*

Emotion regulation (ER) difficulties in older adults are associated with increased depression and decreased resiliency to stressful life events. In general, maladaptive ER is a transdiagnostic risk factor for a range of psychological and physical problems across the lifespan. Thus, interventions targeting ER may be valuable in reducing risk for a range of late-life pathologies. The present study evaluated and adapted an existing ER-focused treatment (i.e., Problem Adaptation Therapy (PATH)) for community older adults. We completed a small clinical pilot study to assess the feasibility of the adapted protocol and initial signals of effect of the intervention on ER, depression, and resiliency. Participants were recruited using an online survey, which was

used to then identify participants scoring in the highest and lowest quartiles for ER. Individuals in the lowest ER quartile (N=27) were randomly assigned to the PATH condition or a physical health education (PHET) control condition. Of the 27 participants in the low ER group, four participants (3 PATH, 1 PHET) dropped out of the intervention. A paired samples t-tests revealed significant decreases in depressive symptoms, significant increases in self-reported ER skill, and improvements in resiliency (all $p < .05$) for the PATH condition. For the PHET condition, only significant increases in self-reported ER skill ($t(12) = -2.68, p = .020$) were observed. In sum, the intervention protocol proved feasibility and demonstrated initial signals of effect in the expected directions. Future studies will examine mechanisms of action and the efficacy of the adapted PATH protocol.

FUNCTIONAL MOBILITY, AGING, AND PEOPLE WITH MENTAL ILLNESS: ISSUES AND CHALLENGES

Michelle Zechner,¹ Ellen Anderson,² and Kenneth Gill,³ *1. Rutgers, New Jersey, United States, 2. Rutgers, Newark, New Jersey, United States, 3. Rutgers, Piscataway, New Jersey, United States*

People with serious mental illness (SMI) are more likely to experience chronic health conditions at younger ages, which increases the risk of premature death. Co-morbid health conditions and risk for premature death are well-studied in the population, however less is understood about the impact of aging and SMI on functional ability. Research suggests that the population walk less and may have lower fitness levels than other populations (Gill et al., 2016). Specific data exploring functional age of people with SMI is sparse. The authors compared published standardized geriatric functional fitness values for people over 65 to baseline values of a community sample of people living with SMI who participated in a community health promotion intervention. The average age of the sample was 50 (SD=11). Three physical functioning measures were used in the comparison to measure physical functioning; the Sit to Stand Test, 6 Minute Walk, and Single Legged Stance. Results indicated significant differences in mean physical functioning values between the sample and standardized geriatric values. The sample performed at levels 20-30 years older than their chronological age. This finding suggests that mental health and aging services may need to adjust interventions, services and methods to improve physical functioning in middle-aged and older adults living with SMI. Premature functional decline impacts community living skills, independent living, housing choice, vocational options, and may impede personal goal attainment. Recommendations for interventions will be offered, as will suggestions for policies targeting services that cross aging and mental health silos.

TRAUMA, POSTTRAUMATIC STRESS DISORDER, AND TREATMENT AMONG MIDDLE-AGED AND OLDER WOMEN

Laura Sampson,¹ Shaili Jha,² Andrew Ratanatharathorn,¹ Andrea L. Roberts,¹ Laura D. Kubzansky,¹ Eric B. Rimm,¹ and Karestan C. Koenen,¹ *1. Harvard T.H. Chan School of Public Health, Boston, Massachusetts, United States, 2. Harvard T.H. Chan School of Public Health, Harvard T.H. Chan School of Public Health, Massachusetts, United States*

Posttraumatic stress disorder (PTSD) is twice as prevalent in women as in men, and is an established risk factor for chronic disease, but few studies have comprehensively assessed lifetime PTSD in middle-aged and older civilian women. We surveyed 33,328 women aged 54-74 from the Nurses' Health Study II from August 2018 to January 2020 to understand trauma exposure, PTSD based on the Diagnostic and Statistical Manual of Mental Disorders Version 5, and trauma-related treatment use. The majority (82.2%) of women reported one or more lifetime traumas. 10.5% of those with trauma had lifetime PTSD and 1.5% had past-month PTSD. The most common trauma types were sudden or unexpected death of a loved one (44.9%) and interpersonal or sexual violence (43.5%). Almost 30% experienced occupational (nursing-related) trauma. Interpersonal or sexual violence event types explained the largest proportion of PTSD cases (33.6%) out of seven categories of events assessed. Only 25% of women with trauma ever accessed trauma-related treatment, but this proportion was higher (66.4%) among those with diagnosable PTSD, and among those with current depression (35.9%). Treatment was most common among women who experienced interpersonal/sexual violence and lowest among those with occupational trauma, but treatment satisfaction did not vary by worst trauma type. Psychotherapy was the most common type of treatment. These results demonstrate that trauma is nearly universal in middle-aged to older women, which has important implications for their long-term health and well-being—particularly in the era of COVID-19 which is likely to produce additional trauma in this population.

Session 3600 (Symposium)

Models to Study Aging

UNIVERSAL DNA METHYLATION AGE ACROSS MAMMALIAN TISSUES

Chair: Viviana Perez Ake Lu,¹ Zhe Fei,² Ken Raj,³ and Steve Horvath,² 1. *UCLA, Los Angeles, California, United States*, 2. *UCLA, Los Angeles, California, United States*, 3. *Centre for Radiation, Chemical and Environmental Hazards, Public Health England, Chilton, England, United Kingdom*

Aging is often perceived as a degenerative process caused by random accrual of cellular damage over time. In spite of this, age can be accurately estimated by epigenetic clocks based on DNA methylation profiles from almost any tissue of the body. Since such pan-tissue epigenetic clocks have been successfully developed for several different species, it is difficult to ignore the likelihood that a defined and shared mechanism instead, underlies the aging process. To address this, we generated over 10,000 methylation arrays, each profiling up to 37,000 cytosines in highly-conserved stretches of DNA, from over 59 tissue-types derived from 128 mammalian species. From these, we identified and characterized specific cytosines, whose methylation levels change with age across mammalian species. Genes associated with these cytosines are greatly enriched in mammalian developmental processes and implicated in age-associated diseases. From the methylation profiles of these age-related cytosines, we successfully constructed three highly accurate universal

mammalian clocks for eutherians, and one universal clock for marsupials. The universal clocks for eutherians are similarly accurate for estimating ages ($r > 0.96$) of any mammalian species and tissue with a single mathematical formula. Collectively, these new observations support the notion that aging is indeed evolutionarily conserved and coupled to developmental processes across all mammalian species - a notion that was long-debated without the benefit of this new and compelling evidence.

THE COMMON MARMOSET: A HIGHLY TRANSLATABLE SMALL NONHUMAN PRIMATE MODEL OF AGING

Ricki Colman, *University of Wisconsin, Madison*

BATS: SECRETS OF EXTENDED HEALTHSPAN

Emma Teeling, *University College Dublin, Ireland, Ireland*

Of all mammals, bats possess the most unique and peculiar adaptations that render them as excellent models to investigate the mechanisms of extended longevity and potentially halted senescence. Indeed, they are the longest-lived mammals relative to their body size, with the oldest bat caught being >41 years old, living approx. 8 times longer than expected. Bats defy the 'rate-of-living' theories that propose a positive correlation between body size and longevity as they use twice the energy as other species of considerable size, but live far longer. The mechanisms that bats use to avoid the negative physiological effects of their heightened metabolism and deal with an increased production of deleterious Reactive Oxygen Species (ROS) is not known, however it is suggested that they either prevent or repair ROS damage. Bats also appear to have resistance to many viral diseases such as rabies, SARS and Ebola and are the suspected reservoir species for a huge diversity of newly discovered viruses, including Sars-CoV-2. This suggests that their innate immunity is different to other mammals, perhaps playing a role in their unexpected longevity. Here the potential genomic basis for their rare immunity and exceptional longevity is explored across multiple bat genomes and divergent ageing and immune related markers (e.g. microbiome, telomeres, mitochondria, cellular dynamics, cytokine response) studied in wild bat populations. These findings provide a deeper understanding of the causal mechanisms of ageing and tolerant immunity, potentially uncovering the key molecular pathways that could be utilised to benefit society.

Session 3605 (Paper)

Nursing Homes

A CROSS-SECTIONAL STUDY COMPARING YOUNGER AND OLDER NURSING HOME RESIDENTS IN WESTERN CANADA

Bianca Shieu,¹ Todd Schwartz,² Anna Beeber,³ Matthias Hoben,⁴ Mark Toles,² and Ruth Anderson,³ 1. *University of Pittsburgh/ School of Medicine, Pittsburgh, Pennsylvania, United States*, 2. *UNC Chapel Hill, UNC Chapel Hill, North Carolina, United States*, 3. *University of North Carolina at Chapel Hill, UNC Chapel Hill, North Carolina, United States*, 4. *University of Alberta at Edmonton, Edmonton, Alberta, Canada*

Specialized care for younger nursing home (NH) residents may be necessary to meet their unique health and quality of life needs; however, key attributes of younger NH residents are poorly understood and limit the development of effective, tailored interventions. This study described differences in clinical and nonclinical characteristics of younger vs. older nursing NH residents. In a retrospective cohort study, we used SPSS and analyzed comprehensive Resident Assessment Instrument – Minimum Data Set (RAI-MDS 2.0) data from NHs in Western Canada, for the period from January 2016 to December 2017. We included all assessments (full and abbreviated) performed quarterly. These findings indicated that younger (age 18-64) vs. older (age ≥ 65) NH residents differed considerably: younger residents were predominately male, single, more obese, more depressed, had higher prevalence of depression, cerebral vascular accident, and hemi- or quadriplegia, and required more assistance in activities of daily living than older residents. The findings will contribute a better comprehension of the characteristics of the younger NH population and how they differ from other residents. The study provides useful information to policymakers, providers, and researchers to guide them in developing tailored policies, programs, and interventions. Also, findings may guide consumers as they plan for long-term care needs of loved ones. Finally, the findings provide a baseline estimate as researchers continue to track the growth of and changes in, the populations served in nursing homes.

ACUITY DIFFERENCES AMONG NEWLY ADMITTED MEDICARE RESIDENTS IN RURAL AND URBAN SKILLED NURSING FACILITIES

Yvonne Catharina Jonk,¹ Andrew Coburn,² Catherine McGuire,² Deborah Thayer,² and Karen Mauney,² 1. *University of Southern Maine, Muskie School, Portland, Maine, United States*, 2. *University of Southern Maine, Portland, Maine, United States*

Using the 2015 national Minimum Data Set Version 3.0, the Area Health Resources Files, the 2015 Provider of Services File, and the Rural-Urban Commuting Area codes, this study assessed rural-urban differences in newly admitted, Medicare skilled nursing facility (SNF) residents' functional status, cognitive performance, and behavioral issues using self-performance, early loss, and late loss Activities of Daily Living (ADLs); the Cognitive Function Scale (CFS); and indicators of aggression, psychosis, or wandering, respectively. The study evaluated 686,881 unique patient assessments for newly admitted Medicare SNF residents across 15,157 facilities in 47 states. Negative binomial and generalized linear models with state fixed effects and clustering by SNFs were used to evaluate rural-urban acuity differences before and after adjusting for socio-economic factors; admission source, and market area characteristics. Compared to urban SNF residents, rural residents were more likely to be cognitively impaired (45% Isolated Small Rural, 44.5% Small Rural, 41% Large Rural, 38.8% Urban), and have behavioral issues (6.7% rural, 4.8% urban). Unadjusted and adjusted regression models confirmed bivariate findings that rural SNF residents were less functionally impaired (IRR range: 0.974-.987), but had more cognitive and behavioral issues in more remote rural locations than urban. The (unadjusted) odds of cognitive impairment were 1.1-1.3 times higher for residents

of rural vs urban SNFs; while the odds of having any one of the behavioral issues were 1.2-1.6 times higher in more remote rural locations. The capacity of rural SNFs to manage complex cognitive and behavioral problems deserves further research.

FACTORS AFFECTING THE SUSTAINMENT, SUSTAINABILITY, AND SPREAD OF PRACTICE CHANGES IN CANADIAN LONG-TERM CARE HOMES

Lauren MacEachern,¹ Yuting Song,² Liane Ginsburg,³ Malcolm Doupe,⁴ Adrian Wagg,² Jude Spiers,² and Whitney Berta,⁵ 1. *University of Toronto, Toronto, Ontario, Canada*, 2. *University of Alberta, Edmonton, Alberta, Canada*, 3. *York University, York University, Alberta, Canada*, 4. *University of Manitoba, Winnipeg, Manitoba, Canada*, 5. *University of Toronto, University of Toronto, Ontario, Canada*

Our understanding of the post-implementation sustainment, sustainability, and spread (SSS) of complex quality improvement interventions is limited. We explored factors that influenced the SSS of a care aide-led quality improvement initiative (Safer Care for Older Persons (in residential) Environments [SCOPE]) implemented in 6 Manitoba long-term care homes two years after the conclusion of SCOPE in 2017. We analyzed small group interview data collected from all unit- and facility-level managers who participated in SCOPE and were still working in these facilities. We asked about SCOPE implementation, post-SCOPE quality improvement activities, factors that influenced them, and about inter-unit spread of SCOPE following the project's conclusion. The interviews were audio-recorded, transcribed verbatim, de-identified, and analyzed using thematic analysis. Five of the 6 facilities reported sustained SCOPE quality improvement activities, tools, and facilitative structures. In the same 5 facilities, SCOPE benefits (e.g., increases in care aide empowerment and self-efficacy, manager belief in care aide capacity) continued post-implementation. Spread beyond the original SCOPE units had occurred in 3 facilities. Factors that influenced the SSS of SCOPE were related to the team (e.g., care aides' quality improvement capacity), to the unit and facility (e.g., culture of innovation and change), and to the long-term care system (e.g., competing imperatives). Some factors influencing SSS differ from factors known to influence implementation. The identified factors affecting SSS highlight the influence of social dynamics (i.e., interactions, communication, relationships) among staff on SSS. Further research is warranted to explore interactions among these influencing factors and how they lead to SSS.

FEASIBILITY OF ROUTINE QUALITY-OF-LIFE ASSESSMENT IN LONG-TERM CARE HOMES

Matthias Hoben,¹ Sube Banerjee,² Anna Beeber,³ Stephanie Chamberlain,⁴ Laura Hughes,⁵ Hannah O'Rourke,⁴ Kelli Stajduhar,⁶ and Jude Spiers,⁷ 1. *University of Alberta at Edmonton, Edmonton, Alberta, Canada*, 2. *University of Plymouth, University of Plymouth, England, United Kingdom*, 3. *University of North Carolina at Chapel Hill, UNC Chapel Hill, North Carolina, United States*, 4. *University of Alberta, University of Alberta, Alberta, Canada*, 5. *University of Sussex, University of Sussex, England, United Kingdom*, 6. *University of Victoria,*

*University of Victoria, British Columbia, Canada, 7.
University of Alberta, Edmonton, Alberta, Canada*

Maximizing long-term care (LTC) residents' quality of life (QoL) is the primary goal of care. However, most residents have cognitive impairment and care staff time is severely limited, leading to various complexities in measuring QoL. This study developed and assessed the feasibility of an approach to routinely measuring QoL in LTC residents. We used the DEMQOL-CH, a practical, reliable, valid tool, developed in the UK to be completed by care aides to assess QoL in residents with moderate to severe dementia. We recruited 45 care aides in 10 LTC homes in Alberta, Canada who we surveyed on the QoL of 263 residents via video calls. We assessed time to complete; care aide and manager perceived feasibility of completing the DEMQOL-CH; internal consistency and inter-rater reliability of DEMQOL-CH scores; and we conducted cognitive interviews with 7 care aides to assess care aide comprehension of the tool. Time to complete was on average 4 minutes with little variation. Care aides and managers rated using the DEMQOL-CH as highly feasible and valuable. The internal consistency of the DEMQOL-CH score was 0.80. The DEMQOL-CH score inter-rater agreement was 0.73. Cognitive interviews suggested good comprehension overall with some comprehension problems especially in care aides who speak English as a second language. Asking care aides to complete the DEMQOL-CH is highly feasible, requires minor resources, and reliability is high. However, some items caused comprehension and reliability problems. Reasons and possible solutions will be subject to further investigations.

IMPACT OF RACE ON DECISION MAKING FOR NURSING HOME RESIDENTS WITH ADVANCED DEMENTIA: CAN WE DISRUPT AND TRANSFORM?

Ruth Lopez,¹ Ashley Roach,² Meghan Hendricksen,³ Anita Rogers,⁴ Fayron Epps,⁵ and Ellen McCarthy,⁶ 1. *MGH Institute of Health Professions, Boston, Massachusetts, United States*, 2. *OHSU, Portland, Oregon, United States*, 3. *Hinda and Arthur Marcus Institute for Aging Research, Boston, Massachusetts, United States*, 4. *University of Tennessee at Martin, Parsons, Tennessee, United States*, 5. *Emory University, Atlanta, Georgia, United States*, 6. *Marcus Institute for Aging Research, Hebrew SeniorLife, Boston, Massachusetts, United States*

Despite 20 years of research and numerous experts and associations advocating a palliative approach to care for nursing home (NH) residents with advanced dementia, research consistently demonstrate striking and persistent racial differences in the use of burdensome interventions such as feeding tubes and hospital transfer. Most notable is that Black NH residents experience more burdensome interventions at the end of life. The reasons for these differences are poorly understood. The purpose of this study was to examine NH staff members' perceptions of advance care planning with proxies of Black and White residents. We conducted thematic analysis of semi-structured interviews with 158 NH staff members gathered as part of the ADVANCE study. This is a large qualitative study in 13 NHs in 4 regions of the country aimed at explaining regional and racial factors influencing feeding tube and hospital transfer rates. We found that NH staff, regardless of region of the country,

held several assumptions about Black proxies including: being attached or not wanting to let go; not wanting to talk about death, believing everything must be done; not wanting to play God; having large conflicted families, not trusting; putting on attitude, and tending not to use NHs. We found that these assumptions led some NH staff to feel that rather than engaging in shared decision making, they were engaged in a battle with proxies leading them to pick and choose their battles and at times even giving up trying. Whether these assumptions can be disrupted and transformed will be discussed.

Session 3610 (Symposium)

ORAL HEALTH IN LATE LIFE: CHALLENGES AND SOLUTIONS

Chair: Xi Chen

Co-Chair: Bei Wu

Discussant: Stephen Shuman

Older adults face a unique challenge in maintaining their oral health due to an increased disease burden, polypharmacy, functional impairment and other reasons. The five papers in this symposium describe the oral health issues in various groups of older adults and discuss different approaches to improve oral health for older adults. Using data from the Population Study of Chinese Elderly in Chicago, the first paper examined the relationship between self-reported discrimination and oral health related quality of life and investigated how resilience mediated such a relationship among foreign-born older Chinese Americans. The second paper described the oral health concerns and related treatment needs in older adults receiving palliative care using a mixed method design. The third paper demonstrated how to use behavior change techniques to improve oral self-care skills of individuals with mild dementia and support their family caregivers. The fourth paper described a project that integrates the age-friendly health system's principles into specialty dental care to address healthy aging and oral health. This initiative helped prevent and change the false belief that aging inevitably involves deterioration in oral health. The fifth paper described the impact of COVID-19 on the management of oral health problems and access to dental care in older adults. Transformative changes in care delivery and the impact of vaccination on access to care was also explored. This symposium helps better understand the oral health needs in older adults and provides new evidence to improve oral health for these individuals.

ORAL HEALTH IN ADULT PATIENTS RECEIVING PALLIATIVE CARE: A MIXED METHOD STUDY

Xi Chen,¹ Violet D'Souza,² Timothy Thomsen,³ Stephanie Gilbertson-White,⁴ Jirakate Madiloggovit,¹ Chandler Pendleton,⁵ Xianjin Xie,⁵ and Arshi Munjal,⁵ 1. *University of Iowa, Iowa City, Iowa, United States*, 2. *University of Toronto, Toronto, Ontario, Canada*, 3. *University of Iowa Roy J. and Lucille A. Carver College of Medicine, Iowa City, Iowa, United States*, 4. *University of Iowa College of Nursing, Iowa City, Iowa, United States*, 5. *University of Iowa College of Dentistry, Iowa City, Iowa, United States*

Oral disease is highly prevalent in persons receiving palliative care (PRPC). Yet, little is known about how PRPC perceive their oral health status and related treatment needs. Forty-nine PRPC were recruited. They first completed a structured oral symptom review, followed by an oral exam. A nested sample of 11 participants also completed an in-depth interview querying their perceived oral health concerns and related treatment needs. Quantitative and qualitative data was analyzed and integrated for interpretation. Eighty-six percent of participants reported at least one oral symptom, including dry mouth (83.7%), a pain-related symptom (40.8%), or oral function difficulties (51.0%). About 40% of participants reported compromised quality of life due to oral conditions; however, the perceived impacts and treatment needs were modest. Oral disease was highly prevalent in PRPC, yet its overall impact was modest. Except for painful symptoms, most participants reported limited desire to seek treatment for oral health conditions.

SELF-REPORTED DISCRIMINATION, RESILIENCE, AND ORAL HEALTH-RELATED QUALITY OF LIFE AMONG OLDER CHINESE AMERICANS

Weiyu Mao,¹ Bei Wu,² Iris Chi,³ Wei Yang,⁴ and XinQi Dong,⁵ 1. *University of Nevada, Reno, Reno, Nevada, United States*, 2. *New York University, New York, New York, United States*, 3. *University of Southern California, University of Southern California, California, United States*, 4. *University of Nevada Reno, Reno, Nevada, United States*, 5. *Rutgers University, Rutgers Institute for Health, New Jersey, United States*

There is a lack of empirical evidence on self-reported discrimination and oral health-related quality of life (OHRQoL). Further, the mechanism linking the two constructs is not well understood. This study aimed to examine the relationship between self-reported discrimination and OHRQoL and investigate resilience as a mediator in such a relationship among foreign-born older Chinese Americans. Data came from the Population Study of Chinese Elderly in Chicago collected between 2017 and 2019. The working sample included 3,054 foreign-born Chinese Americans (60+ years of age). Mediation analysis was conducted to examine the direct and indirect pathways towards OHRQoL. Self-reported discrimination was directly and indirectly associated with poorer OHRQoL. Resilience mediated the relationship between self-reported discrimination and OHRQoL. Specifically, individuals experienced discrimination reported weaker resilience, and subsequently, reported poorer OHRQoL. Findings illustrate the importance of studying self-reported discrimination in relation to OHRQoL and further identify resilience as an intermediary pathway to promote OHRQoL.

REFINING AN ORAL HEALTH CARE PARTNER INTERVENTION USING BEHAVIOR CHANGE TECHNIQUES

Ashley Leak Bryant,¹ Rachel Hirschey,² Courtney Caiola,³ Ya-Ning Chan,⁴ Brenda Plassman,⁵ Bei Wu,⁶ Donald Bailey Jr.,⁷ and Ruth Anderson,⁸ 1. *School of Nursing, Durham, North Carolina, United States*, 2. *UNC School of Nursing, Chapel Hill, North Carolina, United States*, 3. *East Carolina University, Greenville, North*

Carolina, United States, 4. *UNC Chapel Hill, Chapel Hill, North Carolina, United States*, 5. *Duke University, Durham, North Carolina, United States*, 6. *New York University, New York, New York, United States*, 7. *duke University School of Nursing, Durham, North Carolina, United States*, 8. *University of North Carolina at Chapel Hill, UNC Chapel Hill, North Carolina, United States*

Following a pilot, we refined an oral health carepartner intervention for individuals with mild dementia (IMD). In this intervention, we use behavior change techniques (BCTs) to foster changes by carepartners including using new oral-care techniques and developing skills for using cueing and communications approaches to support behavior changes by IMD (duration and frequency of toothbrushing and oral-hygiene skills); thus, improving plaque and gingival indices. We describe our approach to refining the intervention manual including a) completing the self-paced BCT taxonomy course, b) developing a coding schema, c) coding the original manual for evidence of BCTs, and d) refining the manual to improve use of BCTs in the refined intervention. Our results detail how BCTs can be applied to refine and improve interventions. This research demonstrates the value in using BCTs for interventions to address how carepartners and IMD can collaborate to improve oral hygiene care.

ADOPTING THE 4MS FRAMEWORK AND AGE-FRIENDLY CONCEPTS INTO DENTAL CARE

Szilvia Arany,¹ Annette Medina-Walpole,² and Thomas Caprio,³ 1. *Specialty Care, General Dentistry, Eastman Institute for Oral Health, University of Rochester, Rochester, NY, New York, United States*, 2. *University of Rochester, Rochester, New York, United States*, 3. *University of Rochester Medical Center, Rochester, New York, United States*

We report on launching a dental initiative that addresses healthy aging and oral health, focusing on prevention and changing the false belief that aging inevitably involves deterioration in oral health. Our project integrates the age-friendly health system's principles into specialty dental care at Eastman Institute for Oral Health, URM. We established an oral health-centered framework with project elements of the 4Ms - what matters, medication, mentation, and mobility. We developed pilot 4Ms templates integrated into dental charts to implement healthy-aging key oral health processes, including oral health assessment, treatment planning, and oral hygiene support. We engaged all members of the dental team through educational sessions for providing care for patients affected by Alzheimer's disease and related dementias. We leveraged on locally available interdisciplinary resources and the collaboration reflecting ongoing efforts at the University of Rochester Division of Geriatrics and the Finger Lakes Geriatric Education Center, a Geriatric Workforce Enhancement.

PANDEMIC-DRIVEN DISRUPTIONS IN ORAL HEALTH: TRANSFORMATIVE TRENDS IN CARE FOR OLDER ADULTS

Elisa Ghezzi,¹ Samuel Zwetchkenbaum,² Mary Fisher,³ Brooke Fukuoka,⁴ Jeffrey Dodge,⁵ and Michael Helgeson,⁶ 1. *University of Michigan School of Dentistry, Ann Arbor, Michigan, United States*, 2. *Rhode Island Department of Health, Providence, Rhode Island, United States*, 3. *Michigan*

Geriatric Dental Care, West Bloomfield, Michigan, United States, 4. Your Special Smiles PLLC, Jerome, Idaho, United States, 5. CareLink, Woonsocket, Rhode Island, United States, 6. Apple Tree Dental, Mounds View, Minnesota, United States

Oral healthcare for the aging was severely disrupted during the pandemic of coronavirus disease 2019 (COVID-19). Transformative changes in care delivery involved teledentistry, mobile/portable dentistry, minimally invasive dentistry, aerosol minimization, and interprofessional oral care. Management of chronic oral health problems evolved through periods of limited to no access to daily and professional oral healthcare. Access to care has been influenced by availability of the oral care workforce, variability in long term care policy, and the lack of funding to cover medicinally necessary services delivered via asynchronous telehealth technologies. Impacts were identified six and twelve months into the pandemic. These will be compared to the state of oral healthcare for the aging 18 months from the start of the pandemic. The impact of vaccination on access to care will be explored. Variability between states (Idaho/Michigan/Minnesota/Rhode Island) will be addressed. Directions of new and needed research opportunities will be discussed.

Session 3615 (Symposium)

POST-RETIREMENT PAID WORK AND INEQUALITIES AT OLDER AGES

Chair: Benjamin Shaw

Co-Chair: Kevin Cahill

Discussant: Michael Giandrea

Participation in paid work frequently extends beyond pensionable age, with the Organization for Economic Cooperation and Development observing, in “Pensions at a Glance” (2017, pp. 126–7), that effective retirement ages in high-income countries exceed normal full-pension-eligibility ages by 10 months for men and two months for women. While working after pensionable age is becoming ever more common, not all workers on the cusp of retirement are able to continue in their current position or find a new job. Remarkably, little is known about the implications of unequal access to post-retirement work for social and income inequalities in later life, nor how job quality might change as people work into the years normally set aside for retirement. The four papers in this symposium address the following questions: 1) do bridge employment transitions exacerbate or mitigate income inequality later in life? 2) how does job quality (job satisfaction, physical and psychosocial working conditions) compare before and after pensionable age? 3) which processes lead to changes in working conditions in the late career? and 4) might empirical and theoretical gains be made by considering post-pensionable-age paid work as a specific career stage? The presenters use longitudinal data from the United States (the Health and Retirement Study, HRS), Sweden (Swedish Longitudinal Occupational Survey of Health, SLOSH), and Japan (Japanese Study of Aging and Retirement, JSTAR) complemented by interviews with older workers in Sweden. This symposium will provide insights into the nature and consequences of working after pensionable age in contrasting institutional settings.

DOES BRIDGE EMPLOYMENT MITIGATE OR EXACERBATE INEQUALITIES LATER IN LIFE?

Kevin Cahill,¹ Michael Giandrea,² Joseph Quinn,³ Lawrence Sacco,⁴ and Loretta Platts,⁵ 1. *Center on Aging & Work at Boston College, Chestnut Hill, Massachusetts, United States, 2. U.S. Bureau of Labor Statistics, Washington, District of Columbia, United States, 3. Boston College, Chestnut Hill, Massachusetts, United States, 4. Stockholm University, Stockholm, Stockholms Lan, Sweden, 5. Stress Research Institute, Department of Psychology, Stockholm University, Stockholm, Stockholms Lan, Sweden*

This paper explores how gradual retirement impacts inequality later in life, with a focus on transitions from career to bridge employment. We use 26 years of longitudinal data from the Health and Retirement Study to document the various pathways that older Americans take when exiting the labor force, and examine how bridge employment impacts non-housing wealth and total wealth, including the present discounted value of Social Security benefits. We find that gradual retirement in the form of bridge employment neither exacerbates nor mitigates wealth inequalities among Americans who held career jobs later in life. We do find evidence that wealth inequalities grow among the subset of older career workers who transition from career employment to bridge employer at older ages. These findings provide quantitative evidence that bridge employment at older ages is taken by those who need to continue working financially and those who continue working for nonpecuniary reasons.

HAVING A POST-RETIREMENT JOB: IMPROVISATION AND CONTAINING COMMITMENTS

Loretta Platts,¹ Agnieszka Ignatowicz,² Hugo Westerlund,³ and Dara Rasool,⁴ 1. *Stress Research Institute, Department of Psychology, Stockholm University, Stockholm, Stockholms Lan, Sweden, 2. University of Birmingham, Birmingham, England, United Kingdom, 3. Stockholm University, Stockholm University, Stockholms Lan, Sweden, 4. Dalarna University, Falun, Dalarnas Lan, Sweden*

This qualitative paper focuses on individuals who work after pensionable age, a distinctive period in the late career when workers are supported by the known and reliable income of a pension. Using constant comparative analysis, we analyzed interviews from a purposive sample of 25 Swedish people in their late sixties and early seventies. We examined conditions for being in paid work in terms of enabling factors (self-employment, shift work, shortage occupation), improvisation, and the role of chance. The interviews revealed that post-retirement workers took charge of the aspects of work that mattered most to them, evading the disciplinary aspects of work by controlling scheduling and limiting the duration of their commitment. These constrained commitments had knock-on effects of improving psychosocial working conditions. Women and immigrants—groups facing low pensions—experienced the greatest financial consequences of being unable to work in their retirement years in order to supplement their pension income.

CHANGES IN JOB QUALITY AS PEOPLE WORK BEYOND PENSIONABLE AGE IN SWEDEN

Lawrence Sacco,¹ Kevin Cahill,² Hugo Westerlund,³ and Loretta Platts,⁴ 1. *Stockholm University, Stockholm, Stockholms Lan, Sweden, 2. Center on Aging & Work*

at Boston College, Chestnut Hill, Massachusetts, United States, 3. Stockholm University, Stockholm University, Stockholms Lan, Sweden, 4. Stress Research Institute, Department of Psychology, Stockholm University, Stockholm, Stockholms Lan, Sweden

This paper uses data from the biennial Swedish Longitudinal Occupational Survey of Health to examine changes in job quality among older workers, controlling for work intensity and employment characteristics. Job quality outcomes included job satisfaction and physical (dangerous, strenuous or unpleasant work) and psychosocial (job strain, effort-reward imbalance, work time control) working conditions. First difference estimation was used to analyze within-individual changes in job quality, as well as changes in hours, employment characteristics (shifting to a non-permanent contract, the private sector and self-employment) and health. Individuals who worked beyond pensionable age experienced statistically significant improvements in job quality, with larger improvements among those who reduced working hours and shifted from permanent to non-permanent contracts, from the public into the private sector, and from wage-and-salary to self-employment. We conclude that work beyond pensionable age is a distinctive period characterized by employment that becomes more flexible and rewarding and less stressful.

JOB QUALITY IN THE LATE CAREER IN SWEDEN, JAPAN, AND THE UNITED STATES

Hugo Westerlund,¹ Loretta Platts,² Lawrence Sacco,³

Ayako Hiyoshi,⁴ Kevin Cahill,⁵ and Stefanie König,⁶

1. Stockholm University, Stockholm University, Stockholms Lan, Sweden, 2. Stress Research Institute, Department of Psychology, Stockholm University, Stockholm, Stockholms Lan, Sweden, 3. Stockholm University, Stockholm, Stockholms Lan, Sweden, 4. Örebro University, Örebro, Örebro Lan, Sweden, 5. Center on Aging & Work at Boston College, Chestnut Hill, Massachusetts, United States, 6. University of Gothenburg, Gothenburg, Gotlands Lan, Sweden

This paper examines job satisfaction and psychosocial and physical job quality over the late career in three contrasting national settings: Sweden, Japan and the United States. The data come from an ex-post harmonized dataset of individuals aged 50 to 75 years constructed from the biennial Swedish Longitudinal Occupational Survey of Health (SLOSH, 2006–2018, n=13936 to 15520), Japanese Study of Ageing and Retirement (JSTAR, 2006–2013, n=3704) and the United States Health and Retirement Study (HRS, 2006–2016, n=6239 and 8002). The job quality outcomes were physical labour, psychosocial working conditions (time pressure, discretion, pay satisfaction, job security) and job satisfaction. Random effects modelling was performed with age modelled with spline functions in which two knots were placed at ages indicating eligibility for pensions claiming or mandatory retirement. Interestingly, in each country, post-pensionable-age jobs were generally less stressful, freer, and more satisfying than jobs held by younger workers.

Session 3620 (Symposium)

PRESIDENTIAL SYMPOSIUM: STORIES OF STRUGGLE AND RESILIENCE: EXPERT INTERDISCIPLINARY REFLECTIONS OF THE PAST YEAR

Chair: Danielle Waldron

Co-Chair: Kalisha Bonds Johnson

Are you an ESPO member curious about what the “new normal” means for your future career in the field of aging? Or are you a GSA member interested in hearing from your colleagues about their experiences over the past year? Welcome to the ESPO Presidential Symposium! During this session, speakers will share honest and candid insights about their careers in the field of aging amidst the pandemic, racial discrimination/social unrest, and economic insecurity. Speakers in the ESPO Presidential symposium include: Dr. Thomas K.M Cudjoe, Dr. Candace S. Brown, and Dr. Marnin J. Heisel. Dr. Cudjoe, a physician, will discuss his clinical experience treating older adults with COVID-19, the shift to tele-health, and his research on the impact of social isolation on older adults. Dr. Brown, an academician, will discuss how the new attention to the longstanding issues of social injustice in the U.S. shaped her teaching pedagogy, research, student mentorship, and provide critical context regarding the impact of COVID-19 on Black and Indigenous People of Color (BIPOC) professors. Dr. Heisel, a clinical psychologist, will share how his intervention research on resiliency and well-being in older adulthood shifted amidst the “new normal,” as well as how older adults in his clinical practice encountered and coped with difficulties over this past year. As our society confronts social injustice, tackles health implications of COVID-19, and adjusts to a new way of life, we must consider how these factors, together, inform the interdisciplinary stories of struggle and resilience in the field of aging.

A PANDEMIC PARADOX: INNOVATIONS IN PSYCHOLOGICAL RESILIENCY AND SUICIDE PREVENTION IN OLDER ADULTS

Marnin Heisel, *Schulich School of Medicine & Dentistry, The University of Western Ontario, London, Ontario, Canada*

The COVID-19 pandemic has had a substantial negative impact on the health and well-being of older adults, a demographic with the highest proportion of fatalities in North America. Long-term care and retirement homes have been especially hard hit. Sheltering in place can increase social isolation among older adults and contribute to feelings of stigmatization, burden, stress, anxiety, anger, and despair. As older adults also account for high rates of suicide, fear of infection, reduced access to professional and social supports, and growing apathy, hopelessness, and social isolation could amplify suicide risk (see Zortea et al., 2020). The speaker will discuss how his program of research on psychological resiliency and suicide prevention in older adults has pivoted online over the past year, and how the pandemic has paradoxically inspired innovative approaches to research, education, clinical practice, and social advocacy for older adults that will likely continue well beyond the present time.

SOCIAL CONNECTIONS: TRANSFORMATIVE EXPERIENCES AMID DISRUPTIVE TIMES

Thomas Cudjoe, *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*

Today many older adults are experiencing intensified social isolation and loneliness as they attempt to “stay safe at home.” The notion, is a stark contrast from our understanding of the importance of social connections on health and well-being. This session highlights: first hand experiences

caring for older adults during the COVID-19 pandemic and the implications of social isolation on the health of older adults. The speaker will offer perspectives for ESPO members on the role of community engagement in orienting research agendas, both now (amid the pandemic) and into the future.

BLACK, PROUD, SILENT, AND LOUD: EXPERIENCES OF A JUNIOR FACULTY MEMBER IN 2020

Candace Brown, *University of North Carolina, Charlotte, Charlotte, North Carolina, United States*

Several social injustice issues, well known within the Black community, were brought to light to other ethnic/racial groups in 2020 and could no longer be ignored within the academic community. This led to personal, departmental, and institutional initiatives meant to increase racism awareness and apply change in thought and action. These initiatives often came at a cost of personal time and resources to Black and Indigenous People of Color academics, expected to contribute to these initiatives, redefine classroom syllabi, uphold research agendas, and continue with mentoring activities amidst their home environment (due to COVID-19) while monitoring their own feelings of pride, hurt, anger, anxiousness, and often- fatigue. This presentation will present the perceived triumphs and failed experiences of a junior faculty member, how they navigated this process, and explain the continued importance of institutions' forward movement of initiatives meant to change the social and racial academic atmosphere.

Session 3625 (Symposium)

REABLEMENT SERVICES ACROSS THE WORLD: EFFECTIVENESS AND IMPACTING FACTORS

Chair: Stan Vluggen

Co-Chair: Lise Buma

Discussant: Barbara Resnick

Due to the ageing of the world population, solutions are necessary to reduce the increasing demand for care. Besides the need for more care, older people often wish to remain as independent as possible and retain as much control as possible. A possible solution are services based on the concept of reablement, which includes working in a more rehabilitative and person-centered manner and has been researched in various forms internationally. Reablement services are promising and use the patient's strengths and, through interdisciplinary cooperation, aims to achieve the goals important for, and set by, the individual to remain/become as independent as possible. During this symposium, five presenters from the US, New-Zealand, Norway and the Netherlands talk about the impact and implementation of reablement services. The first presentation is about the results of a systematic review of the effects of reablement on daily functioning and identifying common features of effective interventions. The second presentation is about a systematic scoping review mapping how physical activity strategies are integrated and explored in reablement research and identifying knowledge gaps. The third presentation is about the significant impact of COVID-19 and its associated restrictions on residents in assisted living communities. The fourth presentation is on

combining lessons learned and practical implications from research on reablement services into the SELF-intervention. The fifth presentation describes the implications of funding on practice and outcomes of reablement. This symposium represents the current practice and future directions regarding implementation and research of reablement services across the world.

THE EFFECTIVENESS AND COMMON FEATURES OF REABLEMENT SERVICES ON CLIENTS' DAILY FUNCTIONING: A SYSTEMATIC REVIEW

Lise Buma, Stan Vluggen, Sandra Zwakhalen, Gertrudis Kempen, and Silke Metzelthin, *Maastricht University, Maastricht, Limburg, Netherlands*

This systematic review, guided by the ReAble-definition, (1) provides an overview of reablement interventions and their effect on Activities of Daily Living (ADL), and (2) identifies common features of effective interventions. A systematic search was conducted from 2002 to 2020, identifying nineteen studies from eight countries with a total of 6,534 participants. Ten studies (with moderate to high quality) revealed improvements in ADL functioning. Three common intervention features were identified within effective interventions: use of multidisciplinary teams; a protocolled or standardized assessment; and using multiple components such as ADL-training, education and exercise programs. This review emphasizes that future studies should provide a more consistent and detailed reporting on the intervention and its components. Furthermore, a uniform approach regarding components, follow-up times and outcome measures can contribute to the comparison of reablement interventions and better determine their effectiveness, independent of the healthcare system or country in which it is used.

INTEGRATION OF PHYSICAL ACTIVITY IN REABLEMENT FOR COMMUNITY-DWELLING OLDER ADULTS: A SYSTEMATIC SCOPING REVIEW

Hanne Leirbekk Mjøsund,¹ Cathrine Moe,¹ Elissa Burton,² and Lisbeth Uhrenfeldt,³ 1. *Nord University, Bodø, Nordland, Norway*, 2. *Curtin University, Perth, Western Australia, Australia*, 3. *Nord University, Nord University, Bodø, Nordland, Norway*

The aim of this study was to map evidence of how physical activity (PA) strategies are integrated and explored in research of interdisciplinary, time-limited reablement for community dwelling older adults and to identify knowledge gaps. Following an apriori protocol, we searched eight databases for eligible studies, in addition to citation and reference searches. Study selection and data-extraction was made independently by two reviewers. Fifty-one studies were included, showing that exercises and practice of daily activities were included in the majority of intervention studies, but in most cases little information about exercise components or strategies for increasing PA were provided. There was insufficient evidence for any synthesis of how reablement affects older adults' PA levels, their physical fitness or how PA is experienced in reablement. There is a need to further investigate how the promotion of PA can be adequately implemented in reablement and how it may affect older adults' function.

THE IMPACT OF COVID-19 AND ASSOCIATED RESTRICTIONS ON PHYSICAL ACTIVITY AMONG ASSISTED LIVING RESIDENTS

Elizabeth Galik,¹ Barbara Resnick,¹ and Rachel McPherson,² 1. *University of Maryland School of Nursing, Baltimore, Maryland, United States*, 2. *University of Maryland Baltimore and Baltimore County, Catonsville, Maryland, United States*

COVID-19 and associated restrictions significantly impacted residents in assisted living (AL) communities. This was a descriptive study of 35 AL communities that were participating in an implementation trial of Function Focused Care for Assisted Living Residents with Dementia during the COVID-19 pandemic. Within twelve months of the COVID-19 pandemic, 18% of the AL communities had at least one resident who was positive for COVID-19. Almost half of the ALs allowed health care providers into the setting. All of the ALs facilitated family visits outside and by telephone and technology, but only 11% allowed visitors inside the community. Over 50% stopped using recreational supplies to encourage physical activity and 28% reported that residents experienced more behavioral and psychological symptoms of dementia. Restrictions designed to prevent the spread of COVID-19 may have negatively impacted resident behavior and the AL staff's engagement of residents in physical and recreational activities during the pandemic.

FUNDING INFLUENCING PRACTICE AND OUTCOMES IN REABLEMENT

Matthew Parsons,¹ and Paul Rouse,² 1. *University of Waikato, Hamilton, Waikato, New Zealand*, 2. *University of Auckland, Auckland, Auckland, New Zealand*

Internationally, Home Care is invariably funded through fee-per-service, e.g., if an hour of care is delivered, the provider receives an associated amount of funding. However, the funding model discourages reductions in packages-of-care when a client's functional capacity improves, and further disincentivises providers to discharge clients. Similarly, staff income is often directly associated to the delivered hours-of-care and if a client's hours are reduced, so is their income; again, discouraging the right behaviour, such as reporting improvements in independence levels. In 2008 in New Zealand, we developed a case-mix funding methodology and have been progressively implementing the new model since that time. This presentation highlights the findings in relation to how Home Care service hour allocations titrate against needs following implementation of the model as well as a number of other key quality outcomes that have been observed as a result of the case-mix model.

FEASIBILITY OF A GENERIC FFC INTERVENTION FOR LONG-TERM CARE: EVIDENCE FROM INTERVENTIONS IN VARIOUS CARE SETTINGS

Stan Vluggen,¹ Silke Metzelthin,¹ Janneke de Man-van Ginkel,² Getty Huisman-de Waal,³ and Sandra Zwakhalen,¹ 1. *Maastricht University, Maastricht, Limburg, Netherlands*, 2. *UMC Utrecht, Utrecht, Utrecht, Netherlands*, 3. *Radboud University Medical Center, Nijmegen, Gelderland, Netherlands*

Function Focused Care (FFC) interventions support nurses to adapt their level of care to the capabilities of older

people and to optimize their self-reliance. Recently, three FFC-interventions were implemented in various Dutch care settings. Lessons learned and implications were synthesized and an advanced FFC-program 'SELF' was developed for wide application. SELF comprises interactive and multidisciplinary sessions, is theoretically grounded, primarily focuses on behavior change in nurses, and is tailored to the team's needs. It also includes policy and environment review, goal-setting, and coaching-on-the-job. SELF was tested in one Dutch psychogeriatric ward. Afterwards, focus groups were conducted with nurses, trainers, manager and coaches. The interactive content, mutual discussions, and practice-based working methods were highly valued. SELF increased awareness and willingness to practice FFC and was considered feasible in practice. Increased involvement and support of allied health professionals and the manager was preferred. A nationwide effectiveness trial is planned after refining SELF.

Session 3630 (Symposium)

RURAL RESILIENCE THROUGH COVID-19

Chair: Shannon Freeman

Co-Chair: Raven Weaver

Discussant: Shannon Freeman

The effects of the COVID-19 pandemic have been felt globally affecting everyone, but have disproportionately harmed some of the most vulnerable and marginalized including individuals residing in rural and remote areas. The geographic isolation initially thought to protect rural and remote communities from the pandemic soon became a disadvantage, requiring individuals to navigate long-standing systemic barriers (e.g., lack of transportation issues, limited access to healthcare resources, and fragmented accessibility to vaccines), alongside the new challenges posed by COVID-19 restrictions to mitigate the spread of disease. The purpose of this symposium is to showcase examples of rural resiliency in the face of significant struggle. Taking a strength-based approach, the papers discuss efforts to identify healthy coping and positive aspects of physical distancing (Paper 1; Weaver), explore social support and psychological mindset (Paper 2; Fuller), inform successful strategies to pivot programming to remote coalition engagement for obesity prevention (Paper 3; Buys), implement a peer mentoring program to spur development of new strategies to build community resilience (Paper 4; Oh), and review elements of rurality that empower or exclude older people and the implications for a post-COVID world (Paper 5; Curreri). As we continue to uncover and learn about the short and long-term implications of living through the pandemic, these papers describe ways in which rural communities demonstrate resilience in the face of adversity. Our presenters will showcase a range of US and international perspectives and offer policy and program recommendations for building resilience in the longer term.

ADAPTATION AND COPING AMONG RURAL OLDER ADULTS THROUGHOUT THE COVID-19 PANDEMIC

Heather Fuller,¹ and Andrea Huseth-Zosel,² 1. *North Dakota State university, Fargo, North Dakota, United*

States, 2. North Dakota State University, Fargo, North Dakota, United States

In the past year, older adults have faced challenges due to COVID-19, yet many have also shown great resilience. This qualitative study explores older adults' experiences and perceptions of adaptation, social connection, and coping across the first six months of the COVID-19 pandemic, with a particular focus on unique resilience factors among rural older adults. A Midwestern sample (35% rural) of 70 older adults aged 70-97 completed three phone interviews (April, June, and October 2020) about their experiences with social distancing due to COVID-19. Thematic analysis of qualitative responses identified themes of resilience including: 1) purposeful and flexible social connections, 2) positive psychological mindset, and 3) hardiness and life experience. Strains related to the loss of community connections were evident, yet older adults demonstrated signs of adaptability and coping as compensation. Implications and future directions will be discussed in the context of change over time and geographic variation.

EXPERIENCES WITH PHYSICAL DISTANCING: COPING STRATEGIES AND POSITIVE EXPERIENCES

Raven Weaver, *Washington State University, Pullman, Washington, United States*

A representative U.S. sample of adults completed an online survey (N=360) about perceived changes in social health and wellbeing since the implementation of physical distancing restrictions in April. Analyses are conducted on a subsample of adults aged 60+ (n=93; m=65.7 years; SD=4.7). Baseline bivariate descriptive analyses showed no geographic-based differences in self-rated health, resilience, perceived financial wellbeing, or family/friend support measures. Content analysis of rural residents' (n=20) responses about coping strategies and positive experiences across three time points (April/July/November) revealed aspects of resilience. Individuals coped via acceptance and planning; engaging in activities; and keeping with routines. Positive experiences were relatively stable over time, with individuals describing improved health habits and enhanced social connectedness with family/neighbors. Individuals identified societal betterment and saving money as unintended benefits of the efforts to mitigate the spread of COVID-19. When faced with adversity, identifying positive experiences may help individuals cope with challenges in the long-term

COMMUNITY-ENGAGED OLDER ADULT-LED POLICY, SYSTEMS, AND ENVIRONMENT INTERVENTIONS IN THE MS HIGH OBESITY PROGRAM

David Buys,¹ Masey Smith,² Katie Halfacre,³ and Megan Holmes,³ 1. *Mississippi State University, STARKVILLE, Mississippi, United States*, 2. *Mississippi State University, Starkville, Mississippi, United States*, 3. *Mississippi State University, MS State, Mississippi, United States*

Older adults in rural areas are at unique risk for poor outcomes due to social isolation and limited access to resources. The Mississippi High Obesity Program (HOP) aims to enhance access to social connections and resources like community gardens, food pantries, and physical activity as part of its broader objective to prevent and reduce obesity. Through policy, systems and environment strategies, development of

Memoranda of Understanding (MOUs) between aforementioned entities, and community based participatory research approaches, Mississippi HOP efforts enhance food systems improvement efforts; grow multi-sectoral collaboration; and evaluate the effectiveness of new policies, and specifically MOUs, in reaching these goals. Older adults represent more than 40% (n=27) of all coalition members and stakeholder leaders (n=61); they are essential for the success of these initiatives. This presentation will highlight the work done during the COVID-19 pandemic and the role of and benefits to older adults, especially ones in rural communities.

PEER MENTORING TO FOSTER RESILIENT AGE-FRIENDLY RURAL COMMUNITIES IN MAINE

Patricia Oh,¹ Jennifer Crittenden,² and Laura Lee,³

1. *UMaine Center on Aging, Bangor, Maine, United States*, 2. *University of Maine, University of Maine, Maine, United States*, 3. *Maine Community Foundation, Ellsworth, Maine, United States*

Maine has a growing number of age-friendly community initiatives (AFCIs); 116 communities are actively working to adapt the social, service, and built environments for aging and 71 have formally joined the AARP Network of Age-Friendly States and Communities. During COVID, rural municipalities were faced with dynamic changes that limited older resident's access to services and social engagement. To overcome these limitations, it is critical for emergent AFCIs to have tools and strategies to maintain and further enhance healthy environments and resilient communities. This study uses group interviews with 6 leaders of established AFCIs and 6 leaders of emergent AFCIs to explore how the Lifelong Fellows Program, a peer mentoring model that matches experienced leaders with newly formed initiatives, was able to spur development of new strategies to build community resilience. Prominent themes were (1) engaging new local and regional partners; (2) intergenerational volunteerism; (3) fun and flexibility; and (4) relationship-building.

FEATURES OF RURAL COMMUNITIES IN LATIN AMERICA AND SUB-SAHARAN AFRICA THAT INFLUENCE WELL-BEING OF OLDER PERSONS

Nereide Curreri,¹ Andrew Banda,² Norah Keating,³ Jaco Hoffman,⁴ and Jose Parodi,⁵ 1. *Optentia Unit, North-West University, South Africa, Stirling, Scotland, United Kingdom*, 2. *University of Zambia, Lusaka, Lusaka, Zambia*, 3. *Swansea University, Swansea, Wales, United Kingdom*, 4. *North-West University, Vanderbijlpark, Gauteng, South Africa*, 5. *San Martin de Porres University, Lima, Lima, Peru*

In their recent volume, *Critical Rural Gerontology*, Skinner et al (2021) challenge us to set aside unidimensional notions of rural communities as bypassed vs very supportive; and to identify the elements of rurality that empower or exclude older people and how these differ across cultures and settings. Covid-19 has highlighted the need for safe and inclusive communities. Given that LMIC will be home to the majority of older adults (Gonzales et al. 2015), we undertook a scoping review of features of rural communities that influence wellbeing of older people in countries across Latin America and Sub-Saharan Africa. The review included literature in English, French, Spanish and Portuguese, using

search engines MEDLINE, CINAHL Complete, PsycInfo, SocINDEX, SciELO, AJOL (Africa Journals Online), LILACS, Redalyc, LatinIndex and Clasco. Findings illustrate diversity in how community features including remoteness, infrastructure and belonging influence material, social and subjective wellbeing of older residents.

Session 3635 (Symposium)

SHIFTING ISSUES OF SUPPORT EXCHANGE UNDER 20-YEAR IMPLEMENTATION OF JAPANESE LONG-TERM CARE INSURANCE PROGRAM

Chair: Tomoko Wakui

Japan has faced numerous issues in the last twenty years with its mandatory long-term care (LTC) insurance program. This LTC insurance program obviously affected older adults' informal support exchanges, reducing support from family and the community, which became more valuable, subjectively. Furthermore, changes in support have impacted older adults' subjective well-being and children's perceived care motivation. Additionally, a mandatory uniform system challenges the issue of tolerance of diversity, meaning how non-traditional families' opinions be involved LTC situations. This symposium discusses unexpected shifting issues in Japan in the implementation of a public LTC program with a focus on older adults' support exchanges. The first paper examines the long-term impacts of formal and informal support by examining the effects of implementing formal services. The second paper assesses a community's role in relation to family in the presence of a public LTC program. The third paper examines the subjective impacts of older parents, who provided support to adult children and their reciprocal expectations of receiving LTC. The fourth paper, on the other hand, articulates reciprocal impacts on sons' care motivation, which has become more important, since the introduction of the LTC program reinforced men's participation in LTC. Finally, the fifth paper clarifies how a public uniform program accommodates informal support from non-traditional families when the program premises the presence of family in advanced care planning. Our findings have long-term implications for aging societies in relation to formal and informal support exchanges.

TRENDS IN INFORMAL AND FORMAL LONG-TERM CARE USE AMONG OLDER ADULTS WITH DISABILITIES IN JAPAN

Hidehiro Sugisawa,¹ Yoko Sugihara,² Erika Kobayashi,³ Taro Fukaya,⁴ and Jersey Liang,⁵ 1. *J.F. Oberlin University, Tokyo, Tokyo, Japan*, 2. *Tokyo Metropolitan University, Tokyo, Tokyo, Japan*, 3. *Tokyo Metropolitan Institute of Gerontology, Itabashi-ku, Tokyo, Japan*, 4. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Tokyo, Japan*, 5. *School of Public Health, University of Michigan, Ann Arbor, Michigan, United States*

Whether increased formal long-term care (LTC) reduces informal LTC use by serving as a substitute or has a complementary role that boosts both informal and formal LTC use has been an important issue for evaluating LTC policy effectiveness. We described trends in in-home LTC use among older adults and LTC availability in relation to changes in LTC policy

in Japan. In addition, we examined whether these trends differ by living arrangements, gender, income, and disability levels. We used five waves of repeated cross-sectional data starting in 1999 to 2017. The use of both informal and formal LTC types combined increased until 2006 and then gradually decreased while remaining higher than in 1999. Although implementing the LTC program may have temporarily contributed to the complementary use of both LTC types, eligibility limitations brought about by LTC reform potentially reduced the effects of formal LTC's complementary role.

NEIGHBORHOOD RELATIONSHIP MATTERS FOR WHOM?: INTERACTION WITH FAMILY STRUCTURE AND FUNCTIONAL CONDITIONS

Ikuko Sugawara,¹ and Erika Kobayashi,² 1. *Bunri University of Hospitality, Suginami-ku, Tokyo, Japan*, 2. *Tokyo Metropolitan Institute of Gerontology, Itabashi-ku, Tokyo, Japan*

Living environment is considered to have unignorable effect on our health and well-being, especially when we face shrinkage of mobility as we age. Social interaction with neighbors constitutes our social environment, and it may affect our well-being by interacting with other social resources such as support from family and professional care providers. In this study we examined the effect of social environment in neighborhood on older people's well-being, and how its effect is moderated by their family structure, functional conditions, and LTC service usage. Data was obtained from the survey conducted in 2012 with nationally representative sample of Japanese adults aged 60 years and older. The results showed that for people with functional limitation but were not certified as needing LTC, neighborhood social network was positively associated with well-being. These results suggest the unique function of neighbors for frail people to keep everyday life in the community.

WHEN DOES SUPPORT TO ADULT CHILDREN NEGATIVELY AFFECT THE SUBJECTIVE WELL-BEING OF OLDER JAPANESE?

Erika Kobayashi, *Tokyo Metropolitan Institute of Gerontology, Itabashi-ku, Tokyo, Japan*

Providing time and money to adult children may enhance perceived usefulness and consequently the subjective well-being (SWB) of older parents. However, non-reciprocal relationships with children and conflicts with leisure activities could negatively affect parents' SWB. It was hypothesized that a substantial amount of support to children would be associated with lower SWB when older parents (a) had a low expectation of receiving long-term care from the children, and (b) were engaged in hobbies/learning activities. Life satisfaction and depressive symptoms measured as SWB were predicted based on the Generalized Estimating Equations, using panel data (2012-2017) with a nationwide representative sample of Japanese adults aged 60 years and older (1,212 parents). Providing child-rearing support (i.e., grandchild care) of 30 hours or more per month was positively associated with SWB regardless of conditions (a) and (b). Hypothesis (b) was partially supported: providing financial support enhanced depressive symptoms among older adults with hobbies/learning.

ROLE OF EMOTIONAL ATTACHMENT AND RECIPROCITY IN SONS' PERCEIVED CARE MOTIVATION FOR PARENTAL FIGURES

Tomoko Wakui,¹ Ryo Hirayama,² and Ichiro Kai,³ 1. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Tokyo, Japan*, 2. *Osaka City University, Osaka, Osaka, Japan*, 3. *The University of Tokyo, Tokyo, Tokyo, Japan*

The collapse of the traditional Japanese household system and the subsequent social advancement of women has led supporting parents as a family matter, and led more men to assume caregiving roles; however, very few studies have focused on sons' care motivation. This study aimed to understand adult sons' perceived care motivation and to examine the respective related factors of emotional attachment and reciprocity. A total of 1322 men (M [age] = 44.5) participated in a web-based questionnaire survey. Perceived care motivation for providing five types of support (e.g., helping with daily activities and housework) to each parent and parent-in-law was assessed. Regression analyses revealed that emotional attachment with parents and parents-in-law predicted perceived care motivation for all types of support. Furthermore, the role of reciprocity was indicated by the association between rearing by mother-in-law and son-in-law's motivation to provide assistance in financial matters, housework, and visiting a hospital.

WHO SHOULD MAKE CARE ARRANGEMENT FOR OLDER ADULTS? HETERONORMATIVE FAMILY RESPONSIBILITY IN JAPAN

Ryo Hirayama, *Osaka City University, Osaka, Osaka, Japan*

In Japan, despite the greater availability of public care services upon implementation of national long-term care insurance, families are still considered as primarily responsible to make care arrangement for older adults. My aim in this study was to explore (hetero)normative ideas about families that underlie Japan's institutionalized practices of elder care. In doing so, I focused on care managers, who are certified care practitioners helping families to make care arrangement, and whether they would count older adults' same-sex partners as legitimate family members to participate in such arrangement. Data were collected from 1,580 care managers working for officially designated in-home care providers across the nation. Preliminary analysis revealed that although most care managers believed the voices of same-sex partners should be preferably reflected in the process of care arrangement, they also thought that these partners could not participate in such process without permission from older adult's "blood relatives" (e.g., siblings).

Session 3640 (Symposium)

SOCIAL DETERMINANTS OF MEN'S HEALTH ACROSS THE LIFE COURSE

Chair: Roland Thorpe, Jr.

Discussant: Keith Whitfield

There is a paucity of research focusing on the complex interaction between social, behavioral, biological, and psychosocial factors, and health outcomes among men. This symposium contains a collection of papers that discuss some key social determinants of health (SDOH) that can provide

insights to advance our understanding of men's health and aging across the life course. Dawn will discuss the Stroke Counseling for Risk Reduction (SCORRE) intervention designed to increase awareness, risk perceptions, and health behaviors to reduce stroke risk in African Americans. Findings suggest tailoring the intervention to the needs and preferences of young African American men. Archibald and colleagues seek to determine if race differences in allostatic load (AL) among adult men vary by age. Black men 45-64 had a higher AL score (PR = 1.14, 95% CI 1.02, 1.28) than White men. Skipper and colleagues used a grounded theory approach to examine the negative interactions of 35 religious middle and old age Black men. Analyses reveal that church-related negative interactions broadly fall within the following themes: (1) ageism within intergenerational churches, (2) people are messy, and (3) issues with leadership. Bruce and colleagues examine the association between religious service attendance and mortality among Black men. Participants who attended at least once per week were 18% less likely to die than their peers who did not attend a religious service at all (HR 0.82; 95% CI 0.68-0.99). These presentations collectively will bolster our knowledge on key SDOH among men across the life course.

TAILORING STROKE COUNSELING FOR RISK REDUCTION INTERVENTION TO AFRICAN AMERICAN MEN

Dawn Aycok,¹ J. Taylor Harden,² Laura Salazar,¹ Gayenell Magwood,³ and Patricia Clark,¹ 1. *Georgia State University, Atlanta, Georgia, United States*, 2. *University of Texas at Austin, Austin, Texas, United States*, 3. *Medical University of South Carolina, Charleston, South Carolina, United States*

Early life course achievement and maintenance of ideal cardiovascular health is associated with reduced risk of developing stroke later in life. The Stroke Counseling for Risk Reduction (SCORRE) intervention is an age-and-culturally relevant intervention originally designed to correct inaccurate stroke risk perceptions and improve lifestyle behaviors to reduce stroke risk in AAs age 20-35. In a study testing SCORRE, fewer men participated, but most were not at a stage of readiness for behavior change; many did not think they were at risk despite averaging three modifiable risk factors, and while improvements in outcomes were observed in women they were not in men. These differences led to tailoring SCORRE to young AA men. The methods for tailoring SCORRE and resulting strategies for attracting, engaging, and empowering them towards stroke risk reduction, including hypotheses concerning food supply, housing, economic and social relationships, education, and mental health care will be raised for discussion.

IT'S NOT HEALTHY FELLOWSHIP: NEGATIVE INTERACTIONS AND THE IMPLICATIONS FOR MIDDLE- AND OLD-AGE BLACK MEN

Antonius Skipper,¹ Loren Marks,² and Cassandra Chaney,³ 1. *Georgia State University, Atlanta, Georgia, United States*, 2. *Brigham Young University, Provo, Utah, United States*, 3. *Louisiana State University, Baton Rouge, Louisiana, United States*

Despite the benefits of social support on the well-being of Black men across the life course, scholars are more closely examining the potentially negative outcomes associated with some social networks. As one social support system, the Black church frequently serves middle and old age Black men who identify as religiously involved. Yet, higher levels of religious involvement have also been associated with more church-related negative interactions. The present study utilizes a grounded theory approach to examine the negative interactions of religious middle and old age Black men. A semi-structured interview protocol is used to gather data from 35 Black men between the ages of 45 and 76. Analyses reveal that church-related negative interactions broadly fall within the following themes: (1) Ageism Within Intergenerational Churches, (2) People are Messy, and (3) Issues with Leadership. Since negative interactions can be more detrimental than social support is beneficial, health-related implications are discussed.

RACE DIFFERENCES IN ALLOSTATIC LOAD AMONG BLACK AND WHITE MEN: DOES AGE MATTER?

Paul Archibald,¹ Sarah Hill,² Hossein Zare,³ Marino Bruce,⁴ Keith Norris,⁵ Keith Whitfield,⁶ and Roland Thorpe, Jr.,⁷

1. CUNY, Staten Island, New York, United States, 2. Johns Hopkins School of Medicine, Baltimore, Maryland, United States, 3. John Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States, 4. University of Houston, Houston, Texas, United States, 5. University of California Los Angeles, Los Angeles, California, United States, 6. University of Nevada Las Vegas, Las Vegas, Nevada, United States, 7. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States

Although Black-White disparities in health and mortality among men persist, there has been a paucity of work focusing on race differences in physiological dysregulation of biological processes resulting from the cumulative impact of stressors among men. The purpose of this study was to assess potential race differences in Allostatic Load (AL) among adult men and if such differences varied by age. Data were drawn from the 1999-2016 NHANES and the study population included 21,529 non-Hispanic Black (NHB) and 34,282 Non-Hispanic White (NHW) born in US. Adjusting for potential confounders, NHB men 25-44 and 45-64 had a higher AL score (OR = 1.19, 95% confidence interval (CI) 1.00, 1.42) and (OR = 1.14, 95% confidence interval (CI) 1.02, 1.28) NHW men. No race differences with respect to AL score were observed among the other age groups. The results suggest that age plays a role in race differences in AL.

RELIGIOUS SERVICE ATTENDANCE, ALLOSTATIC LOAD, AND MORTALITY AMONG BLACK MEN

Marino Bruce,¹ Bettina Beech,² Dulcie Kermah,³ Gillian Marshall,⁴ Paul Archibald,⁵ Genee Smith,⁶ and Roland Thorpe, Jr.,⁶ 1. University of Houston, Houston, Texas, United States, 2. University of Houston, Houston, Texas, United States, 3. Charles R. Drew University of Medicine and Science, Los Angeles, California, United States, 4. University of Washington, Tacoma, Washington, United States, 5. CUNY, Staten Island, New York, United States, 6. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States

Black men experience high levels of social and psychological stress and religion has been a coping strategy. The purpose of this study was to examine the association between religious service attendance and mortality among Black men. Data were drawn from the NHANES III (1988-1994) sample linked to the 2015 public use Mortality File. The analytic sample (n=2300) was restricted to Black men. All-cause mortality was the primary outcome and religious service attendance was the primary independent variable. Findings from Cox proportional hazards models indicated participants who attended at least once per week were 18% less likely to die than their peers who did not attend a religious service at all (fully adjusted HR 0.82; CI 0.68-0.99). The robust association between religious service attendance and mortality among Black men suggest that prospective studies are needed to further examine the influence of religion on health among this population.

Session 3645 (Symposium)

SOCIAL DETERMINATES OF HEALTH AMONG OLDER ADULTS LIVING WITH HIV/AIDS

Chair: Erin Robinson

Co-Chair: Tonya Taylor

Discussant: Charles Emler

In the United States (U.S.), people aged 55 years and older make up 36% of people living with HIV/AIDS (PLWHA). Nearly 20% of new HIV infections occur among people aged 50+. While medical breakthroughs in HIV treatment have allowed PLWHA to live longer, healthier lives, structural conditions still exist that affect health outcomes of older adults living with HIV/AIDS (OALWHA). These conditions continue to disproportionately burden OALWHA, particularly older adults of color. Therefore, a greater understanding of the social determinates of health (SDH) is essential to continue making progress in HIV treatment, maintenance, and prevention. The U.S. Centers for Disease Control and Prevention (CDC) has highlighted several SDH among OALWHA, including: poverty, education, income, employment status, health insurance coverage, and housing. This symposium will highlight emerging research that examines several of these indicators among OALWHA. Using a variety of research methodologies, the five abstracts included in this symposium aim to address: 1) psychosocial risk factors of quality of life; 2) life instability and mental health; 3) institutional barriers and facilitators of successful aging; 4) determinants of engaging in advance care planning; and 5) a needs assessment of OALWHA, with particular emphasis on SDH. Results from this research identify several priority areas (such as housing instability, mental health, food insecurity, and isolation) for healthcare leaders to consider in targeting future policy, programming, and funding. Future initiatives are essential to help continue the progress in HIV/AIDS treatment and prevention, including addressing SDH among the aging population living with HIV/AIDS.

PSYCHOSOCIAL RISK FACTORS OF QUALITY OF LIFE OUTCOMES AMONG OLDER ADULTS LIVING WITH HIV

Monique Brown, University of South Carolina, Columbia, South Carolina, United States

Antiretroviral therapy, higher education, and HIV disclosure have been linked to improved quality of life (QoL) among people living with HIV. However, research examining psychosocial risk factors of QoL among older adults living with HIV (OALH) is lacking. Therefore, the main aim of this study was to examine the psychosocial risk factors of QoL among OALH. Data were obtained from 156 adults aged 50 and older living with HIV in South Carolina. Multivariable regression models adjusting for sociodemographic characteristics were used to determine the association between psychosocial risk factors and QoL domains among OALH. Stigma was associated with the physical ($\beta=0.058$, $p=0.023$), social ($\beta=-0.149$, $p=0.006$), and spiritual ($\beta=0.124$, $p<0.001$) domains. Resilience was associated with the psychological ($\beta=0.206$, $p<0.001$), independence ($\beta=0.100$, $p=0.010$), social ($\beta=0.166$, $p=0.004$), and environmental ($\beta=0.312$, $p<0.001$) domains. Depression and experiencing trauma were also associated with varying QoL domains. Findings may inform interventions geared towards improving QoL among OALH.

EXPLORING LIFE INSTABILITY'S RELATIONSHIP TO THE MENTAL HEALTH OF OLDER ADULTS WITH HIV

Elliott Weinstein,¹ Audrey Harkness,² Gail Ironson,³ Cho-Hee Shrader,² Dustin Duncan,⁴ and Steven Safren,³

1. *Psychology, Miami, Florida, United States*, 2. *Department of Public Health Sciences, University of Miami, Florida, United States*, 3. *Department of Psychology, University of Miami, Florida, United States*, 4. *Mailman School of Public Health, Columbia University, New York, United States*

The study is one of the first to examine both the prevalence of life instability among older adults with HIV (OAWH) in a community clinic and its relationship to their mental health. OAWH (N=623) from a community medical clinic completed an interviewer-administered assessment (English/Spanish) which included an additive Life Instability Index (LII) composed of indicators at the individual (e.g. education, housing instability, employment status) and community (e.g. poverty, transportation) levels. Participants were a mean age of 60 years (SD = 5.90) with the majority identifying as Black-non-Hispanic (65.9%), cisgender male (60.8%), and heterosexual (80.6%). Participants reported an average of 6.08 destabilizing factors (SD = 1.44). In multiple linear regression analyses LII was significantly related to increased substance use among participants ($b=0.08$, $p < 0.01$), but not with anxiety or depression. An LII is an innovative approach to assess the relationship between OAWH's mental health and social determinants of health.

PERCEPTIONS OF SOCIAL DETERMINANTS OF SUCCESSFUL AGING AMONG OLDER MEN LIVING WITH HIV

Anna Rubtsova,¹ David Moore,² Dilip Jeste,³ and Marcia Holstad,⁴ 1. *Emory University Rollins School of Public Health, Emory University, Georgia, United States*, 2. *University of California, San Diego, San Diego, California, United States*, 3. *University of California San Diego, La Jolla, California, United States*, 4. *Emory University, Atlanta, Georgia, United States*

The overall purpose of this qualitative study was to examine barriers and facilitators of successful aging among

older men living with HIV (OMLH). Participants were recruited through HIV Neurobehavioral Research Program at the University of California, San Diego. Our sample included 14 OMLH: average age - 62 years old (range: 53 to 72), 79% white, 43% living alone, 79% men who have sex with men, 57% having college education or higher. Semi-structured interviews lasted from 43 to 114 minutes and were fully transcribed. Several themes emerged related to perceived barriers to successful aging stemming from social institutions: i.e., age discrimination and ageism, sexual and HIV-related stigma, social isolation, lack of resources, and food insecurity. Perceived institutional solutions promoting successful aging included mixed-age/inter-generational support groups, computer literacy training, health education, information and resources related to healthy lifestyle on a limited budget, and increased transparency of resources available to older adults.

BARRIERS AND FACILITATORS TO ADVANCE CARE PLANNING AMONG VETERANS AGING WITH HIV

Emily Pinto Taylor,¹ Sean Halpin,² Vincent Marconi,³ Amy Justice,⁴ Theodore Johnson II,¹ D. Keith McInnes,⁵ and Molly Perkins,⁶ 1. *Emory University School of Medicine, Atlanta, Georgia, United States*, 2. *University of Georgia, Decatur, Georgia, United States*, 3. *Division of Infectious Diseases, Emory University School of Medicine, Atlanta, Georgia, United States*, 4. *West Haven VA Medical Center, West Haven, Connecticut, United States*, 5. *Boston University School of Public Health, Boston, Massachusetts, United States*, 6. *Emory University of Medicine, Atlanta, Georgia, United States*

Advance care planning (ACP) and hospice services are underutilized by patients living with HIV (PWH). Little is known about how older PWH approach ACP; the purpose of this qualitative study was to understand barriers and facilitators to ACP within the context of the patient-clinician relationship. Data are from a larger multimethod study designed to understand social determinants of health (SDH) that shape the lives and healthcare experiences of veterans aging with HIV. The sample includes 25 veterans from the Veterans Aging Cohort Study (VACS) recruited from an urban VA medical center. Semi-structured interviews were performed and analyzed using thematic analysis. Less than half of participants reported engaging in ACP. Key barriers to ACP include: fragile social ties, distrust of the healthcare system, and fear of disclosure and discrimination. We offer several recommendations for clinicians to engage in these conversations successfully and highlight the importance of considering SDH when designing interventions.

SOCIAL DETERMINANTS OF HEALTH AMONG THOSE WITH AND WITHOUT HIV INFECTION IN NYC, THE EPICENTER OF THE U.S. CRISIS

Tonya Taylor, *SUNY Downstate Health Sciences University, Brooklyn, New York, United States*

The COVID-19 pandemic in NYC, the epicenter of the US crisis, revealed indisputable evidence that social determinants of health (SDoH, e.g., racism, crowded housing, employment risks) and disparities in comorbid health risk factors produce higher burdens of disease and death among racial and ethnic populations. We conducted a needs assessment of SDoH

among 1400 patients in several ambulatory care clinics to explore the impact among older adults, across different clinical populations. Among older adults with HIV (OAH), we found lower rates of food and housing insecurity compared to older adults without HIV. Despite higher levels of COVID knowledge and prevention adherence, we also found significantly higher levels of isolation, loneliness, depressive symptoms, and anxiety among OAHs compared to those without HIV. Access to Ryan White entitlements did buffer some impacts but preexisting high burdens of mental health issues were exacerbated, perhaps due to heightened perceptions of increased vulnerability to COVID-19.

Session 3650 (Symposium)

TECHNOLOGY IS THE NEW NORMAL FOR INDIVIDUALS AGING-IN-PLACE WITH DISABILITIES

Chair: Travis Kadylak

Discussant: Susy Stark

Technology designers often exclude individuals aging with diverse needs, capabilities, and disabilities from engaging in the design process, which can hinder the usability and usefulness of emerging technologies. In this symposium, investigators report on research and development efforts aimed at understanding the needs of, and developing supportive technologies for, people aging with long-term disabilities. This symposium features projects from the Rehabilitation Engineering Research Center on Technologies to Support Aging-in-Place for People with Long-Term Disabilities (RERC TechSAGE), which is an interdisciplinary collaboration between Georgia Tech and the University of Illinois at Urbana-Champaign. First, Bayles et al. will discuss findings from the Aging Concerns, Challenges, and Everyday Solution Strategies II study, focused on Deaf older adults' use of technologies as solution strategies for common everyday challenges. Next, Mitzner et al. will highlight the development of an evidence-based group exercise intervention (Tellewellness Tai Chi for Arthritis) aimed at promoting both physical exercise and social interaction for older adults with long-term mobility disabilities. Kadylak et al. will describe how voice-activated digital assistants can support older adults aging with mobility disabilities by reporting on findings from a longitudinal demonstration project with older adults in assisted and independent living communities. Exploring the potential for smartbathroom technology to promote aging in place, Sanford et al. will discuss how smartbathroom sensor data can be analyzed and visualized to identify ways to communicate insight from sensor data to improve training of occupational therapy practitioners. Susy Stark from Washington University will serve as the discussant for the symposium.

TECHNOLOGY SOLUTIONS FOR EVERYDAY BARRIERS AMONG DEAF OLDER ADULTS

Megan Bayles,¹ Lyndsie Koon,² Shraddha Shende,¹ Wendy Rogers,¹ and Jenny Singleton,³ *1. University of Illinois Urbana-Champaign, Champaign, Illinois, United States, 2. University of Kansas, Lawrence, Kansas, United States, 3. University of Texas at Austin, Austin, Texas, United States*

American Sign Language (ASL) is the primary form of communication for approximately 250,000 people in the U.S. (Mitchell et al., 2006). As these individuals age, they

may experience challenges in their everyday activities. For example, ASL users rely on visual cues, but have age-related change in vision. Moreover, ASL users may need to utilize technology to communicate with non-ASL users, but the technology may not be suitable/usable for older adults. We explored these issues in the Aging Concerns, Challenges, and Everyday Solution Strategies (ACCESS) study, wherein we interviewed Deaf older adults (N=60) in ASL, who provided insights into unique, everyday challenges they encounter. We will focus on the technology solution strategies they incorporate to address and overcome challenges with daily activities. Understanding how participants think about, adapt, and utilize different technologies can inform future technology design to successfully support diverse, aging populations.

DELIVERING A TAI CHI INTERVENTION TO ADULTS AGING WITH MOBILITY DISABILITIES USING ZOOM

Tracy Mitzner,¹ Elena Remillard,² Kara Cohen,³ and Lelah Cochran,³ *1. Georgia Institute of technology, Atlanta, Georgia, United States, 2. Georgia Institute Of Technology, Atlanta, Georgia, United States, 3. Georgia Institute of Technology, Atlanta, Georgia, United States*

Many individuals aging with mobility disabilities experience barriers to participating in physical activity, including transportation challenges and the need for specialized instruction. Since the COVID-19 pandemic began, these participation barriers have been amplified due to lockdowns and restrictions. Tele-technologies, including videoconferencing platforms like Zoom, can facilitate access to exercise classes from one's home. Virtual group exercise classes that incorporate social interaction have particular potential to support the physical and mental health of this population. This session will highlight lessons learned from launching the 'Tele Tai Chi' study, in which we are delivering an evidence-based Tai Chi program (Tai Chi for Arthritis) via Zoom to small group classes of older adults with long-term mobility disabilities. We will describe adaptations made in translating the in-person program to an interactive, online class, and provide an overview of a 'Telewellness' Tool that provides guidelines for using Zoom to deliver exercise classes to older adults.

EXPLORING USE OF DIGITAL HOME ASSISTANTS FOR OLDER ADULTS: A DEMONSTRATION PROJECT

Travis Kadylak,¹ Maya Malecki,² Leonardo Galoso,² Saahithya Gowrishankar,³ Amy Brown,⁴ Ramavarapu Sreenivas,³ and Wendy Rogers,² *1. University of Illinois Urbana Champaign, Champaign, Illinois, United States, 2. University of Illinois Urbana-Champaign, Champaign, Illinois, United States, 3. University of Illinois at Urbana-Champaign, Champaign, Illinois, United States, 4. CRIS Healthy Aging Center, Danville, Illinois, United States*

Emerging digital home assistant technology has potential to support older adults in their homes. Voice-activated assistants can be used for entertainment, environmental control, physical activities, health management, and social engagement. However, many older adults have limited experience with these devices, which are not designed with them in mind. We conducted a demonstration project to explore how seven older adult assisted and independent living residents interacted with digital assistants over four months. We conducted

monthly semi-structured telephone interviews and pre/post questionnaires. Participants desired to use their devices to communicate with others, and for a range of health activities, including nutrition tracking, medication management, and health information searching. However, numerous usability barriers emerged. Some participants perceived their device as a social companion. These findings indicate that older adults are willing to use digital assistants for various activities that may enhance independence, although instructional and training materials are needed to support their use.

SMARTBATHROOM DATA VISUALIZATION TOOL TO INFORM OT CLINICAL REASONING

Jon Sanford,¹ Avinandan Basu,¹ and Yangyi Xu,² 1. *Georgia Tech, Georgia Tech/Atlanta, Georgia, United States*, 2. *Georgia Tech, GA Tech/Atlanta, Georgia, United States*

Traditionally, Occupational Therapy assessment of an older adult's toilet transfer performance has been based on qualitative observation and client self-report. The purpose of this study was to evaluate the effectiveness of supplementing traditional clinical reasoning with quantitative transfer performance data about body and foot position, balance, hand placement and grasping forces on grab bars. Specifically, we conducted an online survey of occupational therapy practitioners and educators to assess the usefulness and usability of 2D and 3D graphic visualizations representing foot and hand position and forces exerted on the floor, toilet seat and grab bars. These data were captured by sensors located throughout GA Tech's SmartBathroom laboratory during a study of transfer performance. Findings are being used to identify the most useful sensor data and the most effective ways to convey that data to improve training of occupational therapy students.

Session 3655 (Symposium)

TECHNOLOGY TO SUPPORT SOCIAL, HEALTH, AND WELL-BEING OUTCOMES AMONG OLDER ADULTS

Chair: Walter Boot

In response to the COVID-19 pandemic, information and communication technologies (ICTs) are primarily how many people communicate, socialize, and receive healthcare. In a recent Pew report, experts in the role of technology in society believe that post-COVID-19 pandemic, society will continue to be far more technology-driven than pre-pandemic. That is, technology will play an even greater role in our lives in the "new normal." However, compared to younger adults, many older adults are less likely to adopt the technologies needed to perform these everyday tasks. Differences in technology proficiency, acceptance, and adoption between groups is often referred to as the "digital divide," and older adults are more likely to be on the disadvantaged side of this digital divide. This session explores the potential of technology to support social, health, and wellbeing outcomes among older adults, and the challenges involved. This session will start with a talk by A. Lothary on the success and challenges of using a simple video chat platform to address loneliness and social isolation. S. Shende will present a video-technology intervention for older adults with and without cognitive impairment, and how this intervention was designed to facilitate engagement.

This will be followed by a presentation by X. Lin on the relationship between social media usage and well-being across the lifespan, and mediators of this relationship. The session will conclude with a presentation by W. Qin on predictors of older adults' use of telehealth technology to support health and wellbeing during the COVID-19 pandemic.

VIDEO CHAT TECHNOLOGY TO SUPPORT HOME AND COMMUNITY-BASED ORGANIZATIONS

Madina Khamzina,¹ Brielle Ross,¹ Allura Lothary,² Dillon Myer,³ Raksha Mudar,⁴ and Wendy Rogers,¹ 1. *University of Illinois Urbana-Champaign, Champaign, Illinois, United States*, 2. *University of Illinois Urbana-Champaign, Urbana, Illinois, United States*, 3. *OneClick.Chat, Philadelphia, Pennsylvania, United States*, 4. *University of Illinois-Urbana Champaign, Champaign, Illinois, United States*

Concerns about loneliness and social isolation for older adults were already evident but have been exacerbated during the pandemic. Home and Community Based Organizations (HCBOs) provide support for their older clients in the community and need to support their staff, who may be working remotely. We are exploring the potential of video chat technology to connect older adults with their friends, families, and other support. We review the technologies available to older adults in the community and staff working with older adults to promote social engagement. We are collaborating with OneClick.chat to identify the needs of the HCBOs through a literature review and qualitative interviews of staff members from different senior living environments. Their challenges and successes of engaging older adults through video chat technologies will provide guidance for design of an HCBO dashboard for OneClick.chat that will support diverse needs.

CONTENT DEVELOPMENT FOR A VIRTUAL SOCIAL ENGAGEMENT INTERVENTION

Shraddha Shende,¹ Allura Lothary,² Justine King,³ Sarah Jones,⁴ Raksha Mudar,⁴ Dillon Myers,⁵ and Wendy Rogers,¹ 1. *University of Illinois Urbana-Champaign, Champaign, Illinois, United States*, 2. *University of Illinois Urbana-Champaign, Urbana, Illinois, United States*, 3. *iN2L, Greenwood Village, Colorado, United States*, 4. *University of Illinois-Urbana Champaign, Champaign, Illinois, United States*, 5. *OneClick.chat, Philadelphia, Pennsylvania, United States*

Video technology has the potential to provide older adults with socially and cognitively engaging activities for in-home participation. We are exploring use of OneClick.chat, a video technology platform, to present older adults with and without mild cognitive impairment opportunities for engagement. In collaboration with iN2L we have developed events that will facilitate conversations that do not rely on episodic memory, cover a range of topics, and represent different cultures and interests. We selected event topics that were positive, socially and cognitively engaging, and included a range of pictures based on our previous research. Events were carefully controlled for length of presentation, picture type, and readability. Discussion questions related to the events were designed to stimulate engaging conversations through

open-ended questions and to not burden memory recall or enforce stereotypes. Our work highlights potential future avenues for researchers and home and community-based organizations to use technology to promote social engagement.

THE RELATIONSHIP BETWEEN SOCIAL MEDIA USE AND WELL-BEING: THE MEDIATING ROLE OF SOCIAL SUPPORT

Xin Yao Lin,¹ and Margie Lachman,² 1. *Brandeis University, Waltham, Massachusetts, United States*, 2. *Brandeis University, Brandeis University, Massachusetts, United States*

Frequent social media usage can have negative effects on well-being, but the mechanisms involved are unclear. This study explored the mediating role of giving and receiving support. Using the Midlife in the United States Refresher eight-day daily diary study (N=782, age 25-75), multilevel structural equation modeling examined the hypothesized relationships at both the within- (intraindividual) and between-person (interindividual) levels. Results showed that at the within-person level, days with more social media use were associated with a larger proportion of time giving support and worse well-being (less positive affect and more stress, negative affect, and loneliness). At the between-person level, more social media use was associated with worse well-being. Giving support, but not receiving support, mediated the relationship between social media use and well-being at the within, but not the between-person level. Discussion focuses on ways to address the negative consequences of social media use related to social connections and well-being.

ADOPTION OF TELEHEALTH AMONG OLDER ADULTS DURING THE COVID-19 PANDEMIC

Weidi Qin, *University of Michigan*

The COVID-19 pandemic has disrupted older adults' in-person healthcare services. Many individuals rely on remote communication with their healthcare providers for non-urgent health or mental health issues. The present study investigated the effects of technology learning and depressive symptoms on new adoption of telehealth (e.g. online messaging, video call) to communicate with healthcare providers during the COVID-19 pandemic. A sample of 1,500 Medicare beneficiaries aged 65 or older was selected from the National Health and Aging Trend Study. A series of logistic regressions were performed. Results showed that older adults who learned a new online technology during the COVID-19 outbreak were more likely to adopt telehealth. Also, older adults with a higher level of depressive symptoms were more likely to start using telehealth. The findings highlight the importance of technology training to help older adults go online. Telehealth can be an important coping tool for depressive symptoms during the pandemic.

Session 3660 (Symposium)

TRAUMATIC EVENTS AND HEALTH: AN ECOLOGICAL AND LIFE COURSE PERSPECTIVE

Chair: XinQi Dong

During the past decades, researchers have shown an increasing interest in the study of traumatic events among aging populations. The majority of studies on trauma focus

on mental health, which overlooks the possibility that trauma may also have an adverse effect on other health outcomes, such as cognitive function. A number of studies focus on a single traumatic event. However, this approach may underestimate its health impact as many people experience multiple forms of traumatic events. Indeed, the impact of traumatic events on health depends on the event itself (e.g., single or multiple forms, time) as well as ecological factors. This symposium aims to address the above limitations. The first longitudinal study An Ecological Model of Risk Factors in Elder Mistreatment (EM) Victims tested different dimensions of the ecological model to prevent recurrence of EM. The second study Polyvictimization and Cognitive Function in an Ethnic Minority Aging Population explored whether exposure to multiple forms of EM affects cognitive function. The third study Traumatic Events and Cognitive Function: Does Time Matter? examined whether traumatic events happened in childhood, adulthood, or old age will influence late-life cognitive function. The fourth study Face-saving and Help-seeking among Older Adults with EM identified cultural determinants of help-seeking behaviors in EM victims. This symposium will advance knowledge in the health consequences of polyvictimization and exposure to traumatic events in different life stages. It will also inform interventions to stop the recurrence of EM in immigrant families and enhance the help-seeking behaviors of ethnic minority older adults.

POLYVICTIMIZATION AND COGNITIVE FUNCTION IN AN ETHNIC MINORITY AGING POPULATION

Mengting Li,¹ and XinQi Dong,² 1. *Rutgers, The State University of New Jersey, New Brunswick, New Jersey, United States*, 2. *Rutgers University, Rutgers Institute for Health, New Jersey, United States*

Globally, around 1 in 6 older adults experienced some form of elder mistreatment in community settings. However, little is known about the prevalence of polyvictimization, or experience of multiple forms of abuse, which may exacerbate negative outcomes over that of any one form of victimization in isolation. Data were drawn from the PINE study. Polyvictimization was defined as exposure to multiple forms of victimization, including psychological, physical, and sexual mistreatment, financial exploitation, and caregiver neglect. Cognitive function was evaluated by global cognition, episodic memory, executive function, working memory, and MMSE. Regression analyses were performed. Among 3153 participants, 128 experienced two forms of abuse while 12 experienced three or more forms of abuse. Polyvictimization was associated with lower global cognition ($b=-0.05$, $SE=0.02$, $p<.05$), episodic memory ($b=-0.06$, $SE=0.03$, $p<.05$), working memory ($b=-0.14$, $SE=0.07$, $p<.05$), and processing speed ($b=-0.68$, $SE=0.33$, $p<.05$). Interventions could target older adults with polyvictimization and protect their cognitive function.

AN ECOLOGICAL MODEL OF RISK FACTORS IN OLDER ADULTS WITH REPEATED EXPOSURE TO ELDER MISTREATMENT

Mengting Li,¹ Qun Le,² and XinQi Dong,³ 1. *Rutgers, The State University of New Jersey, New Brunswick, New Jersey, United States*, 2. *Rutgers University, New Brunswick,*

New Jersey, United States, 3. Rutgers University, Rutgers Institute for Health, New Jersey, United States

Limited empirical studies examined the factors related to repeated EM exposures among Chinese older immigrants. Guided by the ecological model, this study aims to explore what are the risk factors leading to recurrence of EM. Data were drawn from the two-wave PINE Study with 725 participants having EM at baseline and 191 reported repeated EM after two years. EM was evaluated by a 66-item instrument, including psychological, physical, and sexual mistreatment, financial exploitation, and caregiver neglect. Logistic regression was used. Increasing financial independence was associated with lower possibility of repeated EM (OR: 0.72, 95%CI 0.56-0.92). Every one unit increase in ADL impairment (OR: 1.10, 95%CI 1.02-1.18), IADL impairment (OR: 1.09, 95%CI 1.05-1.13) and increase frequency of alcohol consumption (OR: 1.33, 95%CI 1.06-1.66) were associated with higher possibility of repeated EM. Social service could improve physical function, provide financial support, and reduce health-risk behavior to prevent the recurrence of EM.

TRAUMATIC EVENTS AND COGNITIVE FUNCTION: DOES TIME WHEN TRAUMATIC EVENTS HAPPEN MATTER?

Gabriella Dong, Rutgers, The State University of New Jersey, New Brunswick, New Jersey, United States

People at different life stage may respond differently to traumatic events and result in different cognitive health. This study aims to examine the relationship between life stage at which one experiences traumatic events and cognitive function. The data were drawn from the 2017-2019 PINE study (N = 3,125). The time of life events happened was evaluated by childhood (<20), adulthood (20-59), and old age (60 and above). Cognition was measured through global cognition, episodic memory, working memory, processing speed, and MMSE. Linear regression was used. Individuals with the latest exposure to traumatic events at adulthood or old age have higher cognitive function than those without traumatic events over the life course. Exposure to traumatic events in middle or later life stimulates cognition, while trauma exposure in earlier life stage does not. Future research to understand the impact of traumatic events on health could consider the time when traumatic events happen

FACE-SAVING AND HELP-SEEKING AMONG U.S. CHINESE OLDER ADULTS WITH ELDER MISTREATMENT

Ying-Yu Chao,¹ Dexia Kong,² and XinQi Dong,³ 1. Rutgers University, Newark, New Jersey, United States, 2. The Chinese University of Hong Kong, Hong Kong, Hong Kong, 3. Rutgers University, Rutgers Institute for Health, New Jersey, United States

Chinese culture places a high value on saving face and not bringing shame to the family. This study aimed to examine the associations between face-saving and help-seeking among U.S. Chinese older adults who experienced elder mistreatment (EM). Data were retrieved from the PINE study. Regression analyses were performed. Most EM victims sought help from informal sources only (48.21%), followed by no help (26.79%), informal plus formal help (19.64%), and formal help only (5.36%). For EM screening, face-saving

was associated with informal help-seeking intentions ($p < .05$). For EM subtypes, face-saving was associated with overall help-seeking intentions for financial exploitation ($p < .05$), but not on physical mistreatment, psychological mistreatment, and caregiver neglect. Face-saving was not associated with help-seeking behaviors. Study findings underscore the significance of a unique cultural value in understanding EM help-seeking intentions among Chinese older adults. Cultural constructs should be considered in future EM research in diverse populations.

Session 4000 (Symposium)

ACCESS AND BARRIERS TO USE OF LONG TERM SERVICES: CONTEXTUAL ISSUES

Chair: Allen Glicksman

Co-Chair: Lauren Ring

Discussant: Norah Keating

The challenges that some older adults face in accessing both health and social services is a topic of continuing concern. This panel will focus on contextual issues that often shape specific challenges. These contextual issues usually emerge either from issues of diversity among the older persons themselves (for example, minority status or foreign born) and diversity between the ways in which services are offered (usually established at the national or in the case of the United States, at the state level). The intersection of these two forms of diversity often define the specific challenges faced by older persons in accessing health and social services. Further, unexpected events, such as the COVID pandemic, can affect both types of diversity (greater challenges for persons who do not speak the dominant language; inability of services to quickly adapt to radically changed environment). Our panel will address these issues through four presentations, each taking a different look at the ways in which diversity affects access. Our first paper, by Torres, will place this discussion in wider context by presenting results from a scoping review. Our second paper, by Diederich looks at access to services by immigrant generation (that being another source of diversity) in Germany. The third paper, by Thiamwong looks at how the COVID crisis affected older Hispanic women. Finally, Ring will examine how a national policy, here the definition of poverty, affects outcome and access for older person in the United States.

DEFINING POVERTY AS AN ELIGIBILITY REQUIREMENT FOR SUPPORTIVE SERVICES

Allen Glicksman,¹ and Lauren Ring,² 1. None, Philadelphia, Pennsylvania, United States, 2. Philadelphia Corporation for Aging, Philadelphia, Pennsylvania, United States

Deciding which individuals qualify as "poor" often depends on how each country or municipality defines the term 'poverty'. In the United States, program eligibility is often tied to the Federal Poverty Level (FPL), using 100% of the FPL as a cut-off for receipt of services. However, research has shown that incomes of 200% of the FPL and higher are often needed to establish even minimum levels of economic security. Using data from an omnibus health study conducted in 2018 that included 1,581 persons ages 60+ who were asked about their health and service needs, we compared persons making 100% of the FPL or less to persons

making 101%-199% and 200%+, respectively. Results show that poor health status and need for services among persons in the 101%-199% are similar to those with incomes less than 100% FPL, and significantly higher than persons with incomes at 200%+ of the FPL.

ETHNICITY AND RACE IN ACCESS AND USAGE OF HEALTH AND SOCIAL CARE: RESULTS FROM A SCOPING REVIEW

Sandra Torres, *Department of Sociology, Uppsala, Uppsala Lan, Sweden*

Scholarship on ethnicity and old age is at a crossroad now that increased diversity is a given in older populations. The same holds true for the study of the role that ethnicity and race play in access and usage of health and social care in old age. This presentation relies on a scoping review of scholarship published between 1998 and 2020 that brings attention to the ways in which ethnicity & race – as grounds for stratification and disadvantage – are made sense of in this scholarship. The presentation will describe the topics that the review divulged, whether racism has been acknowledged in this scholarship so far, and how this has been the case. In doing so, this presentation will argue that if we are to address the inequalities that older ethnic minorities face we need not only a diversity-astute research agenda but also an injustice-aware one.

CULTURAL DIFFERENCES IN OLDER IMMIGRANTS' HEALTH AND SOCIAL SERVICES USE

Freya Diederich, *University of Bremen, Bremen, Bremen, Germany*

Even though Germany has a mandatory health and long-term care insurance with no or only very low co-payments, immigrants and the native population differ in their health and social services use. Differences in cultural traits and a lack of knowledge about the institutional setting are frequently mentioned as contributing factors. Relying on the epidemiological approach in the economic literature, this empirical study shows that both cultural traits that prevail in older immigrants' country of origin and older immigrants' knowledge about the host country's institutional setting affect their health and social services use in Germany. We distinguish foreign-born immigrants and their descendants as both groups differ in their connection to the home and the host country. The results will be used to discuss immigrants' access and potential barriers to the use of health and social services in comparison to the native population.

HOW THE COVID-19 CRISIS AFFECTED DIVERSE OLDER ADULTS: A MIXED METHODS CASE SERIES

Ladda Thiamwong, *College of Nursing, University of Central Florida, Orlando, Florida, United States*

The coronavirus disease (COVID-19) pandemic has magnified inevitable physical, mental and social health consequences, especially in Hispanic older adults who experience health disparities and ageism. Even though physical distancing has been adopted as a key strategy to help reduce further spread of COVID-19, prolonged periods of physical distancing may worsen existing health problems. This study aims to explore how the COVID crisis affected diverse older adults. An explanatory sequential mixed methods design was

utilized. Quantitative data were collected by questionnaires via Qualtrics survey and qualitative data were collected by individual phone interviews with four open-end questions. One in 4 older adults lives alone and one in 20 has no friend to call on. More than half of the participants were afraid of COVID and a fourth of them were afraid of losing their life to COVID. Participants identified keeping themselves busy as key to staying healthy during the pandemic.

Session 4005 (Symposium)

ACTIVE AGING FROM THEORY TO PRACTICE: NATIONAL EXPERIENCES OF POLICY MAKING IN EUROPE AND CANADA

Chair: Francesco Barbabella

Born in Europe as a concept aiming to counteract new demographic and societal challenges, active aging has progressively become a key pillar of an extended welfare state for aging populations in many high-income countries. Needs, interests, and preferences of new aging cohorts are changing, becoming more diverse and requiring a better understanding and greater attention by policy makers, beyond mere social welfare programmes for those with social, economic or health needs. Active aging policies aim at improving individuals' quality of life by optimizing opportunities for health, participation, and security (WHO 2002), hence unlocking the potential of older people as active citizens in the community and the society. Since the focus is on a multidimensional concept of quality of life, active aging works at the intersection of labour, social, educational, family, infrastructure, and many other policy areas. However, there may be gaps and discrepancies between the concept in itself and its application at the policy level. The purpose of this symposium is to present and discuss how different post-industrial societies are advancing and implementing active aging policies, in the context of overarching societal challenges and competing needs. In this respect, the symposium focuses on four countries representing different traditional welfare state models: Canada, Italy, Poland, and the United Kingdom. These four case studies bring analyses of active aging policies at national and/or regional level, providing a picture of how such policies have been designed, how they evolved and what they have achieved in recent years.

HOW ACTIVE AGING POLICIES EVOLVED IN ITALY? A SYSTEMATIC REVIEW OF NATIONAL AND REGIONAL POLICIES

Francesco Barbabella,¹ Davide Lucantoni,² Marco Socci,² Giovanni Lamura,² and Andrea Principi,² 1. *National Institute of Health and Science on Ageing (IRCCS INRCA), Ancona, Marche, Italy*, 2. *National Institute of Health and Science on Ageing (IRCCS INRCA), Ancona, Marche, Italy*

In recent years, active aging became a concept progressively considered by policy makers in Italy. A national project for creating a multilevel and co-managed coordination of active aging policies was launched in 2019 by the Italian Government and the National Institute of Health and Science on Ageing (IRCCS INRCA). A systematic review of active aging policies was conducted at both national and regional level. Results showed that national policies still reflect the

general categorical fragmentation of Italian welfare system, although substantial developments were found in some sectors, i.e. prolonging working life, supporting families, social inclusion, and healthy ageing. Ten out of twenty-one regions have approved laws dedicated to active aging, although in most cases these laws are too recent to show impact. National and regional policy makers still need to overcome several cultural, coordination and fragmentation challenges for improving active aging policies and harmonise them with societal needs.

AGING EQUALLY? EMPLOYING ACTIVE AGING POLICY IN THE UNITED KINGDOM

Liam Foster, *University of Sheffield, Sheffield, England, United Kingdom*

The UK's responses to the challenges of ageing have largely focused on productivist notions of active ageing, with more comprehensive responses tending to be reactive and largely remedial. This presentation will show that productivist policies, often characterised by individual responsibility, including raising the retirement age, restricting access to early retirement, and providing a stronger link between pension benefits and contributions, have incentivised remaining in the labour market. These strategies have been justified in the context of ageing populations and increasing pension costs. However, opportunities to extend working lives have not been experienced equally. In practice most policies are gender blind. Furthermore, a more comprehensive approach to active ageing in the UK needs a collective emphasis to mobilise a wide range of societal resources, underpinned by a commitment to public welfare, which is highly problematic under neo-liberalism. Therefore, a comprehensive approach to ageing in the UK requires a substantial ideological shift.

POLICY IMPLICATIONS OF THE ACTIVE AGING FRAMEWORK IN POLAND

Jolanta Perek-Białas, and Maria Varlamova, *Jagiellonian University, Krakow, Malopolskie, Poland*

Poland's relatively young population in the past, is aging rapidly, which provokes a growing interest in the realisation of the older population's potential within the framework of the concept of active ageing. From 2012, when the first Governmental Program on Social Participation (ASOS 2012-2013) was introduced, the active aging framework remains one of the dominant strategies in developing and implementing social policies for the older generation. In the current paper, the focus is made on the employment and social participation of older citizens policies, showing the considerable gap in the prioritisation and hence in the outcomes, highlighted both by Active Ageing Index (AAI) indicators and more in-depth analysis. We will discuss the perceived risks and pitfalls of the current long-term ageing policy approach in Poland and provide recommendations for improvement.

SOCIAL ISOLATION AND AGING OUT OF PLACE AMONG IMMIGRANTS AND REFUGEE SENIORS IN CANADA

Shanthi Johnson,¹ Juanita-Dawne Bacsu,² Tom McIntosh,³ Bonnie Jeffery,³ and Nuelle Novik,³ *1. University of Alberta,*

Edmonton, Alberta, Canada, 2. University of Saskatchewan, Saskatoon, Saskatchewan, Canada, 3. University of Regina, Regina, Saskatchewan, Canada

Immigrant and refugee seniors experience cultural barriers, discrimination, and limited networks which increase the risk of social isolation and thus hinder their active participation in the society. This paper explores social isolation among immigrant and refugee seniors in Canada based on an environmental scan of federal/provincial/territorial and community-based programs and a systematic scoping review. Findings revealed important gaps and regional disparities in opportunities to reduce social isolation and great active participation. Research was limited, often qualitative in nature, typically based on larger urban centres, with measurement issues related to the need for consideration beyond one's living arrangements. The results highlight the need for greater understanding Canada's immigration and refugee system and policies, and collaboration across levels of government. Reducing issues of social isolation and enabling better active aging for vulnerable seniors require a more nuanced and multidimensional conceptualization with prioritization on addressing the unique factors of culture and geographical context.

Session 4010 (Symposium)

POLICY SERIES: AGEISM: OUTCOMES, INTERVENTIONS, FUTURE DIRECTIONS

Chair: Kelly Trevino

Discussant: Becca Levy

Ageism is stereotyping and discrimination against individuals or groups based on their age. Ageism toward older adults is ubiquitous in American society and takes many forms including prejudicial practices and institutional policies that lead to unfair treatment of older adults. Ageism negatively impacts older adults in numerous domains such as health care and the workplace. Older adults themselves often internalize ageist views with detrimental effects on physical and mental health including increased risk for suicidal ideation and worse memory performance. This symposium addresses ageism from multiple perspectives and describes strategies for detecting and combatting ageism. The first speaker is Patricia D'Antonio, Vice President of Policy and Professional Affairs of The Gerontological Society of America (GSA). Ms. D'Antonio will describe GSA's Reframing Aging Initiative which aims to improve the public's understanding of the meaning of aging in order to counter ageism and support policies and programs that benefit older adults. The second speaker, Dr. Fredriksen Goldsen will use an Age Equity Framework to present her research on the relationship between ageism and mental and physical health and quality of life in LGBTQ older adults. The third speaker, Dr. Gendron will describe a content analysis of an anti-ageism resource that evaluates ageism interventions using an ecological framework. The fourth speaker, Dr. Hinrichsen will discuss ways psychotherapists can help older adults identify and move beyond internalized ageist beliefs. Finally, Dr. Levy, an internationally recognized expert in ageism will discuss themes across speakers and comment on the future of work in this area.

REFRAMING AGING: A GENERATION'S WORK

Patricia D'Antonio, *The Gerontological Society of America, Washington, District of Columbia, United States*

Changing American culture is challenging and changing attitudes and behaviors around the universal experience of aging especially so. Unless the field of advocates who care about aging issues cultivates a more visible, more informed conversation on older people, it will remain difficult to advance the systemic changes needed to adjust to a society with increased and increasing longevity. Advocates will need to be vigilant to avoid cueing negative attitudes towards aging and aging policies. The Reframing Aging Initiative is a long-term, social change endeavor designed to improve the public's understanding of what aging means and the many contributions older people bring to society. Using evidence-based research, the initiative seeks to teach how to tell an effective story about aging that will promote positive perceptions of aging and reduce ageism.

AGE EQUITY: A FRAMEWORK FOR ADDRESSING AGEISM, STIGMA, AND BIAS

Karen Fredriksen Goldsen,¹ and Charles Emlert,²

1. *University of Washington, Seattle, Washington, United States*, 2. *University of Washington, Tacoma, Washington, United States*

In the Covid-19 context, researchers and policy makers have turned their attention to long-standing disparities in health equity, including by race, ethnicity, poverty, sexuality, and gender. Yet, scholarship to date does not conceptualize age as a critical aspect of difference requiring an equity lens. In this presentation, we utilize an Age Equity Framework to investigate ageism based on research findings from the 2018 National Health, Aging and Sexuality/Gender Study (NHAS): Aging with Pride. Investigating ageism, stigma, and bias, we found nearly half of LGBTQ older adults feel invisible and disrespected. After adjusting for background characteristics, experiences of ageism were associated with higher rates of stigma, lifetime victimization, discrimination, lower support and community engagement, and adverse outcomes (lower mental and physical health and quality of life). The rapidly growing older adult population highlights the pressing need to consider age inequities and the importance of achieving age equity across the life course.

ANTI-AGEISM INTERVENTIONS: AN ECOLOGICAL APPROACH

Tracey Gendron,¹ Alexa Van Aartjik,¹ Kyrie Carpenter,² Ryan Backer,³ and Ashton Applewhite,⁴ 1. *Virginia Commonwealth University, Richmond, Virginia, United States*, 2. *OldSchool Clearinghouse, San Francisco, California, United States*, 3. *OldSchool Clearinghouse, Mednham, New Jersey, United States*, 4. *This Chair Rocks, Brooklyn, New York, United States*

Ageism, discrimination based on age, is a systemic problem that occurs at multiple levels of the ecological system – meaning that ageism manifests at the individual, dyadic, institutional and societal levels. The expression of ageism within the levels of the ecological system makes ageism a continually shifting and dynamic force of oppression. Although ageism is a well-documented phenomenon with wide-reaching negative impacts, interventions to mitigate

ageism's effects remain understudied. Little is known about the taxonomy of interventions available addressing ageism at the individual, dyadic, subcultural, institutional and societal levels. The current study conducted a deductive content analysis of an anti-ageism resource clearinghouse, OldSchool.info, to evaluate ageism interventions using an ecological framework. Results indicate the majority of ageism interventions are passive-oriented societal-level macrosystem approaches. A gap analysis will be discussed that indicated more active-oriented interventions with engageable content to address ageism at the personal and relational levels are needed.

AGEISM ON THE THERAPEUTIC COUCH: AGING ATTITUDES AND LATE-LIFE PSYCHOTHERAPY

Gregory Hinrichsen, *Icahn School of Medicine at Mount Sinai, New York, New York, United States*

Ageist stereotypes characterize older adults as depressed, demented, and dependent. A large body of research has documented the adverse physical and emotional impact of ageism on older adults. Mental health professionals, however, often see the minority of older adults who, in fact, are depressed, have cognitive impairments, and/or are increasingly dependent on others. To what degree do pre-existing attitudes about aging come into play in psychotherapy with older people? With all age groups, psychotherapists often help clients better understand and challenge longstanding negative assumptions about self and world (sometimes called “the unconscious” or “underlying schemas”). These assumptions often impede the individual's ability to successfully contend with life problems. This presentation will discuss ways in which psychotherapists can assist older clients in clarifying their underlying (and often self-limiting) negative assumptions about aging, moving beyond them to better contend with late life stressors, and improving emotional well-being.

Session 4015 (Paper)**Aging and Technology Interventions I****EFFICACY OF ONLINE GOAL MANAGEMENT TRAINING FOR AGE-ASSOCIATED EXECUTIVE IMPAIRMENT**

Lynn Zhu,¹ Danielle D'Amico,² Susan Vandermorris,¹ Yushu Wang,¹ Laryssa Levesque,¹ Jordan Lass,¹ Angela Troyer,¹ and Brian Levine,¹ 1. *Baycrest, Toronto, Ontario, Canada*, 2. *Ryerson University, Toronto, Ontario, Canada*

Goal Management Training® (GMT) is a standardized cognitive rehabilitation program that enhances individuals' awareness of executive function impairments and trains them to regularly monitor and manage their goals. In-person GMT is well-validated among numerous subpopulations, including people experiencing age-related cognitive impairment or acquired brain injury, and people with psychiatric disorders. The goal of this study was to evaluate the efficacy and usability of online GMT relative to computerized “brain training” in a registered randomized controlled trial (protocol NCT03602768 at Trials.gov). Both interventions were administered in a self-paced format, with background

therapist support provided for GMT. Primary outcomes were measured as self-reported executive impairment on standardized measures (the Dysexecutive Questionnaire and the Cognitive Failures Questionnaire) at pre-, immediate post-, and 6 weeks post-intervention. 62 older adults without psychiatric or neurological diagnoses completed the trial (online GMT: $n = 37$, age[mean] = 69 years; computerized brain training: $n = 25$, age[mean] = 64 years; both groups: 76% female). Improvements on the primary outcomes were observed post-intervention and were maintained at follow-up. GMT and computerized brain training groups could not be differentiated statistically, possibly due to restriction of range in the outcome measures at baseline. Additionally, the self-paced format prolonged the intervention beyond the recommended duration, which may have diluted efficacy. GMT was well-received, with participants reporting frequent use of the trained metacognitive strategies. Future studies will examine online GMT's effectiveness in samples with documented executive impairment and with additional supports to promote engagement for this virtual program.

EVALUATION OF AN ECOLOGICAL MOMENTARY INTERVENTION FOR DEPRESSION IN OLDER ADULTS LIVING ALONE

Heejung Kim,¹ Soyun Hong,² Sangeun Lee,³ Kijun Song,¹ Mijung Kim,⁴ Yuntae Kim,⁴ and Hyein Kim,¹ 1. *Yonsei University, Seoul, Seoul-t'ukpyolsi, Republic of Korea*, 2. *Yonsei university, Seoul, Seoul-t'ukpyolsi, Republic of Korea*, 3. *University of Illinois, Chicago, Illinois, United States*, 4. *Mapo Senior Welfare Center, Seoul, Seoul-t'ukpyolsi, Republic of Korea*

Depression is a common but treatable mental health problem among older adults. Daily management and monitoring is very important; thus, diverse approaches have been developed. The objective of this research was to develop and pilot-test a counseling-plus-mobile health (mHealth) intervention using ecological momentary intervention (EMI) to reduce daily depressive mood for older adults living alone. Of 64 older adults living alone in community settings, 44 completed mHealth training and EMI for 7 weeks between October 2018 and October 2019. Study participants were randomized into experimental and control groups. The intervention was based on the protocol developed for an mHealth program for older Korean adults. Participants wore an actiwatch that measured their depressed moods four times a day for 2 weeks. Depressive symptoms were measured using the Hamilton Depression Rating Scale (K-HDRS) and the Korean version of the Short Geriatric Depression Scale (SGDS-K). Sleep quality was assessed using the Korean version of the Pittsburgh Sleep Quality Index (PSQI-K). The mean age of the study sample was 76.05 ± 5.66 years, and the majority of the participants were female (61.0%, 36/59). There were no demographic characteristic differences between intervention and control groups. Based on multi-level modeling, EMI was not associated with significant improvements in depressive symptoms. However, depressive symptoms showed an initial decreasing trend, leveling off toward the end of the intervention period. This study finding could function as preliminary data to develop mHealth-based EMIs for older users in a larger, long-term study.

EXPANSION OF A WEB-BASED PLATFORM TO SUPPORT CAREGIVERS IN CALIFORNIA USING CARENAV

Heather Young,¹ Janice Bell,² Kathleen Kelly,³ Tina Kilaberia,² and Jennifer Mongoven,² 1. *University of California Davis, Sacramento, California, United States*, 2. *University of California, Davis, Sacramento, California, United States*, 3. *Family Caregiver Alliance, San Francisco, California, United States*

About one in five Americans is engaged in providing care to a family member. Caregivers (unpaid family members or friends) support older adults and persons with disability with a variety of conditions, including challenges in physical, cognitive, and mental health. In California, 4.5 million family caregivers are assisting individuals over the age of 18. The CA Department of Health Care Services funds 11 Caregiver Resource Centers (CRC) to support caregivers and, in 2019, provided support to expand information technology services through adoption of a statewide online assessment platform and client portal, CareNav™, to serve as a client record and referral tool. CareNav™ facilitates collection of consistent state-wide data that can inform program improvement and policy. This study evaluated the implementation process from the perspective of 35 CRC team members in guided focus group discussions. CRC staff identified several potential benefits to adopting CareNav™, including ease of client access and convenience, the ability to aggregate data to inform planning and policy, and a streamlined process for resource sharing. Challenges included customizing site-specific data needs, as well as concerns about equitable access to internet services. Ongoing evaluation will focus on validation and visualization of data, and translation of data into actionable information to improve quality and reach.

SMARTWATCH TECHNOLOGY FOR PHYSICAL ACTIVITY IN OLDER ADULTS: A QUALITATIVE STUDY

Mengchi Li,¹ Miranda McPhillips,² Sarah Szanton,³ Jennifer Wenzel,⁴ and Junxin Li,³ 1. *Johns Hopkins University, BALTIMORE, Maryland, United States*, 2. *University of Pennsylvania, University of Pennsylvania, Pennsylvania, United States*, 3. *Johns Hopkins University, Baltimore, Maryland, United States*, 4. *Johns Hopkins University SON, baltimore, Maryland, United States*

Older adults' experiences using smartwatch technology for physical activity (PA) have not been well studied. We studied older adults' acceptance, capacity, and experience using smartwatches for self-monitoring and promoting PA. We conducted individual interviews using semi-structured interview guides with 15 older adults who participated in two studies. The two studies employed smartwatches in combination with personalized exercise training to promote PA and the interventions were 4 and 24 weeks in length. Interviews were transcribed verbatim. Two researchers conducted inductive content analysis using NVivo V.12 to identify and categorize codes into major themes. Participants reported high overall acceptance, ease of use (i.e., charging, checking steps, reading the screen), and attractive design of smartwatches. Participants' positive descriptions of their smartwatch experience included: increased activity awareness (step counts and heart rate), improved exercise accountability, and enhanced motivation

(response to prompts). Most participants expressed interest in long-term smartwatch use. While participants expressed enjoyment of smartwatch technology for self-monitoring and PA promotion, some reported decreased motivation over time. Participants' concerns of smartwatch functionalities included short battery life, inaccurate step-recordings, and touchscreen insensitivity. Some also reported failure to troubleshoot smartwatch syncing/pairing problems with smartphones and daily smartwatch charging issues. Smartwatch Bluetooth connectivity and battery life can be improved to increase usability and acceptability among older adults. Future research should explore the role of smartwatches for older adults' PA with emphasis on behavior change over time.

USING TECHNOLOGY FOR PRESCRIPTION AND ADHERENCE IN AN ALZHEIMER'S PREVENTION PROGRAM

Amber Watts,¹ Angela VanSciver,² Jon Clutton,² Katrina Finley,² Erica Flores,² Amanda Szabo-Reed,² Jeffrey Burns,² and James Vacek,³ 1. *University of Kansas, Lawrence, Kansas, United States*, 2. *University of Kansas Medical Center, Fairway, Kansas, United States*, 3. *University of Kansas Medical Center, Kansas City, Kansas, United States*

Healthy lifestyle change is difficult to adopt and maintain without support. Often physicians recommend exercise to their patients, but have limited means to support this change. A major goal of our study is to provide physicians with a simple method of referring patients to a program that supports adoption and maintenance of exercise that meets recommended guidelines for older adults. The Lifestyle Empowerment for Alzheimer's Prevention program (LEAP! Rx) is a yearlong intervention to support cognitively normal older adults in adoption and maintenance of moderate to vigorous exercise, a key prevention factor for Alzheimer's disease. The program uses the electronic medical record and builds relationships with physicians to identify patients eligible to participate. It electronically communicates about patients' progress back to referring physicians to facilitate ongoing physician-patient interaction. Participants receive exercise coaching to reach their weekly exercise goals and have access to online lifestyle education classes (e.g., nutrition, sleep, stress management). The study is currently enrolling (n= 121 enrolled; mean age 71.4; 12% non-white, 4% Hispanic/Latino, and 83% female). Physician referrals originate from five clinics represented by 48 physicians. The study design will actively compare the physician referral process to self-referrals from the community (n=20). We have adapted the protocol to the conditions of the pandemic including online exercise coaching and support. This presentation will discuss successes and lessons learned from this novel method of recruitment and adherence to exercise.

Session 4020 (Symposium)

AGING WITH INTELLECTUAL AND DEVELOPMENTAL DISABILITIES: WHEN DEMENTIA IS DIAGNOSED OR SUSPECTED

Chair: Phillip Clark

Discussant: Kelly Munly

Individuals with lifelong intellectual and developmental disabilities (IDD) have unique needs associated with aging that pose challenges for them and their families. In particular,

an increased likelihood for early onset Alzheimer's disease is a major concern that can place individuals at risk for a host of biomedical, psychological, and social challenges. Faced with providers not trained in how to properly screen for, diagnose, and treat conditions, individuals and families are often left with inadequate care, services, and support. To address these concerns, education for professionals is essential in providing accurate information based on clinical best practices. This symposium presents an innovative and interprofessional model developed by a partnership of geriatrics and IDD educational and service organizations based on Project ECHO (Extension for Community Healthcare Outcomes) methodology. A virtual community is created in which participants both teach and learn from each other through a combination of didactic and case presentations. The first paper describes the ECHO model, including the development of the hub and spoke structure, recruitment of providers, and collaborative and multidisciplinary process of curriculum development. The second paper explores educational experiences of participating spoke agencies in the program, including professionals' and clients' outcomes. The third paper presents the implications of creating a foundation based on interprofessional education and networking principles to bridge the gap between health and social care disciplines and parallel service systems. The final paper provides recommendations and implications for developing and refining methods to address the need for provider education in this rapidly expanding field.

CREATING, RECRUITING, AND DEVELOPING: KEY TASKS AND THEIR CHALLENGES

Edward Ansello,¹ and Faith Helm,² 1. *Virginia Commonwealth University, Richmond, Virginia, United States*, 2. *University of Rhode Island, Kingston, Rhode Island, United States*

The ECHO model is uniquely suited to developing education for a wide range of agencies and providers serving the needs of older adults with IDD. The program's structure and its educational philosophy depend on modeling teamwork in both the hub and the spokes. Recruitment of participants included paid caregivers, healthcare practitioners, and direct service providers, focusing on team participation at each site. In developing the curriculum, it was critical to recognize the roles played by each sector, as well as the complementary contributions of others. Consequently, curriculum content needed to be multidisciplinary and multifocal, and recognize both the breadth of contributors and time limits in selecting content for each session. Didactic presentations and case studies embodied these features. Priorities included best practices in person-centered care; differential diagnoses; and physical, social, and environmental factors. The facilitators of, and challenges to, these priorities offer implications for advancing educational programs with similar objectives.

EDUCATIONAL EXPERIENCES WITHIN THE LEARNING COMMUNITY: ECHO EFFECTS ON PARTICIPANTS AND CLIENTS

Yumi Shirai,¹ and Kathleen Bishop,² 1. *University of Arizona, Tucson, Arizona, United States*, 2. *National Task Group on ID and Dementia Practices, Lee Center, New York, United States*

Although Project ECHO is a well-established, effective model to promote quality care in the general healthcare field, this project is the first attempt to implement the model with community care providers of individuals with IDD who are affected by dementia. In order to capture spokes' (community providers and NTG-Affiliated Regional Trainers) experiences and explore potential benefits, we conducted a content analysis of qualitative data gathered from a spoke feedback session and follow-up surveys from the same group ($n = 20$). Our findings indicated that spokes appreciated (1) didactic sessions by gaining new knowledge; (2) in-depth, mutual discussion about their cases; (3) experts taking time and ensuring their good practices; and (4) the ability to apply this gained knowledge to their day-to-day practices to improve quality of life for individuals with IDD and their families. We will discuss specific examples that inform future practices.

BRIDGE BUILDERS AND BOUNDARY SPANNERS: INTERSECTORAL, INTERORGANIZATIONAL, AND INTERPROFESSIONAL EDUCATION

Phillip Clark, *University of Rhode Island, Kingston, Rhode Island, United States*

The needs of individuals aging with intellectual and developmental disabilities (IDD) and their families do not fall neatly within defined policies, programs, and professions. They comprise complex challenges based on medical, psychological, social, environmental, economic and familial dimensions. These needs pose a challenge for providers in developing solutions at three levels: (1) different policies and programs create barriers based on different funding sources, eligibility requirements, and administrative restrictions; (2) clinical and community-based programs embody the gap between healthcare and human service providers; and (3) different professions are trained in their own methods of assessment and care plan development that impede the design of integrated approaches to defining and solving problems. This paper proposes an intersectoral, interorganizational, and interprofessional framework for addressing these problems based on networking and collaborative practice principles embodying bridge-building, boundary-spanning, and team-working as a basis for provider education. Implications for expanded education in this field are explored.

IMPLICATIONS AND RECOMMENDATIONS FROM A PROJECT ECHO SERIES ON AGING WITH IDD

Faith Helm,¹ and Jenni Mathews,² *1. University of Rhode Island, Kingston, Rhode Island, United States, 2. Virginia Geriatric Education Center, Richmond, Virginia, United States*

Ongoing evaluations of innovative educational programs provide opportunities for quality improvement. This paper reports results from a Project ECHO series on lifelong IDD and dementia. Participant responses ($n = 85$) were collected from spoke sites in various settings across the US. Using a 5-point (5 very effective) Likert scale, data were collected from assessment items on 4 didactic presentations and 5 case studies representing essential components of the ECHO model. Overall scores by spoke sites for satisfaction with the didactic and case presentations ranged from 3.94 to 4.94; relevance of case studies to the work setting ranged from 4.0 to 4.75. Knowledge gain questions showed consistently positive directionality. As a result of their participation,

spokes rated intent to provide better care for patients (57% to 88%), train staff (62% to 81%), and educate family/caregivers (57% to 88%). Implications of findings for the application of quality improvement methods are discussed.

Session 4025 (Symposium)

AGINGPLUS: A RANDOMIZED TRIAL TO INCREASE PHYSICAL ACTIVITY IN MIDDLE-AGED AND OLDER ADULTS

Chair: Manfred Diehl

Discussant: Jennifer Schrack

Engagement in physical activity (PA) has well-documented benefits for delaying or preventing age-related diseases. Thus, it is important to study innovative ways to increase PA in the adult population. This symposium describes AgingPLUS, an ongoing trial that addresses three psychological mechanisms to increase adults' PA: Negative views of aging (NVOA), low self-efficacy beliefs, and deficient goal-planning skills. The symposium also presents preliminary findings, based on a pre-pandemic subsample, on changes in explicit NVOA, implicit VOA, and changes in PA. Diehl et al. describe the theoretical background and study design of the ongoing RCT. This also includes the main study hypotheses. Rebok et al. present preliminary findings showing significant effects of the intervention on NVOA and frequency of moderate intensity exercise. Effects on physical function and accelerometry measures were not statistically significant in this subsample. Tseng et al. examined the effects of the intervention on two measures of implicit VOA: a lexical decision-making task (LDMT) and the Brief Implicit Association Test (BIAT). Findings showed that differences in post-intervention latencies on the LDMT were not statistically significant. Differences on post-intervention BIAT d scores also failed to be significant. Finally, Nehr Korn-Bailey et al. tested a multiple mediator model examining the mediational role of self-efficacy (SE) and exercise intention (EI) on PA. Results showed that Week 4 SE significantly mediated the effect of intervention condition to Week 8 anticipated PA engagement. Week 4 EI significantly mediated the effect of intervention condition on Month 6 PA engagement. Anticipated PA effects predicted subsequent involvement in PA.

AGINGPLUS: THEORETICAL BACKGROUND AND STUDY DESIGN OF THE RANDOMIZED TRIAL

Manfred Diehl,¹ George Rebok,² David Roth,² Kaigang Li,¹ Abigail Nehr Korn-Bailey,¹ Diana Rodriguez,¹ and Katherine Thompson,¹ *1. Colorado State University, Fort Collins, Colorado, United States, 2. Johns Hopkins University, Baltimore, Maryland, United States*

The AgingPLUS program targets three psychological mechanisms that are known barriers to middle-aged and older adults' engagement in physical activity (PA): Negative views of Aging (NVOA), low self-efficacy beliefs, and poor goal planning skills. These risk factors are addressed in a 4-week intervention program that is compared to a generic health education program as the control group. Middle-aged and older adults (age 45-75 years) are enrolled in the trial for 8 months, with four assessment points: Baseline (pre-test), Week 4 (immediate post-test), Week 8 (delayed post-test), and Month 6 (long-term follow-up). The major outcome

variables are participants' engagement in PA as assessed via daily activity logs and actigraphs. Positive changes in NVOA, self-efficacy beliefs, and goal planning are the intervention targets and hypothesized mediating variables leading to increases in PA. This trial adopted the experimental medicine approach to assess the short- and long-term efficacy of the AgingPLUS program.

EXAMINING THE EFFECTS OF THE AGINGPLUS PROGRAM ON PHYSICAL ACTIVITY: A MULTIPLE MEDIATOR MODEL

Abigail Nehr Korn-Bailey,¹ George Rebok,² David Roth,² Shang-En (Michelle) Chung,² Kaigang Li,¹ Diana Rodriguez,¹ Katherine Thompson,¹ and Manfred Diehl,¹ 1. *Colorado State University, Fort Collins, Colorado, United States*, 2. *Johns Hopkins University, Baltimore, Maryland, United States*

This study examined the effect of the AgingPLUS program on anticipated physical activity (PA) and PA engagement, along with the hypothesized mediator roles of self-efficacy (SE) and exercise intention (EI). Data came from 147 participants (Mage = 60.11 years; SD = 8.28 years) of the ongoing trial. Structural equation modeling tested the effects of the intervention, week 4 EI, and week 4 SE on anticipated PA at week 8 and engagement in PA at 6 months. The pathway from week 8 anticipated PA to month 6 PA was also assessed. Results showed that week 4 SE significantly mediated the pathway of intervention condition to week 8 anticipated PA, whereas week 4 EI significantly mediated the pathway from intervention condition to engagement in PA at 6 months. Furthermore, anticipated PA predicted subsequent engagement in PA. Results from these analyses provide preliminary support for the efficacy of the AgingPLUS program.

THE AGINGPLUS TRIAL: INTERVENING TO PROMOTE PHYSICAL ACTIVITY IN MIDDLE-AGED AND OLDER ADULTS

George Rebok,¹ David Roth,¹ Shang-En (Michelle) Chung,¹ Kaigang Li,² Abigail Nehr Korn-Bailey,² Katherine Thompson,² and Manfred Diehl,² 1. *Johns Hopkins University, Baltimore, Maryland, United States*, 2. *Colorado State University, Fort Collins, Colorado, United States*

This paper investigated whether the AgingPLUS program promotes physical activity in middle-aged and older adults by examining outcomes at weeks 4 and 8 with baseline scores included as covariates. The analyses assessed intervention effects on negative views of aging (NVOA), physical activity (CHAMPS), physical function (SPPB, VO2max), and accelerometry measures (e.g., minutes sedentary). We found significant intervention effects on NVOA ($p < .001$) and frequency of moderate intensity exercise ($p = 0.048$), but no significant effects on physical function, VO2max, or the accelerometry measures. Standardized effect sizes for the significant effects ranged from 0.31 to 1.03 standard deviation units. These findings suggest that AgingPLUS improved motivational factors for engaging in physical activity but did not lead to objective changes in physical activity in the short term. Further research will investigate the mediational role of these motivational factors in enhancing physical activity over the longer term (6 months).

AGINGPLUS: EXAMINING THE MALLEABILITY OF IMPLICIT VIEWS OF AGING

Heidi Tseng, Garrett Forsyth, Abigail Nehr Korn-Bailey, Diana Rodriguez, Kat Thompson, and Manfred Diehl, *Colorado State University, Fort Collins, Colorado, United States*

AgingPLUS also examines whether the intervention can change participants' implicit VOA. To that end, participants completed a lexical decision-making task (LDMT) and the Brief Implicit Association Test (BIAT) at baseline and post-intervention. One-way ANCOVAs with baseline scores as covariate were used for these analyses. For LDMT, there was no significant difference between the groups regarding their post-intervention latencies for old-positive words, $F(1,181) = 0.01$, $p = .60$, old-negative words, $F(1,181) = 0.43$, $p = .51$, young-positive words, $F(1,181) = 0.19$, $p = .67$, and young-negative words, $F(1,181) = 1.16$, $p = .28$. For BIAT, both groups showed a slight preference for the young at baseline (mean $d = 0.39$), and post-intervention (mean $d = 0.38$). There was no significant difference between the groups regarding post-intervention d scores, $F(1,181) = 0.002$, $p = .97$. These preliminary findings suggest that in the current subsample, AgingPLUS did not significantly change participants' implicit VOA.

Session 4030 (Symposium)

ALZHEIMER'S ALPHABET SOUP: ADRD RESEARCH IN NHATS AND NSOC

Chair: Loretta Anderson

Co-Chair: Alexandra Wennberg

Discussant: Frank Lin

There are 5.8 million Americans living with Alzheimer's disease, but currently there is no cure or effective treatment. Alzheimer's disease and related dementias (ADRD) are characterized by cognitive decline, but patients also have behavioral symptoms and functional decline. Understanding the gamut of risk and prognostic factors for ADRD and those associated with the task of caring for these patients is layered. The National Health and Aging Trends Study (NHATS) and the sister National Study of Caregiving (NSOC) are excellent resources to investigate layers of ADRD incidence, progression, and caregiving in the population. NHATS is a nationally representative sample of Medicare beneficiaries aged 65 and older. Since 2011, annual in-person interviews have collected data in many areas, including health, environment, wellbeing, cognition, and function. NSOC has been conducted at three timepoints corresponding with NHATS rounds and collects detailed data on caregivers, including information on care activities, caregiver burden, and caregiver wellbeing. This symposium illustrates the broad range of ADRD research questions that can be probed using NHATS/NSOC data. The session begins with a presentation the association between caregiver burden and ADRD patient cognitive outcomes. The second presentation examines the role of physical performance as a predictor of developing ADRD. The third presentation investigates the role of dual sensory impairment – both hearing and vision impairment – on dementia incidence. The session concludes with an examination of whether hearing impairment among dementia patients is associated with different caregiving needs.

CAREGIVER BURDEN IS ASSOCIATED WITH DEMENTIA PATIENT COGNITIVE PERFORMANCE IN NHATS

Alexandra Wennberg,¹ and Loretta Anderson,² 1. *Karolinska Institutet, Stockholm, Stockholms Lan, Sweden*, 2. *University of Maryland, Baltimore, School of Medicine, Reisterstown, Maryland, United States*

Informal caregivers of dementia patients engage in multicomponent care that is often stressful. In heart failure patients, caregiver burden has been associated with occurrence of cardiovascular events. However, little is known about how caregiver burden affects patient cognition in dementia care dyads. Using data from the National Health and Aging Trends Study and National Study of Caregiving, we examined the association between caregiver burden, assessed on 38 aspects of caring, and patient cognition, assessed with the immediate and delay word recall, Clock Drawing, and self-rated memory. In fully adjusted models at round 7 (2017) higher caregiver burden was cross-sectionally associated with lower immediate ($B=-0.02$, 95% CI -0.03 , -0.01) and delayed ($B=-0.03$, 95% CI -0.04 , -0.02) word recall. Longitudinally, across rounds 7-9 (2017-2019) higher burden was associated with lower patient Clock Draw score ($B=-0.01$, 95% CI -0.03 , -0.001). These findings have implications for economic assistance and interventions in dementia care dyad.

LINKS OF SHORT PHYSICAL PERFORMANCE BATTERY SCORE WITH INCIDENT DEMENTIA: RESULTS FROM THE NHATS

Di Wu,¹ Emily Smail,¹ Jennifer Schrack,² Amal Wanigatunga,³ Judith Kasper,⁴ and Adam Spira,¹ 1. *Department of Mental Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 2. *Department of Epidemiology, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 3. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 4. *Department of Health Policy and Management, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

Physical performance is associated with cognitive function in later life, but few studies have examined the prospective association of physical performance with incident dementia. We studied 4539 community-dwelling National Health and Aging Trends Study (NHATS) participants aged ≥ 65 years with data on demographics and the Short Physical Performance Battery (SPPB) in 2011, who were followed through 2014. Our outcome was dementia diagnosis from a validated NHATS algorithm. We applied survey weights to make results nationally representative and performed Cox regression analyses. After adjustment for potential confounders, lower baseline SPPB scores were associated with incident dementia ($HR=1.68$, $p < 0.01$). Slower gait speed was the SPPB component most strongly associated with incident dementia ($HR=1.21$, $p < 0.01$). We found that poorer physical performance was linked to incident dementia in a cohort of older adults. More research is needed to examine the effect of improving physical performance on the prevention of dementia.

PREVALENCE OF CONCURRENT FUNCTIONAL VISION AND HEARING IMPAIRMENT AND ITS ASSOCIATION WITH DEMENTIA

Jennifer Deal,¹ Pei-Lun Kuo,² Alison Huang,³ Joshua Ehrlich,⁴ Judith Kasper,⁵ Nicholas Reed,³ Frank Lin,⁶ and Bonnielin Swenor,⁷ 1. *Johns Hopkins University, Baltimore, Maryland, United States*, 2. *National Institute on Aging, National Institute on Aging, Maryland, United States*, 3. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 4. *University of Michigan, University of Michigan, Michigan, United States*, 5. *Department of Health Policy and Management, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 6. *Johns Hopkins University, Johns Hopkins University, Maryland, United States*, 7. *Johns Hopkins School of Medicine, Baltimore, Maryland, United States*

Vision and hearing impairment are common and independently linked to dementia risk. Adults with concurrent vision and hearing impairment (dual sensory impairment, DSI) may be particularly at-risk. Data were from the National Health and Aging Trends Study (NHATS) (2011–2018, $N=7,562$). Functional sensory impairments were self-reported (no impairment, vision only, hearing only, and DSI). We calculated age-specific prevalence of sensory impairments. Discrete time proportional hazards model with a complementary log-log link were used to assess 7-year dementia risk. Of 7,562 participants, overall prevalence of functional vision, hearing and DSI was 5.4%, 18.9% and 3.1%, respectively. DSI prevalence increased with age, impacting 1 in 7 adults ≥ 90 years. DSI was associated with a 50% increased 7-year dementia risk (adjusted hazard ratio 1.50; 95% confidence interval, 1.12–2.02) compared to no impairment. Sensory rehabilitative interventions for multiple impairments may be an avenue for consideration in efforts to reduce dementia risk.

WORKING WHILE CARING FOR OLDER ADULTS WITH HEARING IMPAIRMENT AND DEMENTIA: EVIDENCE FROM THE NSOC

Emmanuel Garcia Morales,¹ Varshini Varadaraj,² Bonnielin Swenor,³ and Nicholas Reed,¹ 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 2. *The Wilmer Eye Institute, Baltimore, Maryland, United States*, 3. *Johns Hopkins School of Medicine, Baltimore, Maryland, United States*

Age-related hearing loss (HL) and dementia are common among older adults. The implications of caregiving for older adults with dementia is documented. Whether the presence of HL modifies these association is unknown. We used data from the 2011 NHATS/NSOC. Hearing loss and dementia were identified among care recipients (CR). Our outcomes included: hours of care provided, and caregiver's work activities. Among 1,013 caregivers, 456 assisted individuals without HL or dementia (HL-/D-), 229 with dementia (D+), 193 with HL, and 135 with HL and dementia (HL+/D+). In fully adjusted models, as compared to caregivers of HL-/D-, caregivers of D+ spent 39.1 hours more (95% CI: 13.6,64.6) in caregiving, caregivers of HL+/D+ spent 56.6 more hours (95% CI: 25.1,88.1). We found no differences in work activities between CR groups. The presence of HL increases the caregiving needs of adults with dementia. The additional time does not affect the labor participation of caregivers.

Session 4035 (Symposium)

CHRONOBIOLOGICAL FACTORS RELATED TO SLEEP AND NEUROPSYCHIATRIC SYMPTOMS IN PERSONS LIVING WITH DEMENTIA

Chair: Nancy Hodgson

Co-Chair: Fanghong Dong

Circadian rhythm disturbances (CRD) are commonly seen in people living with dementia. A clear understanding of the role of CRD in dementia etiology will be beneficial by exploring the exogenous factors (externally influence the duration of sleep hours, such as light/dark cycles) and endogenous factors (internal biological rhythm, such as diurnal cortisol pattern). This symposium will apply a chronobiological approach to study exogenous and endogenous factors that influence circadian rhythm and their effects on sleep and neuropsychiatric symptoms in persons living with dementia (PLWD). Four paper presentations will use secondary data analysis of data from the Healthy Patterns Clinical Trial (NCT03682185), a randomized controlled trial of a home-based activity intervention designed to improve circadian rhythm disorders in PLWD. We will first describe the circadian rhythm pattern reflected by endogenous factors (salivary cortisol), then examine salivary cortisol (endogenous) and white light intensity (exogenous) and on subjective sleep and neuropsychiatric symptoms (including depression) in PLWD, respectively. In session 1, we will present cortisol diurnal rhythm pattern in PLWD using a cross-sectional design. In session 2, we will discuss the relationship between salivary cortisol indicators and depressive symptoms. In session 3, we focus on the association between diurnal cortisol slope and neuropsychiatric symptoms using the baseline data. In session 4, we describe the association between evening white light exposure and subjective sleep. The discussant will describe how these findings build on our understanding the nature of circadian rhythm disturbance in dementia and inform future research and treatment approaches.

BEDTIME SALIVARY CORTISOL AND DEPRESSIVE SYMPTOMS IN OLDER ADULTS LIVING WITH DEMENTIA

Fanghong Dong,¹ Miranda McPhillips,² Darina Petrovsky,³ Liming Huang,⁴ Adriana Adriana,⁴ and Nancy Hodgson,⁵
 1. *UPenn, Philadelphia, Pennsylvania, United States*, 2. *University of Pennsylvania, University of Pennsylvania, Pennsylvania, United States*, 3. *Rutgers University, Philadelphia, Pennsylvania, United States*, 4. *University of Pennsylvania, Philadelphia, Pennsylvania, United States*, 5. *University of Pennsylvania, School of Nursing, Philadelphia, Pennsylvania, United States*

The dysregulation of cortisol has been associated with depressive symptoms in older adults. To date, no prospective longitudinal studies have examined whether salivary cortisol is a risk factor for depressive symptoms in persons living with dementia (PLWD). With a sample of 123 PLWD, baseline salivary cortisol was collected at awaking, 30 minutes after awaking, and bedtime. Depressive symptoms were assessed at baseline and the four-week follow-up. Cortisol indicator were centered. Baseline bedtime cortisol level was significantly associated with depressive symptoms in a curvature style while controlling age, gender, and baseline depressive symptoms ($\beta=3.76$ for linear term and $\beta=-1.57$ for quadratic

term, both $ps<0.04$). No other baseline cortisol measures were significant prospective predictors. Our results suggest the bedtime cortisol was a significant risk factor for depressive symptoms in PLWD. These findings suggest that bedtime cortisol may play a role in the etiology of depressive symptoms in PLWD.

SALIVARY CORTISOL PATTERNS IN PEOPLE LIVING WITH DEMENTIA

Darina Petrovsky,¹ Fanghong Dong,² Liming Huang,³ Subhash Aryal,⁴ G. Adriana Perez,⁵ and Nancy Hodgson,⁶
 1. *Rutgers University, Philadelphia, Pennsylvania, United States*, 2. *UPenn, PHILADELPHIA, Pennsylvania, United States*, 3. *University of Pennsylvania, Philadelphia, Pennsylvania, United States*, 4. *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania, United States*, 5. *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania, United States*, 6. *University of Pennsylvania, School of Nursing, Philadelphia, Pennsylvania, United States*

Salivary cortisol has a well-documented circadian pattern in older adults. Yet, the pattern of salivary cortisol in persons living with dementia (PLWD) due to circadian rhythm disturbances is unknown. This study examined diurnal salivary cortisol patterns in 176 PLWD (mean age 73.6 ± 8.8 , 33.3% male, clinical dementia rating ≥ 0.5) by collecting saliva at waking (AM1), 30 minutes after waking (AM2) and bedtime (PM) over two consecutive days. Cortisol awakening response (CAR) was calculated as the change between AM2 and AM1 cortisol levels. The mean baseline salivary cortisol levels (ug/dl) were 0.35 (SD:0.3) at AM1, 0.40 (SD:0.39) at AM2, and 0.19 (SD:0.4) at PM. On average, cortisol levels decreased from morning to evening, with 58% exhibiting a positive CAR (mean 0.05; SD:0.34). There were no significant associations between cortisol levels with age, sex, obesity, and comorbidities. The findings demonstrated that diurnal cortisol rhythms are maintained in PLWD with a flattened CAR.

RELATIONSHIPS BETWEEN SALIVARY CORTISOL SLOPE AND NEUROPSYCHIATRIC SYMPTOMS IN PERSONS LIVING WITH DEMENTIA

Yeji Hwang,¹ Fanghong Dong,² G. Adriana Perez,³ and Nancy Hodgson,⁴
 1. *University of Pennsylvania, School of Nursing, Philadelphia, Pennsylvania, United States*, 2. *UPenn, Philadelphia, Pennsylvania, United States*, 3. *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania, United States*, 4. *University of Pennsylvania, School of Nursing, Philadelphia, Pennsylvania, United States*

While a flatter diurnal cortisol slope has been related to poor health outcomes in healthy populations, little is known about this relationship in persons living with dementia (PLWD). The purpose of this study was to examine the association between diurnal cortisol slope and neuropsychiatric symptoms in PLWD. Secondary data analysis was conducted using baseline data from the Healthy Patterns Study (N=168). Diurnal cortisol slope was calculated using the difference between changes in salivary cortisol from 30 minutes after awakening to bedtime. Spearman rho coefficients were used. Flatter cortisol slope was associated with the presence of symptoms of agitation ($r=-0.191$, $p=0.013$) and disinhibition

($r=-0.168$, $p=0.03$). Steeper cortisol slope was related to a more severe level of anxiety symptoms ($r=0.36$, $p=0.009$) and higher frequency of insomnia ($r=0.292$, $p=0.011$). We found that cortisol slope was associated with neuropsychiatric symptoms in PLWD. Future research is needed to examine the mechanisms underlying the relationships.

ASSOCIATION BETWEEN EVENING LIGHT EXPOSURE AND SUBJECTIVE SLEEP MEASURES AMONG PEOPLE LIVING WITH DEMENTIA

Miranda McPhillips,¹ Yeji Hwang,² Sonia Talwar,² and Nancy Hodgson,³ 1. *University of Pennsylvania, University of Pennsylvania, Pennsylvania, United States*, 2. *University of Pennsylvania, School of Nursing, Philadelphia, Pennsylvania, United States*, 3. *University of Pennsylvania, School of Nursing, Philadelphia, Pennsylvania, United States*

Excessive light exposure before bedtime can disrupt one's circadian rhythm and can lead to poor sleep. The purpose of this study was to describe the relationship between evening light exposure and subjective sleep measures in people living with dementia (PLWD). We conducted secondary data analysis using the baseline data from Healthy Patterns Clinical Trial (N=137). We used Actiwatch Spectrum Plus to collect light data over three consecutive days. We defined evening light exposure as the average white light intensity for 4 hours before sleep. Sleep measures included Epworth Sleepiness Scale and PROMIS Sleep-Related Impairment. We used univariate regression analysis. We found that that greater evening intensity of light exposure was associated with higher daytime sleepiness ($\beta=0.209$, $p=0.015$) and more sleep impairment ($\beta=0.228$, $p=0.014$). The results of our study suggest that exposure to bright light during evening can disturb nighttime sleep and increase daytime sleepiness in PLWD.

Session 4040 (Symposium)

CONTRIBUTION OF SENSORY FUNCTION TO PRECLINICAL INDICATORS OF PHYSICAL AND COGNITIVE FUNCTIONING WITH AGING

Chair: Yuri Agrawal

Co-Chair: Jennifer Schrack

Discussant: Bonnielin Swenor

There are well established associations between sensory loss and physical and cognitive deficits with aging, but gaps remain in our understanding of the associations between sensory function and early preclinical indicators of physical and cognitive decline. This symposium will present data from the Baltimore Longitudinal Study of Aging (BLSA) on a series of studies investigating the links among sensory function, motor function, and physical and cognitive outcomes in older adults. In the first study, Dr. Gross will present an operational definition of early cognitive impairment (ECI) based on a combination of two cognitive measures – the Card Rotations test and the California Verbal Learning Test Immediate Recall – to predict progression to MCI/AD. In the second study, Dr. Cai will evaluate the relationship between multisensory impairment (in vision, hearing, olfaction, proprioception and vestibular function) and the algorithmic definition of ECI. In the third study, Dr. Armstrong will evaluate the association between multisensory impairment and another biomarker of ECI or preclinical AD, specifically PET-PiB deposition. In the

fourth study, Dr. Schrack, will present the joint contribution of multisensory (hearing and vision) impairment and motor function (gait speed) on risk of incident MCI/AD in longitudinal analyses. Finally, Dr. Martinez Amezcua will present the longitudinal association between hearing and vestibular function and decline in higher level physical function and endurance performance. Taken together, these studies present compelling data about the contribution of sensory function to preclinical indicators of physical and cognitive functioning with aging.

DERIVATION AND VALIDATION OF AN ALGORITHMIC CLASSIFICATION OF EARLY COGNITIVE IMPAIRMENT

Alden Gross,¹ Yang An,² Frank Lin,³ Luigi Ferrucci,⁴ Jennifer Schrack,¹ Yuri Agrawal,⁵ and Susan Resnick,⁴ 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 2. *NIA, Baltimore, Maryland, United States*, 3. *Johns Hopkins University, Johns Hopkins University, Maryland, United States*, 4. *National Institute on Aging, Baltimore, Maryland, United States*, 5. *Otolaryngology, Baltimore, Maryland, United States*

The long prodromal period for dementia pathology demands valid and reliable approaches to detect cases before clinically recognizable symptoms emerge, by which time it may be too late to effectively intervene. We derived and compared several algorithms for early cognitive impairment (ECI) using longitudinal data on 1704 BLSA participants. Algorithms were based on cognitive impairment in various combinations of memory and non-memory tests, and the CDR. The best-performing algorithm was defined based on 1SD below age- and race-specific means in Card Rotations or California Verbal Learning Test immediate recall, two tests that in prior work show the earliest declines prior to dementia onset. While this ECI algorithm showed low concordance with concurrent adjudicated MCI/dementia (AUC: 0.63, sensitivity: 0.54, specificity: 0.73), it was among the best predictors of progression to MCI/dementia (HR: 3.65, 95% CI: 1.69,7.87). This algorithm may be useful in epidemiologic work to evaluate risk factors for early cognitive impairment.

SENSORY IMPAIRMENT AND ALGORITHMIC CLASSIFICATION OF EARLY COGNITIVE IMPAIRMENT IN MIDDLE-AGED AND OLDER ADULTS

Yurun Cai,¹ Yuri Agrawal,² Jennifer Schrack,¹ Alden Gross,¹ Nicole Armstrong,³ Eleanor Simonsick,⁴ and Susan Resnick,⁵ 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 2. *Otolaryngology, Baltimore, Maryland, United States*, 3. *Warren Alpert Medical School of Brown University, Providence, Rhode Island, United States*, 4. *National Institute on Aging/NIH, Baltimore, Maryland, United States*, 5. *National Institute on Aging, Baltimore, Maryland, United States*

Sensory function has been linked to cognitive impairment and dementia, but the link between multiple sensory impairments and early cognitive impairment (ECI) is unclear. Sensory function (vision, hearing, vestibular, proprioception, and olfaction) was measured in 390 BLSA participants (age=75±8 years; 57% women; 69% white) from 2012 to 2018 over a mean

3.6 years. ECI was defined based on 1 standard deviation below age- and race-specific means in Card Rotations or California Verbal Learning Test immediate recall. Cox proportional hazard models examined the risk of ECI for each sensory impairment and across categories of impairments. Vision impairment (vs. no vision impairment) was associated with a 70% greater risk of ECI (HR=1.70, $p=0.05$). Participants with 1 or ≥ 2 sensory impairments had triple the risk of ECI (HR=3.74 and 3.44, $p=0.008$ and 0.02 , respectively) compared to those without impairment. Future studies are needed to examine whether treatment for sensory impairments can modify these risks.

SENSORY IMPAIRMENT AND BETA-AMYLOID DEPOSITION IN THE BALTIMORE LONGITUDINAL STUDY OF AGING

Nicole Armstrong,¹ Yurun Cai,² Hang Wang,³ Jennifer Schrack,² Yuri Agrawal,⁴ Eleanor Simonsick,⁵ and Susan Resnick,⁶ 1. *Warren Alpert Medical School of Brown University, Providence, Rhode Island, United States*, 2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 3. *Johns Hopkins University, Baltimore, Maryland, United States*, 4. *Otolaryngology, Baltimore, Maryland, United States*, 5. *National Institute on Aging/NIH, Baltimore, Maryland, United States*, 6. *National Institute on Aging, Baltimore, Maryland, United States*

Studies have demonstrated a link between sensory impairment and dementia risk, but little is known about the presence of beta-amyloid plaques in individuals with single and multisensory impairments. Sensory function (combinations of vision, hearing, vestibular function, and proprioception) and amyloid PET imaging were measured in 170 BLSA participants (age=78 \pm 9 years; 53% women; 77% white; 28% amyloid positive) from 2012 to 2019. Log-binomial regression models were used to examine the prevalence ratios (PR) of amyloid positivity for individual sensory impairments and across categories of impairments. While crude associations indicate associations of vision impairment (PR=1.72, $p=0.04$) and impairments in all four senses (PR=2.38, $p=0.03$) with amyloid positivity, these associations were insignificant after adjusting for age, sex, race, and education. There were no other crude and adjusted associations. These results suggest sensory impairments may be related to dementia independent of AD pathology. Future studies with larger sample sizes are warranted.

MOTOR AND SENSORY FUNCTION AS PREDICTORS OF MCI AND DEMENTIA IN THE BALTIMORE LONGITUDINAL STUDY OF AGING (BLSA)

Jennifer Schrack,¹ Amal Wanigatunga,¹ Yurun Cai,¹ Hang Wang,² Yuri Agrawal,³ Susan Resnick,⁴ Luigi Ferrucci,⁴ and Qu Tian,⁴ 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 2. *Johns Hopkins University, Baltimore, Maryland, United States*, 3. *Otolaryngology, Baltimore, Maryland, United States*, 4. *National Institute on Aging, Baltimore, Maryland, United States*

Motor and sensory impairments are linked with dementia risk, but whether there is a joint effect of deficits in motor and sensory function is unknown. We analyzed 649 BLSA participants (aged 72 \pm 11 years; 55% women; 68% white) who had concurrent baseline 6-meter usual gait speed and

sensory function (vision, hearing) between 2012-2019. Mild cognitive impairment (MCI) and dementia were adjudicated during an average follow-up of 3 years. We examined the association between baseline gait speed, z-scored sensory function, and a gait*sensory interaction with risk of MCI/dementia using Cox proportional hazard models, adjusted for demographics and chronic conditions. Each .01 m/s faster baseline gait was associated with a reduced risk (HR:0.98 (0.96-0.99)) of MCI/dementia, and each 1 SD higher in hearing and vision z-score was associated with an increased risk (HR:1.84 (1.1-3.1)) increased risk. There was no significant interaction, suggesting motor and sensory impairments may be independently associated with MCI/dementia risk.

ASSOCIATION OF HEARING IMPAIRMENT WITH HIGHER LEVEL PHYSICAL FUNCTIONING AND WALKING ENDURANCE

Pablo Martinez Amezcua,¹ Pei-Lun Kuo,² Nicholas Reed,³ Eleanor Simonsick,⁴ Yuri Agrawal,⁵ Frank Lin,⁶ Jennifer Deal,⁷ and Jennifer Schrack,³ 1. *Columbia University Irving Medical Center, New York, New York, United States*, 2. *National Institute on Aging, National Institute on Aging, Maryland, United States*, 3. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 4. *National Institute on Aging/NIH, Baltimore, Maryland, United States*, 5. *Otolaryngology, Baltimore, Maryland, United States*, 6. *Johns Hopkins University, Johns Hopkins University, Maryland, United States*, 7. *Johns Hopkins University, Baltimore, Maryland, United States*

The longitudinal associations between hearing impairment and higher-level functional measures and the potential confounding role of vestibular function have not been assessed. We investigated these associations in 831 participants of the Baltimore Longitudinal Study of Aging (2012–2019). Hearing was measured using pure-tone audiometry and categorized using WHO standards. Physical function was assessed with the Health Aging and Body Composition Physical Performance Battery (HABCPB, higher=better) and walking endurance with time to walk 400 meters. Multivariable regression models tested the hypotheses that participants with hearing impairment have poorer physical outcomes. In a subset, we further adjusted for vestibular function. Hearing impairment was associated with decrements in higher-level physical performance and walking endurance, and faster decline over time, regardless of vestibular function. Among participants with any hearing impairment, hearing aid users were faster in the 400-m walk. Early screening for higher-level functional loss among older adults with hearing loss is warranted.

Session 4045 (Paper)

COVID-19 and Community Dwelling Adults

AGING THROUGH THE TIME OF COVID-19: HEALTHCARE ACCESS FOR OLDER ADULTS LIVING WITH CHRONIC CONDITIONS

Allie Peckham,¹ Molly Maxfield,² Keenan Pituch,² M. Aaron Guest,² Shalini Sivanandam,³ and Brad Doebbeling,⁴ 1. *Arizona State University, Phoenix,*

Arizona, United States, 2. Arizona State University, Phoenix, Arizona, United States, 3. Arizona State University, Arizona State University, Arizona, United States, 4. College of Health Solutions, Arizona State University, Phoenix, Arizona, United States

Chronic conditions require on-going continuous management and preventive treatment. Over 80% of adults aged 65 and older have multiple chronic conditions. Concerns have arisen about how the COVID-19 pandemic is affecting the management of chronic conditions. Delay, avoidance, and poor management of healthcare during the COVID-19 pandemic may increase the risk of unnecessary hospitalizations and mortality. This study aims to understand the impact of COVID-19 on healthcare access in a U.S. sample of Americans 50 years of age or older. Participants completed an online survey about healthcare access and other risk factors during the COVID-19 pandemic. Multinomial regression analysis examined the results of two key access points: healthcare provider /doctor (n=468) and medication (n=754). One-half (56%) of those who needed access to a provider were able to be seen. Participants who were older, had multiple chronic conditions, and those with a provider were more likely to have access. However, when individuals with more chronic conditions did not have access, they indicated that this lack of access was due to COVID-19. When not receiving access to medications, unemployed participants attributed the lack of access more often to COVID-19 than other reasons. These findings demonstrate an important lack of access to providers and medication among older adults during the pandemic. In multivariate models, this lack of access was most often due to COVID-19, in addition to traditional factors such as insurance, employment, and medical and behavioral comorbidity. Interventions are needed to lower access barriers to care even further during COVID-19.

CAREGIVING DURING COVID-19: A MULTI-STATE QUALITATIVE STUDY OF FAMILY CAREGIVER EXPERIENCES AND DECISION MAKING

Tonie Sadler,¹ Kevin Yan,¹ Daniel Brauner,² Harold Pollack,³ and R. Tamara Konetzka,³ 1. *The University of Chicago, Chicago, Illinois, United States*, 2. *Western Michigan University, Kalamazoo, Michigan, United States*, 3. *University of Chicago, Chicago, Illinois, United States*

COVID-19 poses unique challenges to family caregivers. This study explores how family caregivers for older adults with cognitive impairments experience and make decisions about caregiving during a global pandemic. Using purposive sampling, 63 family caregivers across eight states participated in open-ended qualitative interviews (2019-2020), until thematic saturation was reached. Questions broadly examined caregivers' experiences and decisions, focusing on decisions made around type of care setting. Questions about responses to the Pandemic were added as events unfolded. States were selected to represent variation in Home and Community Based Service (HCBS) expenditures as a percentage of total Medicaid long-term services and supports expenditures. Family caregivers experienced significant concern about COVID-19 itself, and about the indirect consequences of caregiving caused by the pandemic. Caregivers also displayed flexibility and adaptability in ceasing selected services, contingently continuing services, and utilizing telemedicine and

other remote healthcare interventions to protect their loved ones. Many family caregivers utilized remote health care tools such as telemedicine, no-contact prescription and grocery delivery. Such measures improved service access and reduced caregiver workload. Given the persistent challenges posed by COVID-19, long-term service organizations have an opportunity to enhance their policies to meet the needs of caregivers and those they care for. There is a need to expand telemedicine and other remote healthcare tools, while adapting these technologies to the needs of families. Also, procedures are needed for safe pathways to utilize HCBS and nursing care during a pandemic including communication supports, sufficient PPE, increased staffing, and utilization of evidence-based protocols.

HOW HAS COVID-19 IMPACTED OLDER ADULTS AND THEIR NEEDS FOR SERVICES?

Alycia Bayne,¹ Mallory Kennedy,¹ Emily Alvarez,² Bernadette Wright,³ Lucy Theilheimer,⁴ and Jennifer Benz,⁵ 1. *NORC at the University of Chicago, Bethesda, Maryland, United States*, 2. *NORC at the University of Chicago, Chicago, Illinois, United States*, 3. *Meals on Wheels America, Arlington, Virginia, United States*, 4. *Meals On Wheels America, Arlington, Virginia, United States*, 5. *NORC at the University of Chicago, Kamuela, Hawaii, United States*

COVID-19 has had profound effects on older adults and will have lasting impacts on their preferences and needs for services, including those offered by Meals on Wheels and other community organizations. Organizations serving older adults would benefit from insights about how to prioritize resources and services to address older adults' needs during the pandemic and beyond. On behalf of Meals on Wheels America, NORC at the University of Chicago conducted a study to explore COVID-19's impacts on older adults and older adults' needs during the pandemic. We conducted two data collection activities with adults age 60 and older: a nationally representative survey with 1,535 respondents and 24 interviews. Results indicated that COVID-19 has affected older adults' physical and mental health, social connectedness, employment, and use of services and technology. Informal networks of family members and friends are a source of assistance for 50% of older adults during the pandemic. Impacts of COVID-19 differed by income, rurality, disability status, and living situation. Findings documented the extent to which older adults had unmet needs during the pandemic, such as activities to help keep busy at home and affordable food to meet dietary needs. Survey respondents who have a lower income, are 75 and older, live alone, and who are Black were more likely to have unmet needs. Findings suggested a need to strengthen partnerships among organizations that serve older adults to address diverse needs, conduct ongoing assessments of older adults' needs and preferences, and enhance assistance for informal support networks.

LONGITUDINAL EFFECTS OF COPING STRATEGIES ON MENTAL HEALTH OF OLDER ADULTS LIVING ALONE DURING THE COVID-19 PANDEMIC

Seoyoun Kim,¹ Hyunwoo Yoon,² and Yuri Jang,³ 1. *Texas State University, San Marcos, Texas, United States*, 2. *Gongju National University, Gongju, Ch'ungch'ongnamdo, Republic of Korea*,

3. University of Southern California, Los Angeles, California, United States

The COVID-19 pandemic and related social distancing measures have posed a significant threat to the mental health of older adults, particularly those living alone. Accordingly, the World Health Organization implemented the #HealthyAtHome program, encouraging people to keep in regular contact with loved ones, stay physically active, and keep a regular routine. The current study aims to examine a micro-longitudinal link between positive coping strategies (e.g., exercise, meditation, relaxation, and virtual social contacts) and depressive symptoms among older adults who live alone during the COVID-19 pandemic. We used 21 biweekly waves of longitudinal data from the Understanding America Study (UAS) collected between April 2020 and February 2021 (N=839, observation= 16,256). The multilevel models with correlated random effects were estimated to examine lagged effects of coping strategies (t-1) on depressive symptoms (t). The analysis used the xthybrid command with clustered standard errors in Stata 15.1. The results show that exercise (b=-.10, p=0.02), relaxation (b=-.02, p=0.01), and virtual social contacts (b=-.01, p=0.01) were predictive of lower depressive symptoms even after controlling for time-invariant and time-varying covariates. Meditation, however, was associated with higher depressive symptoms (b=.01, p=0.02). The results show that modifiable lifestyle factors, such as taking time to exercise or relax, may enhance mental health and well-being for older adults living alone. Virtual social contacts such as video calls could be an effective way to keep older adults socially connected and emotionally healthy.

SOCIAL ISOLATION AND COVID-19 MITIGATION: PERSPECTIVES OF KEY INFORMANTS IN THE UNITED STATES AND JAPAN

Emily Ihara,¹ Megumi Inoue,¹ Cortney Hughes Rinker,¹ and Naoru Koizumi,² 1. *George Mason University, Fairfax, Virginia, United States*, 2. *George Mason University, Arlington, Virginia, United States*

The deleterious health effects of social isolation and loneliness among older adults have been well-established and were exacerbated by the forced separation for those at health risk of contracting the COVID-19 virus. Both the United States and Japan are experiencing phenomenal growth of the older adult population; Japan is considered a “super-aged” society, with the highest proportion of people aged 65 and older in the world. This study examined how COVID-19 and mitigation measures may have affected services for older adults. We conducted key informant interviews with specialists in aging and older adult care in both Japan (n=5) and the United States (n=14). All interviews were conducted over Zoom and lasted 30-60 minutes. The research team transcribed and checked the interviews for accuracy and conducted multiple coding sessions to identify, sort, and consolidate the codes using Atlas.ti. Key themes in both countries that emerged included the many cracks in the system of programs and services for older adults, the inaccessibility to technology and the internet, and the particular difficulties of socioeconomic inequities, especially for those living alone. Older adults were motivated to become more technologically proficient and local communities came forward to help provide support. One key informant from

the U.S. noted that their organization experienced a 600% increase in interest among volunteers as a result of the pandemic. Despite the many challenges of the pandemic, many silver linings emerged. One participant poetically stated, “I think that's human nature – when you have no other choice, you find a way.”

Session 4050 (Paper)

Depression and Outcomes

ANTIDEPRESSANT USE AND RISK OF SUICIDAL BEHAVIOR IN OLDER PERSONS WITH DEPRESSION: A COHORT STUDY IN HONG KONG

Yi Chai,¹ Hao Luo,² Kenneth K.C. Man,³ Wallis C.Y. Lau,³ and Ian C.K. Wong,² 1. *The University of Hong Kong, Hong Kong, Hong Kong*, 2. *The University of Hong Kong, Hong Kong, Hong Kong*, 3. *University College London, London, England, United Kingdom*

Background: Depression is highly prevalent in older adults and requires treatment. However, debate persists on whether antidepressant use is associated with an elevated risk of suicidal behavior. This study aims to examine the short- and long-term risk of suicidal behavior by various classes of antidepressants in older persons with depression. Methods: Persons aged 40 years and above and received a clinical diagnosis of depression between January 1, 2001, and December 31, 2016 were identified from the Clinical Data Analysis and Reporting System in Hong Kong. The risk of suicidal behavior in persons who were prescribed antidepressants was compared with persons who were not prescribed any antidepressant drugs. Antidepressants were classified as tricyclic and related antidepressant drugs (TCAs), selective serotonin reuptake inhibitors (SSRIs), noradrenergic and specific serotonergic antidepressants (NaSSAs), serotonin–norepinephrine reuptake inhibitors (SNRIs) and others. Incidence and adjusted hazard ratio (aHR) of subsequent self-harm and suicide within one-year and the whole study period were estimated by age groups. Results: A total of 34,927 persons aged 40-64 years, and 19,300 persons aged 65+ years were included. In the younger age group, the highest short-term and long-term risks were found in others (aHR, 2.33; 1.02-5.34) and NaSSAs (2.88; 2.15-3.86), respectively. In the older age group, no significant association was observed between antidepressant use and suicidal behavior across all antidepressant classes. Conclusion: The self-harm and suicide associated risks vary across antidepressant classes and age groups. Cautions are always needed for antidepressant prescriptions.

ASSOCIATION OF EARLY-LIFE FAMILY AND NEIGHBORHOOD CIRCUMSTANCES WITH DEPRESSIVE SYMPTOMS IN CHINESE OLDER ADULTS

Chenkai Wu,¹ and Jie Tan,² 1. *Duke Kunshan University, Kunshan, Jiangsu, China (People's Republic)*, 2. *Duke Kunshan University, Kunshan, Jiangsu, China (People's Republic)*

A growing body of literature suggests that early life circumstances can influence mental health throughout the

lifespan. However, how these early life circumstances cumulatively contribute to depression in old age is not completely understood. The present study examined the associations of eight factors representing multifaceted early life experience at individual, family, and community levels with depression among community-dwelling older adults. Data were from the China Health and Retirement Longitudinal Study. We included 8,239 community-dwelling individuals who were ≥ 60 years, completed the life history questionnaire, and had assessment of depression. Chi-square test was used to examine the unadjusted associations between each of the eight early life risk factors and depression. An early life disadvantage index was established using risk factors that were significantly associated with depression. Logistic regression was used to examine the association of each early life risk factor and the index with depression. Of 8,239 individuals included, 2,055 (24.9%) had depression. In bivariate analysis, each of eight early life risk factors was significantly associated with depression. Except for maternal and paternal education, all risk factors persisted to be associated with depression after multivariable adjustment. In the multivariable-adjusted model, a one-point higher in the early life disadvantage index (range: 0-6) was associated with a 45% (95% CI: 37%, 53%) higher odds of depression. There was a strong association between early life environments and depressive symptoms among Chinese community-dwelling older adults. Adverse early life circumstances could contribute cumulatively to depression in old age.

COGNITIVE FRAILTY AND ITS LONG-TERM EFFECT ON DEPRESSION IN AN OLDER POPULATION IN KOREA

Yoonjung Ji, TaeWha Lee, and EunKyung Kim, *Yonsei University, Seoul, Seoul-t'ukpyolsi, Republic of Korea*

Cognitive frailty is a condition where physical frailty and mild cognitive impairment (MCI) co-exist without dementia. It occurs in 1.8%-8.9% of the general older population, and older people with depression have a higher risk of frailty. However, the relationship between cognitive frailty and depression is still unclear. This study aimed to determine the relationship between cognitive frailty and depression of older adults by time using comparative group analysis. A secondary analysis was conducted using the Korean Longitudinal Study of Aging (KLoSA) dataset from 2010 to 2018. A sample was 981 older adults who were 65 years old and without dementia over residing in the community. Cognitive frailty was defined as having a mini-mental state examination score of 18-23 and 3 or more of the Fried frailty indexes. Generalized Estimating Equation model and chi-square test were employed. Of the 981 subjects, the cognitive frailty (CF) was 28.5%, followed by robust (37.7%), physical frailty (PF, 29.4%), mild cognitive impairment (MCI, 4.4%) at baseline. The group differences on depression measured by the Center for Epidemiological Studies Depression (CESD) were statistically significant in the PF ($F=4.70$, $p<.001$) and the CF ($F=4.95$, $p<.001$) group compared to the robust group. The time difference effect ($F=.09$, $p=.05$) and a group-by-time interaction effect were observed ($p<.001$). This study confirmed that cognitive frailty is strongly associated with depression. Effective approaches to managing psychological wellbeing, including dementia, are essential for older adults with cognitive frailty.

DEPRESSION AND AGE-RELATED CHANGES IN BODY COMPOSITION, CARDIOVASCULAR FUNCTION, GRIP STRENGTH, AND LUNG FUNCTION

Julian Mutz, and Cathryn Lewis, *King's College London, London, England, United Kingdom*

Individuals with mental disorders, on average, die prematurely, have higher levels of physical comorbidities and may experience accelerated ageing. In individuals with lifetime depression and healthy controls, we examined associations between age and multiple physiological measures. The UK Biobank study recruited $>500,000$ participants, aged 37-73, between 2006-2010. Generalised additive models were used to examine associations between age and grip strength, cardiovascular function, body composition, lung function and bone mineral density. Analyses were conducted separately in males and females with depression compared to healthy controls. Analytical samples included up to 342,393 adults (mean age = 55.87 years; 52.61% females). We found statistically significant differences between individuals with depression and healthy controls for most physiological measures, with standardised mean differences between -0.145 and 0.156. There was some evidence that age-related changes in body composition, cardiovascular function, lung function and heel bone mineral density followed different trajectories in individuals with depression. These differences did not uniformly narrow or widen with age. For example, BMI in female cases was 1.1 kg/m² higher at age 40 and this difference narrowed to 0.4 kg/m² at age 70. In males, systolic blood pressure was 1 mmHg lower in cases at age 45 and this difference widened to 2.5 mmHg at age 65. Individuals with depression differed from healthy controls across a broad range of physiological measures. Differences in ageing trajectories differed by sex and were not uniform across physiological measures, with evidence of both age-related narrowing and widening of case-control differences.

WAYS COMMUNITY-BASED ORGANIZATIONS ENHANCE LATE-LIFE DEPRESSION CARE IN PARTNERSHIP WITH CLINICS

Theresa Hoefft,¹ Melissa Gosdin,² Jenny Wagner,² Stuart Henderson,² Mindy Vredevoogd,³ Katherine James,³ Jurgen Unutzer,³ and Ladson Hinton,⁴ *1. University of Washington, Seattle, Washington, United States, 2. University of California Davis, University of California Davis, California, United States, 3. University of Washington, University of Washington, Washington, United States, 4. University of California, Davis, Sacramento, California, United States*

Late-life depression is a serious public health concern in the U.S., especially as the population ages. To improve care coordination and increase the number of providers working to improve depression outcomes, primary care clinics and community-based organizations (CBOs) can partner and improve care. Addressing social determinants of health is one area CBOs can help respond to but there are other ways CBOs can bring value to these partnerships with primary care clinics. As part of a qualitative evaluation of the Care Partners Project, 84 key informant interviews and 20 focus groups were conducted over five years with selected primary care physicians, care managers, administrators and psychiatric consultants. These data were coded and organized using an inductive and deductive thematic analysis

approach. CBOs contributed to care through 1) adding new services that focus on clients' social needs (e.g., assistance locating affordable housing, reliable transportation, applying for social security benefits) that were foundational to effective depression care; 2) strengthening core aspects of existing care; 3) incorporating a lay health workforce to enhance care; and/or 4) adding home visits that supported deeper understanding of patient's life context, enhanced trust and improved access to care. CBOs can enhance depression care through increasing access and quality of care. Findings can inform conversations about the value CBOs offer when partnering with health care systems and improve partnership efforts. Such conversations are worth revisiting as organizations deepen their connections and work together over time.

Session 4055 (Paper)

Developmental Challenges in Later Life

DIFFERENTIAL TREATMENT OF OLDER WORKERS DUE TO COVID-19: POTENTIAL FOR AGEISM AND AGE DISCRIMINATION AT WORK

Lisa Hollis-Sawyer, *Northeastern Illinois University, Chicago, Illinois, United States*

This paper examines the implications of employers' current COVID-19 protective workplace attendance policies toward older workers, potentially creating the outcomes of increased numbers of involuntary retirees and the discouraged older worker syndrome among otherwise qualified older workforce participants. How potential ageist assumptions and age discrimination under COVID-19 affect workplace decisions in reflection on the Age Discrimination in Employment Act (1967) guidelines is discussed. Older workers may remain in the workforce longer than ever before due to having healthier life expectancies. Workplace policies need to be increasingly sensitive to older employees' rights to sustain their workplace engagement (Cummins, 2014; Cummins, Harootyan, & Kunkel, 2015). The author reviewed current unemployment trends in 2020 and emerging litigation in reflection upon general issues of COVID-19 related age discrimination in the older workers' workplace attendance decisions by employers and the historical framework of the Age Discrimination in Employment Act (1967, with significant amendments in 1978 and 1986). The policy analysis paper presents the implications of employers' COVID-19 protective policies on older workers and how it may affect the "health" of the workplace and older adults and the economy beyond the pandemic. Lastly, strategies to address an "age-friendly" workplace during a pandemic and post-pandemic are discussed.

EARLY RETIREMENT AND SENSORY IMPAIRMENTS: THE MODIFYING EFFECT OF TOTAL ASSETS

Emmanuel Garcia Morales, and Nicholas Reed, *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

Sensory impairments are common among older adults. Little is known on the association between sensory impairments, which impact labor productivity, and the effect modification of wealth. We used the 2006-2018 rounds of the

Health and Retirement Study. Hearing (HI) and vision (VI) impairments (self-report) at baseline, and working status throughout the study period was observed. Logistic regression models, adjusted for demographic, socioeconomic, and health characteristics, were used to characterize the association of sensory impairment and early retirement (i.e., before age 65). Secondary analysis stratified by assets. Among 1,688 adults ages 53-64, 1,350 had no impairment, 140 had HI only, 141 VI only, and 57 had dual sensory impairment (DSI). Only adults with HI had higher odds of early retirement (Odds Ratio [OR]: 1.6; 95% Confidence Interval [CI]: 1.0,2.5) relative to those without sensory impairment. Among those with large assets, those with HI had higher odds (OR:2.6, 95% CI: 1.4,5.2) and those with VI had lower odds (OR: 0.37; 95% CI: 0.2,0.8) of early retirement. Among the low asset group, we found no differences across impairment groups for the odds of retirement. In sample of older adults, we provide evidence that the presence of hearing impairment is associated early retirement. Secondary analyses suggest wealth may modify this association which highlights the wealth disparities faced by people with sensory impairments.

ELDERCARE RESPONSIBILITIES AND PHYSICAL HEALTH SYMPTOMS AMONG MANUFACTURING WORKERS

Richard Fortinsky,¹ Janet Barnes-Farrell,² Jennifer Garza,¹ Samantha Lacey,² Hannah Austin,² James Grady,¹ and Martin Cherniack,¹ *1. University of Connecticut School of Medicine, Farmington, Connecticut, United States, 2. University of Connecticut, Storrs, Connecticut, United States*

Working adults responsible for providing care to older relatives at home (eldercare) have reported greater psychological health problems such as depressive symptoms and stress than workers without eldercare responsibilities. Less is known about how eldercare is associated with physical health symptoms such as sleep-related problems and pain. Among manufacturing workers, such physical health symptoms have the capacity to diminish productivity. Therefore, we explored associations between eldercare responsibilities and physical health symptoms that could affect work performance in a sample of 357 adult employees from five manufacturing companies in a northeastern US state. Research questions were: are workers with eldercare responsibilities more likely than those without eldercare responsibilities to report sleep-related and pain-related symptoms, and are the number of eldercare tasks associated with these physical health symptoms? Among sample members, 52 (14.6%) provided eldercare, 62% were male, mean(standard deviation) age=49.8(12.7), and 77% were non-Hispanic White; no demographic differences were found between those with and without eldercare responsibilities. In bivariate analyses, we found that providing eldercare was associated with lower sleep quality ($p=.05$), fewer hours of sleep during the workweek ($p=.04$), more pain interference at home and at work ($p=.02$), and more pain on average in the past week ($p=.01$). Providing more types of eldercare tasks ranging from personal care to providing transportation was associated with more pain on average in the past week ($p=.04$). We conclude that eldercare is associated with physical health symptoms that could directly affect job performance among

manufacturing workers. Workplace policy implications will be discussed.

RETIREMENT MIGRATION AND PRECARIETY: MATERIAL AND SOCIAL ASPECTS

Marion Repetti,¹ and Toni Calasanti,² 1. *University of Applied Sciences and Arts Western Switzerland HES-SO // Valais-Wallis, Sierre, Valais, Switzerland*, 2. *Virginia Tech, Blacksburg, Virginia, United States*

Discussions of precarity in later life have tended to focus on the uncertainties of material resources, and the feelings of anxiety that this evokes (e.g., Lain et al. 2019) as some older people thus face the risk of being excluded from the broader society. Although scholars often point to inequalities, such as those based on class and gender, as having an influence on the likelihood of older people experiencing such precarity, ageism is considered only to the extent that it can exacerbate the impact of these statuses through, for instance, labor market experiences. Here, we expand upon the impact of ageism on the social aspects of precarity: the loss of recognition and respect as a person that is at the core of social bonds. Drawing on qualitative interviews we have conducted among Swiss, British, and U.S. older people who migrated to cheaper countries in retirement, we demonstrate that ageism can influence precarity regardless of classes. We find that even among wealthier older migrants, who otherwise might fit the image of the retiree seeking an active lifestyle in a sunny location, the attempt to escape the devaluation heaped upon older people in their original country plays an important role. In their new countries, retired migrants of all classes felt that they were valued and part of a community, and this differed from the ageism in their home countries. We thus argue that ageism be considered in future analyses of precarity in later life.

Session 4060 (Symposium)

DYNAMIC RELATIONSHIPS BETWEEN PERCEIVED HOUSING AND LIFE TRANSITIONS: A BETTER UNDERSTANDING OF GOOD AGING IN PLACE

Chair: Frank Oswald

Co-Chair: Steven Schmidt

Discussant: Malcolm Cutchin

Housing has gained increased relevance as a central factor for health and well-being. Many countries have implemented ageing in place policies, which provide services focused on improving the physical environment. Housing needs change as people grow older and experience different transitions across their life courses. Studies have demonstrated relationships between housing and health and well-being in later life on the one hand and life transitions and health and well-being in later life on the other hand. However, research on life transitions in combination with perceived housing in relation to indicators of good ageing is virtually nonexistent. This symposium aims to address the dynamic relationship between perceived housing and life transitions and how they impact health, well-being, functioning, and social/neighborhood participation as people age by data from a mixed-method approach in Sweden and Germany. The first contribution by Slaug and colleagues introduces changes in

how older adults perceive their housing following the life transition of a fall at home. Second, Eriksson and colleagues present qualitative results on the experience of relationships between perceived housing, several life transitions and well-being among community-dwelling Swedish older adults. Third, Wanka and colleagues present partially different results from a comparable study in German on the same topic but emphasizing the experience of interrelationships between different life course transitions. Fourth, Granbom and colleagues explore how low-income older adults in Sweden reason about their current housing situation and a future life transition of relocation. Finally, Malcolm P. Cutchin will serve as the session's discussant.

TO FALL OR NOT TO FALL – FALLS AND PERCEPTIONS OF CONTROL AND MEANING OF THE HOME

Björn Slaug, Susanne Iwarsson, and Steven Schmidt, *Lund University, Lund, Skane Lan, Sweden*

Falls are a major public health problem among older people. Even if the outcome of a fall is not fatal, it may be a traumatic experience with both physical and psychological consequences. However, there is a lack of studies examining how falls in the home may impact the perception of the home. To compare perceptions of the home between those who had fallen and those who had not, we utilized data from the Swedish SNAC-GÅS study (N=371; mean age=68; 43% men). Perceptions of control and meaning of the home were captured by established psychological instruments. Excluding falls in other environments than the home (n=99), those who fell in the home the previous year (n=34) scored notably higher on housing control by "powerful others" (p=0.053) and notably lower on perceived "behavioral home bonding" (p=0.056) compared to non-fallers (n=238). These results warrant further research into the impact of falls on perceived housing.

REASONING ABOUT LIFE TRANSITIONS IN RELATION TO PERCEIVED HOUSING: IN-DEPTH DATA FROM SWEDEN

Erik Eriksson,¹ Steven Schmidt,¹ and Maya Kylén,² 1.

Lund University, Lund, Skane Lan, Sweden, 2. *CASE Lund University, Lund, Skane Lan, Sweden*

The accessibility and suitability of housing to improve health and well-being for the growing share of older adults in the population has important policy implications. Yet, current housing policies tend to neglect the heterogeneity of older adults housing needs which vary across age, health, and personal preferences. Little is known about how life transitions in combination with perceived housing relates to good aging. This qualitative study aims to explore the relationship between perceived housing, life transitions, well-being, health, and participation in older age. Participants were community-dwelling and aged 65-75 years. All participants reported multiple transitions considered as important for the way they viewed their housing situation and social relationships as well as for the choices they made around their housing. The findings from this project may be used to develop health promotion programs that proactively support housing decisions along the process of ageing and enable full participation in society.

REASONING ABOUT LIFE TRANSITIONS IN RELATION TO PERCEIVED HOUSING: IN-DEPTH DATA FROM GERMANY

Anna Wanka,¹ Karla Wazinski,² and Frank Oswald,²

1. *Goethe University Frankfurt, Frankfurt, Hessen, Germany*, 2. *Goethe University Frankfurt, Frankfurt am Main, Hessen, Germany*

Partially different to the Swedish contribution, this paper analyses the relationships between perceived housing, life course transitions and wellbeing among community-dwelling older adults in Germany. Based on 15 qualitative interviews with persons aged 60-75 years, the contribution focuses on the experience of interrelationships between different life course transitions and perceived housing, and how they contribute to wellbeing in later life. First findings indicate a concurrence of different transitions around the retirement age (e.g. illnesses, changes in partnerships) and a temporal as well as causal relationship between the two transitions relocation and retirement (for example, relocation becomes possible only after retiring or people relocate with the retirement phase in mind). The entanglement of life course transitions, in turn, shapes the person-place-relationships and perceived housing in different ways, which will be exemplified and interpreted in the presentation. However, further research is needed to consider the effects of social inequalities in these processes.

Session 4065 (Symposium)

EMERGING BIOTECHNOLOGY MARKERS OF COGNITIVE IMPAIRMENT

Chair: Megan Huisingsh-Scheetz

Discussant: Jennifer Schrack

The early detection of cognitive impairment is among the National Institute on Aging's (NIA) current research priorities. Sensor-based technologies have exploded in recent years allowing remote, continuous measurement of older adults' free-living activity. This highly granular data has stimulated exciting new research exploring how change in health can be detected remotely using novel "biotechnology" markers. Yet, this area of research is in its infancy as it relates to predicting cognitive function. This symposium will provide an overview of the sensor-cognition research landscape and will feature 5 new studies exploring the relationship between biotechnology markers and cognitive function, each with unique sensors, cognitive measures and samples. The first three presentations will report associations between accelerometry-based activity measures (chest or wrist devices) and cognitive function (assessed by diagnosis, a neurocognitive assessment, or microstructural changes on DTI) in the Baltimore Longitudinal Study on Aging, a large, NIA-funded epidemiologic dataset. The fourth presentation will report the significance of free-living hip accelerometry activity measures beyond clinically-available information in a random forest prediction model of 1-year change in Montreal Cognitive Assessment scores among urban, predominantly African-American older adults without moderate-severe dementia residing in the community. The final presentation will report associations between room-to-room transitions as detected by in-home, infrared motion sensors and mild cognitive impairment using data from a community-dwelling sample of older adults residing alone. This symposium will provide a

substantial expansion of current knowledge in this research space and will be relevant to clinicians or researchers with an interest in sensor technology or dementia.

RELATIVE VIGOROUS-INTENSITY PHYSICAL ACTIVITY PREDICTS BRAIN MICROSTRUCTURAL CHANGES IN OLDER ADULTS

Qu Tian,¹ Jennifer Schrack,² Bennett Landman,³

Amal Wanigatunga,² Susan Resnick,¹ and Luigi Ferrucci,¹

1. *National Institute on Aging, Baltimore, Maryland, United States*, 2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 3. *Vanderbilt University, Nashville, Tennessee, United States*

Physical activity especially at moderate-to-vigorous intensity may preserve brain structure in old age. However, current findings are cross-sectional and rely on absolute intensity. This study aimed to examine whether relative or absolute vigorous-intensity physical activity (VPA) predicts brain microstructural changes. We analyzed 260 initially cognitively normal and well-functioning participants (age=70.5yrs) who had VPA data via ActiHeart and longitudinal brain microstructure by DTI (follow-up=3.7yrs). Associations of VPA with microstructural changes were examined using linear mixed-effects models, adjusted for demographics. Each SD higher relative VPA defined by heart rate reserve (i.e. 21 min/day) was significantly associated with less decline in memory-related microstructural integrity, including mean diffusivity of entorhinal cortex and parahippocampal gyrus and fractional anisotropy of uncinate fasciculus and cingulum-hippocampal part, and not executive/motor-related microstructure. Absolute VPA was not associated with microstructural markers. Among well-functioning older adults, participating in VPA defined by heart rate reserve may predict less brain microstructural decline in memory-related areas.

DAILY PHYSICAL ACTIVITY PATTERNS: A WINDOW ON COGNITIVE DECLINE IN THE BALTIMORE LONGITUDINAL STUDY OF AGING (BLSA)

Amal Wanigatunga,¹ Fangyu Liu,² Hang Wang,²

Jacek Urbanek,³ Yang An,⁴ Eleanor Simonsick,⁵

Susan Resnick,⁶ and Jennifer Schrack,¹ 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 2. *Johns Hopkins University, Baltimore, Maryland, United States*, 3. *Johns Hopkins School of Medicine, Baltimore, Maryland, United States*, 4. *NIA, Baltimore, Maryland, United States*, 5. *National Institute on Aging/NIH, Baltimore, Maryland, United States*, 6. *National Institute on Aging, Baltimore, Maryland, United States*

Gradual disengagement from essential daily physical activity (PA) necessary for independent living could signal present or emerging mild cognitive impairment (MCI) or Alzheimer's disease (AD). We used BLSA data to examine whether PA patterns including: 1) total activity counts/day, 2) minutes/day spent active, and 3) activity fragmentation (reciprocal of the mean active bout length) differs between participants with adjudicated normal cognition (n=498) and MCI/AD diagnoses (n=32). Linear models were used and adjusted for demographics, APOE-e4 status, morbidity, and gait speed. Compared to those with normal cognition, those with MCI/AD had 3.0% higher activity fragmentation (SE=1.1%, p=0.006) but similar mean total activity counts/

day ($p=0.08$) and minutes/day spent active ($p=0.19$). Results suggest that activity fragmentation may arise as a compensatory strategy in the absence of reduced activity in MCI and early AD and that activity monitoring may be potentially useful for detecting MCI and AD at an earlier stage.

CIRCADIAN REST AND ACTIVITY RHYTHMS AND COGNITIVE CHANGE IN THE BALTIMORE LONGITUDINAL STUDY OF AGING

Jill Rabinowitz,¹ Yang An,² Sarah Wanigatunga,³ Vadim Zipunnikov,⁴ Mark Wu,⁵ Eleanor Simonsick,⁶ Susan Resnick,⁷ and Adam Spira,¹ 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 2. *NIA, Baltimore, Maryland, United States*, 3. *Johns Hopkins, Baltimore, Maryland, United States*, 4. *Department of Biostatistics, Bloomberg School of Public Health, Johns Hopkins, Baltimore, Maryland, United States*, 5. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*, 6. *National Institute on Aging/NIH, Baltimore, Maryland, United States*, 7. *National Institute on Aging, Baltimore, Maryland, United States*

Alterations in 24-hour movement patterns, or circadian rest/activity rhythms (RARs), commonly occur with aging. Using linear mixed effects (LME) modeling, we examined associations of baseline RARs with longitudinal change in cognition. Participants ($N=424$; 47% male, baseline age 72.8 ± 10.1 years) were from the Baltimore Longitudinal Study of Aging and completed 5.6 ± 0.8 nights of wrist actigraphy at baseline. Tests of memory, executive function, attention, language, and visuospatial ability were administered at baseline and subsequent visits (3.7 ± 1.7 years of follow-up in those with >1 visit ($n=295$)). In unadjusted random intercept and slope LME models, greater RAR stability predicted slower memory decline, and higher activity during participants' least active 5 hours (L5) predicted slower decline in visuospatial ability. After covariate adjustment, higher activity in participants' most active 10 hours (M10) and higher L5 predicted slower decline in visuospatial ability ($p<.05$). Further research is needed on RARs as risk factors for later-life cognitive decline.

HIP ACCELEROMETRY ACTIVITY PATTERNS IMPROVE MACHINE LEARNING PREDICTION OF 1-YEAR MOCA SCORE CHANGE

Chengjian Shi,¹ Jacek Urbanek,² Niser Babiker,³ Alan Gonzolez,³ Jovany Soto,⁴ Andrey Rzhetsky,³ and Megan Huisinigh-Scheetz,³ 1. *University of Chicago, Chicago, Illinois, United States*, 2. *Johns Hopkins School of Medicine, Baltimore, Maryland, United States*, 3. *University of Chicago, Chicago, Illinois, United States*, 4. *Illinois Institute of Technology, Orland Park, Illinois, United States*

We tested whether free-living hip accelerometry measures improved prediction of 1-year change in Montreal Cognitive Assessment (MoCA) scores beyond clinically available information. We analyzed data ($n=126$) from predominantly African American (78.2%) older adults without moderate-severe dementia residing near our geriatrics clinic. Age (73.6 ± 6.1 years), gender, education, comorbidities, income, and MoCA performance were collected at baseline; participants then wore a right hip, triaxial Actigraph accelerometer (30Hz) continuously for 7 days. A MoCA was

repeated at 1 year. Six measures were calculated from the daytime (7am-5pm) data: mean/variance of hourly counts per minute, mean/variance of daily percent of time spent in the lowest activity quartile, and mean/variance of daily percent of time spent in the highest activity quartile. In a random forest model containing baseline MoCA, demographics and comorbidities, the accelerometry measures improved prediction of 1-year MoCA performance by $\sim 17.8\%$. Accelerometry data may be clinically useful for predicting early cognitive decline.

STABILITY AND VARIABILITY OF INDOOR ROOM TRANSITIONS AND MILD COGNITIVE IMPAIRMENT IN OLDER ADULTS

Chao-Yi Wu,¹ Christina Reynolds,¹ Lisa Barnes,² Lisa Silbert,¹ Hiroko Dodge,¹ Jeffrey Kaye,¹ and Zachary Beattie,¹ 1. *Oregon Health & Science University, Portland, Oregon, United States*, 2. *Rush University Medical Center, Chicago, Illinois, United States*

Indoor room transition is an underexplored real-world activity outcome. We estimated the stability and variability of indoor room transitions and their associations with mild cognitive impairment (MCI) in older adults. Older adults living-alone ($n=159$, age= 78.3 ± 8.8 years, 14% MCI) from the Oregon Center for Aging & Technology (ORCATECH) and the Minority Aging Research Study (MARS) were included. Room transitions were detected using passive infrared motion sensors in bathroom, bedroom, kitchen, and living room. The hourly number of room transitions was used to calculate the interdaily stability and intradaily variability of room transitions. MCI was operationalized by the Clinical Dementia Rating equaled 0.5. Generalized estimating equations models adjusted for demographics, health, and environmental factors revealed that older adults with MCI had a lower interdaily stability of room transitions than cognitive healthy peers ($z=-2.06, p=0.03$). A pervasive-sensing system deployed in homes can obtrusively measure room transition activities to inform cognitive health in older adults.

Session 4070 (Paper)

Fall Risk

ACCELEROMETER-MEASURED DAILY STEPS, PHYSICAL FUNCTION, AND SUBSEQUENT FALL RISK IN OLDER WOMEN: THE OPACH STUDY

Benjamin Schumacher,¹ John Bellettiere,² Michael LaMonte,³ and Andrea LaCroix,² 1. *University of California, San Diego, San Diego, California, United States*, 2. *University of California, San Diego Herbert Wertheim School of Public Health and Human Longevity Science, La Jolla, California, United States*, 3. *University at Buffalo, Buffalo, New York, United States*

We sought to investigate the association between steps per day (steps/d) and incident fall risk while also assessing the role of physical functioning on this association. Steps/d were measured by accelerometer for 7 days in 5,545 women aged 63 to 97 years between 2012 - 2014. Falls were ascertained from daily fall calendars for 13 months. Median steps/d were 3,216. There were 5,473 falls recorded over 61,564 fall

calendar months. The adjusted incidence rate ratio comparing women in the highest vs. lowest step quartiles was 0.71 (95% confidence interval, 0.54 - 0.95; P-trend across quartiles of steps/d = 0.01). After further adjustment for physical function using the Short Physical Performance Battery, the rate ratio was 0.86 (0.64-1.16; P-trend = 0.27). Mediation analysis estimated that 66.7% to 70.2% of the association of steps/d and fall risk may be mediated by physical function. In conclusion, higher steps/d were related to lower incident falls primarily through their beneficial association with physical functioning. Interventions that improve physical function, including those that involve stepping, could reduce falls in older adults.

FINDING STATIC STABILITY LIMITS: COMPARISON OF REACTIVE BALANCE IN OLDER PEOPLE WITH AND WITHOUT A HISTORY OF FALLS

Michel Hackbarth, Jessica Koschate, Sandra Lau, and Tania Zieschang, *Carl von Ossietzky University Oldenburg, Oldenburg, Niedersachsen, Germany*

Reactive balance is a highly relevant fall risk factor, but is rarely considered in clinical practice. Especially medial-lateral perturbations lead to a pronounced instability of the gait pattern. However, there is no consensus on a method for the assessment of individually challenging perturbation intensities to apply during walking. The aim of this study is to determine and compare the static stability-limits in older adults with and without a history of falls. Twelve older adults with (OAF; 75.6 ± 3.66, 9♀) and 19 older adults without a history of falls (OA; 77.5 ± 4.99, 12♀) were subjected to progressive-intensifying perturbations while standing on a perturbation treadmill. In addition, functional performance (Mini-BESTest), fear of falling (FES-I), and physical activity (kcal) were assessed. Deflection of the treadmill-platform was randomized by timing and direction and was increased until the subject had to compensate with a step (stability-limit). The maximum deflection distance for each direction, as well as the FES-I score, mini-BESTest score, and activity level were evaluated for group differences using the t-test and Mann-Whitney-U test ($\alpha \leq 5\%$). There were no significant group differences in the mini-BESTest and between the maximum tolerated deflection distances. The OAF-subjects showed an increased FES-I score (median for OA=18.0 and OAF=22.0, $p=0.032$) and higher activity levels (median for OA=1974 kcal and OAF=3365 kcal, $p=0.011$). Despite an increased fear of falling, the older adults with a fall history showed a similar stability-limit, but higher activity levels. In future experiments these static stability limits should be tested during walking and evaluated via motion analysis.

MEAN ARTERIAL PRESSURE AND RISK OF FALLS RESULTING IN HOSPITAL PRESENTATION IN OLDER ADULTS

Sultana Monira Hussain,¹ Michael Ernst,² Christopher Reid,³ Andrew M. Tonkin,¹ Johannes Neumann,¹ Le Thi Phuong Thao,¹ Anna Barker,⁴ and John McNeil,¹ *1. Monash University, Melbourne, Victoria, Australia, 2. University of Iowa, Iowa City, Iowa, United States, 3. Curtin University, Perth, Western Australia, Australia, 4. Silver Chain, Melbourne, Victoria, Australia*

Utilising data from the ASPirin in Reducing Events in the Elderly trial participants aged 70-years, we estimated

MAP and variation in MAP defined as within-individual SD of MAP from baseline and first 2 annual visits. Falls were confined to those involving presentation to a hospital. Cox proportional hazards regression was used to calculate hazard ratio (HR) and 95% confidence interval (CI) for associations with falls. Amongst 16,703 participants (1,540 falls), MAP was not associated with falls irrespective of antihypertensive medication status (all: HR 1.00, 95% CI 0.99-1.01, not on antihypertensive: HR 1.01, 95% CI 0.99, 1.02, on antihypertensive: HR 1.01, 95% CI 0.99-1.02). Amongst 14,818 participants who remained in the study up to year 2 without falls, 1 unit escalation in MAP variability increased the risk (HR 1.01, 95% CI 1.00-1.03). Compared with those in the lowest tercile of variability, those in the middle or highest tercile of variability experienced an increased risk of falling (middle: HR 1.32, 95% CI 1.06-1.65; highest: HR 1.25, 95% CI 1.01-1.55). When stratified for antihypertensive medication status, those receiving diuretics (HR 1.18, 95% CI 1.00-1.39) or beta-blockers (HR 1.37, 95% CI 1.08-1.73) were at increased risk compared to those receiving renin-angiotensin-system acting agents. All results persisted after adjustment for multiple covariates. The association of diuretics and beta-blockers with falls remained significant even after excluding those with history of heart failure. Older community-dwelling adults with high variability in MAP are at increased risk of falls, particularly amongst those receiving beta-blockers or diuretics.

MEASUREMENT DISPARITIES IN FRAILITY AMONG KIDNEY TRANSPLANT PATIENTS: IMPACT OF DIFFERENTIAL ITEM FUNCTIONING

Nadia Chu,¹ Alden Gross,² Xiaomeng Chen,¹ Qian-Li Xue,¹ Karen Bandeen-Roche,² Dorry Segev,¹ and Mara McAdams-DeMarco,¹ *1. Johns Hopkins University School of Medicine, Baltimore, Maryland, United States, 2. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

Frailty is commonly measured for clinical risk stratification during transplant evaluation and is more prevalent among older, non-White kidney transplant (KT) patients. However, group differences may be partially attributable to misclassification resulting from measurement bias (differential item functioning/DIF). We examined the extent that DIF affects estimates of age, sex, and race differences in frailty (physical frailty phenotype/PFP) prevalence among 4,300 candidates and 1,396 recipients. We used Multiple Indicators Multiple Causes with dichotomous indicators to assess uniform DIF in PFP criteria attributable to age (≥ 65 vs. 18-64 years), sex, and race (Black vs. White). Among candidates (mean age=55 years), 41% were female, 46% were Black, and 19% were frail. After controlling for mean frailty level, females were more likely to endorse exhaustion (OR=1.20, $p=0.003$), but less likely to endorse low activity (OR=0.83, $p=0.01$). Younger candidates were more likely to endorse weight loss (OR=1.30, $p=0.005$), exhaustion (OR=1.60, $p<0.001$), and low activity (OR=1.80, $p<0.001$). Black candidates were more likely to endorse exhaustion (OR=1.25, $p<0.001$), but less likely to endorse weakness (OR=0.79, $p<0.001$). Among recipients (mean age=54 years), 40% were female, 39% were Black, and 15% were frail. Younger recipients were more likely to endorse weight loss

(OR=1.55, $p=0.005$) and low activity (OR=1.61, $p=0.02$); however, no DIF was detected by sex or race. Results highlight the impact of DIF for specific PFP measures by age, sex, and race among candidates, but only by age for recipients. Further research is needed to ascertain whether candidate- and/or recipient-specific thresholds to correct for DIF could improve risk prediction and equitable access to KT for older, female, and Black candidates.

PREDICTORS OF FALLS IN OLDER ADULTS WITH AND WITHOUT DEMENTIA

Safiyyah Okoye,¹ Chanee Fabius,² and Jennifer Wolff,²

1. *Johns Hopkins University, Baltimore, Maryland, United States*, 2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

Persons living with dementia (PLWD) have up to twice the risk for falling and three-times the risk of serious fall-related injuries as those without dementia. Falls are a leading cause of hospitalizations among PLWD, who are more likely to incur high costs and experience negative health consequences (e.g., delirium, in-hospital falls) than persons without dementia. Few studies have examined risk factors for falls comparing Americans with and without dementia. We used data from the 2015 and 2016 rounds of the National Health and Aging Trends Study ($n=5,581$) to prospectively identify risk factors for a single fall and recurrent (2+) falls over a 12-month period among community-living older adults ≥ 65 years with and without dementia in a series of bivariate logistic regressions. Overall, we identified fewer predictors of single or recurrent falls among PLWD compared to persons without dementia. For example, socioeconomic indicators (e.g., income, financial hardship) predicted recurrent falls in persons without dementia, but not in PLWD. Among PLWD, falling in the previous year was associated with both single (odds ratio (OR): 3.38, 95% confidence interval (CI): 1.77, 6.49) and recurrent falls (OR: 6.19, 95% CI: 3.50, 10.93). PLWD who experienced recurrent falls were also more likely to be identified as having a fear of falling (OR: 2.17, 95% CI: 1.33, 3.54), physical function impairments, depression symptoms (OR: 2.23, 95% CI: 1.34, 3.71), and anxiety symptoms (OR: 1.73, 95% CI: 1.14, 2.62). Further study of fall-risk factors could inform screening, caregiver education and support, and prevention strategies for PLWD.

Session 4075 (Paper)

Falls and Mobility

ASSOCIATION OF IN-LAB AND FREE-LIVING MOBILITY MEASURES WITH FALLS AND FEAR OF FALLING IN UNDERACTIVE OLDER PEOPLE

Stacey Schepens Niemiec,¹ Cheryl Vigen,¹

Jeanine Blanchard,¹ Matthew Niemiec,² and Brittany Eng,¹

1. *University of Southern California, Los Angeles, California, United States*, 2. *Independent contractor, Glendale, California, United States*

Falls in older adults have significant consequences—a single fall can lead to serious injury, psychological trauma, activity restriction, and increased mortality. This study describes differences in mobility-related characteristics of

underactive (<150 minutes/week of physical activity), racially diverse, older adults (65–84 years) classified by self-reported fall status (0, 1, 2+ falls in previous 12mo) and fear of falling (yes/no). We analyzed baseline data from 105 individuals (mean age=72.1 years; 73% female; 64% white, 29% Black, 12% Asian) who participated in a trial of a physical activity smartphone intervention for older people. Total minutes of daily stepping and medium-to-brisk (≥ 75 steps/min) and brisk (≥ 100) cadence bouts in free-living conditions was gathered over 3 days via ActivPal activity monitor. Gait speed was determined from a 4-meter walk test for those pre-tested prior to COVID-19 mandates ($n=60$). Of the median 81.8 minutes spent stepping daily, very few minutes involved moderate-to-brisk (14.0) or brisk cadence (10.1). Groups classified by fall status (non-fallers $n=74$, 1x fallers $n=18$, repeat fallers $n=13$) differed significantly in daily minutes spent in medium-to-brisk ($p=0.04$) and brisk cadence ($p=0.02$), but not in 4-meter gait speed or total minutes stepping. Individuals who reported fear of falling versus those with no fear did not differ significantly on any mobility-related parameters. Four-meter gait speed was significantly negatively correlated with both cadence measures ($p=0.02$) but not total minutes stepping. This study indicates that faster walking behaviors in everyday activity may be a useful target for intervention to prevent falls in underactive older adults.

SYMPTOMS CONTRIBUTING TO MOBILITY LIMITATIONS AND FEAR OF FALLS IN OLDER ADULTS.

Michelle McKay,¹ Janell Mensinger,² Melissa O'Connor,³ Alexander Costello,¹ and Suzanne Leveille,⁴ 1. *Villanova University, Villanova University, Pennsylvania, United States*, 2. *Villanova University, Fitzpatrick College of Nursing, Villanova University, Pennsylvania, United States*, 3. *Villanova University, M. Louise Fitzpatrick College of Nursing, Villanova, Pennsylvania, United States*, 4. *University of Massachusetts Boston, University of Massachusetts Boston, Massachusetts, United States*

Mobility limitations in older adults are associated with negative outcomes including fear of falls (FOF) and poorer quality of life. However, self-reported symptoms contributing to mobility difficulty have not been fully explored as an area for intervention. The study aimed to identify the prevalence of self-reported symptom causes of difficulty walking and stair-climbing. In addition, we examined associations between symptoms and FOF in a population-based cohort of community-dwelling older adults in the MOBILIZE Boston Study. Of the 243 older adults who reported difficulty with walking one quarter of a mile or climbing stairs, 67% were women, 72% were white, average age=79.4y (SD=5.7). FOF was measured with the Tinetti Falls Efficacy Scale. Pain was most commonly reported as the primary symptom responsible for mobility difficulty (38.4%) followed by endurance (21.1%), multiple symptoms (15.6%), weakness (13.2%), balance (8.7%), other symptoms (2.9%). Factorial ANCOVA determined gender differences in associations between symptoms and FOF, adjusting for age. In pairwise comparisons, women who identified balance as their primary symptom had higher FOF than women identifying endurance ($p=.017$), pain ($p=.015$), other ($p=.017$), or multiple ($p=.050$) symptoms. There were no FOF differences for women identifying

balance compared to weakness as the primary issue ($p=.395$). Men who identified balance as their primary symptom had higher FOF than those who identified pain ($p=.036$); no other FOF differences were noted in men identifying balance compared to other symptoms. Understanding common symptoms experienced by older adults, and symptoms associated with greatest FOF, will assist in developing tailored interventions for mobility improvement.

TRANSITIONS IN ADHERENCE TRAJECTORIES FROM INTERVENTION TO MAINTENANCE OF A FALLS PREVENTION EXERCISE PROGRAM

Pildoo Sung,¹ May-Ling June Lee,² Kok Yang Tan,³ Rahul Malhotra,³ and Angeline Chan,³ 1. *Duke-NUS Medical School, Singapore, Singapore*, 2. *Duke-NUS Medical School, Duke-NUS Medical School, Singapore*, 3. *Duke-NUS Medical School, Singapore, Singapore*

The successful implementation of a falls prevention exercise program for older adults hinges on self-maintenance after active intervention. However, little is known about the pattern of adherence from the intervention to the maintenance phase of such programs, and the factors influencing adherence. We investigate transitions in exercise adherence trajectories from the active intervention to the maintenance phase of a falls prevention exercise program in Singapore, and whether exercise self-efficacy is associated with adherence in the maintenance phase. We analyze data of 143 older adults who participated in a 12-week, group-based falls prevention exercise program, followed by a 6-month maintenance phase, in 2018-2019. Sequential process latent class growth modeling identifies the distinct exercise adherence trajectories in the active intervention and the maintenance phase separately and their transition patterns. Multivariable regression examines whether baseline and change in self-efficacy during the active intervention predict adherence during the maintenance phase. The analysis reveals three exercise adherence trajectories—adherent (40% of participants), intermittent (38%), and disengaged (22%)—in the active intervention phase, and two trajectories—adherent (33%) and disengaged (67%)—in the maintenance phase. Those adherent in the maintenance phase comprise participants who were adherent (42%) or intermittent (58%) in the active intervention phase. Baseline and increase in exercise self-efficacy during the active intervention are positively associated with adherence in the maintenance phase. The findings capture the heterogeneity in exercise adherence patterns within and across the active intervention and maintenance phases of falls prevention exercise program, and the importance of exercise self-efficacy in continued adherence to exercise.

TRANSLATION OF A FALLS PREVENTION BEHAVIORAL INTERVENTION FOR FAMILY CAREGIVER ADMINISTRATION

Victoria Panzer,¹ Veronica Smith,² Dorothy Wakefield,³ and Richard Fortinsky,⁴ 1. *Brookside Research & Development, Freeland, Washington, United States*, 2. *Brookside Research & Development, Freeland, WA, Washington, United States*, 3. *UConn Health, Farmington, Connecticut, United States*, 4. *University of Connecticut School of Medicine, Farmington, Connecticut, United States*

FallsTalk is a one-month evidence-based falls prevention (FP) program that focuses attention on causes of an individual's falls and encourages new FP behaviors. We translated the program for family caregivers of persons with cognitive impairment or dementia (PwCID) to administer to the PwCID and examined the number of new FP behaviors (#newFPBs) reported during the intervention period by the Caregiver. Thirty-four Dyads (Caregiver+PwCID) were trained to conduct brief daily FP discussions together using paper (FTCGnoTech) or computerized (FTCGTech, $n=20$) guidance. Dyads had FallsTalk training, daily discussions and weekly check-in calls. FTCTech included discussion suggestions tailored to Caregiver concerns. To examine the use of technology, Poisson regression models compared #newFPBs between FTCTGnoTech and FTCTGTech and included covariates age (<80 or ≥ 80), Mini-Mental Status Exam (MMSE >25 or ≤ 25) and interactions. To evaluate the influence of Caregiver participation, #newFPBs reported by 115 non-demented clinical trial participants (no Caregiver-FT-CITrNoCG) were compared with the Caregiver outcomes. Dyads using technology reported significantly more #newFPBs (MeanFTCGnoTech=5.34(SEM=0.68), MeanFTCGTech=8.46(SEM=0.76); $p=.004$) during the intervention month. A significant interaction was observed whereby Dyads with MMSE ≤ 25 using technology, reported significantly more #newFPBs than the non-technology group (MeanFTCGnoTech=4.23(SEM=0.72), MeanFTCGTech=9.01(SEM=0.90); $p=.047$). Caregiver ($n=34$) involvement substantially increased #newFPBs (MeanFT-CITrNoCG=1.39(SEM=0.15), MeanCaregiver=7.21(SEM=0.49); $p<.0001$), independent of technology. Across studies, participants or Caregivers for those with MMSE ≤ 25 and <80 yo reported significantly more #newFMBs (Mean=4.38(SEM=0.55) than those 80+yo (Mean=2.06(SEM=0.30); $p=.0026$). FallsTalk Caregiver provides an effective means to promote new Dyad FP strategies. The influence of Caregiver involvement and technology show promise in encouraging behavioral change to prevent falls.

WEATHER, BUILT ENVIRONMENT, OR PERSONAL FACTORS: PREDICTORS OF WALKING BY INDEPENDENT LIVING RESIDENTS WITH FRAILTY

Margaret Danilovich,¹ Aura Espinoza,² and Christie Norrick,² 1. *CJE SeniorLife, Skokie, Illinois, United States*, 2. *CJE SeniorLife, Chicago, Illinois, United States*

Environmental factors influence older adult physical activity. However, the evidence about which factors lead to increased physical activity is mixed and few have studied how these factors affect those with frailty or living in retirement communities. This study investigated how environmental and weather factors influence physical activity among pre-frail and frail older adults residing in independent living retirement communities. We used ActivPal accelerometers to measure 7-day step counts among ($n=108$) pre-frail and frail residents in 9 independent living residences in metropolitan Chicago. We conducted environmental audits using the MAPS Abbreviated tool and collected National Weather Service Station data (temperature, precipitation, and daylight minutes) during the ActivPal periods. Participants were on average 80.0 years, 74% female, and average daily step count was 3,450 (range 151 - 11,663). Four buildings were in

suburban areas and 5 in urban areas and four were private-pay residences while 5 offered subsidized rent. ANOVA results showed private-pay buildings had higher total MAPS scores than subsidized buildings ($p=0.001$), and urban buildings had higher total MAPS scores than suburban buildings ($p < 0.000$). Mean step differences were non-significant between different building types: (mean steps = 3,317 private-pay, 3,629 subsidized, 3,536 urban, 3,350 suburban). Pearson product-moment correlations showed a positive association between steps and MAPS positive streetscape features ($p=0.011$). Multiple regression analysis showed higher temperature days, precipitation, and more minutes of daylight were associated with higher step counts ($p=.04$). Given the dramatic variation in individual step counts, future research should investigate personal factors that contribute to activity among independent living residents.

Session 4080 (Symposium)

FAMILY CAREGIVING DISRUPTED BY COVID-19: OVERCOMING CHALLENGES THROUGH RESILIENCE AND FLEXIBILITY

Chair: Mary Wyman

Discussant: Laura Wray

The impacts of the COVID-19 pandemic have been global and pervasive – yet only partially understood. Older adults and their family caregivers have experienced profound and unprecedented challenges as a result of COVID-19. This symposium features research on these disruptions and the creative adaptations undertaken in response. Four presentations present a variety of geographic regions, caregiving settings, and research focal points. Avidor and Ayalon present findings from interviews with family caregivers of residents in long-term care, highlighting the issues faced as a result of dramatic shifts in policy and procedures in support of pandemic infection control. Gum and colleagues focused on how service access has changed for community-dwelling older adults and their families during the pandemic, and how agencies may best leverage the flexibility of caregivers to adapt service provision. Boucher et al. compare the challenges faced by family caregivers during COVID-19 with those faced during a natural disaster, and highlight unique differences in service access for caregivers of military veterans. Finally, Ko and co-authors share their experience with the implementation of a technology intervention to reduce caregiver stress as part of a research trial, and how the protocol adjustments necessitated by COVID-19 revealed the unique potential of such technologies to support caregivers under isolated conditions. The presenters will focus on themes of resilience and lessons learned for health care systems, service agencies, and society to best support family caregivers in challenging circumstances moving forward.

DISASTER CAREGIVING: CAREGIVERS NEGOTIATING STORMS AND COVID-19 FOR VETERANS AND NON-VETERANS ON THE GULF COAST

Nathan Boucher,¹ Kevin McKenna,² Carrie Dombeck,² Amy Clark,² Ke Wang,³ Jennifer Olson,⁴ and Megan Shepherd-Banigan,² 1. *Duke University, Durham, North Carolina, United States*, 2. *Duke University School of Medicine, Durham, North Carolina, United States*,

3. *Rosalynn Carter Institute for Caregivers, Americus, Georgia, United States*, 4. *Rosalynn Carter Institute for Caregiving, Americus, Georgia, United States*

Natural disasters and COVID-19 likely add complexity to caregiving efforts, yet little is known about these effects. We will discuss our findings exploring additional needs and challenges experienced by caregivers during hurricanes, floods, and COVID focused on US Gulf Coast states. We interviewed caregivers of both Veterans ($n=13$) and non-Veterans ($n=11$). The presentation will include an overview of 1) types of resources needed or used related to storms and to COVID, including social support and access to information for both emergency planning and recovery; 2) caregiver experience before, during, and after the disaster including psychological effects on caregivers and addressing special health needs; 3) comparisons of challenges during storms versus COVID including emotional impact and access to health and specialty care; and 4) additional resources used by caregivers of Veterans. We will also address how these data are informing national caregiver support programs.

PANDEMIC DEPLOYMENT OF A SMARTHEALTH TECHNOLOGY TO IMPROVE STRESS IN DEMENTIA FAMILY CAREGIVERS

Eunjung Ko,¹ Karen Rose,¹ Kristina Gordon,² Emma Schlegel,³ Matthew McCall,² Ye Gao,⁴ and Jason Jabbour,⁵ 1. *The Ohio State University, Columbus, Ohio, United States*, 2. *The University of Tennessee Department Of Psychology, Knoxville, Tennessee, United States*, 3. *The Ohio State University College Of Nursing, Columbus, Ohio, United States*, 4. *University Of Virginia Department of Computer Science, Charlottesville, Virginia, United States*, 5. *University of Virginia Department of Engineering Systems and Environment, Charlottesville, Virginia, United States*

Caregiving stress from repetitive and heavy caregiving workloads can trigger poor emotional health, such as stress, anxiety, and depression, leading to higher caregiver mortality rates. Interest in technology-based interventions for this population has increased among researchers due to availability, acceptability, and flexibility compared to in-person services, especially now, during an unprecedented pandemic. Our study focuses on in-home SmartHealth technologies for caregivers of persons with Alzheimer's Disease and related dementias, delivered using Ecological Momentary Assessment and a novel acoustic monitoring, mood recognition, and self-learning recommendation system. The system provides mindfulness-based stress management in response to interpersonal conflict in real-time. We will report challenges and solutions of creating and deploying a SmartHealth system for older adults in their home during the COVID-19 pandemic. Potential effects of this system on caregivers' emotional health are also examined. Findings suggest SmartHealth technologies may assist caregiving populations adapt and thrive in a new, more isolated normal.

THE CHALLENGES FACED BY LONG-TERM CARE RESIDENTS AND THEIR FAMILIES DURING COVID-19

Sharon Avidor,¹ and Liat Ayalon,² 1. *Ruppin Academic Center, Ruppin Academic Center, HaZafon, Israel*, 2. *Bar Ilan University, Ramat Gan, HaMerkaz, Israel*

The present research aims to examine the effects of protective measures due to the coronavirus disease (COVID-19) within long-term care (LTC) settings on the residents and their family members. Open-ended qualitative interviews were conducted with 14 family members of older adults who resided in LTC settings during the first wave of the pandemic in Israel. The first theme identified is Rupture, including physical disconnect; the disruption in routine treatment to residents; and decline in the satisfaction with the setting. The second theme is Response, including sharing viewpoints and involvement in decision making, as well as an intense ambivalence shared by family members. Our findings highlight the distress caused to residents and family members by the isolation and restrictions in LTC settings during the pandemic, and underscore values and priorities that are central to them and their family members, including maintaining continuity, transparency, and working in unison with their families.

Session 4085 (Paper)

Family Caregiving III

DEMENTIA CARE-RELATED STRESS AND WORKING MEMORY PERFORMANCE: EXAMINING THE MEDIATING ROLE OF SLEEP

Ashley Blasi,¹ and Francesca Falzarano,² 1. *Fordham University, Bronx, New York, United States*, 2. *Weill Cornell Medicine, Douglaston, New York, United States*

Dementia Family caregivers often experience significant stress and burden, which has been associated with a myriad of adverse effects on physical and mental health, as well as cognition. The impact of caregiving on health and well-being may have negative implications on the provision of quality and effective care. Specifically, working memory is a key domain of cognition that ultimately underlies logic and decision making processes. Thus, the purpose of the current study is to examine the associations between dementia care-related stress and working memory, as well as potential mediators of this relationship, in a sample of 50 primary caregivers who completed measures examining stress, including burden and overload, and several domains of cognition. Our results showed that higher levels of caregiving overload were associated with worse working memory performance, measured using the N-back task. Additionally, we found that lower sleep quality fully mediated the relationship between overload and working memory performance, such that the negative effects of overload on working memory performance may operate as a result of sleep impairment. By determining the mediating role of sleep while also providing evidence to support the negative relationship between stress and working memory, our results provide support for the development of interventions that target factors such as burden and sleep quality to help mitigate stress in caregivers.

EXAMINING MENTAL AND PHYSICAL HEALTH STATUS AMONG SANDWICH GENERATION CAREGIVERS

Hansol Kim,¹ Richard Schulz,¹ Scott Beach,² and Heidi Donovan,¹ 1. *University of Pittsburgh, Pittsburgh,*

Pennsylvania, United States, 2. *University of Pittsburgh, University of Pittsburgh, Pennsylvania, United States*

With a sample of 54,076 caregivers, the Behavioral Risk Factor Surveillance System (BRFSS, 2015-2017) provides an opportunity to assess the impact of caregiving on U.S. adults varying in age, gender, and race. We focused on sandwich generation (SG) caregivers, aged 30-59, with childcare and eldercare responsibilities (n=8,805). In multivariate regression models of mental and physical health, we evaluated the association of age, gender, race and caregiving factors controlling for marital status, education, housing status, income, employment status, and self-rated health status. SG caregivers were predominantly female (65.6%), white (69.6%), black (13%) and were caring for a parent/parent-in-law (50%) or another relative (26.4%). Age, gender, and race were associated with mental health outcomes such that SG caregivers who were younger (aged 30-39), female, and white reported poorer mental health during the past month ($p < .05$). Older (aged 50-59), female, and white SG caregivers reported poorer physical health during the past month ($p < .05$). Caregiving factors were not associated with mental health, but SG caregivers who had been providing care for a longer period of time were more likely to report poor physical health in the past month. Finally, education, income, employment, housing status, and self-rated health status were statistically significant covariates in both models ($p < .05$). These findings demonstrate that young caregivers are at risk for poor mental health; older caregivers for poor physical health. Being female, white, with lower socioeconomic status is associated with poor mental and physical health. Future research should address the unique needs of SG caregivers with dual caregiving responsibilities.

EXPLORING THE SUBJECTIVE CAREGIVING EXPERIENCE AMONG CHINESE, KOREAN, AND SOUTHEAST ASIAN COMMUNITIES

Sara Powers,¹ Rachel Schaffer,¹ David Bass,¹ Ocean Le,² and Lauren Pongan,² 1. *Benjamin Rose Institute on Aging, Cleveland, Ohio, United States*, 2. *Diverse Elders Coalition, Diverse Elders Coalition, New York, United States*

Although the Asian American community is one of the fastest growing racial groups in the US, members of this group continue to be underserved and understudied, especially when it comes to the needs of family caregivers. Therefore, through a national initiative to understand the lived experiences of diverse family and friend caregivers, survey data was collected from a variety of Asian American ethnic subgroups including Chinese (n=148), Korean (n=131), and Southeast Asian (i.e., Vietnamese, Hmong, Cambodian, Laotian; n=161). Surveys were distributed in-person and online, and also offered in the translated native languages of the abovementioned groups. Caregivers had to be 18 years and older and providing care to a person aged 55 and older who needed assistance because of ongoing health problems or disabilities. For the overall sample of Asian American caregivers (n=440), participants were on average 51.68 years of age (SD=15.98), identified as female (n=336), were not born in the US (n=348), lived with the care receiver (n=247), and reported less than \$10,000 in income per year (n=199). As guided by the Stress Process Model and through a series of ANOVA tests, when compared on all major outcomes, Southeast Asian caregivers

significantly reported: 1) more difficulty with care related tasks (e.g., financial/legal decisions), 2) a stronger cultural commitment to caregiving, 3) higher work strain, and 4) more depressive symptomology. Discussion will focus on opportunities for professionals to meet the needs of Asian American caregivers through the use of available trainings and programs aimed to support diverse caregivers.

FAMILY CAREGIVING FOR PERSONS WITH EMOTIONAL, DEVELOPMENTAL, AND BEHAVIORAL DISORDERS DURING COVID-19

Scott Beach,¹ Richard Schulz,² Heidi Donovan,² Ann-Marie Rosland,² Tara Klinedinst,² and Hansol Kim,²
1. *University of Pittsburgh, University of Pittsburgh, Pennsylvania, United States*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

COVID-19 has the potential to exacerbate stresses of family caregiving. While studies during COVID-19 have focused on caregivers of those with memory / cognitive issues like Alzheimer's Disease, less attention has been paid to those caring for persons with emotional / developmental / behavioral disorders. This paper compares family caregivers of persons with emotional / developmental / behavioral disorders (EDB); physical conditions (PH); and memory / cognitive problems (MC) during the early phase of the pandemic. We focus on demographics, caregiving context, COVID-related caregiver stressors, and validated physical, psychosocial, and financial well-being outcomes. We conducted a cross-sectional national online survey during April-May, 2020 (n = 556). The sample included 274 PH (50%), 141 MC (25%), and 141 EDB (25%) caregivers. EDB caregivers were younger, with younger care recipients who were more likely to be their child. EDB caregivers reported more COVID-related caregiver stressors than MC or PH caregivers, including increased caregiving duties (p<.01); more family disagreements about care provision (p=.05); and worsened mental health of the care recipient (p<.01). In multivariate regression models, EDB caregivers had significantly higher anxiety; depression; and fatigue (all p<.01); more sleep disturbance (p=.05); less social participation (p<.05); and poorer overall financial well-being (p<.05). MC caregivers also reported more negative outcomes, but effects were consistently strongest for EDB caregivers. This study shows that EDB caregivers are at significantly elevated risk for negative impacts due to COVID-19 and should receive increased support and attention during this public health crisis.

PSYCHOLOGICAL CORRELATES OF (NON)USE OF FORMAL RESOURCES BY FAMILY CAREGIVERS OF PEOPLE WITH DEMENTIA

Laura Gallego-Alberto,¹ Isabel Cabrera,¹ María Márquez-González,¹ María del Sequeros Pedroso Chaparro,¹ Laura Mérida-Herrera,¹ Cristina Huertas,² and Andrés Losada-Baltar,² 1. *Universidad Autónoma de Madrid, Madrid, Madrid, Spain*, 2. *Universidad Rey Juan Carlos, Madrid, Madrid, Spain*

Caring for a relative with dementia is a stressful task characterized by a high number of demands extended in time. Therefore, caregivers frequently report the need for assistance to cope with the situation. However, formal resources use is

low among that population. The objective of this study was to explore the correlates of (non)use of formal resources (day care center and home care) by family caregivers of people with dementia. Participants were 225 dementia family caregivers that were individually assessed in a) use of formal resources, b) sociodemographic variables, c) stressors (frequency and reaction to behavioral problems), and d) psychological variables (depression, anxiety, and dysfunctional thoughts about caregiving). A logistic regression was done comparing those who used formal resources with those who did not use them. Caregivers who did not use formal resources were younger (OR = .95; 95% CI [.92 - .98]), devoted more daily hours to caring (OR = 1.07; 95% CI [1.02 - 1.11]), reported higher levels of dysfunctional thoughts about caregiving (OR = 1.07; 95% CI [1.04 - 1.10]) and higher anxiety levels (OR = 1.07; 95% CI [1.00- 1.13]), and their care-recipient had a higher functional autonomy (OR = 1.04; 95% CI [1.02 - 1.05]). Higher levels of anxiety and dysfunctional thoughts in caregivers may be act as barriers to seek for formal support. Targeting these variables may help to increase the use of formal resources by family caregivers of people with dementia.

Session 4090 (Symposium)

ISOLATION IN OLDER ADULTS IN THE UNITED STATES AND JAPAN: AN EARLY EXAMINATION OF IOT POSSIBILITIES

Chair: Dana Bradley

Co-Chair: Carmen Sceppa

Discussant: Carmen Sceppa

Isolation in older adults is a growing problem in both the US and Japan. This symposium showcases work funded by NSF and JST (Japan Science Technology Committee) to develop smart technology to create caring, connected communities by integrating gerontology and technology research. The U.S. and Japan are experiencing dramatic population aging and share several similarities: Populous (U.S. 327 million at #3 and Japan 127 million at #11) and economically developed (GDP: the U.S. #1 and Japan #3) and isolation was increasing even before the pandemic. This multi-year project addresses the challenges of isolation by using smart technologies in culturally appropriate ways to support older adults and suggests ways that isolation and loneliness may be managed by older persons, local governments, and NGOs. The first paper examines the experiences of loneliness as characterized by early retirees in both countries. The interdisciplinary research team has used this qualitative set of case studies to identify promising technology support points. Our second paper explores these issues surrounding isolation using data from Study on the Lifestyle and Values of Senior Citizens (Japan). This analysis focuses on longitudinal data from both countries and helps situate our work outside the Covid-19 Pandemic. The third presentation focuses on the intersection between culture and technology and proposes a continued research collaboration model. Our discussion will highlight how community stakeholders in U.S. and Japan have a role in creating evidence-based adaptive environments to detect and mitigate isolation by developing and using gero-centric approaches.

A QUALITATIVE COMPARISON OF THE POST-COVID RETIREMENT EXPERIENCE BETWEEN JAPANESE AND AMERICAN OLDER ADULTS

Dana Bradley,¹ Mariko Nishikitani,² Mie Ariyoshi,³ Fumihiko Yokota,⁴ Gretchen Tucker,¹ and Laura Allen,⁵
 1. *UMBC Erickson School of Aging Studies, Baltimore, Maryland, United States*, 2. *Kyushu University Hospital, Medical Information Center, Kyushu University Hospital, Fukuoka, Japan*, 3. *St Catherine's University, Matsuyama, Ehime, Japan*, 4. *Kyushu University, Kyushu, Fukuoka, Japan*, 5. *Bar-Ilan University, Ramat Gat, Tel Aviv, Israel*

The purpose of this collaborative study between researchers in Japan and the U.S. was to understand the retirement experience and potential changes in social interactions (amount, type, and mode of communication) among older adults living independently in the community. Specifically, we were interested in individuals' expectations about retirement and the types of social interactions experienced prior to and post-retirement, situated within the context of the COVID-19 pandemic. Both research teams conducted in-depth one-on-one interviews with community-residing retired older adults in early 2021. In the findings we explore similarities and differences between the retirement experiences of Japanese and American older adults, including methodological differences that transpired; specifically, we evaluate the meaning and experience of the COVID-19 pandemic in each of these cultural contexts and how retired older adults experienced its impact in their social interactions.

A QUANTITATIVE COMPARISON OF SOCIAL INTERACTIONS OF OLDER ADULTS PRE-COVID-19 BETWEEN THE UNITED STATES AND JAPAN

Mariko Nishikitani, *Kyushu University Hospital, Medical Information Center, Kyushu University Hospital, Fukuoka, Japan*

Using the Study on the Lifestyle and Values of Senior Citizens (The Eighth International Study by the Japan Cabinet Office), the social interactions were assessed in the context of health and life satisfaction of the older adults of the U.S and Japan to confirm the relationship between ICT usage and social interactions. The less social interaction was defined as those who answered that they had no "role in the family," "working," or "social activities such as volunteering." The proportion of less-social interaction people and non-use of ICT increased with age, but the proportions of Japanese were higher than that in Americans. The adjusted odds ratio for non-use of ICT to the risk of isolation of the older adults in Japan was 2.43 (95% CI: 1.59-3.73), but no significant relationship was observed in American older adults. Future research will examine the use of ICT by older adults in each country.

DEVELOPING CULTURALLY COMPETENT TECHNOLOGY FOR OLDER ADULTS IN JAPAN AND THE UNITED STATES

Laura Allen,¹ Dana Bradley,² and Gretchen Tucker,²
 1. *Bar-Ilan University, Ramat Gat, Tel Aviv, Israel*, 2. *UMBC Erickson School of Aging Studies, Baltimore, Maryland, United States*

The United States and Japan are experiencing an exponential growth in the number of persons age 65 and older. To

address certain aging-related issues, assistive technological advancements are being developed. These technologies need to be reliable, safe, secure, and culturally accepted by older adults. In addition, technology must be developed within the unique cultural contexts of each country. One approach currently being used is an interdisciplinary team approach comprised of researchers representing gerontology, information systems, robotics, health sciences, sociology, and computer sciences between two universities in the United States and two Japanese universities. This collaborative project between institutions and countries highlights the need to understand the cultures and traditions of each of these countries. To further develop culturally competent technology, an integrative research plan is being utilized, which incorporates the use of community engagement to examine the influence of the cultural context among older adults.

Session 4095 (Symposium)

MANAGED LONG-TERM CARE SERVICES: A PLAYBOOK INNOVATION OR A HAIL MARY?

Chair: Larry Polivka

Discussant: Robert Applebaum

The approach to providing long-term services and supports (LTSS) has changed dramatically over the last three decades in both the financing and delivery arenas. In the U.S., long-term strategies have varied by state in organizational structure, scope of delivery and administrative practices. In the past two decades an additional change has emerged with over half the states adopting some form of managed LTSS. This shift has deepened the divide in state approaches to LTSS system design and delivery. The shift to managed LTSS has been largely fueled by ideological expectations and concerns about growing Medicaid costs: Empirical research findings have played a minimal role. For example, the large CMS evaluation conducted in this area did not include Medicaid data or encounter data from the managed care plans as part of the study efforts. However, the managed LTSS experiment does create an opportunity to compare costs and outcomes of these different models of financing and delivery. This symposium will present preliminary evaluation findings from two states, Ohio and Pennsylvania, which are generating data to assess both the implementation and outcomes of these alternative LTSS models. To set the context an initial paper will discuss the expansion of managed LTSS programs across the nation and examine how these efforts compare to the development occurring in the European LTSS systems. The third presentation will discuss the results of the Community Catalyst dual eligibles' managed care demonstration program monitoring project.

OHIO'S DUAL ELIGIBLE POPULATION: EFFECTS OF PROGRAM DESIGN AND IMPLEMENTATION ON CARE MANAGEMENT

Jennifer Heston-Mullins, Katherine Abbott, and Athena Koumoutzis, *Miami University, Oxford, Ohio, United States*

MyCare Ohio is a prospective blended managed care payment model program tasked to provide comprehensive and coordinated care to Ohio residents who are dually eligible for

Medicare and Medicaid. To understand the administration and day-to-day implementation of care management within MyCare Ohio, n=75 interviews with a total of n=331 personnel from Area Agencies on Aging, Managed Care Plans, and service providers were conducted. Interviews were audio recorded, transcribed, and checked for accuracy. Data were analyzed by iterative reviews and deductive coding in Dedoose. Respondents provided insights on how care management activities are affected by program design features (e.g., ability to opt-out of the Medicare component), transitions between acute and long-term care settings, documentation systems and data-sharing, and high numbers of beneficiaries with behavioral health diagnoses. Implications for practice and policy will be discussed.

OHIO'S LARGE SCALE EXPERIMENT ON INTEGRATED CARE: RESULTS AND IMPLICATIONS FOR LONG-TERM SERVICES REFORM

Robert Applebaum, Matt Nelson, and John Bowlblis,
Miami University, Oxford, Ohio, United States

Implemented through five health plans, Ohio's MyCare demonstration began in 2014 and was designed to coordinate primary, acute care, behavioral health and long-term services in the major urban areas of the state. Individuals who are dually eligible for both Medicaid and Medicare and who reside in specified geographic regions must enroll into a managed MyCare plan. MyCare beneficiaries are assigned to two primary categories: community well and those needing long-term services and supports (LTSS). Individuals receiving the integrated MyCare intervention were expected to have lower acute care hospitalizations, lower long-term nursing home use, better longevity and lower overall health and long-term care costs. Using a propensity score matching design, the evaluation compared MyCare enrollees to comparison group members in non-MyCare counties of the state, using Medicaid and Medicare claims data. The 120,000 MyCare program participants represented about half of the dual eligible individuals in the state.

PENNSYLVANIA'S TRANSITION TO MEDICAID MANAGED LONG-TERM SERVICES AND SUPPORTS

Howard Degenholtz, *University of Pennsylvania, Pittsburgh, Pennsylvania, United States*

Implemented through five health plans, Ohio's MyCare demonstration began in 2014 and was designed to coordinate primary, acute care, behavioral health and long-term services in the major urban areas of the state. Individuals who are dually eligible for both Medicaid and Medicare and who reside in specified geographic regions must enroll into a managed MyCare plan. MyCare beneficiaries are assigned to two primary categories: community well and those needing long-term services and supports (LTSS). Individuals receiving the integrated MyCare intervention were expected to have lower acute care hospitalizations, lower long-term nursing home use, better longevity and lower overall health and long-term care costs. Using a propensity score matching design, the evaluation compared MyCare enrollees to comparison group members in non-MyCare counties of the state, using Medicaid and Medicare claims data. The 120,000 MyCare program participants represented about half of the dual eligible individuals in the state.

Session 4100 (Paper)

Migration and Aging

AGE OF MIGRATION AND THE HEALTH STATUS OF OLDER LATINOS: FINDINGS FROM THE HEALTH AND RETIREMENT STUDY

Blakelee Kemp,¹ and Marc Garcia,^{2,1} *University of Nebraska, Nebraska, United States, 2. Syracuse University, Syracuse, New York, United States*

Life course research emphasizes the importance of considering how early life experiences set individuals on specific trajectories over time with implications across multiple health domains. Life experiences of older Latinos are shaped by where they were born and, for the foreign-born, when they immigrated to the United States. Prior research examining the extent to which age of migration is associated with health has largely been limited to regional studies. To address this gap in knowledge, we use nationally representative data from the Health and Retirement Study to examine associations between age of migration and multiple physical health outcomes among older Latinos residing in the United States. We examine 2010 prevalence and follow-up incidence to 2016 of cardiovascular issues, diabetes, one or more activities of daily living (ADLs), one or more instrumental activities of daily living (IADLs), cognitive issues, and mortality incidence. Preliminary results indicate similar health profiles across Latinos who migrated in early life (<18), during adulthood (18-34), and during later adulthood (35+). Most health profiles were similar among Latino men and women except for prevalence and incidence of experiencing difficulties with at least one ADL. Latino women who migrated in later-adulthood have higher prevalence of ADLs and women who migrated early in life (>18) have higher ADL incidence than Latino men who migrated during the same life course periods. A greater understanding of the how immigrant experiences influence physical health outcomes offers important insights into the development of actionable and culturally appropriate social and health policies.

CAN RURAL MIGRANT WORKERS AFFORD TO RETIRE IN CHINA? A STUDY OF CHINESE MIGRANT WORKER'S RETIREMENT SAVINGS

Jing Liu,¹ Heying Zhan,² and Fengxian Qiu,³ *1. Zhejiang University of Finance and Economics, Hangzhou, Zhejiang, China (People's Republic), 2. Georgia State University, Georgia State University, Georgia, United States, 3. Anhui Normal University, Wuhu, Anhui, China (People's Republic)*

This paper makes connections between social policies of retirement, migrant worker's migration experience, and migrant workers' retirement savings. Using insight from the political economy of aging and stress theory, this paper links the macro levels of understanding with the micro levels of work and aging experiences for migrant workers. Using binary logistic regression with a sample of 699 Chinese migrant workers from three emigration provinces (Anhui, Henan, Sichuan), this paper explores four specific aspects of migrant worker's migration experience in relation to their retirement savings: financial status; length of employment; social support, and levels of hopefulness. Findings reveal that migrant

workers with better financial status, social support, and higher level of hopefulness towards future are more likely to have retirement savings as compared to their counterparts. Discussions linking the macro and micro levels of social policies were provided. Policy implications were discussed.

DISABILITY AND OLDER AGE RETURN MIGRATION: EVIDENCE AGAINST THE SALMON BIAS

Mara Sheftel, *Penn State University, Brooklyn, New York, United States*

Mexican immigrants make up an increasing proportion of the US population 65 and older. Whereas this population has among the lowest rates of disability at working ages, there is growing evidence of high rates of disability at older ages, findings which contradict what mechanisms of selection, namely the “salmon bias,” would predict. However, largely due to data limitations disability rates between those who stay in the US into older ages and those who return to Mexico are rarely compared. Here two waves of data from the US based Health and Retirement Study and the Mexican Health and Aging Study are combined to create a novel dataset that enables an interrogation of the widely held assumption of negative selection on health among return migrants. Investigating three measures of functional limitation and disability, results show higher prevalence of disability for stayers as compared to both younger and older returnees. These results are robust to controls for childhood background, adult socioeconomic status, and migration related variables and hold for those who immigrated during different immigration policy regimes. These findings are novel not only because they stand in opposition to previous assumptions about the direction of health selective return migration, but also because they mean that those remaining in the United States into older ages are among the most vulnerable.

THE RELATIONSHIP BETWEEN PLACE OF DEATH AND IMMIGRANT STATUS

Yujin Franco,¹ Margarita Osuna,² and Jennifer Ailshire,³
 1. *University of Southern California, University of Southern California, California, United States*, 2. *USC, University of Southern California, California, United States*, 3. *University of Southern California, Los Angeles, California, United States*

Increasing attention is being paid to improving care at the end-of-life, including developing a better understanding of where individuals die, and factors related to place of death. The older immigrant population in the United States is increasing rapidly, and while prior research suggests they may differ in their end-of-life experiences, we know relatively little about foreign-born differences in where people die. This study investigates how the place of death (home, hospital, and nursing home) differs between the U.S.-born and foreign-born. We used data on 9,180 U.S.-born and 969 foreign-born respondents from the nationally representative Health and Retirement Study (HRS) for who end-of-life surveys were conducted with a proxy between 2002 and 2016. Approximately one-third of deaths occurred in nursing homes in both groups. Hospital deaths were more common in US-Born decedents (31.9%) than foreign-born decedents (25.2%), while death at home was lower for US-born (35.5%) than foreign-born (40.2%). We used multinomial logistic

regression analysis to determine whether sociodemographic characteristics, cause of death, or receipt of family caregiving explained the observed differences in place of death by foreign-born status. Results from fully adjusted multivariate models indicate the foreign-born differences in place of death cannot be explained by socioeconomic, health, or family factors. Our research shows key differences in the end-of-life experience between US-born and foreign-born older adults and highlights the importance of examining end-of-life experiences for this small, but rapidly growing segment of the older U.S. population.

WHERE TO RETIRE? EXPERIENCES OF OLDER AFRICAN IMMIGRANTS IN THE UNITED STATES

Manka Nkimbeng,¹ Alvine Akumbom,² Marianne Granbom,³ Sarah Szanton,⁴ Tetyana Shippee,⁵ Roland Thorpe, Jr.,⁶ and Joseph Gaugler,¹ 1. *University of Minnesota, Minneapolis, Minnesota, United States*, 2. *Johns Hopkins School of Nursing, Baltimore, Maryland, United States*, 3. *Centre of Ageing and Supportive Environments (CASE), Lund University, Skane Lan, Sweden*, 4. *Johns Hopkins University, Baltimore, Maryland, United States*, 5. *University of Minnesota, University of Minnesota, Minnesota, United States*, 6. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

The needs and conceptualization of age-friendliness likely vary for immigrant older adults compared to native-born older adults. For example, Hispanic immigrant older adults often return to their home country following the development of ill health. Doubling in size since the 1970's, the aging needs of African immigrants are not fully understood. This qualitative study examined experiences of aging and retirement planning for African immigrant older adults in the United States (U.S.). Specifically, it explored the factors, processes, and ultimate decision of where these older adults planned to retire. We analyzed semi-structured interviews with 15 older African immigrants in the Baltimore-Washington Metropolitan area. Data were analyzed using thematic analyses in NVivo. The majority of participants were women, with a mean age of 64. We identified three overarching themes with ten sub-themes. The themes included: 1) cultural identity: indicating participant's comfort with the U.S. society and culture; 2) decision making: factors that impact participants' choice of retirement location, and 3) decision made: the final choice of where participants would like to retire. Age-friendliness for immigrant older adults in the U.S. is complex and it includes the traditional domains such as physical and sociocultural environment (e.g. housing, transportation, and income). However, immigrant age-friendliness also needs to include wider contextual aspects such as political climate in their country of origin, immigrant status, family responsibilities, and acculturation in the U.S. More research is needed understand and facilitate age-friendly environments for transnational immigrant older adults.

Session 4105 (Symposium)

NEW ASPECTS IN METABOLISM OF AGING

Chair: Rozalyn Anderson

In recent years there has been a renewed emphasis on metabolism as a key contributor to a host of chronic non-communicable conditions: cancer, neurodegeneration, frailty,

and functional declines in immune and inflammatory processes. All share a common connection in metabolic dysfunction. Furthermore, aging itself is associated with changes in metabolism, although the underlying drivers for these changes are unknown. Here we introduce speakers working at the cutting edge in metabolism research, and whose studies are of direct relevance to aging. Dr. Chandel will focus on mitochondrial biology, describing recent advances in understanding the mechanisms of the beneficial effects of metformin. Dr. Haigis takes the mitochondrial theme to cancer biology, the area of research that revived metabolic perspectives in biomedical research. Dr. Najt's talk describes a less well studied organelle, the lipid droplet, and its role in a rapidly expanding area of research on lipid metabolic regulation specifically in the context of aging. Dr. Brown-Borg will present data on nutritional and genetic modulation of metabolism and how pathways converge to influence chromatin and epigenetic regulation of gene expression. Together our speakers explore new concepts in metabolism research that are of particular relevance to aging. This session aligns with the concept of GeroScience, the more we know of aging biology the better we understand diseases and disorders of aging. This session will demonstrate that metabolism, its regulation, and its influence on key processes linked to health and longevity, place it in a central position as we seek to discover targets and interventions to improve human aging.

THE ROLE OF MITOCHONDRIA IN AGING AND CANCER

Marcia Haigis, *Harvard Medical School, Boston, Massachusetts, United States*

METHIONINE METABOLISM IN AGING REGULATION

Holly Brown-Borg, *University of North Dakota School of Medicine & Health Sciences, Grand Forks, North Dakota, United States*

Aging is the major risk factor for many diseases but the mechanisms are poorly understood. The risk of developing hepatic steatosis increases with age and the health impact of this disease is negative and high. When challenged with high fat diets, long living Ames mice withstand the detrimental metabolic effects that occur in normal mice. We examined transcriptomic and epigenomic profiles of Ames and wild type hepatocytes in the presence or absence of fat to demonstrate that the epigenomic profile drives transcription factor and downstream gene expression resulting in susceptibility or resistance to fatty liver disease. We found that markers of steatosis are related to gene expression in wild type and Ames mice, and dwarf mice retain fewer lipid droplets compared to wild type mice. These studies will provide data to guide our understanding of mechanisms leading to hepatic disease and define factors that provide protection from age-related metabolic disorders.

METFORMIN INHIBITS MITOCHONDRIAL COMPLEX I TO PROMOTE HEALTH

Navdeep Chandel, *Northwestern University, Illinois, United States*

The major function of mitochondria in cellular homeostasis has been the generation of ATP through oxidative phosphorylation. However, we have previously demonstrated that

mitochondria can serve as signaling organelles by releasing low levels of reactive oxygen species (ROS) and TCA cycle metabolites that are essential for hypoxic activation of HIF, antigen activation of T cells, cellular differentiation and proliferation of cancer cells. The anti-diabetic drug metformin has been proposed to inhibit mitochondrial complex I. We will present data indicating that metformin inhibits mitochondrial complex I to exert its biological effects through controlling ROS, ATP, and NAD⁺.

LIPID DROPLET SIGNALING IN METABOLIC HEALTH AND AGING

Charles Najt,¹ and Douglas Mashek,² *1. University of Minnesota, 2. University of Minnesota, Minneapolis, Minnesota, United States*

Lipid droplets (LDs) are neutral lipid rich organelles involved in lipid storage, fatty acid trafficking, and signaling. Emerging evidence from our laboratory and others suggests that the specific LD resident proteins couple/uncouple cells and tissues from inflammation and metabolic dysfunction. However, the mechanism by which LD proteins influences these critical pathways remains unknown. We will present data delving into the role of LD proteins Perilipin (PLIN) 2 and 5 in balancing cellular energy metabolism, mitochondrial function, and inflammation. Data will be presented defining novel mechanisms through which PLIN2 orchestrates eicosanoid production as a means to promote inflammation. We will contrast these findings to PLIN5, which uncouples LD accumulation from metabolic dysfunction and inflammation, in part due to its promotion of SIRT1 signaling. Overall, these studies will highlight a crucial role of LD metabolism and signaling in regulating cellular energy homeostatic processes known to be key players in governing healthspan.

Session 4110 (Paper)

Physical Activity and Well-Being

DELAYING HEALTH CARE DUE TO THE COVID-19 PANDEMIC: ASSOCIATIONS WITH PHYSICAL AND MENTAL HEALTH AND PREVENTIVE CARE

Felicia Wheaton,¹ Terika Scatliffe,² and Matilda Johnson,² *1. Xavier University of Louisiana, New Orleans, Louisiana, United States, 2. Bethune-Cookman University, Daytona Beach, Florida, United States*

Health care is important for maintaining optimal physical and mental health. However, due to the COVID-19 pandemic, many older adults have delayed or postponed care. Data from the special midterm release of the 2020 Health and Retirement Study (HRS) were used to examine the relationship between chronic conditions and delayed care, as well as between delayed care and mental health outcomes and preventative care among Americans aged 50+ (N=3,266). Approximately 30% of respondents said yes when asked "Since March 2020, was there any time when you needed medical or dental care, but delayed getting or did not get it at all?" Of those, 55% said their provider cancelled, closed or suggested rescheduling, 28.5% decided it could wait, and 20.8% were afraid to go. Results from OLS and

logistic regression, controlling for sociodemographic characteristics, indicate that those with lung disease and those with a heart condition had significantly higher odds of delaying care. Delaying care was associated with significantly higher odds of poor self-rated health and feeling depressed, as well as significantly higher average hopelessness, loneliness and negative affect and significantly lower average positive affect. Surprisingly, delaying care was not associated with receiving a flu shot, cholesterol test, colonoscopy, mammogram or prostate exam in the previous two years. It is likely that the full effects of delaying health care during the pandemic have yet to be felt and there is a need to study the implications of such delays.

LIMITATIONS IN PHYSICAL ACTIVITIES AND LONELINESS: THE ROLE OF GUILT FOR PERCEIVING ONESELF AS A BURDEN

María del Sequeros Pedroso Chaparro,¹ Isabel Cabrera,¹

Carlos Vara-García,² José Adrián Fernandes-Pires,³

Samara Barrera-Caballero,⁴ Laura Mérida-Herrera,¹

María Márquez-González,¹ and Andrés Losada-Baltar,²

1. *Universidad Autónoma de Madrid, Madrid, Madrid, Spain,*

2. *Universidad Rey Juan Carlos, Madrid, Madrid, Spain,*

3. *Rey Juan Carlos University, Alcorcón, Madrid, Spain,*

4. *Rey Juan Carlos University, Alcorcón, Madrid, Madrid, Spain*

Loneliness is a prevalent problem associated with negative health consequences for older adults, such as greater cognitive decline. Limitations to perform physical activities have been associated with greater loneliness in older adults. This association could be moderated by maladaptive social cognition or feelings, such as guilt associated with perceiving oneself as a burden. The objective of this study was to analyze the moderating effect of guilt associated with perceiving oneself as a burden in the relationship between limitations in physical activities and loneliness. Participants were 195 community-dwelling people 60 years or older not showing explicit cognitive or functional limitations that prevent activities of daily life, but who may present limitations in some physical activities (e.g., walking a kilometer or more). A linear regression analysis was conducted for testing the interaction between limitations in physical activities and guilt for perceiving oneself as a burden in loneliness, controlling for gender and age. The interaction between limitations in physical activities and guilt for perceiving oneself as a burden was the only significant predictor of loneliness and the model explained 18.30% of the variance. Limitations in physical activities influenced loneliness when people have high levels of guilt for perceiving oneself as a burden. This study suggests that guilt for perceiving oneself as a burden may play an important role in the association between limitations in some physical activities and loneliness.

LUNG FUNCTION IN OLD AGE AND PHYSICAL ACTIVITY FROM MIDLIFE TO OLD AGE: LONGITUDINAL STUDY WITH 24-30 YEARS FOLLOW-UP

Ingemar Kåreholt,¹ Liberta Mehmedi,² and

Charlotta Nilsson,² 1. *Jönköping University, Jönköping,*

Jonkopings Lan, Sweden, 2. *Jönköping University, Aging*

Research Network Jönköping (ARN-J), Jonkopings Lan, Sweden

The study investigated the role of physical activity, from midlife to older age, in relation to lung function in older age. In order to increase the understanding of the relationship between physical activity and lung function, the relationship between physical activity in midlife and physical activity in older age was also studied. Two Swedish studies based on nationally representative samples were used in this study, the Level of Living Survey, LNU, and the Swedish Panel Study of Living Conditions of the Oldest Old, SWEOLD. The participants were interviewed on three occasions; at the mean ages of 53 years, 61 years, and 81 years. The average follow-up time from the last to the first interview was 24-30 years. The results show that more physical activity in late midlife (mean age of 61 years) was associated with better lung function in older age. The association persists but attenuates when physical activity in older age was included in the analyses. There was also a strong association between physical activity in older age and better lung function in older age. Physical activity in late midlife had a positive association with physical activity in older age. This study shows the importance of physical activity in late midlife and in older ages to maintain good lung function in older ages. To invest in preventive actions in the form of physical activity are vital to be able to promote healthy aging, and should include the oldest old (76+).

PSYCHOSOCIAL AND PHYSICAL ACTIVITY OUTCOMES AMONG GROUP LIFESTYLE BALANCE PROGRAM PARTICIPANTS WITH ARTHRITIS

Cheryl Der Ananian,¹ Ferdinand Delgado,² and

Taylor Hudzinski,¹ 1. *Arizona State University, Phoenix,*

Arizona, United States, 2. *Arizona State University, Arizona*

State University, Arizona, United States

Background: Weight loss and physical activity (PA) are recommended for arthritis management. The Group Lifestyle Balance (GLB) Program(TM) is an evidence-based, lifestyle change program for weight loss in individuals with prediabetes, but hasn't been evaluated in people with arthritis. Purpose: The purpose of this study was to evaluate the effectiveness of an adapted version of the GLB program on PA and psychosocial outcomes related to weight loss among overweight (Body Mass Index >27) individuals with arthritis. Methods: A single-group, quasi-experimental design was used to examine the effects of the adapted GLB program on measures of PA and psychosocial outcomes. All participants (N=15) received the GLB program and completed the following surveys: CHAMPS PA, Self-Efficacy for PA (SE), Social Support for PA (SS), Weight Loss Efficacy (WEL) and Barriers to Healthy Eating (BHE) at baseline, 12-weeks, 6 months, and 12 months. Repeated measures ANOVA and the Friedman Test were used to examine changes over time. Results: Participants (aged 53-79 years) were primarily female (82%), white (94%), and college educated (94%). Significant improvements were found in BHE subsections of self-control and motivation (p=0.002), daily mechanics (p=0.042), and WEL subsections of availability (p=0.049), social pressure (p=0.010), physical discomfort (p=0.011), and positive activities (p=0.007). Weekly caloric expenditure (p=0.004), metabolic equivalent minutes (p=0.022) for all activities, and moderate-intensity activities (p=0.019) also showed significant improvements. However, most improvements were seen

in the short-term. Conclusions: The GLB program should be further evaluated for its effectiveness in people with arthritis.

THE IMPACT OF LOW BACK PAIN AND PHYSICAL ACTIVITY ON MENTAL AND PHYSICAL HEALTH OUTCOMES IN OLDER ADULTS WITH ARTHRITIS

Janiece Taylor,¹ Natalie Regier,² Minhui Liu,³ Sarah Szanton,¹ and Richard Skolasky,⁴ 1. *Johns Hopkins University, Baltimore, Maryland, United States*, 2. *School of Nursing, Johns Hopkins School of Nursing, Maryland, United States*, 3. *Central South University, Changsha, Hunan, China (People's Republic)*, 4. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*

Nearly 50% of Americans aged 65 and above have been diagnosed with arthritis at any point in time, and an estimated 80% of adults experience low back pain (LBP) at some point in their lives. However, little is known about the experience of LBP in older adults with arthritis and whether or not it is related to adverse mental and physical health outcomes over and above those linked to arthritis. This study examined the relationship between LBP and four associated physical and mental health conditions (depression, insomnia, mobility limitations, and self-rated health) in older adults with arthritis. We also examined whether physical activity mediated the relationships between LBP and these four conditions. A cross-sectional analysis was conducted using data from the National Health and Aging Trends Study. Descriptive analyses and chi-square tests assessed whether there were demographic differences between persons with and without LBP. Binary logistic regressions found that participants with LBP were 30% more likely to endorse insomnia (95% confidence interval (CI) =1.1 to 1.5, $p < .001$), had 40% higher odds of depression (95% CI=1.1 to 1.6, $p < .001$), and 70% higher odds of poor self-rated health (95% CI=1.5 to 1.9, $p < .001$) than those without LBP. Activity mediated the relationship between LBP and the four health outcomes in unadjusted models. Findings indicate that LBP may be associated with adverse mental and physical health in older adults with arthritis, and treatment for older adults with arthritis and comorbid LBP should include interventions targeting LBP and routine assessment of mental and physical health.

Session 4115 (Paper)

Physical Activity Interventions

EFFECTS OF A MOVEMENT-BASED MIND-BODY INTERVENTION IN MANAGING OSTEOARTHRITIS SYMPTOMS IN OLDER ADULTS

Juyoung Park,¹ and Carson Herron,² 1. *Florida Atlantic University, Boca Raton, Florida, United States*, 2. *Florida Atlantic University, Florida Atlantic University, Florida, United States*

In a secondary analysis, this study examined differences in age (younger vs. older geriatric groups), gender, and living arrangement (living alone vs. living with others) in elderly patients with osteoarthritis (OA) who utilized chair yoga (CY) as an type of movement-based mind-body intervention (MMBI) for symptom management. A two-arm,

assessor-blinded, randomized control trial was used to examine effects of CY (twice-weekly 45-minute sessions for 8 weeks) on pain interference, physical function, and psychosocial outcomes by gender, age, and living arrangement in older adults with OA who could not participate in traditional exercise. A total of 112 older adults completed CY or a health education program (HEP) and participated in five data collection points. Older women in the CY group showed greater reduction in pain interference during the CY intervention than those in HEP, $F(4, 86) = 3.255$, $p = .016$, $\eta^2 = .131$. The younger group (ages 61 to 74) had decreased depression scores during the intervention, $F(4, 87) = 2.598$, $p = .042$, $\eta^2 = .107$. Regardless of the intervention (CY or HEP), depression scores in older adults who were living alone decreased substantially during the intervention. Group-based and supervised CY interventions are recommended for older adults with OA to reduce pain interference, reduce depressive symptoms, and develop social networks. Online-based synchronous CY sessions may address physical activity needs and improve mental well-being in this population in light of physical distancing practices due to COVID-19.

EPISODIC MEMORY IN OLDER ADULTS WITHOUT DEMENTIA: A META-ANALYSIS OF AEROBIC EXERCISE INTERVENTIONS

Sarah Aghjayan,¹ Themistokles Bournias,² Chelsea Stillman,³ Shannon Donofry,³ Anna Marsland,³ and Kirk Erickson,³ 1. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2. *Carnegie Mellon University, Carnegie Mellon University, Pennsylvania, United States*, 3. *University of Pittsburgh, University of Pittsburgh, Pennsylvania, United States*

The effect of aerobic exercise interventions on episodic memory performance among older adults without dementia remains a matter of intense debate. Prior meta-analyses examining this association have reported minimal improvements in episodic memory performance following exercise training but have also been plagued by several limitations, including restrictive inclusion criteria, combined sample populations, and infrequent examination of the effect of exercise parameters (e.g., volume). To address these gaps, we conducted a meta-analysis of randomized controlled trials (RCTs) to determine if aerobic exercise interventions influence episodic memory performance in older adults without dementia and to examine potential moderators of these effects (e.g., sample and intervention characteristics). Included studies met the following criteria: (1) Studies of adults ($M \geq 55$ years) with normal cognition, subjective cognitive decline, or mild cognitive impairment; (2) Aerobic exercise RCTs; and (3) Assessment of episodic memory. Intervention effects were represented by Hedges' g and combined into pooled effect sizes using random- and mixed-effects models. Thirty-three studies met inclusion criteria, representing data from 2,488 participants. The primary analysis yielded a significant positive effect of aerobic exercise on episodic memory (Hedges' $g[CI] = 0.28[0.10-0.47]$; $p = 0.003$). Mixed-effects analyses demonstrated a positive effect on episodic memory among studies with a high percentage of females ($>66\%$), participants with normal cognition, studies reporting intensity, studies with a no-contact or nonaerobic physical activity control group, and studies prescribing 2,100–3,900 total

minutes of activity (range 540–8,190 minutes). These results suggest that aerobic exercise may act as an accessible, non-pharmaceutical intervention to improve episodic memory in late adulthood before changes in cognition are detected.

HIGH-INTENSITY INTERVAL TRAINING IN OLDER ADULTS WITH TREATMENT NAIVE CHRONIC LYMPHOCYTIC LEUKEMIA

David Bartlett,¹ Grace MacDonald,¹ Mike Deal,¹ Erik Hanson,² Carl Pieper,¹ J. Brice Weinberg,¹ Danielle Brander,¹ and Andrea Sitlinger,¹ 1. *Duke University, Durham, North Carolina, United States*, 2. *University of North Carolina, Chapel Hill, North Carolina, United States*

Chronic lymphocytic leukemia (CLL) is the most common leukemia, affecting predominantly older adults. Treatment naïve patients (CLLtn) with low physical fitness have poor survival following commencement of treatment. CLLtn is characterized by inadequate immune functions, increased risk of secondary malignancies and infections. The aims of this study were to determine the feasibility and preliminary effects of 12-weeks of high-intensity interval training (HIIT) on CLLtn patients. We enrolled eighteen CLLtn patients (64.9±9.1 yrs.). Eleven (5M/6F) were allocated to HIIT and seven (4M/3F) to the control group (CON). HIIT consisted of three 30-minute treadmill sessions/week plus two 30-minute strength training sessions/week. Feasibility was confirmed if >70% of HIIT participants completed >75% of prescribed sessions and prescribed minutes, and if >80% of high-intensity intervals were at a heart rate corresponding to 80% of aerobic capacity (139±19 bpm). Results are presented as mean±SD and effect sizes (d), with 0.2, 0.5 and 0.8 representing small, medium and large effect sizes, respectively. Feasibility was achieved, with HIIT completing 5.0±0.2 sessions/week and 99±3.6% of prescribed minutes/week at 142±19 bpm. No adverse safety events were observed. Compared to CON, HIIT increased leg (d=2.602), chest (d=1.285), and seated row (d=3.323) strength, while aerobic capacity difference between groups was d=0.431. Compared to CON, HIIT increased *in vitro* natural killer immune cell cytolytic activity against K562 (d=1.586) and OSU-CLL (d=0.917) cancer cell lines, and autologous CLL cells (d=1.362). HIIT is safe and feasible in older adults with CLLtn. Preliminary effects suggest that HIIT increases muscle strength and important components of immune function.

NON-INFERIORITY OF A GROUP LIFE VERSION COMPARED TO THE ORIGINAL, INDIVIDUAL LIFE TO PREVENT FALLS

Carl-Philipp Jansen,¹ Corinna Nerz,² Sarah Labudek,³ Sophie Gottschalk,⁴ Judith Dams,⁴ Jochen Klenk,⁵ Clemens Becker,² and Michael Schwenk,³ 1. *Robert-Bosch-Hospital Stuttgart, Karlsruhe, Baden-Wurttemberg, Germany*, 2. *Robert-Bosch-Hospital, Stuttgart, Baden-Wurttemberg, Germany*, 3. *Heidelberg University, Heidelberg, Baden-Wurttemberg, Germany*, 4. *University Medical Center Hamburg-Eppendorf, Hamburg, Hamburg, Germany*, 5. *IB University of Applied Health and Social Sciences, Stuttgart, Baden-Wurttemberg, Germany*

The 'Lifestyle-integrated Functional Exercise' (LiFE) program has been shown to reduce risk of falling via

improvements in balance and strength while increasing physical activity in older adults. Its one-to-one delivery comes with considerable costs hampering large scale implementability. To potentially reduce costs, a group format (gLiFE) was developed and analyzed for its non-inferiority to LiFE in reducing activity-adjusted fall incidence after 6 months. Further, intervention costs and physical activity were analyzed. Older adults (70+ years) at risk of falling were included in this multi-centre, single-blinded, randomized non-inferiority trial. LiFE was delivered in nine intervention sessions to increase balance, strength, and physical activity, either in a group (gLiFE) or at the participant's home (LiFE). 309 persons were randomized into gLiFE (n=153) and LiFE (n=156). Non-inferiority for activity-adjusted falls was inconclusive; the incidence risk ratio (IRR) of gLiFE was 1.350 (95% CI: 0.856; 2.128) at 6 months. Falls were largely reduced in both groups. Physical activity was superior in the gLiFE group (gLiFE +880 steps; CI 252, 1,509) which also had a cost advantage under study conditions as well as real world estimations. GLiFE was associated with lower intervention costs, making it a cost-efficient alternative to the individually delivered LiFE. The added value of gLiFE is the greater effect on physical activity, making it particularly attractive for large scale PA promotion in public health concepts. Depending on individual needs and preferences, both formats could be offered to individuals, with a greater focus on either fall prevention (LiFE) or physical activity promotion (gLiFE).

RECRUITING AND SCREENING OLDER ADULTS WITH ALZHEIMER'S DISEASE FOR THE FIT-AD TRIAL

Fang Yu,¹ Jean Wyman,² Susan Greimel,² and Lin Zhang,³ 1. *Arizona State University, Phoenix, Arizona, United States*, 2. *University of Minnesota, Minneapolis, Minnesota, United States*, 3. *University of Minnesota, University of Minnesota, Minnesota, United States*

Recruiting older adults with Alzheimer's disease (AD) into clinical trials has been very challenging even for resource-rich trials. This presentation will discuss the recruitment rate, screening ratio, and recruitment yield and costs in the FIT-AD Trial. The FIT-AD Trial was a single-site, pilot randomized controlled trial testing the effects of 6-month aerobic exercise on cognition and hippocampal volume in community-dwelling older adults with mild-to-moderate AD dementia. Ten recruitment strategies and a 4-step screening process were used to ensure a homogenous sample and exercise safety. The target sample size was 90. During the 48-month recruitment period, 396 individuals responded to our recruitment, 301 were reached, and 103 were tentatively qualified at step 4. Of these 103, 67 (69.8%) completed the optional magnetic resonance imaging (MRI) component of the trial and 7 were excluded due to abnormal MRIs. In year 4, our sample size was increased to allow individuals in the screening process a chance to enroll, resulting in a final sample size of 96. Per enrolled participant, the recruitment rate was 2.15, the screen ratio was 2.92, and the recruitment yield was 31.9%. Over 49% of the enrolled participants were yielded through referrals (28.1%) and Alzheimer's Association events/services (21.9%). The total recruitment cost was \$38,246 (\$398 per randomized participant). The results indicate that a multi-prong, extensive community outreach-based approach is essential in recruiting older

adults with AD dementia into an exercise trial. Referral was the most cost-effective strategy. Two individuals needed to be screened to enroll one participant.

Session 4120 (Paper)

Physical Health Impact of the COVID-19 Pandemic

CHANGES IN PHYSICAL FITNESS OF OLDER PEOPLE DURING THE COVID-19 PANDEMIC IN GERMANY: OBJECTIVE TRAINING DATA

Jessica Koschate, Michel Hackbarth, Sandra Lau, and Tania Zieschang, *Carl von Ossietzky University Oldenburg, Oldenburg, Niedersachsen, Germany*

The purpose of this study was to analyze objective training data on changes in leg muscle training before and after the COVID-19 lockdown during spring 2020 in Germany. Overall, the training data of 4435 individuals in the age group (AG) 45-64 years (55 ± 5 years, 66% ♀) and of 2853 in the AG 65-95 years (72 ± 6 years, 54% ♀) were exported from chip-controlled exercise circuits. Training weight and number of repetitions performed on the leg extensor were used to calculate a leg score (LS), considering the last three training sessions before the lockdown (baseline) and the first ten individual sessions as well as the averaged sessions for August, September and October after individual training resumption. Based on the baseline LS, three training intensity groups (TG_low, medium, high) were defined, and analyzed for differences (ANOVA). The LS in TG_low remained stable after the lockdown, but increased compared to baseline in both AGs after the first ten sessions ($p < 0.05$). In TG_medium, LS was reduced at the first post training session ($p < 0.05$) and returned to baseline levels at training session eight in the younger and session two in the older adults. In both AGs, LS was reduced in the TG_high ($p < 0.001$), and did not reach baseline levels by October. Hence, the LS of TG_high was identified as being particularly affected by the training interruption, irrespective of age. More individually tailored training recommendations should be made for these individuals to be able to regain their initial training levels and avoid long-term adverse health effects.

FACTORS PREDICTING DELAY OF MEDICAL AND DENTAL CARE AMONG AMERICAN ADULTS OVER 50 DURING THE COVID-19 PANDEMIC

Athena Chung Yin Chan,¹ and Rodlescia Sneed,²

1. University of Minnesota -- Twin Cities, St Paul, Minnesota, United States, 2. Michigan State University, Flint, Michigan, United States

Delaying or avoiding medical care is associated with a range of poor health-related outcomes. Due to concerns about the coronavirus (COVID) pandemic, many older adults delayed or avoided seeking medical and dental care in 2020. The purpose of this study was to examine factors predicting delay or avoidance of care among older adults. Participants were U.S. adults aged ≥ 50 who participated in the Health and Retirement Study, a population-based study of community-dwelling adults. Delays in seeking or obtaining medical and dental care were assessed via self-report in June

2020. Hierarchical logistic regression models were used to predict the influence of demographic variables (e.g. age, marital status, race and ethnicity, gender, education, work status), health insurance status, health status, and COVID-related experiences (self or household history of COVID diagnosis, knowing anyone who died from COVID, willingness to take risks, and pandemic concerns) on delay or avoidance of medical or dental care. Overall, 30% of our sample reported delaying or avoiding medical or dental care. Delayed care was lower among younger age (0.97; 0.96-0.99); non-Hispanic Blacks (0.59; 0.43-0.80), Hispanics (0.63; 0.45-0.87) and women (0.78; 0.63-0.97). Moreover, care avoidance was significantly higher among persons with disability or on sick leave (1.56; 1.04-2.33), those with chronic diseases (1.41; 1.00-2.01), those with fair/poor self-rated health (1.33; 1.03-1.73), and those with high COVID-related concerns (1.34; 1.07-1.68). Understanding factors associated with medical care will inform targeted care delivery and health promotion encouraging persons in need to safely seek timely healthcare services.

HOW COVID-19 IMPACTED OLDER ADULT WALKING GROUP MEMBERS IN SCOTLAND: A MIXED-METHODS STUDY

Kathryn Martin,¹ Kevin Stelfox,¹ Wei Lynn Khor,¹ Amudha Poobalan,¹ Daniel Powell,¹ Rute Vieira,¹ Marjory D'Arcy,² and Peter Murchie,¹ *1. University of Aberdeen, Aberdeen, Scotland, United Kingdom, 2. Grampian 50+ Network, Aberdeen, Scotland, United Kingdom*

Scotland has enacted strict social distancing and stay-at-home policies during the COVID-19 pandemic, at times prohibiting outdoor group-based physical activity. This mixed-method study examined the changing role of older adult walking groups in North East Scotland around the first lockdown and how restrictions impacted members' well-being. Three consecutive surveys were posted or emailed to members of the Grampian 50+ Network over summer 2020, with questions about social contact, loneliness, well-being, physical activity, public health messages, help-seeking behavior, and socio-demographics. 346 members completed the June survey, with 268 (83%) returning the follow-up survey in July, and 258 (80%) in August. Twenty participants (selection criteria - gender and geographic location) participated in repeated semi-structured interviews. Participants were, on average, 72 ± 7 years old (range: 58-90), retired (94%), and women (80%). Participants reported missing in-person interaction from not regularly meeting with their walking group. Groups adapted to stay-at-home measures by using technology (i.e. videoconferencing/text/email/telephone) to maintain relationships. Easing restrictions required groups to modify format, location and size. Concerns about safe transport, mask-wearing, maintaining social distance (2m/6ft), and potential lack of socialisation emerged as barriers for future engagement. While, participants generally expressed confidence in the Scottish Government's pandemic response and public health messaging, they expressed dissatisfaction that 'over-70s' were grouped together. Findings suggest that these walking group members fared well and were adaptive in response to the pandemic. Promoting group-based opportunities for physical activity and social interaction remain

vital for the health and well-being of older adults in the near and long term.

IMPACT OF THE COVID-19 STAY-AT-HOME ORDER ON DIET AND HEALTH IN COMMUNITY-DWELLING OLDER ADULTS WITH OBESITY

Kathryn Porter Starr,¹ Michael Borack,² Marshall Miller,² Heather Hutchins-Wiese,³ Alyssa King,² Kenlyn Young,² and Connie Bales,² 1. *Duke University School of Medicine/ Durham VA Health Care System, Hillsborough, North Carolina, United States*, 2. *Duke University School of Medicine, Durham, North Carolina, United States*, 3. *Eastern Michigan University, Ypsilanti, Michigan, United States*

Profound restrictions were placed on previously free-living older adults due to mandatory stay-at-home orders for Covid-19. Recognizing the potential for worsening health and heightened risk of Covid-19 complications with older age and obesity, we conducted a survey to assess the impact of stay-at-home requirements on diet, health/social behaviors, and food security in 58 older adults (age=70.8±6.2, 55% Black, 93% female) who had participated in past obesity-reduction trials. A 71-item questionnaire was administered by phone and included demographics, health, lifestyle and dietary habits, food attitudes, and food security questions. Results showed indicators of heightened health risk, including health care appointments either delayed/cancelled (69%) and self-reported weight gain (62%). Of those with weight gain, 22% reported a gain of >10 pounds (33% gained 5-10 pounds and 7% < 5 pounds). Increased food intake was reported by 67% and 45% felt their eating patterns were less healthy due to increased snacking (71%) and consumption of sweets (41%). Food access and isolation were also an issue, as 51% were concerned about leaving the house for food and 81% reported eating alone. While some positive behaviors were reported (new ways to access food and health information, more reported cooking at home), the majority of findings indicated increased risk of obesity and its complications. The findings emphasize the need for effective lifestyle interventions that can be delivered remotely to high-risk older adults; this would benefit those presently self-restricted for Covid-19 concerns as well as other isolated older adults who need better access to individualized interventions.

PRIOR PHYSICAL PERFORMANCE IMPACTS SOCIAL CONTACT AND SOCIAL PARTICIPATION OF U.S. OLDER PEOPLE DURING COVID-19

Yun Zhang,¹ Wei Hou,² and Sean Clouston,² 1. *Renaissance School of Medicine, Stony Brook University, Stony Brook, New York, United States*, 2. *Renaissance School of Medicine, Stony Brook University, Renaissance School of Medicine, Stony Brook University, New York, United States*

Objective: To assess what roles the prior physical and cognitive performances of US older people played in changes of social contact and social participation due to the COVID-19 pandemic. Methods: We used the 2020 National Health and Aging Trends Study (NHATS) COVID-19 questionnaire (n=3,188, response rate=80.5%), linked to demographic information from the 2019 NHATS wave. We excluded participants who reported COVID-19 diagnosis and/or symptoms (n=288), and those represented by a proxy (n=414). We

compared older people's social contact with family and friends, social contact with health care providers, and social participation, prior to and during the COVID-19. We used paired t-test for the summed scores, Wilcoxon signed-rank for paired categorical variables, and McNamara test for paired binary variables. We further used weighted linear and logistic regressions adjusted for multiple covariates to investigate the effects of prior physical and cognitive performances on social contact and social participation, prior to, during, and changes in the COVID-19. Results: The sample included 2,486 participants that were predominantly females (56.20%) and non-Hispanic whites (88.43%), with participants averaging 78.24 years old. The COVID-19 pandemic resulted in significantly increased social contact with family and friends but decreased social participation of the US older people. Better prior physical performance was associated with significantly increased video calls and volunteering work during the COVID-19, while prior cognitive ability was not a significant risk factor. Conclusion: Prior physical performance, rather than prior cognitive ability, significantly affected the social way old people responded to a pandemic crisis.

Session 4125 (Paper)

Social Isolation and Loneliness (BSS Paper)

DO SOCIAL CONNECTIONS BUFFER LONELINESS ASSOCIATED WITH LIVING ALONE?

Markus Schafer, Haosen Sun, and Jin Lee, *University of Toronto, Toronto, Ontario, Canada*

The growth of solo living has important implications for the rising "loneliness epidemic" among older adults. This study considers whether two forms of social connectedness—extra-household core discussion networks and formal social participation—buffer the loneliness associated with living alone. Our study uses data from two surveys (National Social Life, Health, and Aging Project; Survey of Health, Ageing and Retirement in Europe) encompassing 20 developed Western countries in 2009/2010 and 2015/2016 (n = 110,817). Harmonizing measures across data sets, we estimate survey-specific and pooled linear regression models with interaction terms. Results indicated that high levels of social connectedness only moderately buffer the loneliness associated with living alone in later life. Findings were largely consistent across regions of Europe and the United States, though the buffering patterns were most robustly identified for widowed solo dwellers. Taken together, the results suggest that extra-household connections are partial compensators, but do not seem to fully replace the ready companionship afforded by residential co-presence in later life. Future research is needed to understand whether the efficacy of compensatory connections differs by gender, race/ethnicity, and across more diverse global regions.

HOW IS DAILY SOCIAL INTERACTION RELATED TO LONELINESS IN OLDER ADULTS? THE ROLES OF TRAIT LONELINESS AND PERSONALITY.

Ruixue Zhaoyang,¹ Stacey Scott,² Karra Harrington,¹ and Martin Sliwinski,¹ 1. *The Pennsylvania State University,*

University Park, Pennsylvania, United States, 2. Stony Brook University, Stony Brook, New York, United States

Loneliness is prevalent among older adults and is associated with increased risks for morbidity and mortality. This study examined what types of social interactions could reduce loneliness for older adults and who would benefit the most from social interactions. We used data from 312 community-dwelling older adults (aged 70 to 90 years) who completed ecological momentary assessments (EMA) five times a day for 16 consecutive days using smartphones ($n=20,507$ reports), as part of the ongoing Einstein Aging Study (EAS). At each EMA, participants reported their social interactions in the past 3 to 4 hours and their current feelings of loneliness. Results from multilevel models revealed that older adults reported lower levels of loneliness on occasions when they had pleasant social interactions ($p<.000$) or interactions with family ($p=.001$) in the past few hours, compared with occasions when they had no social interaction. In contrast, they reported higher levels of loneliness if they had unpleasant social interactions in the past few hours ($p=.004$). These within-person (WP) effects of social interactions on momentary loneliness were significantly moderated by participants' trait levels of loneliness and neuroticism; and were significantly stronger among those with higher (vs. lower) trait loneliness ($ps <.001$) or neuroticism ($ps <.042$). Other personality traits (Extraversion, Openness, Conscientiousness, Agreeableness) did not moderate any WP association. These results highlight the importance of having pleasant social interactions and frequent interactions with family for reducing older adults' loneliness in daily life, especially for those higher in trait loneliness and neuroticism.

LONELINESS AT OLDER AGES IN JAPAN: VARIATION IN LONELY LIFE EXPECTANCY AND THE ROLE OF SOCIAL ISOLATION

Shiro Furuya,¹ and James Raymo,² *1. University of Wisconsin--Madison, Madison, Wisconsin, United States, 2. Princeton University, Princeton University, New Jersey, United States*

Despite growing media, policy, and research attention to loneliness, it remains an understudied dimension of inequality in demography. Additionally, research on loneliness often fails, both methodologically and conceptually, to distinguish loneliness from social isolation. This is an important limitation given the positive correlation between measures of these two distinct concepts, a relationship that may be particularly relevant in collectivistic societies. This study focuses on Japan, describing the synthetic cohort duration of exposure to loneliness at older ages, with and without adjusting for the correlation between loneliness and social isolation. Combining life tables from the Human Mortality Database with individual data from the National Survey of Japanese Elderly, we calculated isolation-adjusted lonely life expectancies. We also evaluated regional and educational differences in isolation-adjusted lonely life expectancies. Results showed significant differences in lonely life expectancy before and after adjusting for social isolation; however, the attention to social isolation did little to alter our general understandings of trends and differentials in lonely life expectancy. In contrast to public perceptions of growing loneliness, we find that lonely life expectancy is short among older Japanese and

has not increased over time. Additionally, we found no clear regional nor educational differences in isolation-adjusted lonely life expectancy.

PERCEIVED DISCRIMINATION, SOCIAL ENVIRONMENT, AND OLDER ADULTS' PSYCHOLOGICAL WELL-BEING

Min-Kyoung Park,¹ and Christine Mair,² *1. University of Maryland, Baltimore & Baltimore County, Ellicott City, Maryland, United States, 2. University of Maryland, Baltimore County (UMBC), Baltimore, Maryland, United States*

Experiencing discrimination can have detrimental effects on psychological well-being. For older adults in the U.S., discrimination on the basis of country of origin may be a particularly alienating experience. A positive social environment, however, has been shown to buffer associations between discrimination and poorer psychological well-being. However, this hypothesis has not been tested in a sample of older Americans who perceive discrimination because of country of origin. As the United States continues to diversify and politically polarize, understanding older adults' experiences with discrimination and identifying potential buffers to these negative effects is increasingly important. We analyze 942 older Americans (aged 50+) from the Psychosocial Module of the most recent wave of the Health and Retirement Study (HRS, 2020). Specifically, we analyze associations between perceived discrimination on the basis of country of origin and three psychological well-being outcomes: loneliness, anxiety, and life satisfaction. We further test if the social environment buffers negative effects by examining interactions between discrimination and social support as well as discrimination and neighborhood environment. Our results reveal clear and consistent associations between older adults' perceived discrimination and increased loneliness and decreased life satisfaction. These negative associations, however, appear to be buffered by social support and positive neighborhood environment, respectively. The potential buffering effect of positive social environments on psychological well-being is particularly pronounced for older adults under the age of 65. We discuss these findings in light of the prevalence of discrimination in the U.S. and consider potential mechanisms for improving the social environment of older adults.

SOCIAL ISLANDS: EXAMINING THE INTERSECTION OF ISOLATION AND TECHNOLOGY USE

Joseph Svec,¹ and Megan Gilligan,² *1. Iowa State University, Ames, Iowa, United States, 2. Iowa State University, Iowa State University, Iowa, United States*

Life course theory suggests that social relationships are tied to overall well-being. In the extant literature social isolation negatively impacts physical and mental health outcomes in later life. In this study, we focus specifically on the association between social isolation and older adult's self-rated health status. We also examine whether and the extent to which technology use augments negative health consequences attributed to isolation. Using data on 3,758 older adults (ages 65+) from the 2018 wave of the Health and Retirement Study, we contribute to current scholarly examinations at the intersection of technology and isolation. We conduct a series of ordinal logistic regressions to estimate the odds of respondents'

higher self-rated health (from poor = 1 to excellent = 5) on subjective measures of social isolation (i.e. feel left out, lack of companionship and isolated from others) in addition to whether respondents live with a partner and have an adult child who lives in close geographic proximity. Preliminary results show that individuals who perceived higher levels of social isolation evaluated their own health status as poorer. We also find that the use of computers for virtual communications corresponds with higher self-rated health statuses, regardless of the proximity of children or other family members. However, a negative interaction between computer use and isolation indicates the positive effects of technology are limited for those who are highly isolated. These findings suggest that technology impacts on health are nuanced, where an overreliance on technology as a substitute may not consistently yield positive outcomes.

Session 4130 (Symposium)

SPEAKING OF DEMENTIA: HOW TO REFER TO DEMENTIA IN RACIAL-ETHNIC MINORITY COMMUNITY-FACING COMMUNICATIONS

Chair: Zachary Baker

Co-Chair: Tetyana Shippee

Discussant: Joseph Gaugler

What do you call “dementia”? In academic writing, researchers often chose the inclusive, “Alzheimer’s Disease and Alzheimer’s Disease Related Dementias (AD/ADRD)”. When referring to the people experiencing dementia, the person-centered language: “persons living with dementia (PLWD)” is preferred. This is a welcome departure from the antiquated disease-centered language of “dementia patients” or “the demented”. Still, AD/ADRD and PLWD may be less fitting in community-facing education or participant recruitment. For instance, community-facing materials may benefit from choosing terms like “memory loss”, “issues related to memory or aging”, or “changes in ability, behavior, or judgment”. In this symposium we present a range of viewpoints focused on how to refer to “dementia” in community-facing materials/conversations. These viewpoints include those of several racial and ethnic groups (i.e., African Americans, African Immigrants, American Indians, Asians, Hispanics/Latinos/as/x/e, and Whites). We also include viewpoints from people interfacing with many different diseases that cause dementia (i.e., Alzheimer’s disease, dementia with Lewy bodies, Early-onset Alzheimer’s disease, and Parkinson’s disease dementia) because of the different manifestations of dementia that can arise from those diseases. Viewpoints were gathered through 1) a nation-wide community advisory board, 2) community conversations with African Immigrants, 3) a national effort to increase the representation of Hispanics/Latinos/as/x/e PLWD in AD/ADRD research, and 4) eight community projects exploring the African American AD/ADRD experience. These talks will present possible terms to use within groups, considerations to increase inclusiveness, issues with translation into native languages, considerations surrounding symptoms that may be most recognizable to community members, and stigmatized terminology.

GOING INTO A COMMUNITY, WE NEED TO START FROM WHERE THEY’RE AT: CAREGIVER AND ADVOCATE PERSPECTIVES

Zachary Baker, *University of Minnesota, University of Minnesota/Minneapolis, Minnesota, United States*

We recorded and inductively coded an open-ended discussion of jargon surrounding “dementia” with the “Supporting Dementia Caregivers After Death” community advisory board (CAB). CAB-members included current and former caregivers of PLWD due to early- and normal-onset Alzheimer’s, Lewy body, and Parkinson’s, a co-president of the Alzheimer’s Association (ALZ) Young Champions, a dementia trainer/consultant and member of a Catholic church that preserves American Indian spiritual traditions, a senior program manager at ALZ who was entrusted by American Indian reservation elders to provide dementia education, a care partner support group leader, and an Alzheimer’s Ambassador chosen by multiple US senators. Themes identified included differential inclusiveness of terms like “memory loss” versus “dementia”, misuse and misunderstanding of “dementia” versus “Alzheimer’s”, and the difficulty of translating “dementia” into the American Indian Ojibwe (i.e., Anishinaabemowin) language where suggested translations directly translated to “slow memory loss”, “brain deterioration”, “absent mindedness”, or even “craziness”.

I DIDN’T REALLY FULLY UNDERSTAND UNTIL I CAME INTO THE STATES: AFRICAN IMMIGRANTS’ ADRD INTRODUCTION AND AWARENESS

Manka Nkimben, ¹ Kwame Akosah, ¹ Tetyana Shippee, ² Christina Rosebush, ³ Wynfred Russell, ⁴ and Joseph Gaugler, ¹
 1. *University of Minnesota, Minneapolis, Minnesota, United States*, 2. *University of Minnesota, University of Minnesota, Minnesota, United States*, 3. *University of Minnesota, Twin Cities, Minneapolis, Minnesota, United States*, 4. *The African, Career Resources and Education Inc, Brooklyn Park, Minnesota, United States*

Most African immigrants report that they had never heard about dementia until their arrival in the United States. Conversations and insights from project advisory board meetings of the African Immigrant Memory Loss and Dementia Education projects (5 conversations and 8 meetings in the Minneapolis area) reveal unique cultural and immigrant characteristics surrounding dementia terminology and awareness. Dementia is often lumped together with mental illness which is associated with stigma. In addition to the fear of bad news and death, mental health issues are often considered a result of witchcraft, spiritual attack or punishment. Additionally, there are no traditional or cultural words for dementia in many African languages and current terms used are related to mental illness and all have negative connotations. There is a need to identify appropriate words for dementia in many tribal and immigrant dialects that can facilitate dementia awareness and education programs in African communities.

FROM DEMENTIA TO DEMENCIA: WAY MORE THAN A SINGLE LETTER

Maggie Britton, *University of Houston, Houston, Texas, United States*

Hispanic or Latino/a/x/e (H/L) individuals are at 1.5x risk for Alzheimer’s Disease and Related Dementias (ADRD)

compared to non-H/L White individuals. Although H/L individuals make up roughly 18% of the U.S. population, they are vastly underrepresented in ADRD research. For example, less than 9% of individuals in the National Alzheimer's Coordinating Center (NACC) data set are H/L. Collaborative efforts like the ECHAR Network are working to increase the representation of H/L individuals in ADRD research across the U.S. A non-exhaustive list of barriers to H/L participation include limited health literacy, perspectives on aging, and preferences for family-centered care that aligns with H/L cultural values (e.g., familismo). For example, H/L individuals are less likely to have a medical conceptualization of the Spanish translation for dementia. The cognate "demencia" is more likely to be conflated with alternative meanings like insanity, which may create barriers when developing community-facing recruitment and study materials.

LESSONS LEARNED FROM FOCUS GROUPS AND COMMUNITY EDUCATION PROVISION IN THE AFRICAN AMERICAN COMMUNITY

Robbin Frazier, *University of Minnesota, University of Minnesota/Minneapolis, Minnesota, United States*

The present symposium will synthesize themes derived from eight different projects designed to better understand dementia in Minnesota (MN) within the African American community (where individuals are disproportionately susceptible to dementia and the tolls of dementia care). These projects included focus groups, community outreach, community education, networking with aging service providers, and community forums. Projects were funded by and conducted in partnership with the MN Department of Human Services, the Alzheimer's Association, the MN Board on Aging, and the MN Leadership Council on Aging's Diverse Elders Coalition. Themes included the unique ways that African American elders share their viewpoints and the importance of faith-based outreach. Another major theme, which connects to the other symposium talks, was the importance of three S's: Stigma, Shame, and Silence as cultural considerations in the African American, West African, and Latino/a/x/e communities as they apply to access to information and training to better understand AD/ADRD.

Session 4135 (Paper)

Spirituality and Health

CARING FOR A FAMILY MEMBER WITH MILD DEMENTIA: PERCEPTIONS, CONNECTIONS, AND RELATIONAL DYNAMICS WITH THE SACRED

Jocelyn McGee,¹ Dennis Myers,² Rebecca Meraz,³ and Davie Morgan,^{2,1} *Baylor University, United States, 2. Baylor University, Waco, Texas, United States, 3. Baylor University, Dallas, Texas, United States*

Researchers define spirituality as the search for or connection with the "sacred", which is transcendent and considered blessed, holy, or revered. For some, the sacred is connection with a divinity (e.g., God, gods) and for others, a close relationship with something else bigger than themselves (e.g., the Universe, Nature, a life philosophy). Current research reports that family caregivers with a strong connection to

the sacred, as compared with those who do not, have fewer symptoms of depression, more positive perceptions of the caregiving experience, improved coping, and bolstered resilience. However, there is limited research on the impact of spirituality on the perceptions of familial caregivers whose loved ones have recently been diagnosed with dementia. In this study, 27 family caregivers of persons with mild dementia (CDR=1) were interviewed using the Dimensions of Caregiving Interview (DCI, McGee & Carlson, 2013). The DCI identified positive psychological aspects of the caregiving experience, including spirituality. Three heuristic themes emerged from Directed Content Analysis: perceptions about the sacred reflect variability in the early part of the caregiving journey; specific characteristics, traits, and functions of the sacred shape caregiver coping and adjustment; and the relational dynamics between caregivers and the sacred inform adaptation. Recommendations for clinical practice and additional research are provided.

EITHER SENT BY GOD OR USED BY GOD: IMPACT OF COVID-19 ON THE RELIGIOUS LIVES OF BLACK FAMILIES WITH DEMENTIA

Fayron Epps, Yiran Ge, Mayra Sainz, and Janelle Gore, *Emory University, Atlanta, Georgia, United States*

The COVID-19 pandemic has underscored systemic disparities and laid its effects on the Black community. Often overlooked is how health disparities heighten stress and affect the emotional well-being of Black American caregivers. The purpose of this study is to explore the impact of COVID-19 on church engagement for Black families affected by dementia. A qualitative design was employed to collect data from current caregivers, faith/church leaders, and persons with cognitive impairment. Participants (n = 17) were predominantly female, all identified as Black. During semi-structured interviews, participants were asked how COVID-19 has impacted their participation in faith practices. The following themes emerged: (a) ability to continue faith practices, (b) increased church engagement, (c) new normal, (d) importance of fellowship, and (e) role of technology. Participants believed COVID-19 did not impact their faith practice partly due to the ability to continue with faith traditions in a virtual format. Online worship services enabled more families affected by dementia to participate. Many church leaders expressed the intent of continuing to provide online worship services post-pandemic. Families highlighted their need to have fellowship with other parishioners. Technology was perceived as a double-edged sword that serves as both a motivator and a barrier to religious engagement. These findings will support faith leaders and churches in understanding the needs of their congregation during the COVID-19 pandemic, specifically, it will allow families living with dementia to continue engaging in religious activity and living in meaningful ways.

GIVE THANKS IN ALL CIRCUMSTANCES? GRATITUDE TOWARD GOD AND HEALTH IN LATER LIFE AFTER MAJOR LIFE STRESSORS

Laura Upenieks,¹ and Joanne Ford-Robertson,² *1. University of Texas at San Antonio, San Antonio, Texas, United States, 2. University of Texas at San Antonio, University of Texas at San Antonio, Texas, United States*

Gratitude is foundational to well-being throughout the life course, and an emerging body of work suggests that older adults may be more inclined to attribute gratitude to a non-human target (God). Drawing on life course theory and Erikson's lifespan development framework, we use data from a national sample of Christian older adults from the United States (N = 1,005) to examine whether gratitude towards God buffers the noxious health effects of the death of a loved one or personal illness. Results suggest that gratitude towards God tends to predict better age-comparative and global self-rated physical health in the aftermath of stress, a moderation effect which is partially mediated by stronger beliefs in God-mediated control (that God is a collaborative partner in dealing with problems). We conclude by proposing some interventions for clinicians and counselors centered around gratitude and religiosity that may assist older adults in coping with major life stressors.

HOLY AND HELPING: THE ROLE OF SANCTIFICATION IN THE COMMUNAL COPING OF OLDER AFRICAN AMERICAN COUPLES

Antonius Skipper,¹ Andrew Rose,² Jhazzmyn Joiner,¹ Ethan Jones,² and Alex Reeves,¹ 1. *Georgia State University, Atlanta, Georgia, United States*, 2. *Texas Tech University, Lubbock, Texas, United States*

Disproportionately affected by numerous relational stressors (e.g., financial strain, morbidity), older African American couples frequently find solace in religion and each other. Research notes that both married and cohabiting couples effectively respond to difficult situations by sharing the ownership of a stressor and organizing a collaborative, collective response. However, little is known about the influence of religion on shared coping experiences, particularly among older African American couples. This study examined dyadic data from the Strong African American Couples Project to capture the influence of relational sanctification on the communal coping practices of married and cohabiting older African American couples. The sample included 194 African American couples (146 married and 48 cohabiting) between the ages of 50 and 86 years. With the use of Actor Partner Independence Models, this study found that men's sanctification predicted both their own communal coping and their partner's communal coping. However, there were no significant effects when women's sanctification was used as a predictor of communal coping among older African American couples. These findings are both important and novel, because these relationships had never before been examined within the United States, much less among older African American couples. Similar to existing research among majority White couples, this research finds that men's religiosity may be a more influential predictor of relational outcomes than women's religiosity. Such findings offer a valuable foundation for future studies seeking to consider how relational sanctification and communal coping may impact other outcomes associated with the romantic relationships of older African Americans.

SPIRITUAL EXPERIENCE IN DEMENTIA FROM THE HEALTH CARE PROVIDER PERSPECTIVE: IMPLICATIONS FOR INTERVENTION

Jennifer Palmer,¹ Michelle Hilgeman,² Tracy Balboni,³ Sara Paasche-Orlow,⁴ and Jennifer Sullivan,⁵ 1. *Center for*

Healthcare Organization and Implementation Research, VA Boston Healthcare System, Boston, Massachusetts, United States, 2. *Tuscaloosa VA Medical Center, Tuscaloosa, Alabama, United States*, 3. *Harvard Medical School, Boston, Massachusetts, United States*, 4. *Hebrew SeniorLife, Roslindale, Massachusetts, United States*, 5. *VA Providence Medical Center LTSS COIN and Brown University, Providence, Rhode Island, United States*

Spiritual care seeks to counter negative outcomes from spiritual distress and is notably needed in dementia. Such care needs disease-appropriate customization. Employing "cognitive apprenticeship" theory's focus on learning from contrast, we explored spiritual needs salient within dementia as related to other disease states; we aimed to inform future dementia-focused spiritual care design. Accordingly, we conducted semi-structured qualitative interviews with 24 providers who serve older adults inclusive of persons with dementia. We sampled participants purposively by discipline (chaplains, nursing staff, social workers, activities professionals) and religious tradition (for chaplains). Our interview guide inquired about the nature of spiritual needs in dementia and stakeholders' roles in addressing them. Hybrid inductive/deductive thematic analysis was employed. A thematic structure emerged with two themes: 1) spiritual experience in dementia compared to other medical conditions (sub-themes: the salience of (a) fear; (b) loss of self; (c) dementia's progressive and incurable nature; (d) dementia's impact on accessing faith); and 2) the need for spiritual intervention at the mild stage of dementia (sub-themes: (a) awareness in mild dementia and its influence on spiritual distress; (b) a window of opportunity). These findings pointed to possibilities for the "what" of spiritual needs and the "who" and "when" of implementing spiritual care. Implications included the imperative for dementia-specific spiritual assessment tools, interventions targeting fear and loss early in the disease, and stakeholder training. Researchers should study the "how" of dementia-appropriate spiritual care given recipients' cognitive and linguistic challenges. Conjointly, these efforts could promote the spiritual well-being of persons with dementia worldwide.

Session 4140 (Symposium)

SUSTAINABILITY OF THE AGING NETWORK'S COVID-19 RESPONSES: ISOLATED IMPACT OR TRANSFORMATIVE CHANGE?

Chair: Suzanne Kunkel

Discussant: Suzanne Kunkel

The COVID-19 pandemic mobilized individuals, organizations, and communities. Area Agencies and Aging (AAAs) and Title VI Native American Programs, core organizations of the network of community-based organizations (CBOs) that serve older adults and their families, pivoted their service delivery methods to provide life-sustaining services. Their long-standing expertise in community needs assessment, pre-existing cross-sectoral partnerships, and an infusion of emergency federal funding, enabled this rapid response. Recently concluded studies using key-informant interviews and national surveys of AAAs and Title VI programs highlight these service adaptations, from expansion of home-delivered meal programs to new partnerships in telehealth. These organizations also reported expansion of services offered and people

served, and the emergence or strengthening of partnerships with other CBOs, businesses, and governmental organizations such as public health entities. For example, 78% of the respondents to the recent survey of AAAs reported that they have a role in vaccination outreach, scheduling support, or delivery. The papers in this symposium will use these new studies to describe the nature, origins, and potential sustainability of new and expanded services and partnerships. The Collective Impact Model for community change (introduced in the Stanford Social Innovation Review) will provide a framework for the discussion. Built on the importance of cross-sector coordination, the five pillars of success for collective rather than isolated impact are: a common agenda, mutually reinforcing activities, continuous communication, shared measurement, and a backbone organization. Each of these five pillars is relevant to the heightened community response during the pandemic, and to the likelihood of sustainability.

DELIVERY OF HOME AND COMMUNITY BASED SERVICES DURING A PANDEMIC: UNEXPECTED CONSEQUENCES

Emily Cherlin,¹ Adeola Ayedun,² Jane Straker,³ Traci Wilson,⁴ Amanda Brewster,⁵ Chris Rubeo,⁵ and Leslie Curry,² 1. *Yale School of Public Health, Yale Global Health Leadership Initiative, New Haven, Connecticut, United States*, 2. *Yale School of Public Health, New Haven, Connecticut, United States*, 3. *Miami University, Oxford, Ohio, United States*, 4. *USAging, Washington, District of Columbia, United States*, 5. *University of California, Berkeley School of Public Health, Berkeley, California, United States*

The COVID-19 pandemic required AAAs to pause essential services, serving as a catalyst for innovation. We examined such innovations as part of an explanatory mixed-methods, positive deviance study of AAA partnerships with health and social service organizations. We identified 8 AAAs with many partners serving areas with lower levels of health care use, and 3 AAAs with few partners serving areas with higher levels of health care use. We interviewed AAA and partners, (total = 123). Using the constant comparative method, we identified recurrent themes: 1) AAAs adapted to increased demand for services by developing new ways to deliver services, 2) the pandemic raised awareness of unmet needs such as social connection, 3) changes in delivery of services included embracing technology, and 4) AAAs and their partners identified resources to rapidly pivot services. AAAs and partners demonstrated resiliency to not only to sustain programs, but to innovate throughout the pandemic.

THE EVOLVING ROLE OF AREA AGENCIES ON AGING THROUGH THE COVID-19 PANDEMIC AND BEYOND

Traci Wilson,¹ and Elizabeth Blair,² 1. *USAging, Washington, District of Columbia, United States*, 2. *n*
4. *a, Washington, District of Columbia, United States*

Area Agencies on Aging (AAAs) have played an important and well-documented role in meeting the nutritional and wellness needs of older adults during COVID-19. To better understand the continued impact of COVID-19 pandemic on AAA services, partnerships, and clients, the National

Association of Area Agencies on Aging surveyed the nation's 618 AAAs in February 2021, with a 27% response rate. As a result of COVID-19, most AAAs reported both increased numbers of new clients and needs of existing clients; three-quarters of AAAs developed new external partnerships; and over half are implementing strategies to address equity and inclusion regarding their services and clients. Nearly 80% of AAAs are involved with COVID-19 vaccine outreach and delivery, from scheduling appointments to administering the vaccine to homebound clients. We will describe these and other transformations of services, partnerships, and client needs; discuss challenges and opportunities; and provide examples and video vignettes from AAA directors.

CASE STUDY ON THE COMMUNITY RESILIENCE WITHIN TITLE VI PROGRAMS DURING COVID-19: A QUALITATIVE ANALYSIS

Abigail Bailey, *Scripps Gerontology Center, Oxford, Ohio, United States*

Health inequalities increased for Native Americans during the COVID-19 pandemic due to poor infrastructure, lack of electricity, health disparities, limited transportation, and rural location (Yellow Horse, 2021). Title VI programs--aging network organizations that serve tribal elders--had to be resourceful to meet increased needs and restrictions on service delivery options. Qualitative data from the national 2020 Title VI Native American Aging Programs Survey illustrated the challenges faced and the resiliency of these organizations and their communities. Two rounds of thematic coding of 479 open-ended responses to the survey revealed that communication across organizations, a sense of shared mission, and sharing of resources allowed these agencies to provide more services in innovative ways. Challenges included limited funding, regulatory barriers, and staff burnout. A video presentation by a Title VI program director will provide context for the results of the survey.

Session 4145 (Symposium)

TELEHEALTH AS A RESOURCE FOR CONTINUITY OF CARE IN THE FACE OF DISASTER

Chair: Walter Boot

Co-Chair: Judith Robertson Phillips

This symposium co-sponsored by the Disasters and Older Adults and the Technology and Aging special interest groups of GSA aims to highlight the promise of, and barriers to, the use of telehealth to support continuity of care in the face of disasters and crises, such as the ongoing COVID-19 pandemic. M. Mattos will showcase a home-based medical care (HBPC) program to address chronically ill and homebound persons living with dementia and caregivers' needs during the pandemic. T. Wytte-Lake will present the results of a national survey on how changes were made to the Department of Veterans Affairs (VA) HBPC programs in response to the pandemic. G. Demiris describes a large caregiver study in which problem solving therapy and positive appraisal theory interventions designed specifically to support family caregivers of hospice patients during the COVID-19 pandemic were implemented via telehealth. D. Lindeman will specifically discuss challenges and implementation strategies for telehealth solutions applied to low-income older adults

living in affordable housing communities. Finally, H. Xu will present the results of an analysis examining the effectiveness of telehealth in reducing readmissions among heart failure patients during the COVID-19 pandemic. While the COVID-19 pandemic has especially impacted older adults and those who care for them, these talks highlight the potential of telehealth services and interventions to provide support and facilitate the continuity of care during times of crisis.

AN INTERDISCIPLINARY HOME-BASED MEDICAL CARE PROGRAM TO REACH HOMEBOUND ADULTS LIVING WITH DEMENTIA

Meghan Mattos,¹ Karen Duffy,² Tuula Ranta,³ and Justin Mutter,³ *1. University of Virginia, School of Nursing, Charlottesville, Virginia, United States, 2. UVA Health, Charlottesville, Virginia, United States, 3. University of Virginia, School of Medicine, Charlottesville, Virginia, United States*

The COVID pandemic has impacted access to care, particularly for older, homebound persons living with dementia (PwD). At the beginning of the pandemic, our interdisciplinary team introduced a home-based medical care program (HBMC) to address chronically ill and homebound PwD and caregivers' needs to promote aging in place. The purpose of this presentation is to describe PwD and caregiver service use and experiences with Virginia at Home (VaH) HBMC during the pandemic. All PwD participating in VaH program are offered home telehealth access with necessary devices. We will discuss telehealth access and use and dyad-care provider communication across up to 20 dyads to facilitate continuity of care. These data are supplemented by qualitative interviews with dyads presenting needs, preferences, and experiences accessing and using services across the first six months of program launch. We will conclude with a discussion of participant-informed program alterations to facilitate optimal overall care and outcomes.

ADAPTATIONS TO IN-HOME HEALTH CARE DUE TO COVID-19: THE VA'S HOME-BASED PRIMARY CARE PROGRAM

Tamar Wyte-Lake,¹ Leah Haverhals,² Chelsea Manheim,² Nelly Solorzano,² and Suzanne Gillespie,³ *1. US Department of Veterans Affairs, U.S. Department of Veterans Affairs (VA), California, United States, 2. Denver Center of Innovation for Veteran Centered and Value Driven Care (COIN), Denver, Colorado, United States, 3. Finger Lakes VA Healthcare System, Canandaigua, New York, United States*

The COVID-19 pandemic disrupted traditional Home Based Primary Care (HBPC) care processes, including changes to provision of face-to-face care in-home for older adults. Our study describes and explains care delivery changes Department of Veterans Affairs (VA) HBPC programs made in response to the pandemic. We fielded a national survey to all 140 VA HBPC programs, targeting interdisciplinary care teams and HBPC leadership. We structured survey questions using a mixed method approach with both closed and open-ended questions, applying a qualitative content analysis approach to open-ended responses complemented by analysis of descriptive quantitative data. Preliminary findings highlight the value and consideration of different telehealth modalities when caring for an older, homebound population, as

well as creative adaptations HBPC teams made to deliver care during the pandemic. Implications include nascent development of decision-making paradigms beyond the pandemic particularly for appropriate use of telehealth modalities for older homebound adults.

USE OF TELEHEALTH TO SUPPORT FAMILY CAREGIVERS OF HOSPICE PATIENTS DURING THE COVID-19 PANDEMIC

George Demiris,¹ Debra Parker Oliver,² and Karla Washington,² *1. School of Nursing, University of Pennsylvania, University of Pennsylvania, Pennsylvania, United States, 2. Washington University in St. Louis, St. Louis, Missouri, United States*

Family caregivers of hospice patients faced additional challenges in the context of the COVID-19 pandemic where social isolation and loneliness that are often observed among those taking care of a loved one at the end of life, were exacerbated by social distancing rules and workflow changes introduced by hospice agencies. The use of telehealth technologies has the potential to facilitate the delivery of supportive services for family caregivers. We conducted a study examining the use of telehealth for the delivery of a supportive intervention based on problem solving therapy and positive appraisal theory designed specifically to support family caregivers of hospice patients during the COVID-19 pandemic. We recruited 248 caregivers who each participated in three telehealth sessions over a month; caregivers reported higher levels of quality of life and lower levels of anxiety post intervention. Specific recommendations for inclusive telehealth design are discussed based on lessons learned.

LESSONS FROM LIGHTHOUSE: OPERATIONALIZING TECHNOLOGY TO SUPPORT OLDER ADULTS IN AFFORDABLE HOUSING COMMUNITIES

David Lindeman, *UC Berkeley, Oakland, California, United States*

Lighthouse for Older Adults, an innovative public-private partnership, was developed in response to COVID-19 as a means of advancing telehealth for low-income older adults living in affordable housing communities. Residents of these communities often don't have reliable access to devices, sufficient bandwidth for telehealth, or adequate social services, further complicated by the need for multi-lingual and culturally sensitive programs. This presentation will share program implementation strategies and outcomes, including the essential role telehealth services play in the care and wellbeing of older adults during and beyond COVID-19. This session will review evidence-based components of a telehealth intervention, including digital literacy training and technology support. Key drivers for successful implementation (e.g., peer led training, user input into technology selection) as well as barriers to implementation (e.g., broad band installation, internet service availability/cost, tech support) will be reviewed. Lessons learned through program replication and scaling of Lighthouse telehealth services will be discussed.

TELEHEALTH AND 30-DAY READMISSIONS AMONG HEART FAILURE PATIENTS DURING THE COVID-19 PANDEMIC

Hanzhang Xu,¹ Bradi Granger,² Eric Peterson,³ and Matthew Dupre,⁴ *1. Duke University School of Medicine,*

Duke University, North Carolina, United States, 2. Duke University School of Nursing, Durham, North Carolina, United States, 3. University of Texas Southwestern Medical Center, Dallas, Texas, United States, 4. Duke University School of Medicine, Durham, North Carolina, United States

This study examined whether outpatient follow-up within 14 days of discharge via telehealth visits are as effective as in-person visits for reducing 30-day readmission in heart failure (HF) patients. Using electronic health records from a large health system, we included HF patients ($n=1,722$) who were hospitalized during the period of March 15-July 15, 2020. Overall, 28.1% of patients received an early outpatient follow-up visit. Patients who received telehealth visits ($n=119$) were more likely to be older and live in areas with higher median household incomes than those with in-person visits ($n=365$). Thirty-day readmission rates were 20.5% during the COVID-19 period. Multivariate models showed that patients who received a telehealth (OR=0.36, 95%CI [0.23-0.56]) or an in-person (OR=0.42, 95%CI [0.31-0.57]) visit were less likely to be readmitted within 30 days compared with patients without an early outpatient follow-up. Telehealth visits were just as effective as in-person visits at reducing 30-day readmissions.

Session 4150 (Paper)

Telehealth Interventions for Older Adults: COVID-19

RURAL-URBAN DIFFERENCES IN AVAILABILITY OF TELEMEDICINE SERVICES AMONG MEDICARE BENEFICIARIES DURING COVID-19

Yvonne Catharina Jonk,¹ Erika Ziller,² and Heidi O'Connor,² *1. University of Southern Maine, Muskie School, Portland, Maine, United States, 2. University of Southern Maine, Portland, Maine, United States*

The COVID-19 pandemic has created substantial disruptions to all aspects of rural and urban U.S. life. At the same time, it has provided opportunities for shifts in health service delivery, including policy innovations to increase telehealth availability and use for diagnosis and treatment of health concerns. However, it is unclear whether rural residents, particularly older adults, have the same access to telehealth services as their urban counterparts. Rural providers may face unique barriers to delivering telehealth services, and rural patients may have more difficulty accessing those services from their homes. This study used the Fall and Summer 2020 Medicare Current Beneficiary Survey COVID-19 Supplement Public Use Files to examine rural-urban differences in the telemedicine services available to Medicare beneficiaries from their primary care providers, as well as their ability to access those services. Preliminary findings suggest that rural beneficiaries are less likely to have access to telehealth services during the pandemic, they were more likely to exhibit hesitancy towards receiving the COVID-19 vaccine, they were less likely to engage in preventive behaviors such as hand washing and sterilizing surfaces, and more likely to have missed diagnostic or medical screening tests (37%) compared to urban (27%) beneficiaries. Finally, rural beneficiaries were less likely to have a smartphone, computer, or tablet at home and less

likely to have access to the internet (78% rural; 84% urban). Policy implications include the need for outreach efforts to better inform the provider community, and efforts to improve rural health system infrastructure available to support telehealth.

TECHNOLOGY IS OUT THERE FOR THE BETTERMENT OF US: AFRICAN AMERICAN FAMILY CAREGIVERS AND COVID-19

Afeez Hazzan,¹ Carol D'Agostino,² and Phyllis Jackson,³ *1. State University of New York at Brockport, Brockport, New York, United States, 2. Geriatric Mental Health Specialist, Geriatric Mental Health Specialist, New York, United States, 3. Common Ground Health, Common Ground Health, New York, United States*

Unpaid family caregivers are mostly responsible for bearing the costs associated with caring for older adults with dementia. Importantly, the ongoing COVID-19 pandemic has created unforeseen challenges for many family caregivers. Specifically, the restrictions put in place to limit the spread of the coronavirus may be exacerbating the challenges faced by these caregivers as they try to navigate the system. Further, studies have shown that family caregivers who are members of a racial or ethnic minority group such as African-Americans or Hispanics face unique challenges when caring for their loved ones. Additional challenges may include socioeconomic disadvantages, health disparities, and language barriers that make it more difficult to access healthcare and social services. In this study, we examined the perspectives of African-American family caregivers of older adults on the feasibility of utilizing technology as a coping strategy (including for research participation) during the ongoing COVID-19 pandemic. The research question was: What are the perspectives of African-American family caregivers of people with dementia on the feasibility, opportunities, and challenges of technology as a means to engage family caregivers during a pandemic? In-depth one-on-one interviews were conducted with 12 African-American/black family caregivers. Thematic analysis of the qualitative data yielded the following three themes: (1) Acceptance that technology will play a greater role in the world going forward, and family caregivers need to adapt; (2) Opportunities to avoid social isolation while maintaining links with critical community resources; and (3) Challenges due to possible loss of privacy and lack of physical interactions

TELEHEALTH: A RESOURCE FOR VULNERABLE POPULATIONS TO ACCESS ORAL HEALTHCARE DURING THE COVID-19 PANDEMIC

Victoria Raveis,¹ David Glotzer,² and Andre Ritter,³ *1. New York University, New York University, New York, United States, 2. New York University, New York University, New York, United States, 3. New York University, New York, New York, United States*

Dental care and adherence to daily oral hygiene practices are particularly important for healthy aging. For socially disadvantaged or impoverished, older community residents, populations who are at risk for long-standing oral disease, public dental clinics are safety nets. In March 2020, when COVID-19 cases surged in the New York metropolitan area, a months-long suspension of the area's community dental

services occurred, including clinical operations at the NYU College of Dentistry. To ameliorate the impact of this widespread service suspension, NYU Dentistry implemented an interim Dental Telehealth Service, open to the community, with telehealth consultations delivered by NYU faculty. This consultative service served a diverse population, adhering to guidelines the American Dental Association (ADA) issued on “urgent” and “emergency” care, with the goal of treating with a minimally invasive approach, to relieve the burden on hospital emergency rooms. Older adults, experiencing dental issues and fearing they were particularly vulnerable to the virus, called into this service, as they desperately wanted to avoid the overwhelmed public hospital ERs. A range of significant dental issues, i.e. pain, swelling, tooth fractures, were addressed. Implementing this community resource was a creative strategy to address a serious health services gap during this public health crisis. It also yielded important insights regarding the feasibility, acceptability and utility of telehealth, as a routine component of dental practice, when treating older adults, who often have serious co-morbidities and limited mobility. Certainly, the conversational nature of telehealth is a less stressful and anxiety-provoking clinical encounter.

TELEMEDICINE USE AMONG OLDER ADULTS DURING THE COVID-19 PANDEMIC

Anita Szerszen,¹ Yulia Kogan,² and Edith Burns,² *1. Northwell Health, Staten Island University Hospital, Staten Island, New York, United States, 2. Northwell Health, New Hyde Park, New York, United States*

Objective: Although technology adoption among older adults is improving, ethnic minorities and those with socioeconomic disadvantages may have lower utilization of telemedicine. Here, we evaluate telemedicine uptake amongst community-based older adults. **Materials and Methods:** Using a retrospective cohort design, we examined electronic medical records (EMR) for documentation of telemedicine use among patients > 65 years old at Geriatric practices in the New York metropolitan area from January-November 2020. Demographic details and insurance payer were captured for telemedicine visits and compared to in-person encounters. Multivariable regression was used to evaluate the association of demographic, socioeconomic factors and visit type. **Results:** A total of 712 patients (32.3%) engaged in 1,085 telemedicine visits. Telemedicine represented 80% and 66% of all encounters during April and May, respectively and averaged 11.8% between June and November. Use was similar across age groups, gender, race and insurance payer status between telemedicine versus in-person encounters. Patients with greater number of comorbidities were more likely to use telemedicine-. Medicaid recipients had preference for video visits. 47.5% of patients who engaged in video visits had another person/family member present during an encounter. **Conclusions:** Telemedicine augmented access to health care for older individuals during the peak of the COVID pandemic and continues to be utilized to improve access to care for older Americans. Given the distinct preference for video visits among patients with multiple medical conditions and those who have Medicaid, telemedicine has potential to serve as a tool to reduce enduring health care disparities beyond the pandemic.

Session 4155 (Symposium)

THE PATHWAYS TO HEALTHY AGEING: EVIDENCE FROM LONGITUDINAL STUDIES AND REAL-TIME DATA

Chair: Terry YS Lum

The WHO has replaced its active ageing policy framework developed in 2002 with the new Healthy Ageing framework developed in 2015 and declared the decade between 2020 and 2030 as the Decade of Healthy Ageing. Healthy Ageing framework emphasizes the pivotal role of functional ability (FA) among older adults and conceptualizes that FA can be determined by intrinsic capacity (IC), environments (EN), and their interaction. WHO calls for global research to advance theoretical understanding of Healthy Ageing framework and translate the evidence into policy actions. This symposium provides the latest findings on Healthy Ageing from multi-country studies using real-time data and longitudinal study design. Dr. Röcke explored daily time-out-of-home and place visit diversity with daily emotional and stress processes in Zurich, using sensor-based and self-reported mobility and activity indicators to capture FA. Dr. Lu investigated the EN and 4-year trajectories of IC and their impact on FA trajectories among older adults in Hong Kong. Dr. Liu explored the longitudinal associations between neighborhood physical EN and depressive symptoms of older adults in Hong Kong and the moderating effects of terrain slope and declining daily activity of living. Dr. Guo investigated the relationship between perceived EN (environmental cognition) and mental health and the mediating roles of physical activity and place attachment. Dr. Chan explored neighborhood physical EN and cognition among older people and identified whether this association varies among different older age groups. Based on these findings, this symposium will discuss the future research direction on Healthy Ageing and its policy implication.

DAY-TO-DAY MOBILITY, AFFECT, AND STRESS COUPLINGS IN SWISS OLDER ADULTS

Christina Roecke,¹ Eun-Kyeong Kim,² Pascal Griffel,¹ Robert Moulder,¹ Cheng Fu,² Minxia Luo,² Mike Martin,² Robert Weibel,² *1 University of Zurich, Zurich, Zurich, Switzerland, 2 University of Zurich, Zurich, Zurich, Switzerland,*

The Mobility, Activity, and Social Interactions Study (MOASIS) is part of a global effort to more closely examine indicators of functional ability in relation to person characteristics and life contexts as proposed by the WHO's healthy aging definition. In MOASIS, sensor-based and self-reported mobility and activity indicators were used to capture functional ability in 153 community-dwelling older adults aged 65-91 over 30 days. The present study examines daily time out-of-home and place diversity and its within-person associations with positive and negative affect and stress. Initial between-person analyses indicate that mobility is only weakly related to indicators of physical and mental health. We propose that the health- and well-being implications of mobility more strongly play out in daily life and at the within-person level, and will examine general health, cognitive ability, and marital status as intrinsic capacity moderators accounting for some of the expected interindividual heterogeneity.

NEIGHBORHOOD ENVIRONMENT, INTRINSIC CAPACITY AND 4-YEAR LATE-LIFE FUNCTIONAL ABILITY TRAJECTORIES

Shiyu Lu, Yuqi Liu, Yingqi Guo, Hung Chak Ho, Hiu Kwan Chui, Chris Webster, Lai Har Chiu, and Terry YS Lum, *The University of Hong Kong, Hong Kong, Not Applicable, Hong Kong*

Knowledge on how intrinsic capacity (IC) and neighbourhood physical environment shape functional ability (FA) trajectories in later life remains understudied. We investigated the 4-year trajectories of IC and their impact on FA trajectories, and the associations between neighbourhood physical environments and FA trajectories over time among older adults. We conducted a four-wave longitudinal study from 2014-2017 in Hong Kong with 2,081 adults aged 65 and above. FA was assessed by The Chinese Lawton Instrumental Activities of Daily Living. We used cognition, affect, locomotion, sensory capacity, and vitality to capture multi-domains of IC. Neighbourhood physical environment attributes included green space, land use diversity, and facilities availability, assessed within 200- and 500-meter buffers of respondents' homes. IC and FA each decreased significantly over time. Individuals with declines in IC experienced faster declines in FA over time. Green space, the number of leisure facilities and public transport slowed the decreasing FA rate.

ASSOCIATIONS BETWEEN NEIGHBORHOOD ENVIRONMENTS AND DEPRESSIVE SYMPTOMS OF OLDER ADULTS

Yuqi Liu, Shiyu Lu, Yingqi Guo, Hung Chak Ho, Hiu Kwan Chui, Chris Webster, Lai Har Chiu, and Terry YS Lum, *The University of Hong Kong, Hong Kong, Not Applicable, Hong Kong*

Little is known about the accumulative impacts of neighbourhood physical environments on depression among older adults. Based on a cohort study of 2,081 older adults in Hong Kong, this study examined longitudinal relationships between neighbourhood physical environments and depressive symptoms among older adults and the moderating effects of the slope of terrain and individual functional ability using latent growth curve modelling. Results indicated that the availability of community centres and passive leisure facilities reduced depressive symptoms over time. The protective effects of residential surrounding greenness on depressive symptoms among older adults differed by the slope of terrain. Longitudinal associations between neighbourhood physical environments and depressive symptoms varied between older adults with and without functional limitations. Identifying environmental barriers and applying targeted residential environment interventions are essential.

ENVIRONMENTAL COGNITION AND MENTAL HEALTH: PHYSICAL ACTIVITY AND PLACE ATTACHMENT AS PATHWAYS

Yingqi Guo, Shiyu Lu, Yuqi Liu, On Fung Chan, Hiu Kwan Chui, and Terry YS Lum, *The University of Hong Kong, Hong Kong, Not Applicable, Hong Kong*

Few studies have explored the underlying pathways between environment cognition (i.e., perception of environment) and mental health in older adults. We tested the mediation effects of physical activity and place attachment

in the relationship between environmental cognition and mental health, based on a survey study of 1,553 older adults in Hong Kong using structural equation model. The results showed that significant relationship between negative environmental cognition (i.e., residing in higher accessible area but perceive lower) on access to convenient stores, leisure facilities, clinics, community centers, religious places and lower mental health can be explained by lower daily average physical activity time. Place attachment can significantly mediate the positive effect of positive environmental cognition (i.e., residing in lower accessible area but perceive higher) towards all types of services on mental health. Findings from this study have policy implication for urban planning and age-friendly community design

NEIGHBORHOOD PHYSICAL ENVIRONMENT AND COGNITION IN LATER LIFE: A CROSS-SECTIONAL STUDY IN HONG KONG

On Fung Chan, Yuqi Liu, Yingqi Guo, Shiyu Lu, Hiu Kwan Chui, Lai Har Chiu, Chris Webster, Terry YS Lum, *The University of Hong Kong, Hong Kong, Not Applicable, Hong Kong*

This study examined the association between neighbourhood physical environment and cognition among community-dwelling older people and identifies whether this association varies among different older age groups. Data came from a cross-sectional survey data with 2,081 older people living in 12 public housing estates in Hong Kong. We merged individual data with neighbourhood physical environment data from community audit and GIS. Multivariable linear regression model was used. Young-old who resided in neighbourhoods with a higher land use mix and more public transport terminals, were associated with better cognition. Only the number of community centres was positively associated with the cognition for old-old. A curvilinear association was found between cognition and the number of active leisure facilities in the overall sample and young-old. Our findings could inform urban planners and policymakers on planning community facilities and physical environments based on the needs of older people in different age groups.

Session 4160 (Symposium)

THE RATIONAL USE OF HORMONE REPLACEMENT THERAPY IN OLDER ADULTS

Co-Chair: Jennifer Mammen

Co-Chair: Eleanor Simonsick

Discussant: Eleanor Simonsick

Multiple hormone levels are lower in older compared to younger adults, but the clinical implications are controversial. Lower thyroid hormone, testosterone, estrogen and vitamin D are variously associated with metabolic syndrome, sarcopenia, low bone density and cognitive decline, for which treatment has been recommended in the past. However, evidence from the T Trials of testosterone therapy failed to show benefit for endpoints other than sexual function. In the Women's Health Initiative, a large RCT of estrogen replacement in older women, found evidence of an interaction between estrogen therapy and metabolic risk factors such as diabetes that actually exacerbates risk of cognitive decline. Longitudinal observation of thyroid hormone and thyrotropin patterns in

the Baltimore Longitudinal Study of Aging demonstrate heterogeneity that might account for a lack of benefit in studies of treatment for subclinical hypothyroidism in older adults. At the same time, new data suggest the need for a more aggressive threshold for vitamin D in older adults, with a lower threshold associated with a drop in physical function compared to younger adults. Complexity in the regulation of hormonal pathways and the downstream effects on target tissues means multiple individuals with similar hormone levels may have different underlying physiology, with divergent clinical needs. Changes in activity and diet common during aging, and exacerbated by the pandemic, lead to physical and mood changes associated with hormonal dysfunction in popular culture and patient requests for evaluation. The ultimate goal should be personalized treatment decisions based on comprehensive evaluation and pathophysiology.

THE MANY FACES OF ELEVATED TSH: WHEN TO AVOID THYROID HORMONE THERAPY IN OLDER ADULTS

Jennifer Mammen,¹ Enoch Abbey,¹ John McGready,² Luigi Ferrucci,³ and Eleanor Simonsick,⁴ 1. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*, 2. *Johns Hopkins University Bloomberg School Of Public Health, Baltimore, Maryland, United States*, 3. *National Institute on Aging, Baltimore, Maryland, United States*, 4. *National Institute on Aging/NIH, Baltimore, Maryland, United States*

We have previously demonstrated that hypothalamic-pituitary-thyroid axis aging is characterized by several distinct patterns. An elevated thyrotropin (TSH) level (mean 5.6mIU/L) with normal free thyroxine (FT4) was present in 75 BLSA participants with at least 3 visits. Twenty-one percent had an historical pattern consistent with primary gland failure, while 13% had a pattern consistent with an HPT response to stressors (aging-adaptation). The remainder had intermediate patterns of change. FT4 >0.92pg/ml identified those in whom TSH elevations occurred with aging-adaptation with a 90.0% sensitivity and 93.8% specificity, indicating no need for therapy. In addition, among 597 participants with stable TSH levels in the reference range, being on thyroid hormone therapy increased mortality risk (IRR=1.8; 95% CI 0.9-2.1). Thus, including FT4 in the diagnostic criteria for hypothyroidism in older adults could target therapy to avoid the potential harm of reversing the aging adaptations in those who do not have true early hypothyroidism.

SEX-SPECIFIC 25-HYDROXYVITAMIN D THRESHOLD CONCENTRATIONS FOR FUNCTIONAL OUTCOMES IN OLDER ADULTS

Michelle Shardell,¹ Jack Guralnik,² Eleanor Simonsick,³ Stephen Kritchevsky,⁴ and Peggy Cawthon,⁵ 1. *University of Maryland School of Medicine, Baltimore, Maryland, United States*, 2. *University of Maryland, Baltimore, Baltimore, Maryland, United States*, 3. *National Institute on Aging/NIH, Baltimore, Maryland, United States*, 4. *Wake Forest School of Medicine, Winston Salem, North Carolina, United States*, 5. *California Pacific Medical Center, San Francisco, California, United States*

25-Hydroxyvitamin D [25(OH)D] has extra-skeletal effects, but it is not known whether the minimum sufficient

serum levels for such targets, like muscle, differ from those for bone health (typically recommended at 20 or 30 ng/dL). Therefore, we derived and validated sex-specific thresholds for serum 25(OH)D predictive of poor physical function using 5 cohorts comprising 16,388 community-dwelling older adults (60.9% women). Using a cohort-stratified random two-thirds sample, we found incident slow gait was best discriminated by 25(OH)D<24.0 versus 25(OH)D≥24.0 ng/mL among women (Relative Risk=1.29; 95% CI 1.10-1.50) and 25(OH)D<21.0 versus 25(OH)D≥21.0 ng/mL among men (RR=1.43; 95% CI 1.01-2.02). Estimates from the remaining one-third validation sample were similar. Empirically identified and validated sex-specific 25(OH)D thresholds from multiple well-characterized cohorts of older adults may yield more biologically meaningful definitions in important sub-populations. Such thresholds may serve as candidate reference concentrations or inform design of vitamin D intervention trials in older adults.

TESTOSTERONE THERAPY FOR MEN WITH AGE-RELATED LOW TESTOSTERONE: TEMPEST IN A TEACUP

Shehzad Basaria, *Harvard Medical School, Boston, Massachusetts, United States*

Serum testosterone concentrations decrease in men with age, but benefits and risks of raising testosterone levels in older men remain controversial. In the T-Trials, a total of 790 men, age 65 and older, with a serum testosterone concentration of < 275 ng/dL and symptoms of sexual dysfunction, fatigue or physical dysfunction were randomized to either testosterone gel or placebo gel for 1 year. Treatment in the testosterone arm increased serum testosterone levels to the mid-normal range for young men. Testosterone replacement was associated with a significant increase in sexual activity (p < 0.001), libido and erectile function. In contrast, there was no improvement in vitality or physical function. Adverse findings included increases in non-calcified plaque formation and a higher rate of prostate events. In sum, testosterone treatment in older men was associated with modest benefits, while the risk on prostate and cardiovascular health remain unclear.

ASSOCIATIONS BETWEEN ENDOGENOUS ESTROGEN, POSTMENOPAUSAL HORMONE THERAPY, AND COGNITIVE CHANGES IN OLDER WOMEN

Mark Espeland, and Christina Huggenschmidt, *Wake Forest School of Medicine, Winston-Salem, North Carolina, United States*

How markers of brain health are associated with endogenous estrogen and use of postmenopausal hormone therapy (HT) varies depending on women's years from menopause and metabolic health status, ranging from potential benefit to harm. The Women's Health Initiative (WHI) included 7,233 women age 65-80 who underwent a randomized clinical trial of various HT preparations for an average of 5.9 years. Over up to 18 years of post-trial follow-up, diabetes (DM2) increased the risk of dementia (hazard ratio [HR] 1.54 [95% CI 1.16-2.06]). Having DM2 and also treatment with unopposed conjugated equine estrogens increased the risk to HR=2.12 [1.47-3.06]. We hypothesize

that the metabolic effects of estrogen in the brain drives this interaction. In support of this, the metabolic transition following menopause may alter the impact of other treatments on cognition, for example behavioral weight loss therapy to treat obesity in women with type 2 diabetes (interaction $p=0.02$ for executive function).

Session 4165 (Symposium)

WELL-BEING AMONG AGING WOMEN: OBSERVATIONS FROM THE WOMEN'S HEALTH INITIATIVE STUDY (WHI)

Chair: Barbara Cochrane

Discussant: Barbara Cochrane

Previous efforts to assess well-being in relation to health have relied on descriptive analyses of hedonic or eudaemonic well-being indicators. Factor scores from principal components analysis offer a summary measure of well-being, but limited interpretability in epidemiologic analyses, e.g. estimated risk ratios. Use of latent class analysis to identify groups differing by levels of both hedonic and eudaemonic indicators preserves information about both dimensions while supporting interpretation of well-being effects on health indicators important for studying older women's health. For this symposium, we report on analyses to: (1) Develop a multi-dimensional profile of well-being that would preserve the individual dimensions of well-being (hedonic, eudaemonic) using latent class analysis; and (2) Support epidemiologic analyses of well-being as both an outcome and a predictor of health outcomes, enhancing interpretability of levels of well-being across various dimensions. Data on well-being in over 80,000 older women in the Women's Health Initiative Study were obtained in 2011-2012, along with their baseline demographic characteristics in 1993-1998. All-cause mortality included death from any cause occurring from 2012-2020. Four classes of well-being were identified: (1) lowest hedonic and eudaemonic well-being scores; (2) higher hedonic/lower eudaemonic scores; (3) lower hedonic/higher eudaemonic scores; and (4) highest hedonic and eudaemonic scores. Results will be presented in three papers addressing the development of the well-being profile; relationships of the profile with predictors of well-being; and the relationship of the profile to all-cause mortality. The discussion will focus on future research questions, such as likely factors mediating well-being and health outcomes.

ASSESSING WELL-BEING AMONG AGING WOMEN: OBSERVATIONS FROM THE WOMEN'S HEALTH INITIATIVE

Kenneth Pike,¹ Eileen Rillamas-Sun,² Barbara Cochrane,¹ and Nancy Woods,¹ 1. *University of Washington, Seattle, Washington, United States*, 2. *Fred Hutchinson Cancer Research Center, Seattle, Washington, United States*

Our aim was to develop a profile of well-being preserving the ability to estimate differential effects of both hedonic and eudaemonic dimensions of well-being on health outcomes. Numerous indicators of well-being from over 80,000 aging women included hedonic (enjoyment of life, happiness, satisfaction with life, quality of life) and eudaemonic (personal growth, purpose in life, environmental mastery, control, self

mastery) dimensions. Using latent class analysis, we identified groups of women with distinct profiles of well-being. A four-class solution had both good statistical fit and made conceptual sense. Class 1 ($n=9,146$, 11%) had the lowest scores on hedonic and eudaemonic indicators, while Class 4 ($n=38,246$ 47%) had the highest levels of all well-being indicators. Class 2 ($n=7,106$, 9%) had higher hedonic and lower eudaemonic scores and Class 3 ($n=26,650$, 33%) had lower hedonic and higher eudaemonic scores. These classes form a well-being profile useful for estimating differential effects on health outcomes.

PREDICTORS OF CLASSES OF WELL-BEING AMONG AGING WOMEN

Nancy Woods,¹ Eileen Rillamas-Sun,² Barbara Cochrane,¹ and Kenneth Pike,¹ 1. *University of Washington, Seattle, Washington, United States*, 2. *Fred Hutchinson Cancer Research Center, Seattle, Washington, United States*

Our aim was to examine the relationship of predictors of well-being from prior studies to the well-being profile developed from data from aging WHI participants. Class 1 included women with both low hedonic and eudaemonic well-being scores, class 4 with the highest scores. Classes 2 and 3 had moderate scores, with class 2 having higher hedonic and lower eudaemonic scores and class 3 having lower hedonic and higher eudaemonic scores. We examined associations between predictors and well-being classes. Youngest women were in Class 4 (mean=60.2 years) and oldest in Class 3 (mean=63.2). African American women had higher proportions in in Classes 2 and 3, Latinas in Classes 1 and 3, and Asian/Pacific Islanders in Class 3. College graduates, married women and those with household incomes $> \$50,000$ were most likely in Class 4. Associations with age, race/ethnicity, education, marital status and income were consistent with prior analyses incorporating individual well-being indicators.

WELL-BEING AND ALL-CAUSE MORTALITY IN AGING WOMEN IN THE WOMEN'S HEALTH INITIATIVE (WHI)

Eileen Rillamas-Sun,¹ Kenneth Pike,² Barbara Cochrane,² and Nancy Woods,² 1. *Fred Hutchinson Cancer Research Center, Seattle, Washington, United States*, 2. *University of Washington, Seattle, Washington, United States*

To study the relationship between well-being and all-cause mortality, we estimated mortality among women in four classes of well-being using the well-being profile from the Women's Health Initiative Study (WHI). Demographic characteristics were self-reported at enrollment (1993-98). All-cause mortality included death from any cause between 2012-2020. We used logistic regression to examine all-cause mortality risk across the classes, using Class 4 (highest hedonic and eudaemonic well-being scores) as the referent, adjusting for age and race. Compared to Class 4, all other classes had higher age- and race-adjusted odds of death. Highest risks were in Class 1 women (OR=2.61; 95% CI: 2.46-2.76) and Class 3 women (OR=1.62; 95% CI: 1.55-1.68). Women in Class 4 had the lowest risk of all-cause mortality over an 18-year follow-up. These results confirm the utility of a profile of well-being for predicting all-cause mortality while preserving ability to identify the differences among well-being indicators across classes.

Session 4167 (Symposium)

RECRUITMENT AND RETENTION IN DIVERSE COHORTS: LESSONS FROM COMMUNITY-ENGAGED EFFORTS

Chair: Carrie Nieman

Co-Chair: Haera Han

Discussant: George Rebok

Effective behavioral interventions and associated trials reflect the complexity and context of the communities with which they are tailored and the behaviors they seek to address. Community-engaged methodology can serve to capture these complexities, particularly when focusing on health inequities. Significant health and healthcare disparities persist among racial/ethnic minorities and representation of racial/ethnic minorities is lacking within trials that reflects the diversity of the U.S. population. Novel approaches are needed to increase the diversity of participants within behavioral intervention research. This symposium covers the unique barriers and facilitators related to recruitment and retention across a range of populations, including African American and Hispanic/LatinX older adults with hearing loss to diverse dementia family caregivers and community-dwelling Korean American older adults. Beyond the challenges and opportunities, the symposium will focus on effective recruitment strategies. The discussion will include 1) findings from 10 years of recruiting older Korean Americans into community-based trials, 2) lessons in tailoring recruitment efforts to dementia family caregivers, 3) the integration of human-centered design into a community-engaged hearing care intervention targeting low-income and African American older adults, 4) successful recruitment and retention efforts in a community-based participatory research trial in a borderlands community, and 5) the deployment of strategies to recruit Latino, Asian, and African American older adults with depression and anxiety in the setting of the COVID-19 pandemic. This symposium seeks to build the evidence related to recruitment of older racial/ethnic minorities in diverse settings, which is fundamental to addressing health inequities through behavioral intervention research.

COMMUNITY ENGAGEMENT AND HUMAN-CENTERED DESIGN: LESSONS FROM HEARS IN INCLUSIVE RECRUITMENT OF OLDER ADULTS

Carrie Nieman,¹ Hae-Ra Han,² Nicole Marrone,³ Jonathan Suen,⁴ Sarah Szanton,⁵ Jami Trumbo,⁶ and Frank Lin,⁷ 1. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*, 2. *Johns Hopkins School of Nursing, Baltimore, Maryland, United States*, 3. *University of Arizona, Tucson, Arizona, United States*, 4. *Johns Hopkins University School of Nursing, Baltimore, Maryland, United States*, 5. *Johns Hopkins University, Baltimore, Maryland, United States*, 6. *Cochlear Center for Hearing & Public Health, Baltimore, Maryland, United States*, 7. *Johns Hopkins University, Johns Hopkins University, Maryland, United States*

Within hearing care, significant disparities persist despite the highly prevalent nature of age-related hearing loss and relatively few trials include representation of racial/ethnic minorities. HEARS is an affordable, accessible hearing care intervention delivered by older adult peer mentors. The HEARS randomized controlled trial (NCT03442296)

is a community-engaged RCT with an embedded human-centered design practitioner. Recruitment efforts occurred over 18 months in partnership with 13 affordable housing and social centers. The cohort (n=151) includes 43% (n=65) who self-identify as African American and 63.6% (n=96) with <\$25,000 annual household income. The cohort represents the largest to-date of African American and low-income older adults with hearing loss. Recruitment efforts entailed 470.5 staff hours and \$4,917.26 in supplies, equating to 1.4 hours and \$14.13 per 1 individual screened and 3.1 hours and \$32.56 for 1 participant randomized. Community-engaged research, partnered with human-centered design, may offer critical approaches to increasing representation within behavioral intervention trials.

COMMUNITY-ENGAGED STRATEGIES FOR RECRUITMENT OF KOREAN AMERICANS IN COMMUNITY-BASED RESEARCH STUDIES

Haera Han,¹ Hochang Lee,² and Miyong Kim,³ 1. *Nursing, Baltimore, Maryland, United States*, 2. *University of Rochester, Rochester, New York, United States*, 3. *School of Nursing, The University of Texas at Austin, Austin, Texas, United States*

With increasing numbers of researchers targeting ethnic minorities to address health disparities, it is important to address the unique needs of Korean American (KA) older adults—a “hard to reach” yet one of the most rapidly increasing ethnic and age groups in the nation. The purpose of this paper is to describe the main barriers to research participation and to identify facilitators for recruitment of older KAs. We have analyzed recruitment data pertaining to more than 10 community-based KA research studies we have conducted for the last ten years. There were a number of unique recruitment challenges in regard to the culture, language, and sociodemographic characteristics of the participants. Examples of effective recruitment strategies included: aligning the research agenda with the priorities of the community; establishing collaboration with ethnic churches and ethnic media; recruiting and training bilingual volunteers and community health workers; and placing liaison research staff in the community.

PRIORITIZING COMMUNITY IN RESEARCH DECISION-MAKING THROUGH PARTNERSHIP

Nicole Marrone,¹ Maia Ingram,¹ Aileen Wong,¹ Rosie Piper,² Sonia Colina,¹ Scott Carvajal,¹ and Laura Coco,¹ 1. *University of Arizona, Tucson, Arizona, United States*, 2. *Mariposa Community Health Center, Nogales, Arizona, United States*

In behavioral intervention research, taking a community-based participatory research approach enhances recruitment and retention while facilitating the transfer of research findings into social change. Successes with recruitment and retention are secondary to enacting fundamental principles of trust, reciprocity, cultural humility, empowerment, and respect. This presentation will describe a longitudinal clinical trial in a Southwest borderlands community, Oyendo Bien. The study was co-developed and implemented with community partnership throughout the research process. Dyads were recruited to participate in a community-delivered group education and support program addressing hearing loss for Spanish-speakers age 50+ years (n=132 participants randomized). We highlight the critical role that community health workers (promotoras) held as members of the research team.

Furthermore, we describe an innovative approach for language mediation that integrates and empowers community participation. This presentation will include examples of lessons learned from the community in collaborating to conduct research in a way that truly serves.

RECRUITING DIVERSE DEMENTIA FAMILY CAREGIVERS: WHAT WORKS FOR WHICH GROUPS?

Kyra Mendez,¹ Valerie Cotter,² and Hae-Ra Han,³ 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 2. *Johns Hopkins School of Nursing and School of Medicine, Baltimore, Maryland, United States*, 3. *Johns Hopkins School of Nursing, Baltimore, Maryland, United States*

The purpose of this presentation is to compare success of recruitment methods by race/ethnicity, age, and kinship of dementia family caregivers. We conducted a cross-sectional study and recruited a convenience sample of dementia family caregivers using community-based and online methods. Recruitment success was tracked through survey questions, direct referrals, and community event sign-ups. Using chi-squared statistics, we examined the success of each method by caregiver race/ethnicity, age, and relationship to person with dementia (kinship). There were significant differences in recruitment source based on race/ethnicity, age, and kinship ($P < .001$). Specifically, referrals and newspaper advertisements were most successful for recruiting older (54 years+), White, non-Hispanic, and spousal or child caregivers; community events and reputable websites for recruiting older, minority, child caregivers; ResearchMatch for recruiting younger, minority, child/grandchild caregivers; and social media for recruiting younger, White, non-Hispanic, and child caregivers. Findings support the importance of implementing tailored methods to reach diverse dementia caregivers.

COMMUNITY RECRUITMENT OF ASIAN, LATINO AND AFRICAN AMERICAN OLDER ADULTS WITH DEPRESSION SYMPTOMS DURING COVID-19

Irene Falgas Bague,¹ Ravali Mukthini,² Sahnah Lim,³ Aida Jimenez,⁴ Caroline Ferreira,² Sheri Lapatin Markle,² and Margarita Alegria,^{2,1} 1. *Massachusetts General Hospital, Harvard Medical School, Boston, Massachusetts, United States*, 2. *Disparities Research Unit, Massachusetts General Hospital, Boston, Massachusetts, United States*, 3. *New York University, New York, Massachusetts, United States*, 4. *Department of Psychology, University Of Puerto Rico - Rio Piedras/San Juan, Massachusetts, United States*,

Recruitment and engagement of racial/ethnic minority older adults in clinical trials is crucial to expand implementation of evidence-based interventions for disability prevention. Public Health measures to counteract COVID-19 pandemic have increased the challenges on reaching this population. This study seeks to comprehensively evaluate a set of recruitment strategies to enroll Latino, Asian and African American older adults with symptoms of depression and anxiety during the first year of a randomized clinical trial. A partnership of three academic sites across the U.S. (NYC, MA and PR) involving several collaborations with community agencies recruited racial/ethnic minority older adults using different strategies involving bilingual interviewers calling from hospital research dataset and community agencies' list

of clients, referrals from primary care providers or psychotherapy waitlist. In this presentation we will report various recruitment and retention data including individual and organizational predictors of successful recruitment as well as challenges across all three sites.

Session 4170 (Symposium)

KENT AND KLEEMEIER AWARD LECTURE AND PRESENTATIONS

Chair: Theresa Harvath

The Donald P. Kent Award lecture will feature an address by the 2020 Kent Award recipient, David Ekerdt, PhD, FGSA, of the University of Kansas. The Kent Award is given annually to a member of The Gerontological Society of America who best exemplifies the highest standards of professional leadership in gerontology through teaching, service, and interpretation of gerontology to the larger society. The Robert W. Kleemeier Award lecture will feature an address by the 2020 Kleemeier Award recipient, Matt Kaerberlein, PhD, FGSA, of the University of Washington. The Kleemeier Award is given annually to a member of The Gerontological Society of America in recognition for outstanding research in the field of gerontology.

TARGETING BIOLOGICAL AGING: A NEW PARADIGM FOR 21ST CENTURY MEDICINE

Matt Kaerberlein, *University of Washington, North Bend, Washington, United States*

Biological age is the greatest risk factor for nearly every major cause of death and disability, including COVID-19. Yet, traditional biomedical research and clinical approaches have focused on waiting until people are sick and treating individual diseases one at a time. Attempts to "cure" age-related diseases have proven unsuccessful, and the impact of "disease-first" approaches continue to be incremental. Recent advances in understanding them mechanisms linking biological aging to disease, or geroscience, have identified interventions that directly target the molecular hallmarks of aging. Unlike disease-specific approaches, such interventions have the potential to prevent multiple diseases of aging simultaneously, thereby greatly enhancing healthspan and lifespan for most individuals. Here I will provide an overview of translational geroscience, which I believe will become the paradigm for the practice of medicine in the 21st century. I will also discuss recent work with one such intervention, the drug rapamycin, and our efforts to eventually delay or reverse biological aging in companion dogs and people.

AGING AS READINESS AND WARINESS

David Ekerdt, *University of Kansas, Lawrence, Kansas, United States*

Gerontology concerns itself with events in time, either things that have happened or things that may happen. In the former, our work is to describe and explain. In the latter, the occurrence of events is unknowable, but we can nonetheless study people's imagination of them (how it arises) and how that imagination shapes behavior and attitudes in the present (how it matters). The subjective experience of aging, thus, is one of looking ever forward—welcoming, waiting for, or hoping to avoid what the future may hold. This personal

experience of aging toggles between readiness and wariness of the time ahead, one stance incurring or else eclipsing the other. Transitions are fruitful opportunities to study people's readiness and wariness toward the time ahead, for example, widowhood, the prospect of retirement, and residential relocation. This is when people are more likely to conjure, in their minds, whom they may become. Arguably, the fundamental transition that looms and occupies aging minds (and the minds of loved ones) is not death but rather the potential passage into the "fourth age" of frailty and vulnerability. This prospect hovers above all else: its occurrence increasingly likely but its timing uncertain. About this prospect, gerontology has the capacity, nay the obligation, to promote narratives about later life that shape wariness and readiness for the practical future (e.g., financial matters, bodily care, living arrangements) as well as for the emotional reception of an old age coming ever closer.

Session 4175 (Symposium)

ADAPTIVE CARE AND REMOTE TRAINING: MODELS OF RESILIENCE FOR GWEPs DURING A PANDEMIC

Chair: Max Zubatsky

Service and training are interconnected for GWEP's, whose dual missions are to advance training as well as service delivery to improve the care of older adults. The COVID-19 pandemic has necessitated a pivoting from in-person to remote delivery of program content and services. As a result, older adults and their families require the continuity of services with their providers due to the barriers that the pandemic has created. Additionally, universities and organizations have adapted virtually to teach learners how to work with older adults around different health initiatives. The pandemic required these programs to develop immediate services that provided an alternative to remote delivery services. This collection of GWEP programs utilized students and trainees in their older adult services and initiatives. The goal of this symposium is to demonstrate new models of educational and program delivery to enhance and extend training and service to new audiences. The symposium centers on best practices including technological tools to promote GWEP aims and will allow a discussion of challenges and outcomes faced. The session will be comprised of presentations from five university-based, Geriatric Workforce Enhancement Programs (approximately 12 minutes each), a 20 minute discussion and sharing of best practices, and a 10 minute question/answer session. Individual presentations will address areas that include: 1.) group interventions for dementia and caregivers, 2.) teaching interdisciplinary interns in conducting telehealth visits, 3.) adapting geriatrics regional conferences to reach older adults virtually, and 4.) Developing new programs and services for underserved and underrepresented older adult populations.

SAINT LOUIS UNIVERSITY GWEP PIVOTS TO VIRTUAL SERVICE DELIVERY: LESSONS LEARNED

Marla Berg-Weger,¹ Max Zubatsky,² and John Morley,³

1. *Saint Louis University, Saint Louis, Missouri, United States*,
2. *Medical Family Therapy Program, Saint Louis University, Missouri, United States*, 3. *Division of Geriatric Medicine, Saint Louis University School of Medicine, Missouri, United States*

In response to the COVID-19 pandemic, Saint Louis University GWEP quickly pivoted service initiatives to online formats. Despite challenges of technology literacy and access, GWEP faculty, staff, and students creatively adapted in-person programming to online delivery and developed new virtually-delivered services. These service delivery adaptations provided opportunities for educating students, residents, faculty, community partners, and older adults and their caregivers to gain new knowledge and skills while continuing to participate in programming. This presentation will highlight innovations in the area of services to persons with dementia through Cognitive Stimulation Therapy, caregivers through education and support programs, older adults experiencing loneliness and social isolation through Circle of Friends, and older adults and caregivers through a virtual geriatric assessment clinic. We share highlights here of our efforts to pivot programming, access new funding streams, and, in some cases, create online delivery, including valuable lessons learned.

SUCCESSES AND LESSONS LEARNED IN MOVING ALL EDUCATION AND SERVICE ACTIVITIES TO VIRTUAL LEARNING AND SERVICES

Sam Cotton,¹ Anna Faul,² Pamela Yankeelov,² Barbara Gordon,³ and Joseph D'Ambrosio,² 1. *University of Louisville Trager Institute, University of Louisville Trager Institute, Louisville KY, Kentucky, United States*, 2. *University of Louisville, University of Louisville, Kentucky, United States*, 3. *University of Louisville, Louisville, Kentucky, United States*

Despite technology challenges, the UofL GWEP was able to provide access to quality care during the pandemic by pivoting all health and behavioral health patient appointments to telehealth. We found being flexible and using technology patients were most familiar with, was the most successful way easing into telehealth. We trained providers in a variety of technology tools and modalities to support this flexibility. We implemented a remote patient monitoring program and a virtual friendly visitors' program for our most vulnerable patients. Our workforce development focus supported us in teaching our 60+ interdisciplinary interns how to conduct telehealth visits, how to collaborate as an interdisciplinary team in managing the remote patient monitoring program, and how to do virtual case conceptualization and care planning meetings. To re-create the dynamic atmosphere of an interprofessional learning experience, we have paired students together in teams, and provide them with regular opportunities to meet and engage.

REIMAGINING TRAINING DURING A PANDEMIC: THE EXPERIENCE OF MIDDLE TENNESSEE GWEP

Shana Rhodes,¹ and James Powers,² 1. *Vanderbilt University Medical Center, Nashville, Tennessee, United States*, 2. *Vanderbilt University, Nashville, Tennessee, United States*

A major component of The Middle Tennessee GWEP involves delivery of an annual regional geriatrics update conference. Formerly in-person, the planning committee transformed the 34th Annual Update Conference to a virtual platform within a six-month period. The University partner provided a Zoom platform with licensing and training of program staff. National marketing was achieved through professional societies and purchased e-mailings. Participants numbered 79, including 8 disciplines. Presenters were

instructed on platform techniques including screen sharing, polling function, and breakout rooms to enhance audience participation. REDCap registration captured demographic information and facilitated evaluations and post-attendance intention-to-change surveys. Lessons learned were shared with community partners and advisory board members who demonstrated changes in service delivery models and training of new staff to support care to greater numbers of clients and participants. Virtual platforms can extend outreach for valuable learning and service outcomes and maintain high levels of satisfaction among target audiences.

NEW NETWORKS, NEW CONNECTIONS: GERIATRIC STUDENT SCHOLARS EMBRACE ADAPTIVE LEARNING

Robin McAtee, *University of Arkansas for Medical Sciences, Little Rock, Arkansas, United States*

The Arkansas Geriatric Education Collaborative (AR's GWEP) embraces, nurtures, and encourages students with a passion for caring for older adults. Each year five geriatric scholars are chosen from across the spectrum of health services schools (MD, RN, PT, PA, Pharm D, dental hygiene, etc.) to enhance their geriatric knowledge and experience. Requirements focus on geriatric academic and community-based opportunities. However, these opportunities drastically changed with the pandemic. Therefore, the students became very innovative as they trudged forward to meet and exceed the scholar objectives. They participated in various virtual events to fulfil their academic and community participation requirements. They worked together to develop and implement an interdisciplinary final project that marketed to and engaged rural isolated older adults in a fun educational event aimed at preventing social isolation in older adults and caregivers. Students learned how to connect to and bridge the digital divide with isolated rural older adults.

BRIDGING DIGITAL DIVIDES: GWEP PIVOTS TO SUPPORT TELEHEALTH FOR CLINICAL CARE AND EDUCATION

Jung-Ah Lee,¹ Lisa Gibbs,² Julie Rousseau,³ Sonia Sehgal,³ and Neika Saville,⁴ 1. *University of California, Irvine, Irvine, California, United States*, 2. *UC Irvine Health, UC Irvine Health, California, United States*, 3. *University of California, Irvine, Orange, California, United States*, 4. *Division of Geriatric Medicine and Gerontology, Orange, California, United States*

Early in the pandemic, the University of California, Irvine (UCI), GWEP pivoted to focus on building telehealth and remote patient monitoring, while supporting team-based interdisciplinary learners. Our Health Assessment Program for Seniors (HAPS) adapted to provide hybrid remote/in-person evaluations with our Geriatric Fellows and Doctor of Nurse Practitioner (DNP) students working alongside our multi-disciplinary team. Learner teams innovatively bridged the digital divide through weekly DNP support phone calls, and the Fellows delivered family conferences through Zoom. In ASSIST, medical students and nursing students gained digital competencies through a phone support system for isolated older adults with friendly weekly check-ins providing referrals to community resources. Another IRB-approved pilot, Healing at Home, diverted patients from the Emergency Room and In-Patient care with a team of ED, Hospitalists, Geriatricians

teaching DNP and Fellows telehealth management. GWEP successfully piloted symbiotic learning for both older adults and health profession students through new virtual formats.

Session 4180 (Paper)

Aging in the Community

FACTORS ASSOCIATED WITH DEFICIENT HOUSING AMONG COMMUNITY-LIVING OLDER ADULTS IN THE UNITED STATES

Safiyah Okoye,¹ Laura Samuel,¹ Sarah Szanton,¹ and Jennifer Wolff,² 1. *Johns Hopkins University, Baltimore, Maryland, United States*, 2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

Housing quality is a recognized social determinant of health. Qualitative evidence suggests the ability of older adults to maintain their homes is affected by the domains of financial resources, social environment, and functional abilities, but this conceptualization has not been tested quantitatively. This cross-sectional study examined associations between financial resources (indicated by socioeconomic characteristics: education, racial-status, annual income, financial hardship, Medicaid eligibility), social environment (living arrangement, social integration), and functional abilities (lower extremity performance, self-care disability, independent-living disability, homebound-status, dementia, depression) with deficient housing among 6,489 community-living adults ≥ 65 years participating in the nationally representative 2015 National Health and Aging Trends Study. Sampling weights accounted for study design and non-response. An estimated 9.2% (3.2 million) older Americans lived in housing with ≥ 1 deficiency (any peeling paint, evidence of pests, flooring in disrepair, broken windows, crumbling foundation, missing siding, or roof problems). In bivariate logistic regressions, factors from all three domains were associated with deficient housing. In a multivariable model that included all variables above and adjusted for age and sex, indicators of financial resources and social environment remained associated with deficient housing (including financial hardship, adjusted odds ratio (aOR)=1.48, 95% confidence interval (CI): 1.10,1.98; and living with non-spousal others versus alone, aOR=1.48; 95% CI:1.09, 2.03), whereas indicators of functional abilities did not. To ensure quality housing for all community-dwelling older adults, efforts that increase financial resources and further examine the role of social environment in deficient housing are needed.

NEIGHBORHOOD ENVIRONMENT AND CARDIOMETABOLIC DISEASE IN INDIVIDUALS AGING WITH PHYSICAL DISABILITY

Anam Khan,¹ Paul Lin,² Neil Kamdar,² Elham Mahmoudi,³ and Philippa Clarke,⁴ 1. *University of Michigan School of Public Health, Ann Arbor, Michigan, United States*, 2. *University of Michigan, Ann Arbor, Michigan, United States*, 3. *University of Michigan, Commerce Township, Michigan, United States*, 4. *Institute for Social Research, Ann Arbor, Michigan, United States*

The environment may be particularly important for facilitating participation and health for individuals aging with physical disability. However, little is known about

which features of the neighborhood are particularly pertinent for this population. This study aims to address this gap by examining the type(s) of neighborhood environments associated with cardiometabolic disease. We identified ~26,000 individuals with a diagnosis of physical disability using a national private health insurance claims database in the U.S. Geocoded information for individuals was used to assign them to features of their neighborhood from the National Neighborhood Data Archive. An adapted typology was used to classify neighborhoods into the following based on density of health-promoting and harming features: 1) High health-promoting/harming (service-dense), 2) High health-promoting/low harming, 3) Low health-promoting/high harming, 4) Low health-promoting/harming, and 5) Average. We used time-varying Cox models to estimate adjusted hazard ratios (HR) and 95% confidence intervals (CI) for time-to incident cardiometabolic conditions. High neighborhood-level affluence, and low disadvantage scores characterized service-dense neighborhoods. They had more than 2x higher density of health-promoting resources (e.g., transit) compared to other neighborhood types. Individuals residing in service-dense neighborhoods had an 8% lower risk of any cardiometabolic disease (HR 0.92, 95% CI: 0.85-0.99) compared to those in average neighborhoods. Similar effects were observed for Hypertension and Type 2 Diabetes, with effects most pronounced for the latter (HR 0.82, 95% CI: 0.71-0.94). For individuals aging with physical disabilities, service-dense neighborhoods may be protective against cardiometabolic morbidity. Findings can inform community design that support cardiometabolic health in this population.

NEIGHBORHOOD ENVIRONMENT AND SOCIAL SUPPORT RECEIVED: AN EXAMINATION OF RACE AND GENDER IN BALTIMORE CITY

Sol Baik,¹ Christine Mair,² Amanda Lehning,¹ Ji Hyang Cheon,³ Shari Waldstein,⁴ Michele Evans,⁵ and Alan Zonderman,⁶ 1. *University of Maryland, Baltimore, Baltimore, Maryland, United States*, 2. *University of Maryland, Baltimore County (UMBC), Baltimore, Maryland, United States*, 3. *University of Maryland, Baltimore County, University of Maryland Baltimore County, Maryland, United States*, 4. *University of Maryland, Baltimore County, Baltimore, Maryland, United States*, 5. *NIA, Baltimore, Maryland, United States*, 6. *HANDLS, Baltimore, Maryland, United States*

Social support in urban settings is likely shaped by the context of the neighborhood environment. Patterns of support may also differ by the type of support received as well as characteristics of the person receiving support. For example, women and Black residents may have stronger support networks compared to men and white individuals, and variation by gender and race in social support may have important implications for promoting well-being in disadvantaged neighborhoods. To investigate the presence of these potential patterns in a disadvantaged urban environment, we analyzed 2,553 Baltimore City residents (ages 30-64) from the baseline wave (2004-2009) of the Healthy Aging in Neighborhoods of Diversity across the Life Span (HANDLS) study. We tested associations between self-assessed neighborhood environment (disorder, cohesion, and control) and social support (from partners, children, and/or friends) and

further explored variation by intersections of race and gender using multi-group structural equation modeling. Our results suggest that individuals are more likely to receive support when they perceive their neighborhood to have higher social control and cohesion, particularly in terms of support from friends. Although interactions by race and sex were not statistically significant, a descriptive pattern emerged wherein Black women are particularly likely to receive support from multiple sources when they report more social control in their neighborhood. On the other hand, there is almost no association between neighborhood environment and social support for Black men. We discuss these findings in light of potential neighborhood inequities in informal support access in Baltimore City and similar urban settings.

RESIDENCE IN HUD HOUSING ASSOCIATED WITH GREATER BENEFIT FROM HCBS SERVICES FOR MEDICAID ENROLLEES IN PENNSYLVANIA

Damian Da Costa,¹ and Howard Degenholtz,^{2,1} 1. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2. *University of Pennsylvania, Pittsburgh, Pennsylvania, United States*

State Medicaid programs seek to shift the delivery of long-term care services away from institutional settings and toward community-based settings by expanding access to home-and-community-based services (HCBS). HCBS are hypothesized to prevent or delay the need for protracted nursing home stays. This study explores the question of which types of community residence maximize this protective effect of HCBS. We used a probabilistic matching technique to identify whether waiver-eligible Medicaid enrollees were likely to reside in project-based HUD housing in 2013. We applied multinomial logistic regression to observe the risk of long-stay nursing home admission (>100 days) relative to persistent community residence in the subsequent four years. Our model controlled for age, race, gender, urban status, and receipt of home-and-community based services. Our predictor of interest was the interaction between receipt of home and community based services (HCBS) and residence in HUD housing. The eligible baseline population included 152,632 community-residing Pennsylvania Medicaid enrollees in 2013. The analytic sample excluded individuals who died during 2013 or who were no longer waiver-eligible after 2013. Residence in HUD project-based housing while receiving HCBS is independently associated with a 27% percent reduction in risk of long-stay nursing home admission ($p = .01$) when controlling for individual-level demographics. No significant association was observed between the predictor of interest and risk of death during the follow-up period, suggesting that this finding is not likely confounded by individual health status. Further research should test whether this association is causal and specify possible mechanisms.

THE INTERSECTION OF DEMENTIA-FRIENDLY INITIATIVES AND AGE-FRIENDLY ENVIRONMENTS: THE INTEGRATION MODELS

Fei Sun,¹ Ha Neul Kim,¹ Lucas Prieto,¹ Stéfanie Fréel,² katrin Secher,² and Huali Wang,³ 1. *Michigan State University, East Lansing, Michigan, United States*, 2. *World Health Organization, Geneva, Geneva, Switzerland*, 3. *Peking University Institute of Mental Health (Sixth Hospital), Beijing, Beijing, China (People's Republic)*

While age friendly city (AFC) initiatives aim to build supportive physical and social environments for older adults, dementia-friendly initiatives (DFI) see the critical need of persons living with dementia (PWD) to be included in society. Given the close relationship between advanced age and dementia risk, communities facing challenges of aging and dementia will benefit from the integration of DFI and AFC. This study aims to summarize the differences between AFC and DFI practice and to identify integrative models for DFI and AFC based upon cases in the U.S.A and China. Qualitative interviews with 11 stakeholders from Massachusetts and Michigan of the U.S.A. and Beijing and Shanghai in mainland China were recorded via Zoom and transcribed for analyses in order to identify different integration models. A summary of differences and commonalities between AFC and DFI core values, key players, major activities, and outcomes is reported. Four practice models of AFC and DFI based upon case analyses were described as sequential integration, concurrent integration, sequential separation, and concurrent separation. Massachusetts' model is unique in the support from the state government to integrate both from the beginning, and Michigan witnessed separate efforts between grassroots-based agencies and the state government. Shanghai model represents a sequential integration that includes DFI in local government's long-term aging policy plan, while AFC and DFI in Beijing have a loose connection despite progress made for each initiative. Communities need to develop a practice model considering its local community needs, policy support, and sustainable resources available.

Session 4185 (Symposium)

CARE IN CONTEXT: DEMENTIA SUPPORT IN MEXICO AND THE UNITED STATES

Chair: Sunshine Rote

Co-Chair: Jacqueline Angel

Discussant: William Vega

Due to rapid demographic transitions, the number of people with dementia is rising in the Americas, and is expected to double in the coming decades, increasing from 14.8 million in 2030 to over 27 million by 2050. The burden of dementia is especially pronounced for the Mexican-origin population in Mexico and the U.S. For Mexico, financial support for older low-income citizens and medical care are universal rights, but limited fiscal resources and the needs of a large low-income population create inevitable competition for limited resources among the old and the young. Although the United States has a more developed economy and well-developed Social Security and health care financing systems for older adults, Mexican-origin individuals in the U.S. do not necessarily benefit fully from these programs. The institutional and financial problems are compounded in both countries by longer life spans, smaller families, as well as changing gender roles and cultural norms. Such changes affect the Mexican-origin population in particular because of a higher prevalence rates of cognitive impairment than other racial and ethnic groups, and the lower access to resources to provide care. In this GSA Symposium, the authors of four papers deal with the following topics as they relate to dementia care in Mexico and the United States: (1) living alone in late life; (2) living arrangements and dementia care; (3) the role

of non-governmental organizations in care; (4) next steps to address dementia care needs in the U.S. and Mexico.

WHEN STRANGERS BECOME FAMILY: THE ROLE OF CIVIL SOCIETY ORGANIZATIONS IN THE CARE OF OLDER PEOPLE

Ronald Angel,¹ and Veronica Montes De Oca,² 1. *UT Austin, UT Austin, Texas, United States*, 2. *UNAM, Mexico City, Distrito Federal, Mexico*

As in other nations, the aging of the population of Mexico presents many challenges specially in dependence. These social and political changes occur in the context of a series of interacting political, social and demographic transformations. At the end of the 20th and beginning of the 21st Centuries civil society organizations have begun to define a third sector. A growing desire of individuals to exercise more direct democracy, has accompanied the growth of identity politics and the rise of groups representing women, indigenous populations, racial and religious minorities, environmental interests, older persons, and others. These groups have changed public discourse and today give individuals greater capacity to demand their basic human and social rights. This paper reviews the impact of these changes on older people and multidimensional care.

DEMENTIA AND LIVING ARRANGEMENTS AMONG MEXICANS AND MEXICAN AMERICANS

Phillip Cantu,¹ Jiwon Kim,² Sunshine Rote,³ Silvia Mejia-Arango,⁴ Mariana López-Ortega,⁵ and Jacqueline Angel,⁶ 1. *Sealy Center on Aging, University of Texas Medical Branch, Texas, United States*, 2. *UT Austin, Austin, Texas, United States*, 3. *University of Louisville, Louisville, Kentucky, United States*, 4. *Department of Population Studies El Colegio de la Frontera Norte, Tijuana, Baja California, Mexico*, 5. *National Institute of Geriatrics, National Institutes of Health, Mexico City, Distrito Federal, Mexico*, 6. *UT Austin, UT Austin, Texas, United States*

This study compares the living arrangements of adults 85 and older in Mexican-origin adults in Mexico and the United States. The study uses 475 Mexican-Americans in five southwestern states (Hispanic Established Population for the Epidemiologic Studies of the Elderly, H-EPESE) and 1,710 Mexicans from 32 states in Mexico (Mexican Health and Aging Study, MHAS) to examine living alone vs living with others based on the presence of dementia controlling for demographic, health, and financial correlates. In both countries, more than 20% of respondents living alone have dementia. Dementia is associated with household extension in both countries. Homeownership increases household extension in Mexico but not the U.S. The findings show that individuals with dementia are more likely to live alone in the U.S. than in Mexico. Older individuals with dementia may be at elevated risk of isolation in later life if families or formal organizations cannot provide on-going assistance.

LIVING ALONE IN LATE LIFE

Jacqueline Torres, *University California San Francisco, San Francisco, California, United States*

Approximately one third of older adults in the United States (US) and 13% of older adults in Mexico live alone. In both countries, the prevalence of living alone is higher for

women and increases with advanced age; in the US, an estimated 4.3 million older adults continue to live alone with cognitive impairment or dementia. We will present research from the US and Mexico on the receipt of long-term services and supports and unmet needs for care among older adults living alone, including with cognitive impairment, as well as factors that may modify these outcomes. For the US, we will describe recent findings about the health, health care, and caregiving outcomes of older adults living alone vs. living with others during the COVID-19 pandemic.

FRAMING BINATIONAL CHALLENGES OF MENTAL AND COGNITIVE HEALTH CARE IN MEXICAN-ORIGIN OLDER ADULTS: CONSENSUS FINDINGS

Stephanie Grasso,¹ Flavia Andrade,²

Mariana López-Ortega,³ and Emma Aguila,⁴ 1. *University of Texas at Austin, The University of Texas at Austin, Texas, United States*, 2. *University of Illinois at Urbana-Champaign, University Of Illinois At Urbana-Champaign, Illinois, United States*, 3. *National Institute of Geriatrics, National Institutes of Health, National Institute Of Geriatrics, National Institutes Of Health, Distrito Federal, Mexico*, 4. *Sol Price School of Public Policy, University of Southern California, California, United States*

Growth in older populations, and hence in the number of persons living with dementia, is particularly rapid for individuals of Mexican origin living in the U.S. and Mexico. In order to identify influences on cognitive health in this diverse population, the University Texas at Austin and Mexican National Institute of Geriatrics (INGER) organized their second Bridging Conference titled: "Framing Challenges of Cognitive and Mental Health Care in Mexican-origin Older Adults in Mexico and the U.S". In this presentation, we highlight the results of a consensus-building session, during which bi-national expert opinions were generated and synthesized addressing gaps in research, knowledge, and policy, as well as the setting of priorities for immediate action and future research. Reducing barriers to adequate care for those aging-in-place with dementia was a central theme of the identified priorities. Critical areas of identified need, more specifically, included reducing social isolation, caregiver burden, and diminishing retirement income.

LIVING BEYOND 80: A LONGITUDINAL STUDY OF COGNITIVE AND IADL DISABLEMENT AMONG THE OLDEST MEXICAN AMERICANS

Jiwon Kim,¹ Jacqueline Angel,² and Sunshine Rote,³ 1. *UT Austin, Austin, Texas, United States*, 2. *UT Austin, UT Austin, Texas, United States*, 3. *University of Louisville, Louisville, Kentucky, United States*

Mexican Americans live longer on average than other ethnic groups, but often with protracted cognitive and physical disability. Little is known, however, about the role of cognitive decline for transitions in IADL disability and tertiary outcomes of the IADL disablement for the oldest old. We employ the Hispanic Established Populations for the Epidemiologic Study of the Elderly (2010-2011, 2012-2013, 2016, N=1,078) to investigate the longitudinal patterns of IADL decline using Latent Transition Analysis. Three IADL groups were identified: independent (developing mobility limitations), emerging dependence (limited mobility and community activities), and dependent (limited mobility and household and community activities). Declines in cognitive function were a consistent

predictor of greater IADL disablement, and loneliness was a particularly salient distal outcome for emerging dependence. These results highlight the social consequences of cognitive decline and dependency as well as underscore important areas of intervention at each stage of the disablement process.

Session 4190 (Paper)

Cognition, Sensory Impairment, and Communication

BILINGUALISM AND HEALTHY AGING: ONSET AGE OF BILINGUALISM AS A PREDICTOR OF OLDER ADULT THEORY OF MIND

W.Quin Yow,¹ Xiaolian Li,² and Jia Wen Lee,³ 1. *Singapore University of Technology & Design, Singapore, Singapore*, 2. *Singapore University of Technology and Design, Singapore, Singapore*, 3. *Singapore University of Technology & Design, Singapore University of Technology & Design, Singapore*

The ability to understand and speak more than one language (i.e., bilingualism) may protect against age-related cognitive deterioration (Abutalebi et al., 2015). While there is mounting evidence suggesting that bilingualism confers advantages in domain-general cognitive abilities in late adulthood (see Bialystok, 2017, for a review), few studies have investigated the influences of bilingualism on socio-cognitive abilities such as theory of mind (ToM) in the normal aging process. Thus, in this study, we examine how bilingualism factors (i.e., onset age of bilingualism, language balance, and diversity in language use) are associated with individual differences in ToM in healthy older adult bilinguals aged 58-79 (N=44). ToM abilities were assessed using the Theory-of-Mind Task Battery (Hutchins et al., 2008), where participants viewed vignettes and answered questions about the protagonists' cognitive and affective mental states. All participants completed a self-report language background questionnaire and the Montreal Cognitive Assessment (MoCA) test as a measure of general cognitive ability. Results revealed that better ToM was negatively correlated with participants' chronological age ($r=-.43$, $p=.004$) and the onset age of second-language acquisition ($r=-.41$, $p=.006$), but not language balance and diversity ($ps>.40$). Partial regression analyses showed that earlier onset age of bilingualism predicted better ToM performance ($\beta=-.40$, $p=.009$), even after controlling for age, education, and general cognitive ability. These findings suggest that bilingual language experience, particularly earlier exposure to a second language, may provide benefits to older adults in preserving their ability to understand others' mental states, acting as a cognitive reserve against age-related declines in socio-cognitive functions.

EXAMINING THE COMBINED ESTIMATED EFFECTS OF HEARING IMPAIRMENT AND DEPRESSION ON COGNITIVE DECLINE AND DEMENTIA

Danielle Powell,¹ Willa Brenowitz,² Kristine Yaffe,² Frank Lin,³ Alden Gross,⁴ and Jennifer Deal,¹ 1. *Johns Hopkins University, Baltimore, Maryland, United States*, 2. *UCSF, UCSF, California, United States*, 3. *Johns Hopkins University, Johns Hopkins University, Maryland, United States*, 4. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

Late-life depression is a comorbidity which may co-occur in older adults with hearing loss- each as prevalent and

independent modifiable risk factors for dementia. We used data from 1,820 participants (74 ± 2.8 years, 38% Black race) from the Health Aging and Body Composition Study to test if the hearing loss-dementia/cognitive decline (Modified Mini Mental State Exam[3MS] and Digit Symbol Substitution[DSST]) relationship differed in hearing impaired participants who also had depressive symptoms. Depressive symptoms were defined as CES-D $10 \geq 10$) at one or more visits from years 1-5. Algorithmic incident dementia defined using medication use, hospitalizations and cognitive test scores. Audiometric hearing loss was measured at year 5 and categorized as normal/mild vs \geq moderate loss. In linear mixed models adjusted for demographic and clinical covariates, presence of both hearing loss and depressive symptoms (vs. having neither) was associated with faster rates of decline in 3MS (-0.30 , 95% CI: -0.78 , -0.19) and DSST (-0.35 , 95% CI: -0.67 , -0.03) over 10 years of follow-up. Both hearing loss and depressive symptoms (vs. neither) was associated with increased risk (hazard ratio (HR): 2.91 , 95% CI: 1.59 , 5.33) of incident dementia in multivariable-adjusted Cox proportional hazards models. Comorbid conditions among hearing impaired older adults should be considered and may aid in dementia prevention and management strategies.

INHIBITORY CONTROL IN AGE-RELATED HEARING LOSS

Shradha Shende,¹ Lydia Nguyen,² Grace Rochford,³ and Raksha Mudar,³ 1. *University of Illinois Urbana-Champaign, Champaign, Illinois, United States*, 2. *iN 2. L, Denver, Colorado, United States*, 3. *University of Illinois-Urbana Champaign, Champaign, Illinois, United States*

Inhibitory control involves suppression of goal irrelevant information and responses. Emerging evidence suggests alterations in inhibitory control in individuals with age-related hearing loss (ARHL), however, few have specifically studied individuals with mild ARHL. We examined behavioral and event related potential (ERP) differences between 14 older adults with mild ARHL (mean age: 69.43 ± 7.73 years) and 14 age- and education-matched normal hearing (NH, mean age: 66.57 ± 5.70 years) controls on two Go/NoGo tasks: a simpler, basic categorization task (Single Car; SC) and a more difficult, superordinate categorization task (Object Animal; OA). The SC task consisted of exemplars of a single car and dog, and the OA task consisted of exemplars of multiple objects and animals. Participants were required to respond to Go trials (e.g., cars in SC) with a button press, and withhold responses on NoGo trials (e.g., dogs in SC task). Behavioral results revealed that ARHL group had worse accuracy on NoGo trials on the OA task, but not on the SC task. ARHL group had longer N2 latency for NoGo compared to Go trials in the simpler SC Task, but no differences were observed on the OA task between Go and NoGo trials. These findings suggest that more prolonged neural effort in the ARHL group on the SC task NoGo trials may have contributed to their ability to successfully suppress false alarms comparable to the NH group. Overall, these findings provide evidence for behavioral and neural changes in inhibitory control in ARHL.

NONVERBAL COMMUNICATION IN DEMENTIA FAMILY CAREGIVING: USING THE VNVIS-CG SCALE FOR IN-HOME VIDEO OBSERVATIONS.

Carissa Coleman,¹ Kristine Williams,² Kacie Inderhees,¹ and Michaela Richardson,¹ 1. *University of Kansas, Kansas City,*

Kansas, United States, 2. *University of Kansas School of Nursing, Kansas City, Kansas, United States*

Communication is fundamental for dementia care and identifying communication behaviors is key to identifying strategies that facilitate or impede communication. To measure caregiver nonverbal communication, we adapted the Verbal and Nonverbal Interaction Scale for Caregivers (VNVIS-CG) for second-by-second behavioral coding of video observations. The VNVIS-CG was adapted for computer-assisted Noldus Observer coding of video interactions captured at home by family caregivers from the FamTechCare clinical trial. Operational definitions for nonverbal communication behaviors were developed and inter-rater reliability was excellent (Kappa = .88) using two independent coders. Videos $N=232$ were coded featuring 51 dyads; caregivers who were primarily female (80%) spouses (69%) of men (55%) diagnosed with moderate to severe dementia (64.7%). Mean caregiver age was 65 years. Emotional tone conveyed by caregivers was primarily respectful, occurring 68.1% of the time, followed by overly nurturing (9%), bossy, harsh, or antagonistic (6.2%), and silence occurred 16.7 % of the time. Caregiver gestures and positive postures (i.e., animated facial expressions, head nodding, or caregiver body movements) were the most commonly occurring overt behaviors (46.5%), followed by changing the environment to help the PWD (19.9%), and expressing laughter/joy (18.9%). The least common nonverbal behaviors were negative posture, aggression, compassion, and rejecting. The adapted behavioral coding scheme provides a reliable measure that characterizes dementia caregiver nonverbal communication behaviors for analysis of video observations. Ongoing research will identify strategies that facilitate communication as well as determine how strategies vary by dementia stage, diagnosis, and dyad characteristics.

VERBAL COMMUNICATION IN DEMENTIA FAMILY CAREGIVING: USING THE VNVIS-CG SCALE FOR IN-HOME VIDEO OBSERVATIONS.

Kristine Williams,¹ Carissa Coleman,² Iman Aly,² and Paige Wilson,² 1. *University of Kansas School of Nursing, Kansas City, Kansas, United States*, 2. *University of Kansas, Kansas City, Kansas, United States*

Communication is fundamental for dementia care and identifying communication behaviors is key to identifying strategies that facilitate or impede communication. To measure caregiver verbal communication, we adapted the Verbal and Nonverbal Interaction Scale for Caregivers (VNVIS-CG) for second-by-second behavioral coding of video observations. The VNVIS-CG was adapted for computer-assisted Noldus Observer coding of video interactions captured at home by family caregivers from the FamTechCare clinical trial. Operational definitions for verbal communication behaviors were developed and inter-rater reliability was excellent (Kappa = .86) using two independent coders. Videos ($N=232$) were coded featuring 51 dyads; caregivers were primarily female (80%) spouses (69%) of men (55%) diagnosed with moderate to severe dementia (64.7%). Mean caregiver age was 65 years. Silence occurred most frequently (44.9% of the time), followed by caregiver direction or instruction (22.6%), and the person with dementia (PWD) verbalizing (22.8%). Caregiver communication also included asking questions (14.2%), verbalizing understanding (7.9%), repeating information (2.1%), affirmations (1.0%), acknowledging emotions (0.3%), and ignoring (0.0%). Questions most commonly requested clarification, showed interest, or repetitive quizzing;

few questions sought to engage PWD input (ex. offers choices, encourages emotional expression, or ask permission). Tone was overwhelmingly neutral rather than humorous, aggressive, or patronizing. The adapted behavioral coding scheme provides a reliable measure that characterizes dementia caregiver verbal communication behaviors for analysis of video observations. Ongoing research will identify strategies that facilitate communication as well as determine how strategies vary by dementia stage, diagnosis, and dyad characteristics.

Cognitive Impairment

Session 4195 (Paper)

EXAMINING THE GENDER DISPARITIES IN HEALTH SERVICE UTILIZATION AMONG OLDER ADULTS MANAGING COGNITIVE IMPAIRMENTS

Camille McKenzie,¹ and Patricia Findley,² 1. *Rutgers University--New Brunswick, New Jersey, United States*, 2. *Rutgers University--New Brunswick, Rutgers University--New Brunswick, New Jersey, United States*

Comorbid conditions can complicate healthcare access, yet little is known about the impact of cognition on accessing those services. This study aims to examine the effect of gender on health service utilization among the aging population. Data from the National Health Interview (2019) Survey (n=3,058) were utilized to assess the impact of gender on the use of physician and dental services among older adults managing cognitive impairments. We estimated logistic regression models controlling for demographic, health/physical functioning, and psychological predictors. Findings indicated older male respondents managing cognitive impairments were less inclined to utilize both physician (p<.05) and dental (p<.01) health services on a yearly basis as compared to their female counterparts. Household income (aOR = 0.62 [-0.91, -0.06]; aOR = 0.34 [-1.25, -0.90]) and health insurance coverage (aOR = 0.18 [-2.31, -1.13]; aOR = 0.32 [-1.68, -0.62]) respectively were the strongest structural factors limiting access to both physician and dental services, with lower levels of educational attainment (aOR = 0.46 [-1.00, -0.55]) being an additional barrier for dental service utilization. Respondents with low self-rated health were inclined to utilize physician more than dental services (aOR = 2.31 [0.38, 1.29]; aOR = 0.73 [-0.50, -0.14]). It is imperative geriatric practitioners adopt a more integrative approach to health, especially among the aging population managing chronic disabilities, where additional community supports are warranted to promote and maintain physical and oral health.

GREATER ADOLESCENT COGNITIVE ABILITY IS LINKED TO LOWER RISK OF COGNITIVE IMPAIRMENT IN LATER LIFE

Tara Gruenewald,¹ Catalina Zavala,² Molli Grossman,² Thalida Arpawong,² Jennifer Manly,³ Susan Lapham,⁴ Margaret Gatz,² and Carol Prescott,² 1. *Chapman University, Orange, California, United States*, 2. *University of Southern California, Los Angeles, California, United States*, 3. *Columbia University, Columbia University, New York, United States*, 4. *American Institutes for Research, American Institutes for Research, Virginia, United States*

There have been few investigations of the role that adolescent cognitive ability plays in predicting later-life cognitive

impairment, and the mechanisms, such greater life course educational exposure, that might underlie these connections. This knowledge gap is due, in part, to a lack of cohorts with early-life cognitive assessment who are followed to later adulthood. We capitalized on data from the 1960 Project Talent (PT) high school cohort (n>360,000) and two recent follow-ups, the Project Talent Twin & Sibling (PTTS; n=2,491 in 2014) Study and the Project Talent Aging Study (PTAS; n=6,421 in 2018), to examine these potential links. In 1960, ability was assessed in multiple cognitive domains (e.g., general aptitude, quantitative, reasoning). Participants/proxies reporting 2 or more symptoms of cognitive impairment in 2018 on the AD8 Dementia Screener were classified as having a positive screen. Binary logistic generalized estimating equations with race, sex, and adolescent family SES covariates, indicated that in multiple cognitive domains, higher ability in adolescence predicted lower odds of a positive AD8 screen in later life (ORs of 0.80 - 0.85). The effects were only slightly attenuated with inclusion of life course educational attainment. Sibling models found a similar pattern of associations and effect sizes, indicating that the association is not attributable to shared family and genetic background. These findings indicate that higher cognitive ability as indicated by better performance in multiple cognitive domains in adolescence may be protective against cognitive impairment five decades later and life course educational attainment only partially mediates this association.

INTENSITY OF WALKING TRAINING IMPACTS COGNITION AMONG ASSISTED LIVING RESIDENTS WITH FRAILITY

Margaret Danilovich,¹ and Christie Norrick,² 1. *CJE SeniorLife, Skokie, Illinois, United States*, 2. *CJE SeniorLife, Chicago, Illinois, United States*

Exercise has many proven cognitive benefits but the precise intensity to modify cognition is unclear. This pilot study investigated the role of exercise intensity on cognitive outcomes among assisted living residents. We enrolled n=33 frail or pre-frail residents who completed an 8 week, twice-weekly walking intervention. Participants were 66% female, and on average were 88 years old with a MMSE score=25.6, and low cognitive scores (Category Fluency Animals=10.45, Category Fluency Vegetables=7.67, Trail Making Test A=60.82 seconds, Trail Making Test B=155.18 seconds). Walking sessions used 5-minute intervals focused on maximizing steps, fast speeds, and multi-directions for 45 minutes per session. Participants in the high intensity group walked at >70% heart rate maximum or RPE 15-17 and those randomized to the casual intensity group walked at <60% heart rate maximum or RPE <13. Results showed the casual-intensity group improved more on Category Fluency tests (increase of 0.88 animals and 1.06 vegetables) compared to the high-intensity group (increase of 0.12 animals and increase of 0.35 vegetables). On Trail Making Test A, high-intensity participants had a 7.47 second decrease in time to complete compared to the casual-intensity group (2.00 seconds increase). On Trail Making Test B, high-intensity participants decreased time to complete by 27.13 seconds compared to a 26.19 decrease in the casual-intensity group. Results show promising trends in the role of exercise intensity in impacting different elements of cognition among assisted living residents.

PREVALENCE OF DEMENTIA AMONG THE ELDERLY IN LATIN AMERICA AND THE CARIBBEAN: A SYSTEMATIC REVIEW AND META-ANALYSIS

Fabiana Ribeiro, Ana Carolina Teixeira-Santos, and Anja Leist, *University of Luxembourg, Esch-sur-Alzette, Diekirch, Luxembourg*

Background: Over the last decades, life expectancy in Latin America and the Caribbean showed a rapid increase, which led to a significant increase in the number of people with dementia. Moreover, 9% of the population in this part of the world are aged 65 or older, and by 2050 this percentage is projected to at least double. For this reason, it is essential to estimate the prevalence of dementia in LAC countries with the aim to determine suitable actions to enhance the quality of life of those affected. **Methods:** Database searches for articles were conducted September 2020 throughout Pubmed, Web of knowledge, Scopus, Lilacs, and SciELO. The inclusion criteria comprised population- or community-based studies, published in English, Spanish, or Portuguese, reporting data on the prevalence of dementia collected in LAC countries. The complete data search retrieved 1719 non-duplicates. **Results:** A total of 58 studies met the high-quality inclusion criteria, published 1991-2020, including participants in the following countries: Brazil, Mexico, Argentina, Colombia, Peru, Cuba, Dominican Republic, Venezuela, Ecuador, Trinidad and Tobago, and Jamaica. The most common form of dementia studied was Alzheimer's disease with prevalence ranging from 5.9% to 23.4%. Estimates differed by age, gender, and education, with oldest, women, and lower-educated adults living in rural areas presenting higher dementia prevalence. **Conclusion:** This is the first study giving a comprehensive overview of dementia prevalence in LAC countries, which is relevant to estimate care needs and economic costs related to dementia treatment and care.

TRANSFORMING AGING: INCREASED ACCESS TO CARE MINIMIZES RURAL AND URBAN DIFFERENCES IN COGNITIVE CHANGE

Timothy Ly,¹ Rebecca Allen,² Barbara Jackson,³ Amy Albright,⁴ John Bell,³ Dana Carroll,⁵ and Anne Halli-Tierney,³ *1. University of Alabama, University of Alabama, Alabama, United States, 2. University of Alabama, Tuscaloosa, Alabama, United States, 3. The University of Alabama, Tuscaloosa, Alabama, United States, 4. VA Maine HCS, Gorham, Maine, United States, 5. Auburn University Harrison School of Pharmacy, Tuscaloosa, Alabama, United States*

Rural-urban disparities in cognitive health outcomes, such as greater prevalence of cognitive decline among rural-dwelling older adults, have been linked to inequity in access to care. However, few studies have demonstrated whether longitudinal increased access to care may mitigate such disparities. This paper presents data from ongoing systematically collected behavioral health data on new and returning patients at an interdisciplinary geriatrics clinic at the University of Alabama Medical Center. The aim of this study was to determine baseline predictors of cognitive change across three annual visits ($n = 42$, mean age of 75.63 years ($SD = 9.15$)). Adjusting for baseline cognitive status, baseline subjective health literacy, and baseline depression and

anxiety, results from a univariate ANCOVA showed that age at first visit ($B = -.024$, 95% CI $[-.041, -.008]$, $t(35) = -2.990$, $p = .005$) and rural-urban status ($B = .555$, 95% CI $[.123, .988]$, $t(35) = 2.608$, $p = .013$) predicted cognitive change at timepoint three (T3). Specifically, individuals from rural areas were less likely to experience cognitive decline and scored .555 points better than individuals from urban areas on cognitive screeners at T3 compared with baseline cognitive status. These results suggest that increased access to and utilization of care may ameliorate traditional disparate rates of cognitive decline between rural- and urban-dwelling older adults. Moreover, behavioral health screenings in primary geriatrics clinic care may help identify patient cognitive needs and facilitate integrated care through combined medical, pharmacological, and behavioral interventions to promote positive cognitive health outcomes.

Session 4200 (Paper)

COVID-19 and Mental Health

COVID-19 PANDEMIC-RELATED DISTRESS AND SELF-EFFICACY TO MANAGE DEMENTIA CARE AMONG FAMILY CAREGIVERS

Lena Thompson,¹ Haley Schneider,¹ Maria Donohoe,¹ Elizabeth Saathoff,¹ Lubna Hossain,¹ and Sato Ashida,² *1. University of Iowa College of Public Health, Iowa City, Iowa, United States, 2. University of Iowa, Iowa City, Iowa, United States*

The COVID-19 pandemic posed numerous challenges to persons with dementia (PWD) and their caregivers. To better understand these challenges, we conducted a mixed methods study analyzing data from interviews with family caregivers participating in an ongoing intervention study. Telephone interviews were conducted with 58 family caregivers of PWD diagnosed within the past two years. Participants reported self-efficacy (SE) using a 5-item scale (e.g. handle problems with memory, keep PWD at home) and rated pandemic-related distress on a 1-10 scale. They also qualitatively described effects of the pandemic on care recipients and themselves. Qualitative data were coded and organized by concepts from the Stress Process Model. Distress level ranged from 1-9 and was negatively associated with SE to manage dementia care ($r = -.316$, $p = 0.036$). Caregivers described distress related to primary stressors such as loss of services (respite care, assistance with daily tasks) and resistance to mask wearing by PWD due to behavioral symptoms. Secondary stressors included managing work or supervising children's schoolwork at home while providing care. Caregivers most often expressed distress related to inability to access coping resources such as family or friends, and worried that PWD were not able to rely on their support systems. At all reported levels of distress, inability to interact with members of support networks (e.g., family, friends, service providers) was identified as most distressing. This was compounded by lower self-efficacy to manage dementia care. Efforts to decrease pandemic impacts must consider strategies to safely keep PWD and caregivers connected with family, friends, and service providers.

DISCRIMINATION AND MENTAL HEALTH DURING THE BLACK LIVES MATTER MOVEMENT AND THE COVID-19 PANDEMIC

Peiyi Lu,¹ Dexia Kong,² and Mack Shelley,³ 1. *Columbia University, Fort Lee, New Jersey, United States*, 2. *The Chinese University of Hong Kong, Hong Kong, Hong Kong*, 3. *Iowa State University, Ames, Iowa, United States*

Discrimination has been more prevalent since the pandemic. Black Lives Matter (BLM) movement flourished in the summer of 2020 as protests against police brutality and racial injustice. However, the extent to which individuals' discrimination experiences and associated mental health outcomes change amid a global pandemic and a dramatic societal movement in American society remains unknown. This study examines the dynamic relationship of racism and/or Covid-19-related discrimination with changes in mental health in the context of BLM and Covid-19. Data were from U.S. adults (age ≥ 18) who completed the online Understanding Coronavirus in America survey in June and September of 2020 ($n=3,502$). Respondents were asked to attribute their discrimination experience to 8 main reasons: (1) Covid-19; (2) national origin/race/skin color; (3) gender/sexual orientation; (4) age; (5) physical feature; (6) education/income; (7) health condition; and (8) religion/other. Quasi-Poisson regression models examined the associations between discrimination and anxiety/depression/stress. Results indicated about 33% of respondents reported discrimination in June compared to 21% in September. Racism was significantly associated with more anxiety/depression/stress in June, but not in September or in the longitudinal trend. Covid-19-related discrimination was associated with elevated levels of anxiety/depression/stress in September and in the longitudinal trend, but not in June 2020. We concluded that individuals' discrimination experiences are shaped by societal contexts. Specifically, racism was the dominant discrimination attribution in June 2020 when BLM was at its peak. However, Covid-19 discrimination overtook racism as the primary attribution and showed a significant relationship with poorer mental health over time.

DISPARITIES IN COVID-19 RELATED WORRY AMONG OLDER ADULTS IN THE UNITED STATES

Felicia Wheaton,¹ Terika Scatliffe,² and Matilda Johnson,² 1. *Xavier University of Louisiana, New Orleans, Louisiana, United States*, 2. *Bethune-Cookman University, Daytona Beach, Florida, United States*

Racial disparities in COVID-19 exposure, illness, hospitalization and mortality have been well-documented, however, less is known about whether African Americans and other minorities experience greater worry related to the COVID-19 pandemic. Data from the special midterm release of the 2020 Health and Retirement Study (HRS) were used to examine the relationship between race (white, African American, and other) and ethnicity (Hispanic/Non-Hispanic) and COVID-19 related worry among older Americans ($N=2,069$). Participants were asked, "because of the coronavirus pandemic how worried are you about 1) your own health, 2) the health of others in your family? 3) Your financial situation? 4) Being able to get help if you needed it from family, friends, or others? 5) What will happen in the future?" (0=not at all worried and 10=very worried). Results from OLS regression

controlling for age, gender and education showed that compared with whites, African Americans had significantly higher average worry for all items except the last (other race did not differ). On the other hand, Hispanics had significantly lower worry, on average, for each of the five items. In addition, women had significantly higher average worry, while age was negatively associated with all items except the first. These findings indicate that in addition to the previously documented disparities in COVID-19, older African Americans experienced more worry. This has important implications for long-term physical and mental health.

EFFECTS OF ISOLATION AMONG OLDER ADULTS DUE TO CORONAVIRUS RESTRICTIONS

Cynthia Thomas, *International Network for the Prevention of Elder Abuse, Rockville, Maryland, United States*

Semi-structured interviews were conducted with 35 residents in a Maryland condominium, four to six months after the presence of the epidemic in the US was recognized in mid-March. The objective was to determine to what extent the restrictions resulting from the presence of a new disease was affecting older adults in their daily lives, and in their plans for the future. All respondents were over the age of 60 and half were more than 80 years old. Two-thirds lived by themselves; most others lived with a husband or wife. Respondents for the most part were following guidelines to wear masks, practice social distancing and avoid close contact with persons outside their homes, including other family members. Over half had already made dramatic changes in their daily activities. Some found an opportunity to develop new skills, had connected with people from the past, or had become more introspective. Others, while exhibiting some of the same characteristics, were more focused on the restrictions they faced, and were more aware than ever of the limited amount of time left in their lives. Differences between respondents in the emphasis of their perspectives are explored, by age, gender, and other characteristics.

WORSENING MENTAL HEALTH AND SELF-RATED HEALTH IN OLDER INCARCERATED PERSONS DURING THE COVID-19 PANDEMIC

Lisa Barry,¹ Deborah Noujaim,² Alexandra DePalma,² Emil Coman,² and Dorothy Wakefield,² 1. *University of Connecticut Center on Aging, Farmington, Connecticut, United States*, 2. *UConn Health, Farmington, Connecticut, United States*

Incarcerated persons age 50 and older comprise one of society's most vulnerable groups given high rates of chronic illness, estrangement from family/friends, and suicide. Consequently, the mental health impact of COVID-19 on this population may be especially salient. Using data from the ongoing Aging Inmates' Suicidal Ideation and Depression study (Aging INSIDE), we determined change in older incarcerated persons' mental health (anxiety and depression symptoms) and change in self-rated health (SRH) from before to during the COVID-19 pandemic, and evaluated how these variables were related. Of the 202 still-incarcerated Aging INSIDE participants, 157 (77%) completed Check-In Surveys between August-September 2020. Participants were 96% male, racially diverse (41% White, 41% Black, 18% Hispanic/Other) and average age was 56.0(± 5.8) years. From before to

during the COVID-19 pandemic, average anxiety symptom scores, assessed by the GAD-7, increased (worsened) (from 6.4 ± 5.7 to 7.8 ± 6.6 ; $p < 0.001$), average depressive symptoms scores, measured by the PHQ-8, increased (worsened) (from 5.5 ± 6.0 to 8.1 ± 6.5 ; $p < 0.001$), and average SRH decreased (worsened) (from 3.0 ± 0.2 to 2.6 ± 0.2 ; $p < 0.001$). Worsening anxiety led to worsening depressive symptoms (direct effect = 0.339; $p < 0.05$). A mediation model controlling for age, race, chronic conditions, years until release, and change in social support score found a total effect of change in anxiety on SRH change of -0.04 ($p < 0.001$), of which 34.2% flows indirectly through change in depression ($p < 0.001$). Older incarcerated persons experienced worsening mental health and SRH during the COVID-19 pandemic. Future research will determine if mental health and SRH improve following vaccination and return to “normal” procedures.

Session 4205 (Symposium)

CROSS-NATIONAL PERSPECTIVES ON HEALTH AND WELL-BEING IN LATER LIFE

Chair: Jennifer Ailshire

Discussant: Yuan Zhang

Cross-national comparisons are increasingly being used to re-evaluate whether our theories of aging are dependent on sociocultural context and to develop new insights into both long-standing and emerging issues in aging. The papers in this symposium use harmonized data from the Gateway to Global Aging to examine a range of topics in aging and provide new insights into key questions in aging research. Liu et al., determine whether social relationships mediate the association between early life adversity and later life health and well-being using longitudinal data from the U.S. and England. Considering multiple domains of the social determinants of health, such as socioeconomic status, social relationships, and health care access, Cho et al. identify which are related to self-rated health in China, Japan, and South Korea. Cheng et al. test the age-as-leveler hypothesis for explaining how socioeconomic differentials in health change in older ages in China and 19 European countries to determine if the protective effect of socioeconomic status on multi-morbidity changes with age. Harmonized data facilitate international comparisons papers, but additional efforts are sometimes needed to calibrate specific measures across international surveys. A major challenge in cross-national aging research, for instance, has been the limited ability to compare cognition across countries. Nichols and colleagues present a novel method for cocalibration of cognitive function across the U.S., England, and India that could be used for additional cross-national comparative research. The papers in this symposium demonstrate both the potential and challenges of cross-national studies of health and well-being among older adults.

EARLY ADVERSITY AND LATER HEALTH: THE PATHWAY OF SOCIAL RELATIONSHIPS IN ADULTHOOD IN HRS AND ELSA

Yin Liu,¹ Andrew Steptoe,² William Chopik,³ Amanda Leggett,⁴ Jooyoung Kong,⁵ and Courtney Polenick,⁶ 1. *Utah State University, Logan, Utah, United States*, 2. *University College London, London, England, United Kingdom*, 3. *Michigan State University,*

East Lansing, Michigan, United States, 4. *University of Michigan, Ypsilanti, Michigan, United States*, 5. *University of Wisconsin-Madison, Madison, Wisconsin, United States*, 6. *University of Michigan, Ann Arbor, Michigan, United States*

Early adversity is associated with compromised health and well-being in later life, but whether social functioning mediate the association is unclear. We examined 2 longitudinal samples of older adults (≥ 50 years) whose baseline surveys were between 2006 and 2008 with follow-up until 2016 in the Health and Retirement Study (HRS, $n = 15,946$) and its sister study in England (ELSA, $n = 9,692$). Health outcomes included depressive symptoms, chronic health conditions, and subjective memory complaints. Social relationships were measured by contacts, relationship strains, and feelings of loneliness. Early adversity was measured by parental physical abuse and alcohol and drug problems in the family before the age of 16. Patterns of association were similar in these 2 samples, where social contacts decreased over time, while relationship strains and loneliness increased especially for older adults with early trauma, which in turn mediated the associations between early adversity and poorer later health.

SOCIOECONOMIC STATUS AND LATER-LIFE HEALTH: LONGITUDINAL EVIDENCE FROM EUROPE AND CHINA

Mengling Cheng,¹ Nicolas Sommet,² Daniela Jopp,¹ and Dario Spini,¹ 1. *University of Lausanne, Lausanne, Vaud, Switzerland*, 2. *University of Lausanne Faculty of Social and Political Sciences, Lausanne, Vaud, Switzerland*

Scholars are divided as to how the protective effect of SES on health (the SES-health gradient) varies over the later-life course: The age-as-leveler perspective suggests that the SES-health gradient weakens with age, whereas the cumulative (dis)advantages perspective suggests that it strengthens with age. To clarify this, we used SHARE 2004-2017 (73,407 respondents from 19 European countries) and CHARLS 2011-2018 (8,370 Chinese respondents). Congruent with the age-as-leveler perspective, growth curve models revealed that the overall protective effect of SES on multimorbidity was weaker for older than younger adults (the country-specific effects were significant in two thirds of the case). We interpret this as a selection effect. However, the within-participant protective effect of SES on multimorbidity did not vary over the later-life course (the country-specific effects were nonsignificant in the majority of the case). Findings suggest that extant cross-sectional studies should be interpreted with caution and that longitudinal, cross-national studies are needed.

INFLUENCE OF SOCIAL DETERMINANTS ON SELF-RATED HEALTH IN THREE COUNTRIES OF EAST ASIA

Jimyoung Cho,¹ Takeshi Nakagawa,² and Dannii Yeung,³ 1. *Baylor Scott & White Health Research Institute, Temple, Texas, United States*, 2. *National Center for Geriatrics and Gerontology, Obu, Aichi, Japan*, 3. *City University of Hong Kong, Hong Kong, Hong Kong*

This study aims to compare five domains of social determinants and their associations with self-rated health (SRH)

among older adults in China, Japan, and Korea, where they share some cultural values but the development and conditions of economic status, health care system, and education system vary. A total of 10,111 participants aged 65 years and older were included from three harmonized datasets at baseline CHARLS, KLoSA, and JSTAR. Guided by the Healthy People 2020 Framework, five domains of social determinants were included: education levels, economic stability (total income, working for pay), social and community context (social engagement, living with children), health care access (medical center utilization), and neighborhood (rural vs. urban). Regression models showed that working for pay, social engagement, and medical center utilization were significant predictors for SRH in three countries. However, unique predictors have also been observed in China and Korea, which will be discussed in the presentation.

CO-CALIBRATION OF COGNITIVE DOMAINS ACROSS DIFFERENT COUNTRIES WITHOUT COMMON LINKING ITEMS

Emma Nichols,¹ Richard Jones,² and Alden Gross,³ 1. *Johns Hopkins University School of Public Health, Baltimore, Maryland, United States*, 2. *Brown University, Providence, Rhode Island, United States*, 3. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

Modern psychometric methods allow for cocalibration of cognition across cross-national surveys, given the presence of common tests across studies. For narrow cognitive domains, there may not be common tests due to cultural and linguistic differences in testing. We developed a novel method to facilitate cocalibration that entails (1) identifying a common score across studies highly correlated with the focal domain; (2) deriving scores separately in each study for the domain of interest; and (3) applying stratified equipercentile equating to equate domain scores in (2) to the distribution of the common metric in (1). We tested this method by equating executive functioning in the Harmonized Cognitive Assessment Protocols (HCAP) in the US (N=3496), India (N=4096), and England (N=1273). The method preserves the rank order of executive functioning derived separately ($r > 0.99$ in England; $r > 0.99$ in India), while preserving between-study differences observed in general cognitive functioning. We discuss limitations and future directions.

Session 4210 (Symposium)

CULTURAL ADAPTATIONS TO RECRUITMENT STRATEGIES AND COMMUNITY-BASED INTERVENTIONS FOR DEMENTIA CAREGIVERS

Chair: Lauren Parker

Co-Chair: Katherine Marx

Discussant: Maria Aranda

Nearly 30 years after the 1993 National Institute of Health Revitalization Act, minority groups' low participation in research remains (which required the inclusion of women and racial/ethnic minority groups into government-funded clinical trials). This is particularly the case for participation in research on Alzheimer's Disease and related dementias (ADRD). Deeply rooted historical race-based mistreatment in research and in the health care system at large persist as barriers to low-participation of minorities (i.e.

Black/African American, Hispanic/Latino) and immigrants in research studies, who remain at disparate risk for adverse ADRD health outcomes and expedited mortality. The use of culturally adapted approaches in recruitment strategies and community-based interventions might be helpful to encourage the participation of underrepresented groups into research. As such, this presentation highlights three studies that seek to use cultural adaptation to inform recruitment strategies and community-based interventions. First, Dr. Parker will present how tenets from Critical Race Theory can be used to inform culturally-adapted recruitment strategies of Black/African American caregivers into community-based research by drawing upon two ongoing studies: a randomized trial providing caregiver support through Adult Day Services (ADS) and the evaluation of impact of ADS on stress levels of Black/African American using biomarker measures. Next, Ms. Johnson will present results on cultural adaptations to the ADS-Plus Program for Spanish-speaking populations. Finally, Dr. Nkimbeng will present on the process of culturally-tailoring dementia education for African immigrants in Minnesota. Findings from this presentation identify opportunities for researchers to use cultural adaptations to encourage participation of underrepresented populations into ADRD research.

THE USE OF CRITICAL RACE THEORY TO INFORM CULTURALLY ADAPTED RECRUITMENT STRATEGIES FOR COMMUNITY-BASED RESEARCH

Lauren Parker,¹ Joseph Gaugler,² and Laura Gitlin,³ 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 2. *University of Minnesota, Minneapolis, Minnesota, United States*, 3. *Drexel University, College of Nursing and Health Professions, Drexel University, Pennsylvania, United States*

Black/African American participation in non-pharmacological randomized trials and community-based research on Alzheimer's Disease and related dementias (ADRD) remains low. This presentation introduces Critical Race Theory (CRT), its tenets and how it can be used in tandem with national strategies to encourage participation of Black/African Americans in ADRD research. CRT is a transdisciplinary methodology that draws on anti-racist tenets to study and transform the relationships among race, racism, and power. We describe how CRT constructs (e.g., race consciousness, counter-storytelling) can be used to inform recruitment strategies to enroll Black/African American ADRD caregivers into community-based research by drawing upon two ongoing studies: a randomized trial providing caregiver support through Adult Day Services (ADS) and the evaluation of impact of ADS on stress levels of Black/African American using biomarker measures. In the spirit of CRT this presentation is a call for action and transformation of dementia care research to actively include Black/African Americans.

THE AFRICAN IMMIGRANT DEMENTIA EDUCATION PROJECT: A COMMUNITY-UNIVERSITY PARTNERSHIP

Manka Nkimbeng,¹ Wynfred Russell,² and Joseph Gaugler,¹ 1. *University of Minnesota, Minneapolis, Minnesota, United States*, 2. *African Career, Education & Resource Inc, Brooklyn Park, Minnesota, United States*

The African Immigrant Dementia Education project is a community-university partnership with the goal of developing a culturally tailored dementia education program with African immigrants in Minnesota. In collaboration with our community partner (African Career, Education & Resource, Inc.), a project advisory board that features professionals and family members from the African immigrant community was assembled and its first meeting was held in February 2021. Preliminary discussions about content, mode of delivery and cultural considerations of an eventual dementia education intervention have begun. This presentation will offer details on the process of working with an advisory board and community partner to identify and culturally tailor an evidenced-based dementia education curriculum for a unique cultural group. Also, we will present challenges encountered during this process and offer suggestions and strategies to promote successful researcher-community partnerships.

ADAPTING THE ADS PLUS PROGRAM AND STUDY FOR A SPANISH SPEAKING POPULATION

Elma Johnson,¹ Katherine Marx,² Manka Nkimbeng,³ Joseph Gaugler,³ Laura Gitlin,⁴ and Lauren Parker,⁵

1. *University of Minnesota School of Public Health, University of Minnesota/ Minneapolis, Minnesota, United States*, 2. *Johns Hopkins School of Nursing, Baltimore, Maryland, United States*, 3. *University of Minnesota, Minneapolis, Minnesota, United States*, 4. *Drexel University, College of Nursing and Health Professions, Drexel University, Pennsylvania, United States*, 5. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

While Hispanic/Latinos are at increased risk for Alzheimer's Disease, they are often cited as a "difficult-to-reach population" to engage in community-based research or clinical trials. One reason may be that many community-based supportive interventions for dementia caregivers are not adapted for Spanish-speaking populations. The purpose of this presentation is to describe the process of adapting the Adult Day Services Plus (ADS Plus) program for this population. In addition to translating ADS Plus into Spanish, staff, familiar with the program from four sites, which serve a predominantly Hispanic population, participated in a set of three focus groups that reviewed recruitment and intervention materials. Emerging themes included, Hispanic caregivers do not refer to themselves as caregivers but as the familial relationship (e.g. daughter, son, wife), and Hispanics often view research as a waste of resources. Future studies should consider these cultural elements towards caregiving in developing programs for Spanish-speaking dementia caregivers.

Session 4215 (Symposium)

EAST MEETS WEST: COMMUNITY-BASED PROGRAMS FOR DEMENTIA PREVENTION AND SUPPORT

Chair: Fei Sun

Discussant: Melissa Batchelor

This East Meets West Symposium presents cross-cultural evidence of community-based programs developed to address cognitive health needs of older adults or to support dementia family caregivers. It includes five studies from

mainland China, Taiwan, and the U.S.A. The first study explored the adherence to computerized cognitive training to promote cognitive health among Chinese older adults using a qualitative approach. External encouragement, and self-awareness of performance improvement were found influential to older adults' adherence. The second study spearheaded by American Association of Retired Persons (AARP) in the U.S.A shed further light on technology use in promoting brain health by comparing in-person versus online cognitive training to older Americans during the COVID-19 pandemic. The third study tested the effectiveness of a cognitive health management model for community-dwelling older adults including healthy and mild cognitively impaired (MCI) ones in Shanghai, China. Older adults with MCI who received the management service showed better cognition outcomes compared to their counterparts in the control group. The fourth study focused on a community program named "Carer Café", developed to support dementia family caregiver in Taiwan. Participants (n=375) reported reduced stress and increased access to service referrals. The last study examined the stakeholders' perceptions of dementia friendly initiatives (DFI) being implemented in U.S.A, mainland China, and Taiwan to support persons with dementia and family caregivers. The impacts of DFI made, challenges DFI faced, and strategies DFI used during COVID-19 pandemic were discussed. The discussant will comment on each article's contributions and limitations in the context of literature.

EXPLORING FACTORS CONTRIBUTE TO ADHERING IN COMPUTERIZED COGNITIVE TRAINING AMONG HEALTHY OLDER ADULTS IN CHINA

Yu Liu,¹ Siman Lv,² and Cuiping Ni,² 1. *China Medical University School of Nursing, Shengyang, Liaoning, China (People's Republic)*, 2. *China Medical University School of Nursing, Shenyang, Liaoning, China (People's Republic)*

Computerized cognitive intervention has the potential to enhance cognition among healthy older adults. However, little is known of the factors associated with adherence in computerized cognitive training among healthy older adults in China. This study was designed to explore these factors utilizing a descriptive qualitative method. A semi-structured interview was used to interview 13 informants. The analysis suggested that factors associated with adherence to the computerized cognitive intervention, included 3 core themes: (1) individual characteristics, with three subthemes of "having free time", "emotion", and "persistence characteristics"; (2) encouragement, with three subthemes of "peer group support", "support from healthcare professional", and "supervision from facilitators"; and (3) self-recognized improvement related to training, with two subthemes of "better brain function" and "emotion improved". The results revealed multi-factors promote adherence including personal and social aspects.

A COMPREHENSIVE COGNITIVE HEALTH MANAGEMENT MODEL FOR COMMUNITY-DWELLING OLDER ADULTS IN SHANGHAI

Jiayuan Qiu,¹ Jing Nie,² Yuan Fang,² and Xia Li,²

1. *Shanghai Mental Health Center, Shanghai, China (People's Republic)*, 2. *Shanghai Jiaotong University School of Medicine, Shanghai, Shanghai, China (People's Republic)*

To investigate whether a comprehensive cognitive health management model improves cognitive function among

community-dwelling older adults in Shanghai, China. The comprehensive cognitive health management model included brain health screening, individualized brain health consultation and referrals, and annual follow-up monitoring. We compared 161 older adults (43 with MCI, 118 with normal aging) who received the health management model, to an equal size of control group who did not receive the model on their cognition and emotion using Montreal Cognitive Assessment Scale (MoCA) and Geriatric Depression Scale (GDS). Over one-year, participants with MCI in the intervention group showed a significant increase of MoCA score than their MCI counterparts in the control group. Participants with normal aging in the intervention group showed no differences in MoCA and GDS with those in the control group. The individualized cognitive health management model is promising to assist community-dwelling older adults with MCI to maintain brain health.

CARER CAFÉ IN TAIWAN: AN INNOVATIVE MODEL PROVIDING CAREGIVER SUPPORT FOR OLDER ADULTS

Su-I Hou,¹ and Tsuann Kuo,² 1. *School of Global Health Management & Informatics, University of Central Florida, University of Central Florida, Florida, United States*, 2. *Chung Shan Medical University, Taichung, Taichung, Taiwan (Republic of China)*

Physical places and environments play critical roles in shaping how people interact. This paper introduces an innovative Carer Café model in Taiwan with social infrastructure support and services for family caregivers caring for older adults. Carer cafés are community-based initiatives of Taiwan Association of Family Caregivers (TAFC), aiming to help carers recognizing their own needs and increase awareness of long-term care resources available. Through partnerships with local coffee shops, respite-focused services are provided. The “free coffee for two” campaign encourages family members and friends taking a caregiver out for a “respite coffee”. Carer Café has also become an important “third place” hosting respite programs and the “a shop within a shop” style creating designated space to build a sense of community. Pilot survey (n=375) showed 77% perceived reduced stress, 83% appreciated services provided, and 250% increased referrals within one year. Implications on impact and future opportunities will be discussed.

COMMUNITY-BASED BRAIN HEALTH PROMOTION DURING THE COVID-19 PANDEMIC: EFFORTS OF AARP IN THE USA

Sarah Lock,¹ Lindsay Chura,¹ and Rachel Lazarus,² 1. *AARP, Washington, District of Columbia, United States*, 2. *Staying Sharp, AARP, Washington, District of Columbia, United States*

The pandemic has created new barriers for the delivery of healthcare resources and information, as well as in-person delivery of health care, caregiving, and social engagement. AARP created trainings designed for volunteered community-based brain health promotion. Due to the COVID, we have had to convert them to virtual presentations, distributed through technology. Staying Sharp is AARP’s on-line platform that educates users about integrated, holistic, lifestyle-based approaches for maintaining brain health as

we age. This platform was created for convenience and scalability – we currently have over 800,000 users. During a period of necessary isolation, this platform has performed as an ideal way to get helpful information about maintaining brain health to our consumers, who are now stuck at home without access to in-person (e.g., community-based) alternatives. We will discuss lessons learned from these two different approaches along with preliminary data on behavior change based on these engagements.

IMPLEMENTING DEMENTIA FRIENDLY INITIATIVES IN THE COMMUNITY: PERCEPTIONS OF STAKEHOLDERS IN THE USA AND CHINA

Fei Sun,¹ Ha Neul Kim,¹ Lucas Prieto,¹ Christian Conyers,² and Fredrika Opur,³ 1. *Michigan State University, East Lansing, Michigan, United States*, 2. *University of Michigan, University of Michigan, Michigan, United States*, 3. *MSU, East Lansing, Michigan, United States*

To address the exclusion of persons living with dementia (PWD), Dementia Friendly Initiatives (DFI) are being launched to build a friendly and supportive environment for PWD in the U.S.A, mainland China, and Taiwan. This study aims to identify the impact of DFI, the challenges DFI encountered, and strategies used to address such challenges within the COVID-19 context in American and Chinese societies. Individual interviews via Zoom with 9 stakeholders from the U.S.A, 8 from mainland China and one from Taiwan were transcribed for analyses. DFI have shown effectiveness in raising the public’s dementia awareness and engaging PWD in the community. COVID-19 pandemic posed the challenges of serving isolated PWD due to resources and attention shifted to COVID-19 prevention. Person-centered and technology-based means were used to deliver services for PWD during the pandemic. DFI in American and Chinese societies experienced similar sustainability challenges but showed resilience during the COVID-19 pandemic.

Session 4220 (Paper)

Employment and Social Engagement in Later Life

ACTIVE AGING AND THE MATTHEUS EFFECT
Per Jensen, *Aalborg University, Aalborg, Nordjylland, Denmark*

While active ageing has been discursivized in international organizations and among researchers as a major means to combat the challenges of demographic ageing, this study aims to make a critical-theoretical and empirical assessment of the active ageing concept. It falls into three parts, the first showing how the conceptual framework of active ageing is undertheorized, lacks conceptual and analytical clarity, and that the theoretical framework does not hold clear ideas regarding the factors conditioning active ageing. The second part investigates the main patterns and structuring mechanisms of active ageing in an outcome perspective using Danish data subject to a correspondence analysis. Here, a Matthew Effect of accumulated advantage is found; that is, older adults who are blessed in one sphere of life are also blessed in others, and such inequalities in old age are the outcomes of social life

biographies (i.e., cumulative advantages/disadvantages over the life course). Although nursed by the political system, EU ideas about active ageing are only weakly translated into policies and programs. Part three discusses some of the reasons for this, one obviously being that active ageing is elusive and lacks well-defined cause-and-effect descriptions. Another reason is that the concept has been developed in global elite networks that are quite distant from policymakers; at least in a decentralized political system like the Danish welfare state.

MIGRATION AND HEALTH: FREEDOM OF MOVEMENT AND SOCIAL BENEFITS FOR CHINESE MIGRANT WORKERS

Fengxian Qiu,¹ Heying Zhan,² and Jing Liu,³

1. *Anhui Normal University, Wuhu, Anhui, China (People's Republic)*, 2. *Georgia State University, Georgia State University, Georgia, United States*, 3. *Zhejiang University of Finance and Economics, Hangzhou, Zhejiang, China (People's Republic)*

Nearly 30% of China's workforce consists of China's rural-to-urban migrant workers, accounting for nearly 300 million of China's population. Even though they have gained freedom of movement since the 1980s, they still have no access to healthcare in urban areas where they work. This study utilizes a mixed method of a survey with a sample of migrant workers from three Chinese emigration provinces (n=817) in 2018 and follow-up interviews with 30 migrant workers in 2020 to examine factors of migration experience affecting migrant worker's health and healthcare. Using binary logistic regression, we found that migrant workers' longer work experience is correlated with poorer self-rated health, their better financial status and level of hopefulness towards the future are positively correlated to self-rated health. Qualitative findings shed light on the cumulative effect of the length of work experience and fear of medical cost on migrant workers' declining health. The lack of portability in health insurance and different reimbursement rates in health care access are structural barriers in health-seeking behaviors among migrant workers. Policy implications are presented in the global context of social rights and freedom of movement.

REVIEW OF RESEARCH INTO EMPLOYER APPROACHES TO YOUNGER ONSET DEMENTIA AND MILD COGNITIVE IMPAIRMENT IN THE WORKPLACE

James Carino,¹ Philip Taylor,¹ and Damian Morgan,²

1. *Federation University Australia, Berwick, Victoria, Australia*, 2. *Federation University Australia, Churchill, Victoria, Australia*

Younger Onset Dementia (YOD) and Mild Cognitive Impairment (MCI) are relatively prevalent conditions globally which can affect the job performance of individuals in their working lives. This presentation considers the existing research documenting actual, stated or intended approaches taken by employers to managing and supporting employees with these conditions. Nine relevant research projects were identified based on an extensive exploration of the peer reviewed literature. These show that employers have some knowledge of dementia, but do not recognise this as a possible explanation when performance changes occur in the workplace. Employees typically leave or are removed from the workplace before a formal diagnosis or soon after. The

literature shows both supportive and unsupportive behaviours toward employees. Drawing from this literature recommendations for increasing the quality of support provided to employees are offered: awareness training to foster earlier detection, clarification of these conditions as a disability, and application of methods to support employees to continue to contribute to the workplace while this is feasible and desirable from both the employer and the employee's perspective.

Session 4225 (Paper)

Enhancing Care Support, Competencies, and Outcomes

EFFECTS OF SIMULATION-BASED LEARNING ON NURSING STUDENTS' LEARNING OUTCOMES OF A GERONTOLOGY COURSE

Hsueh-Fen Kao,¹ Minzhi Ye,² and Lin Chen,³ 1. *School of Nursing, The University of Texas at El Paso, El Paso, Texas, United States*, 2. *Benjamin Rose Institute on Aging/Case Western Reserve University, Benjamin Rose Institute on Aging, Ohio, United States*, 3. *Fudan University, Shanghai, China (People's Republic)*

Simulation-Based Learning (SBL) is beneficial to nursing education. Nevertheless, recent studies have shown a side effect of being overwhelmed by repeated exposures to simulation. Thus, how many times simulation scenarios should be provided to students remains a question. The objectives of this study were to (1) explore the changes in nursing students' perceived competence, self-efficacy, and learning satisfaction after repeated exposures to simulations, and (2) determine the acceptable frequency of SBL in the 'Care of Older Adults' course. A one-group repeated measurement experimental design with self-administered questionnaires in a convenient sample of 84 senior nursing undergraduate students was used at a university in southern Taiwan, and 79 students completed all measurements. After taking the baseline measurements (T0), students were exposed to 75-minute simulation scenarios from Time 1 (T1) to Time 3 (T3) three weeks apart throughout the semester. Students' perceived nursing competence, self-efficacy, and learning satisfaction were measured immediately after each exposure. There were statistically significant improvements from T0 to T3 ($p < .001$) in all three areas; however, no significant difference when comparing scores from T1 to T2 and from T2 to T3. To conclude, SBL is effective in improving nursing students' perceived competence, self-efficacy, and learning satisfaction. While the primary changes occur at the first simulation effort, it is the accumulated multiple exposures collectively improve students' learning outcomes. Multiple instructional strategies are recommended to maintain students' learning interests to achieve optimal learning outcomes of the course across a semester.

ENHANCING BEHAVIORAL HEALTH COMPETENCIES: INTERPROFESSIONAL COLLABORATION BETWEEN SOCIAL WORK AND MEDICINE

Bronwyn Keefe, *Boston University, Boston, Massachusetts, United States*

This presentation will describe the creation and findings from an interprofessional curriculum in behavioral

health developed by social work faculty for medical students. Training in behavioral health is needed more than ever during a time of increased isolation and fear during the COVID pandemic. Older adults with untreated behavioral health concerns are a vulnerable population, which can result in negative effects, including emotional distress, reduced physical health, increased mortality, and suicide (IOM, 2012). Healthcare is increasingly complex with a need to focus on the physical, social, and behavioral aspects of daily living, and providers are realizing the importance of interprofessional collaboration. Towards that aim, I created a module for 4th year medical students in mental health and older adults, which is now part of their medical education curriculum. I will present outcomes in: (1) satisfaction; (2) acquired knowledge and skills (post-test); (3) application of knowledge and skills (pre-post competency assessment and comfort around asking about depression); and (4) patient outcomes (frequency of depression screening and number of referrals to social worker). Feedback from the 143 medical students is positive with 95% strongly agreeing or agreeing that this expanded their knowledge and understanding in mental health issues among older adults. At baseline, 17% of medical students were moderately to very comfortable in asking questions on the GDS compared to 42% at post-assessment. After completing the course, almost 25% of medical students made a referral to social work during their rotation. This collaboration resulted in curriculum that is both rigorous and impactful.

EXAMINING THE EFFICACY AND RESULTS OF A SHORT-FORM ALZHEIMER'S SURVEY WITH COLLEGE STUDENTS

Debra Valencia-Laver,¹ Brooke Buchanan,¹ Chelsea McPheron,¹ Anna Rogers,¹ Alex DeTurck,¹ Jasmine Shapiro,¹ and Gary Laver,² 1. *California Polytechnic State University, San Luis Obispo, Cal Poly/ San Luis Obispo, California, United States*, 2. *California Polytechnic State University, San Luis Obispo, Cal Poly, San Luis Obispo, California, United States*

College students are important stakeholders in addressing the significant costs of Alzheimer's disease in their future roles as caretakers, health care consumers, taxpayers, and as individuals in the workforce whose careers may interact with and impact those with Alzheimer's and their caregivers. To assess their knowledge of Alzheimer's, a 10-item True/False on-line quiz was presented to 912 students in Introductory Psychology classes. Participants were 61% white, 13% Asian/Asian American, and 10% Latinx, with 14% reporting other racial and ethnic groups, including that of mixed heritage; 59% of the sample self-reported as female. The quiz was counterbalanced such that items appearing in one format (e.g., True) appeared in the other format (e.g., False) across the two forms of the quiz. A significant difference was found for percent correct in Form A (61.4%) versus Form B (59.3%). In order to prompt participants to consider the ways the disease may impact their own lives, additional questions examined students' own experience with Alzheimer's, their interest and willingness to take action towards supporting Alzheimer's research, and their perceptions about how Alzheimer's would impact their lives personally, financially, and in their career pursuits. The research extends the findings

of earlier research on student knowledge of Alzheimer's (e.g., Bailey, 2000; Eshbaugh, 2014) by allowing the results to be broken down by gender, race/ethnicity, and student major. It also expands upon those findings by identifying how college students project the societal effects and costs of Alzheimer's to their own lives and livelihoods.

ONLINE TRAINING THAT CHANGES FAMILY CAREGIVER BEHAVIOR AND ATTITUDES

Vicki de Klerk-Rubin, *Validation Training Institute, Pleasant Hill, Oregon, United States*

The Family Caregiver Course (FCC) is an 18-week Validation training to sensitize family carers to the psychosocial needs of their relatives, integrate new behaviors that build relationships and specific verbal and non-verbal techniques to increase communication. Validation Training Institute partnered with the Alzheimer's Association of Colorado in 2019 and 2020 in delivering this course. Due to COVID-19 limitations, the 2020 iteration was completely digital, using principles of online learning. To replace the two-day in-person component of this course, we developed four, 4-hour Zoom sessions that allowed participants to: practice specific Validation techniques, exercise, process and apply what was learned, role play and receive coaching to anchor skills. Important online rules were maintained, such as, offer opportunities for participant engagement every 10 minutes and create a community of inquiry. Pre- and Post-Surveys of the 2019 and 2020 iterations of FCC showed that after taking this course, family carers: reported that they knew what to do when faced with challenging behaviors from their relative; understood that lying or pretending to agree with a disoriented person was not an effective strategy for communication; gained knowledge of the different forms of dementia and that the differences are significant; were clear about the differences between Validation and other methods.

PERSON-CENTERED CARE FOR FAMILY CAREGIVERS: EVALUATING AN EDUCATION PROGRAM FOR THE HEALTHCARE WORKFORCE

Sharon Anderson,¹ Jasneet Parmar,² Cheryl Pollard,³ Bonnie Dobbs,⁴ Myles Leslie,⁵ and Gwen McGhan,⁵ 1. *Faculty of Medicine & Dentistry University of Alberta, Edmonton, Alberta, Canada*, 2. *Department of Family Medicine, University of Alberta, Edmonton, Alberta, Canada*, 3. *McEwan University, Edmonton, Alberta, Canada*, 4. *University of Alberta, Edmonton, Alberta, Canada*, 5. *University of Calgary, Calgary, Alberta, Canada*

Background: While family caregivers [FCGs] provide 75-90% of care for people living in the community, most healthcare providers are not trained to provide person-centered care to FCGs. We followed research recommendations that the healthcare workforce receive competency-based education to identify, assess, support and partner with FCGs. Objective: Mixed methods evaluation healthcare workforce education program. Approach: We began by coining the concept "caregiver-centered care," defining it as a collaborative working relationship between families and healthcare providers aimed at person-centered support for FCGs. From this definition, interdisciplinary stakeholders including FCGs (n=101) co-designed the Foundational Caregiver-Centered Care education. Learning resources

included six competency-aligned educational modules with videos and interactive exercises that encourage reflection. Kirkpatrick Barr's healthcare training evaluation framework underpinned our mixed methods evaluation. We measured participant's reaction to the education (Level 1) and changes in learner's knowledge and confidence to work with FCGs (Level 2). Results: 352 healthcare providers completed the education online (caregivercare.ca). Learners were satisfied with quality of education (Mean 4.75/5; SD=.5) and the education increased their motivation to learn more about caregiver-centered care (Mean 4.75/5; SD .5). Student's paired samples T-test indicates pre-post education changes in knowledge and confidence to work with FCGs were significant [Pre (M=37.8, Sd=7.6) to post (M=47.2, SD=3.5) $t(125) = -14.39, p < .0005$ (two-tailed)]. Qualitative results derived from open responses mirrored the quantitative results. Conclusion: The Caregiver-Centered Care education provides a foundation for educating healthcare providers working with FCGs to provide care to FCGs to maintain their wellbeing and sustain care.

Session 4230 (Paper)

Environment and Aging

ADVANCING STATE AND LOCAL HOME MODIFICATION PRACTICE AND POLICY: FINDINGS FROM AGING NETWORK SURVEYS

Julie Overton,¹ Jon Pynoos,² Emily Nabors,³ Damon Terzaghi,⁴ Elizabeth Blair,⁵ Traci Wilson,⁶ Bernard Steinman,⁷ and Suzanne Kunkel,⁸ 1. *University of Southern California, Los Angeles, California, United States*, 2. *University of Southern California, University of Southern California, California, United States*, 3. *USC Leonard Davis School of Gerontology, Los Angeles, California, United States*, 4. *Advancing States, Arlington, Virginia, United States*, 5. *n 4. a, Washington, District of Columbia, United States*, 6. *USAgging, Washington, District of Columbia, United States*, 7. *University of Wyoming, University of Wyoming, Laramie, Wyoming, United States*, 8. *Miami University Scripps Gerontology Center, Oxford, Ohio, United States*

Home modification (HM) can promote older adults' functioning as their needs change, reduce fall risks, and support caregivers. A supportive home environment is increasingly important as homes become healthcare delivery sites for home and community-based services (HCBS). HM is funded and administered by disparate agencies, often hindering access to HM services for at-risk older adults who need them the most. The Aging Network (State Units on Aging (SUAs), Area Agencies on Aging (AAAs), and Title VI organizations serving Native American older adults) plays an important but not well understood role in HM. To address this lack of research, the USC Leonard Davis School of Gerontology, Advancing States, and the National Association of Area Agencies on Aging in cooperation with Scripps Gerontology Center conducted three national surveys, with support from the Administration for Community Living: 1) directors of the 56 SUAs with an 89% response rate; 2) directors of the 618

AAAs with a 79% response rate; and 3) directors of 276 Title VI programs with an 84% response rate. Exemplary practices included HM advocacy through interagency coalitions; state and local plan priority setting; creative HM financing with housing, disability, and health care sectors, including partnerships with Medicaid agencies; and integration of HMs into state and local HCBS, including nursing home transition and caregiver support programs. Findings on the types of HM activities, service delivery barriers, funding sources, collaborations, and targeted populations will inform HM policy and practice for the Aging Network's critical state and local agencies serving low-income older adults.

DETROIT NEEDS ASSESSMENT STUDY: A COMMUNITY ACADEMIC PARTNERSHIP WITH THE DETROIT AREA AGENCY ON AGING

Faith Hopp,¹ Fay Keys,¹ Elizabeth Chapleski,¹ La Cheryll Wicker,¹ Patricia Rencher,² Shirley Thomas,³ Anne Davis,⁴ and Ronald Taylor,⁴ 1. *Wayne State University, Detroit, Michigan, United States*, 2. *Urban Aging L 3. C, Detroit, Michigan, United States*, 3. *Wayne State University, Ypsilanti, Michigan, United States*, 4. *Detroit Area Agency on Aging, Detroit, Michigan, United States*

This presentation discusses a comprehensive needs assessment to inform long-term strategic planning for the Detroit Area Agency on Aging. The goal was to provide in-depth input from the older population (age 60+) and key agency stakeholders, using surveys (413 community participants), listening sessions (132 participants), 23 interviews with homebound older adults, and online surveys (94) targeting medical, church, government, academic, media and HSO stakeholders. Findings indicate that many participants were not aware of available community services. For example, one-third (33.3%) had not heard of Medicaid waivers providing services outside of nursing homes, while nearly one in five (22.0%) had not heard about senior employment services. The most common areas of unmet need were for caregiver workshops (16.3%) and diabetes management classes (15.7%). Community services most often noted as 'extremely important' included health and wellness programs (68.8%), services to help access health and supportive services (71%), easy to find service information (67.7%), home care and housekeeping services (66.4%), and caregiver support (63.7%). Stakeholder findings provide insight regarding this lack of awareness. Asked "How familiar do you think the general public is with DAAA?" , 10.8% answered 'very familiar' and 33% 'unfamiliar'. Findings related to an "Age-Friendly City" suggest the importance of access to supportive community services, transportation, safety, housing, and healthcare. Engagement of older adults in needs assessments plays a vital role in Area Agencies on Aging meeting the needs of emerging aging cohorts by developing 'age friendly' strategies to address increasing racial, ethnic, socioeconomic, and cultural diversity.

DEVELOPING A SHARED LANGUAGE TO DESCRIBE THE AGE-FRIENDLY ECOSYSTEM

Kim Dash,¹ Jody Shue,² Tim Driver,² Alice Bonner,³ Leslie Pelton,³ Rani Snyder,⁴ and Terry Fulmer,⁵ 1. *Education Development Center, Waltham, Massachusetts*,

United States, 2. Age Friendly Foundation, Waltham, Massachusetts, United States, 3. Institute for Healthcare Improvement, Boston, Massachusetts, United States, 4. The John A. Hartford Foundation, New York, New York, United States, 5. The John A. Hartford Foundation, New York City, New York, United States

While multiple sectors—cities and communities, education, employment, health, and public health—have identified and implemented strategies to promote age-friendly systems, their efforts have mainly advanced in siloes. Each sector has met goals specific to its constituents, however, the major transformations required to realize systemic inclusivity and well-being among diverse groups of older adults remains indefinable. To begin to address this gap, we have engaged age-friendly sectors in a process of coordinated planning to define and operationalize an age-friendly ecosystem (AFE) that advances cross-sector and age-friendly solutions to meet the needs of all older adults. Our process borrows from Kania and Kramer (2011) who describe conditions to achieve substantial collective impact when coordinating efforts across sectors: a common agenda, shared measurement systems, mutually reinforcing activities, and continuous communication. In this presentation, we describe our stepwise process to set a common agenda, by engaging older adults and working with experts across sectors, to agree on a series of characteristics that define an AFE. Specifically, we surveyed older adults about their perceptions of an age-friendly ecosystem as well as conducted a review and analysis of relevant activities (i.e., policies, programs, and practices) associated with five age-friendly sectors. Next, activities were organized by common and defining characteristics. We then convened more than 40 international experts representing diverse age-friendly sectors to review and revise the AFE characteristics. Through structured and facilitated group processes, we worked with experts to identify and define six critical AFE characteristics as well as examples of corresponding activities.

SPILOVER BENEFITS AND ACHIEVING SUSTAINABILITY OF AGE-FRIENDLY COMMUNITIES

Shayna Gleason,¹ Caitlin Coyle,² and Jan Mutchler,²

1. University of Massachusetts, Boston, Somerville, Massachusetts, United States, 2. University of Massachusetts Boston, Boston, Massachusetts, United States

As the age-friendly movement grows in its second decade, urgent questions of initiative sustainability have taken hold in the academic literature and among advocates implementing age-friendly changes. The creation of authentically age-inclusive environments requires not just the continuation of the initiative itself, but that its principles become embedded in formal and informal organizational processes, across sectors and beyond familiar networks focused on older populations. This paper argues that sustainability of age-friendly initiatives is enhanced by “spillover” effects, in which a behavioral or policy change in one environment spurs change in another environment. Evidence for such spillover and an understanding of how and when it occurs is currently limited in the context of age-friendly environments. This paper draws on the experiences of Age-Friendly Boston, which has been working towards age-friendly goals for more than five years. Based on Boston’s experience, we identify, describe, and exemplify three pathways to positive spillover

across environments: 1) branding positively; 2) publicizing successes; and 3) embarking on new relationships, while strengthening existing ones, in pursuit of shared goals. We also draw conclusions about what positive spillover means for the sustainability of age-friendly environments.

Session 4235 (Paper)

Gender, Control, and Caregiving

CORPORATE POLICY, MALE BREADWINNERS, AND THEIR FAMILY CARE IN AGING JAPAN

Hiroko Costantini,¹ and Glenda Roberts,² *1. SciencesPo, Paris, Ile-de-France, France, 2. Waseda University, Tokyo, Tokyo, Japan*

A rapidly emerging set of carers are men who combine care for older relatives with employment. In Japan, a 2015 government initiative aimed at reforming work to make employment and care compatible by 2020 failed to reduce the approximately 100,000 annually quitting employment mainly due to care for older relatives. This paper aims to evaluate the initiative’s limited impact through a multilevel understanding of the roll-out of the family care policy. Stakeholder views, based on 32 interviews including with employers, the Japanese Business Federation, local care providers and NPOs, are juxtaposed with the perspectives of employed male family carers drawn from 37 qualitative in-depth narrative interviews complemented by participant observation in the Tokyo area in 2019. The ethnographic fieldwork evidences informants’ diverse engagement with care for older relatives underpinned by strongly held cultural views of care provision being a ‘private’ issue, which contrasts with government attempts to make family care a ‘social’ issue by broadening stakeholder participation. Further, corporates tend to have tacit reluctance to transform working practices to accommodate care. Thus, employed men’s devotion to work competes with the culturally embedded notion that carers should be committed to care provision. In conclusion, such a disjuncture is a major factor in the government initiative’s failure. Although cultural values and meanings in policy evaluation theories are often neglected, this research points to the significance of ongoing (re)construction of the socio-cultural notions congruent with social policy enablement.

DOING EVERYTHING: INTERSECTIONS OF GENDER AND SEXUAL ORIENTATION IN CAREGIVING FOR A SPOUSE WITH DEMENTIA

Toni Calasanti,¹ and Brian de Vries,² *1. Virginia Tech, Blacksburg, Virginia, United States, 2. San Francisco State University, Palm Springs, California, United States*

Gender inequalities are rooted in and drive the division of labor over the life course, which result in heterosexual men and women acquiring different resources, skills, and identities. Gendered differences in caregiving reflect these varying gender repertoires. Whether and how these repertoires vary by sexual orientation is lesser understood. Our qualitative study seeks to explore the ways that sexual orientation and gender, and the related division of both paid and unpaid labor, shapes caregiving for a spouse or partner with Alzheimer’s disease and related disorders (AD). Our data, obtained from

in-depth interviews conducted among lesbian (n=9), gay (n=6), and heterosexual spousal and partner (23 women and 14 men) caregivers of those with AD, reveal that, although all the caregivers spoke about “having to do everything,” with a particular focus on decision-making, they interpret this experience differently based on the intersections of gender and sexuality. The heterosexual women reported they were used to managing daily household life, yet they described having to make decisions as quite stressful: “I don’t like to be the boss.” Heterosexual husbands also lamented that they “had to do everything,” but commenting that they hadn’t realized what it took to “manage a household.” The concerns reported by lesbian and gay spouses and partners were similarly situated but more varied, as each group tended to report their previous divisions of labor as “less well-defined.” Our findings reflect both the influence of gender inequalities on how respondents experience “doing everything,” and their potential modification in same-sex relationships.

FACTORS ASSOCIATED WITH ENGAGING IN REGULAR PHYSICAL ACTIVITY AMONG WOMEN FAMILY CAREGIVERS

Abiola Keller, *Marquette University, Milwaukee, Wisconsin, United States*

Regular physical activity is important for promoting the health of family caregivers. In this study, we used data from the 2015 and 2017 Behavioral Risk Factor Surveillance System Questionnaire-Caregiver module to examine factors associated with meeting physical activity guidelines among women caregivers. Meeting physical activity guidelines was defined as participating in 150 minutes (or vigorous equivalent minutes) of physical activity weekly. We used survey-weighted multivariate regression analyses to examine relationships between sociodemographic, caregiving, and health characteristics and meeting physical activity guidelines. All variables were entered into the model simultaneously. The Wald test was used to test the significance of interactions between race and ethnicity and other covariates. 50.7% of 10,542 women caregivers met physical activity guidelines. The amount of time spent caregiving each week was not associated with the odds of meeting guidelines. Caregivers in the paid workforce had decreased odds (OR=0.73, 95%CI [0.62-0.87]) of meeting guidelines. Compared to women caregiving for <6months, women caregiving for 6 months to 2 years had increased odds of meeting guidelines (OR =1.33, 95%CI [1.08-1.64]). Increasing education was associated with an increased odds of meeting guidelines, but being college educated had a more positive effect for Hispanic than white caregivers (pinteraction=0.03). Having children did not affect the odds of meeting guidelines for white caregivers, but for black caregivers having two or more children decreased the odds (pinteraction=0.03). Understanding how sociodemographic, caregiving, and health characteristics impact engagement in regular physical activity is critical to designing effective interventions and ultimately improving the health of caregivers.

PERCEIVED CONTROL AND ICD CONCERNS IN OLDER ICD RECIPIENTS: SEX AS A MODERATOR

Abigail Latimer,¹ Jennifer Miller,² Misook Lee Chung,² Muna Hammash,³ and Debra Moser,² *1. University of Kentucky College of Nursing RICH Heart Program,*

Lexington, Kentucky, United States, 2. University of Kentucky College of Nursing, Lexington, Kentucky, United States, 3. University of Louisville, Louisville, Kentucky, United States

Implantable cardioverter defibrillators (ICDs) reduce the risk of sudden cardiac death for those with a history of or high risk for lethal arrhythmias. In 2016, 105,000 ICDs were implanted in older adults (age \geq 60) in the US. Approximately 25% of ICD recipients report significant ICD concerns with women reporting higher levels than men. Little is known about the experience of older adults living with life-saving/extending medical technologies, particularly related to sex differences in ICD concerns. Perceived control may decrease ICD concerns, but sex differences have not been explored. The aim of this cross-sectional study was to determine the moderation effect of sex on the association between perceived control and ICD concerns in older adults (age \geq 60). Participants completed a questionnaire on ICD Concerns (ICDC-8) and the Control Attitudes Scale-Revised, a measure of perceived control. We conducted a moderation analysis using Hayes’ PROCESS for SPSS with 5,000 bootstrap samples. Of the 99 participants (73.7% male; age 70 + 7 years; education 13 + 3 years), most participants were white (79.8%) and married (69.7%). There were no differences in participant characteristics, perceived control, or ICD concerns, by sex. We found an interaction between sex and perceived control ($b = -.5715$, $p = .02$), indicating that for women ($-.5801$, $p = .007$), as perceived control increased, ICD concerns decreased. For men ($-.0089$, $p = .9439$), ICD concerns remained the same despite level of perceived control. Future clinical and research interventions to decrease ICD concerns should include ways to increase perceived control particularly for older women living with ICDs.

THE ROLE OF SECONDARY CARE NETWORKS, GENDER, AND RACE ON PRIMARY CAREGIVER BURDEN

Jiaming Liang, and Maria Aranda, *University of Southern California, Los Angeles, California, United States*

In addition to primary caregivers, many older adults receive care from secondary care networks (SCN), which include family members and friends. Literature rarely considers support that SCN provided to primary caregivers. This study examines: (a) the association between SCN support and primary caregiver burden, and (b) the intersectional effects of gender (male/female)-race (White/Black) identities of primary caregivers on the association. A cross-sectional study using data from 2015 National Health and Aging Trend Study (NHATS) and National Study of Caregiving (NSOC) was conducted. A total of 967 older adults, 967 primary caregivers, and 2253 secondary caregivers were selected. SCN support was measured by (a) care domain overlap, and (b) proportion of caregiving by SCN. Negative binomial regressions on overall and split samples estimated main effects of SCN support and the intersectional effects of gender and race. Both SCN-related variables were associated with primary caregiver burden, but significant three-way interaction was only found between gender, race, and proportion of caregiving by SCN. Black female caregivers reported heaviest burden and having SCN support was associated with lower risk of being burdened. Whereas Black

male caregivers reported lightest burden and SCN support was not associated with their perceived burden. Our findings support the positive role of SCN in reducing stress of primary caregivers, and demonstrate that positive impacts of SCN support vary across gender-race groups. The results indicate a strong need for support programs aimed at promoting cooperation among family caregivers for burden reduction, especially families with female and Black primary caregivers.

Session 4240 (Symposium)

GERIATRIC WORKFORCE ENHANCEMENT PROGRAMS' PARTICIPATION IN THE NURSING HOME COVID ACTION NETWORK

Chair: Leland Waters

Discussant: Nina Tumosa

In late September, 2020, the Geriatric Workforce Enhancement Program's (GWEP) Program Officer, at the Health Resources Services Administration (HRSA), alerted the 48 GWEPs about a nationwide initiative focusing specifically on the pandemic's effect in nursing facilities. The ECHO Institute at the University of New Mexico negotiated a national contract with the Agency for Healthcare Research and Quality (AHRQ) to provide a nationwide educational intervention via the CARES Act Provider Relief Fund. The ECHO Institute recruited over 100 Training Centers as educational coordinators for the Project ECHO Nursing Home National COVID Action Network. Our Project Officer suggested that individual GWEPs participate in this effort and take the lead or provide geriatric educators for these Training Centers. Project ECHO (Extension for Community Healthcare Outcomes) is an innovative telementoring program that creates virtual learning communities, bringing together healthcare providers and subject matter experts using videoconference technology for brief presentations, and case-based learning, fostering an "all learn, all teach" approach. This symposium will describe the journeys that five GWEPs experienced becoming Training Centers, rapidly deploying a nursing home ECHO project, to support nursing home staff on best practices for protecting patients, staff, and visitors from coronavirus infection and spread. GWEPs from The University of Louisville, the University of North Carolina, the University of North Texas, the University of Rochester and The Virginia Geriatric Education Center's two ECHO Hubs, joined the National COVID Action Network. This presentation will provide an overview of why GWEPs are well positioned to address emergent needs with short notice.

LESSONS LEARNED IN EXECUTING THE NURSING HOME COVID ACTION NETWORK

Anna Faul,¹ Samantha Cotton,² Pamela Yankeelov,¹ and Barbara Gordon,² 1. *University of Louisville, University of Louisville, Kentucky, United States*, 2. *University of Louisville, Louisville, Kentucky, United States*

The University of Louisville ECHO Hub for the Nursing Home COVID Action Network put together a hub of experts that could effectively address the diverse needs of the 240 nursing homes in the 7 cohorts launched. We included an infectious disease expert, a geriatrician, and a behavioral

health specialist who adjusted the curriculum to be more in line with the needs of the nursing homes. Our nursing homes were diverse in terms of geography, size and location. We created space for our cohorts to feel comfortable with each other, despite their differences. To foster this sense of togetherness, our facilitators used anonymous opinion polls and incorporated the use of virtual breakout rooms to encourage small group discussions. These strategies assisted in developing a sense of community within the Project ECHO sessions, that will continue to evolve in the post COVID world.

NC CAN COVID-19 ACTION NETWORK: PROJECT ECHO IN NORTH CAROLINA

Ben Blomberg,¹ Cristine Henage,² Jennifer Hubbard,¹ and J. Marvin McBride,¹ 1. *UNC Chapel Hill School of Medicine, Chapel Hill, North Carolina, United States*, 2. *The University of North Carolina at Chapel Hill, UNC, North Carolina, United States*

Experts in geriatrics, infection control and nursing home administration joined the ECHO Hub team led by The Carolina Geriatrics Workforce Enhancement Program (CGWEP) at the University of North Carolina at Chapel Hill (UNC). Ninety-two of North Carolina's 423 nursing homes enrolled in a 16-week videoconference series designed to address clinical, logistical, and leadership issues related to COVID-19. The CGWEP coordinated recruitment with two other Training Centers at UNC Family Medicine and the Mountain Area Health Education Center, reaching 58% of all NC nursing homes (N=245). Faculty used curriculum and pre-recorded videos provided by the Institute for Healthcare Improvement (IHI). Discussions demonstrated real-world problem solving as participants applied what they learned to local conditions. Quality Improvement (QI) experts from IHI mentored participants in gathering data and completing Plan, Do, Study, Act cycles to better respond to the challenges of COVID-19 among a critically vulnerable population.

LEVERAGING PARTNERSHIPS FOR A NURSING HOME COVID LEARNING COMMUNITY

Sarah Ross, Jennifer Severance, Janice Knebl, and Susanna Luk-Jones, *University of North Texas Health Science Center - Ft. Worth, TX, Fort Worth, Texas, United States*

The rapid and uncertain trajectory of community spread in nursing homes statewide spurred action by the University of North Texas Health Science Center to create a nursing home (NH) COVID learning community. As an existing ECHO hub, we assembled an interdisciplinary team leveraging local NH partnerships, a regional Quality Improvement Organization (QIO), and a regional emergency response task force to rapidly scale up delivery. Specialist teams include a geriatrician and NH medical director, administrator, nursing administration, infection control expert, and a QIO specialist. With the IHI curriculum as a road map for essential training elements, we adapt each week's agenda based on the interests and concerns of the participating nursing facilities and the incidence rate in our community. At this time, we have two more sessions before completion of phase 1. The three cohorts are engaging 151 participants from 68 nursing facilities with a total attendance of 747.

NURSING HOME COVID-19 ACTION NETWORK: RESPONDING WITH STRESS FIRST AID AND CARING FOR RESIDENTS WITH DEMENTIA

Thomas Caprio,¹ Barbara Ganzel,² and Adam Simming,³
1. *University of Rochester Medical Center, Rochester,
New York, United States*, 2. *Ithaca College Gerontology
Institute, Ithaca, New York, United States*, 3. *University of
Rochester, Rochester, New York, United States*

The GWEP at the University of Rochester (New York) has an established network of nursing homes participating in Project ECHO. This ECHO hub includes geriatric medicine, psychiatry, pharmacy, aging services network and the Alzheimer's Association focusing on best practices in geriatric mental health and dementia care. With the COVID-19 pandemic, this infrastructure quickly pivoted to expansion of 80 facilities and the addition of expertise in medical direction, trauma informed care, and infectious disease. A stress first aid training module was developed in partnership with Ithaca College and the National Center for PTSD to support front line nursing home workers. Dementia care experts contributed to practical problem-solving in addressing social isolation and mental health. Work now is focusing on vaccination and how to best support trauma-informed needs of residents with dementia.

VIRGINIA'S RESPONSE TO THE NURSING HOME COVID ACTION NETWORK

Leland Waters,¹ Anne Rhodes,¹ Shannon Arnette,¹
Dan Bluestein,¹ Emily Ihara,² Megumi Inoue,² and
Catherine Tompkins,² 1. *Virginia Commonwealth
University, Richmond, Virginia, United States*, 2. *George
Mason University, Fairfax, Virginia, United States*

The Virginia Geriatric Education Center's GWEP recruited 195 of Virginia's 273 eligible nursing homes, using two Project ECHO Nursing Home Training Centers located at George Mason University and Virginia Commonwealth University. These sessions promoted collaboration, allowed for sharing of successes and challenges, and nurtured quality improvement projects. Our next steps are to survey Virginia's nursing homes to see if they are interested in future ECHO sessions with other topics. We plan to share these results with the Institute for Healthcare Improvement so that we may be able to continue to enhance this national network of Training Centers with faculty and staffing dedicated to quality assurance and performance improvement. The program has initiated new collaborations with nursing homes across many healthcare disciplines, strengthened connections between nursing homes and research institutions, and will help foster innovative ways to collaborate in this post-pandemic virtually connected world.

Session 4245 (Paper)

Grandparenting

INTENSITY OF GRANDPARENT CAREGIVING AND WELL-BEING IN A CULTURAL CONTEXT: A SYSTEMATIC REVIEW

Athena Chung Yin Chan,¹ Sun-Kyung Lee,²
Jingchen Zhang,² Jasmine Banegas,³ Scott Marsalis,⁴ and

Abigail Gewirtz,² 1. *University of Minnesota -- Twin
Cities, St Paul, Minnesota, United States*, 2. *University of
Minnesota -- Twin Cities, St. Paul, Minnesota, United States*,
3. *University of Minnesota -- Twin Cities, Minneapolis,
Minnesota, United States*, 4. *University of Minnesota --
Twin Cities, St Paul., Minnesota, United States*

With improved longevity and changes in family structure, grandparents are key resources in providing care for grandchildren. However, mixed findings indicate that multiple role engagement may enhance well-being or bring demands on grandparents raising grandchildren. Little is known about how the intensity of grandparent caregiving is associated with their well-being in different family contexts (i.e., structures, cultures/regions, and reasons of care). This systematic review examines the association between the intensity of grandparent caregiving and their well-being. Peer-reviewed articles published after 1990 were identified in five electronic databases. A keyword search was performed for keywords associated with: (a) grandparent caregivers raising grandchildren, and (2) well-being (i.e., physical, mental, cognitive, and life satisfaction). Only quantitative studies were included. Fifty-six articles from 28 countries/regions were included. Findings suggested that the well-being of grandparents is optimal when they provide caregiving of moderate intensity, with optimal amounts varying across sociocultural contexts. In Europe and Australia, providing supplementary care seems beneficial for grandparents' well-being, especially supporting dual-earner families. In Asia, economic resources buffer the adverse effect of primary care on grandparents' well-being. In the U.S., findings vary across ethnicity/race. White grandparents enjoy health benefits providing supplementary care with support from adult children. However, Hispanic grandparent caregivers in multigenerational households have better well-being than those in skipped-generation households, whereas Black custodial caregivers have better well-being than supplemental caregivers. Collectively, the intensity of grandparent caregiving and well-being is complicated by their roles in the family and cultural differences. This systematic review calls for culturally-tailored family interventions.

LIVING ARRANGEMENTS AND GENDERED WORK PROSPECTS AMONG CHINESE GRANDPARENTS

Jing Ye,¹ and Feinian Chen,² 1. *University of Maryland
College Park, University Park, Maryland, United States*,
2. *University of Maryland College Park, University of
Maryland, Maryland, United States*

Recent literature on grandparenthood in China overwhelmingly focuses on the role of grandparents as caregivers for grandchildren. However, many become grandparents at an age when they are still active in the labor force. Using data from the China Health and Retirement Longitudinal Study (2011-2015), this study examines the extent to which coresidence with grandchildren affects grandparents' labor force participation and work hours. Results from our fixed-effect models show that, living with grandchildren has a positive effect on men's work participation and hours worked, especially for those with flexible jobs. For women with inflexible jobs, coresidence with grandchildren has a negative impact on their work prospect. Furthermore, grandparents in skipped generational households are less likely to scale

back in work than those in multigenerational households, indicating a high level of double burden from both work and caregiving responsibilities. Our study extends prior work by emphasizing grandparents' role as active workers and highlights the importance to understand work and caregiving demands in a gendered and dynamic household context.

MATERIAL HARDSHIP AMONG CUSTODIAL GRANDPARENTS AND GRANDCHILDREN'S PHYSICAL AND MENTAL HEALTH IN COVID-19

Yanfeng Xu,¹ Qianwei Zhao,² Brittany Schuler,³ and Sue Levkoff,¹ 1. *University of South Carolina, Columbia, South Carolina, United States*, 2. *Baylor University, Waco, Texas, United States*, 3. *Temple University, Temple University, Pennsylvania, United States*

COVID-19 has increased economic hardship for many families, including custodial grandparent-headed families. We aim to examine latent classes of material hardship among custodial grandparent-headed families, to assess predictors associated with identified classes, and to investigate associations with grandchildren's physical and mental health outcomes during COVID-19. Data was collected from a cross-sectional survey in June 2020. The sample comprised of 362 grandparents. Latent class analysis and logistic regression were conducted. Three latent classes of material hardship were identified: Class 1 (n = 232; 64.1%) low overall hardship with high medical hardship, class 2 (n = 52; 14.4%) moderate overall hardship with high utility hardship, and class 3 (n = 78; 21.5%) severe overall hardship. Factors, such as race, household income, labor force status, financial assistance status, and trigger events to raise grandchildren, were associated with class membership. Class 2 (OR = 0.19, p < 0.05) compared to Class 1 was significantly associated with grandchildren's physical health. Our findings suggest that material hardship is heterogeneous among custodial grandparents during COVID-19, and children in households experiencing utility hardship have a higher risk for poorer physical health outcomes. Results highlight the needs to meet grandparents' material needs and call for future research to examine the mechanism that explains the link between material hardship and grandchildren's outcomes.

RESOURCEFULNESS SKILLS USE BY GRANDMOTHERS RAISING GRANDCHILDREN: A LONGITUDINAL CASE STUDY APPROACH

Alexandra Jeanblanc,¹ Carol Musil,² Elizabeth Tracy,¹ and Jaclene Zauszniewski,¹ 1. *Case Western Reserve University, Cleveland, Ohio, United States*, 2. *CWRU School of Nursing, Cleveland, Ohio, United States*

In the U.S., over 2.7 million grandparents are primary caregivers to grandchildren. It is critical to understand the experiences of grandparent caregivers to design tailored, supportive programs. Our aim was to analyze 4 weeks of daily online journals of 129 grandmothers with respect to their use of a set of Resourcefulness Skills© following web-based skills training. Using a thematic analysis approach, coding was completed by a three person team using NVIVO 12. Percent agreement among coders was over 90% (Kappa = .956). Twelve cases were randomly selected for case study development. Comparative case study analysis was used to look within and across cases for instances where skills were used and how skill use changed over time. The pattern of skill use

showed that grandmother caregivers used resourcefulness skills to deal with the grandchild's behavior and developmental issues as well as within the entire family system to manage conflicted relationships with the grandchild's parents, balance relationships with their spouse/partner, and maintain relationships with other relatives. Case studies will be presented to show skill use over the four weeks of journaling in the context of the family system, as well as the strategies used by participants who improved skill use over time and those who faced barriers to skill use. Findings highlight the use of journals as a means to assess enactment fidelity of treatment interventions and the importance of the family network in skills training program implementation and ways to help grandmothers make use of skills training in the family setting.

SUPPORTING ONE'S OWN? GRANDPARENTS' HELP TO GRANDCHILDREN WHO LIVE WITH OTHER UNRELATED CHILDREN

Teresa Cooney, *University of Colorado Denver, Denver, Colorado, United States*

The structures of young families today are becoming increasingly complex, which may impact grandparents' involvement. I examine whether grandparents' support to adult children's households differs for those with biological grandchildren only, versus households with both biological and non-biological (step, unrelated) grandchildren. The resource dilution hypothesis and sociobiology theory suggest that grandparents will be less supportive of grandchildren when other unrelated children co-reside in their households. Grandparents (mean age 62.23) in the Add Health Parent Study (2015-2017) reported on instrumental and financial help given to each of their adult children's families in the past year. These data were merged with information from their adult children (mean age 36.76) who participated in Add Health Wave V (2016-2018). Adult children's household structures—biological children only (n=400) or biological + other children (n=51)—were determined using their fertility histories and household rosters. No significant differences were found in the likelihood that grandparents offered any instrumental or financial support to these two household types (controlling for grandparent resources and adult child characteristics). Nor was the level of grandparents' financial support significantly different for the two groups. However, grandparents gave significantly fewer hours of help to adult children heading households including both biological grandchildren and unrelated children. Grandparents appear less willing to devote time to assisting their grandchildren's families when their investment is diluted by the presence of unrelated children. Perhaps time with grandchildren is less pleasing or comfortable when unrelated children are present. This same issue does not impact financial giving, which need not involve contact.

Session 4250 (Symposium)

GWEP SUCCESSES AND LESSONS LEARNED FROM MAKING COMMUNITIES AGE FRIENDLY

Chair: Katherine Thompson

Co-Chair: Angela Catic

Geriatrics Workforce Enhancement Programs (GWEPs), funded by the Health Resources and Services Administration have a strong focus on age friendly care and community engagement. With a wide range of populations, locales, and

health systems served, GWEPs have significant experience working with a wide variety of communities to implement age friendly care. In this symposium, we present successes and lessons learned from GWEP projects representing diverse populations and approaches to achieving age friendly communities. For instance, one GWEP is utilizing Patient Priorities Care to lay the framework for What Matters in clinical decision-making. Another GWEP is focusing on What Matters by uniquely embedding Area Agencies on Aging care coordinators within primary care settings to invite the participation of aging patients in advance care planning, among other health interventions. A third GWEP is using the 4Ms to educate patients and caregivers in geriatric psychiatry clinics in a population of veterans. Another GWEP is pairing Age Friendly Health System efforts within a health system with community-based efforts to become an age friendly and dementia friendly city. A final GWEP is using multiple educational modalities to create Age-Friendly Communities and assure that health systems, community-based organizations, and older adults and families are educated about the 4Ms. By exploring successes and lessons learned in making communities age friendly, we can improve existing and future programs centered on age friendly care for older adults.

EDUCATION OF CAREGIVERS AND VETERANS TO IMPROVE THE CARE OF THE GERIATRIC PSYCHIATRIC PATIENT

Kristen Sorocco, *OKC VA Health Care System, Oklahoma City, Oklahoma, United States*

The geriatric psychiatry outpatient clinic provides assessment of the elderly Veteran with mental illness and behavioral and psychological symptoms of dementia. I will describe strategies developed and implemented in this setting to provide education to the caregiver (family) to improve early identification of delirium, depression and cognitive impairment. This education proved to reduce the number of pharmacological treatment and increase the use of nonpharmacological interventions based on "what matters to the patient" and following the BEERS criteria guidelines. One of the most important outcomes of the education and evaluation in the geriatric psychiatric clinic was a decrease in number of emergency room visits of elderly, specifically those with dementia.

SUCCESSSES AND LESSONS LEARNED FROM AGE-FRIENDLY COMMUNITY COLLABORATIONS: BAYSTATE HEALTH GWEP

Maura Brennan, and Rebecca Dobert, *Baystate Health, Springfield, Massachusetts, United States*

Baystate is the largest health system in Western Massachusetts with 4 hospitals, 3 Community Health Centers (CHCs) and a large primary care network. Baystate Medical Center (BMC) is in Springfield, Massachusetts. BMC and the CHCs were the first health care sites nationally to be recognized by the Institute for Healthcare Improvement as "Committed to Care Excellence" in the age friendly movement. Collaboration with a city-wide coalition of community-based organizations led to simultaneous recognition of Baystate as "age friendly" and recognition of the city as both dementia and age friendly. The 3 awards were presented at a Springfield senior center with media coverage and the participation of the mayor and other political

leaders. This collaboration persists and the GWEP and coalition partners continue to participate in multiple joint educational and community outreach projects. As a result, the city coalition has added health care to its initial focus on housing and transportation.

WHAT MATTERS MOST: ACP EVOLVING IN PRACTICE

Kevin Valadares, *University of Southern Indiana, Evansville, Indiana, United States*

The University of Southern Indiana (USI) GWEP uniquely embeds Area Agencies on Aging (AAA) care coordinators within primary care settings to invite the participation of aging patients in advance care planning (ACP), among other health interventions. Two subsequently developed features of the USI GWEP's ACP initiative emerged to address the What Matters metric of the 4Ms: 1) Patients are invited to engage in What Matters Most conversations through multiple touchpoints that frame Medicare Wellness Visits with a Deaconess provider and introduce a free, online ACP platform, Prepare for Your Care. 2) Provider, patients and families are supported in having ACP conversations with the dedication of a new Advance Care Planning facilitator position. Certified in Respecting Choices and jointly funded by the GWEP and Deaconess, the ACP facilitator supports individuals in navigating these essential healthcare conversations about balancing quality care with quality of life.

CATCH-ON EDUCATIONAL INTERVENTIONS FOR PROVIDERS, OLDER ADULTS, AND CAREGIVERS

Erin Emery-Tiburcio,¹ Michelle Newman,² and Robyn Golden,² *1. Rush University, Chicago, Illinois, United States, 2. Rush University Medical Center, Chicago, Illinois, United States*

CATCH-ON, the collaborative GWEP led by Rush University Medical Center, is working to create Age-Friendly Communities by assuring that health systems, community-based organizations, and older adults and families are educated about the 4Ms. For providers, CATCH-ON offers a monthly Learning Community that focuses on one of the 4Ms each quarter. Each session provides practical recommendations for 4Ms implementation and opportunities to share experiences in small groups. CATCH-ON also partnered with Community Catalyst, older adults, and caregivers to develop a 4Ms educational brochure. The brochure is available electronically and by paper to educate older adults and caregivers about the 4Ms and discussing them with their healthcare team. Additionally, CATCH-ON created 4M online modules for older adults and families. This session will explore the success and lessons learned in developing educational interventions for diverse audiences and how this approach strengthens Age-Friendly Communities.

Session 4255 (Paper)

Health Promotion (SRPP Paper)

AGE-TASTIC: AN EVIDENCE-BASED INTERVENTION TO IMPROVE HEALTH, SAFETY, AND WELL-BEING IN OLDER ADULTS

Manoj Pardasani,¹ Jacquelin Berman,² Mebane Powell,³ and Madison Gates,⁴ *1. Adelphi University, Garden City, New*

York, United States, 2. NYC Department for the Aging, New York, New York, United States, 3. NYC Department for the Aging, New York, New York, United States, 4. NYC Department for the Aging, NYC, New York, United States

Age-Tastic! is a holistic intervention that enhances the well-being, health and safety of older adults. Most evidence-based interventions aimed at older adults have focused on singular aspects of health such as cognitive health, falls prevention, depression, advanced care planning, etc. There are few interventions that encompass a holistic approach to health and safety. Age-tastic! is one such intervention that encompasses various aspects of health – social support, financial well-being, physical safety, mental health, health care management, and nutrition. Designed as a competitive board game to entice older adults, this intervention integrates concepts of cognitive restructuring, behavioral activation and game theory to educate, motivate and encourage healthful behaviors. At the core of this intervention is a focus on increasing awareness of health and safety issues, improving health literacy and changing harmful behaviors. A randomized control trial was conducted with 98 older adults assigned to an experimental and control group. Interviews were conducted at baseline, right after the intervention ended (8 weeks) and again after a short time (8 weeks after intervention ended). The results showed significant increases among experimental group participants in knowledge of healthy behaviors ($p=0.05$), perception of self-efficacy for engaging in healthful behaviors ($p<0.001$) and engagement in health behaviors ($p=0.001$). Regression analyses demonstrated that greater knowledge and self-efficacy were associated with behavioral change within the intervention group ($p<0.001$). Knowledge about the importance of preventing falls and communication with medical providers was positively correlated with the corresponding behavioral change ($p<0.05$). Implications for health literacy among older adults will be shared.

CHILDHOOD DISADVANTAGE AND LATER-LIFE MULTIMORBIDITY: DEMONSTRATING ROBUSTNESS UNDER IMPERFECT IDENTIFICATION

Brayan Seixas, and James Macinko, *UCLA, Los Angeles, California, United States*

This study assesses the relationship between indicators of early childhood disadvantage and later-life multimorbidity within a nationally representative sample of Brazilians aged 50 and over ($n = 9,412$). Data come from the baseline assessment (2015/2016) of the Brazilian Longitudinal Study of Aging (ELSI). We employed survey-weighted Ordinary Least Squares regression to estimate the effects of individual and combined measures of childhood disadvantage on the total number of chronic conditions in later life. Mediation analysis assessed whether adult socioeconomic status (SES) mediated the relationship between childhood disadvantage and chronic conditions. We found that individual and combined measures of childhood disadvantage were associated with the total number of chronic conditions, even after controlling for potential confounders. Mediation analysis suggested that part of the effect of childhood adversity is mediated by higher SES in adulthood (~10%). A formal strategy of sensitivity analysis showed that omitted variable bias is extremely unlikely. To rule out the observed effect, an unobserved

hypothetical confounder would need the explanatory power of the residual variance of both the independent and the dependent variables that is at least 30 times larger than that of BMI or 5 times larger than the explanatory power of age. Results should inform efforts to strengthen interventions targeting early childhood development and to improve other key inputs (such as education) to enhance adult SES and lessen the impact of early life stressors on health in older adulthood.

FOOD INSECURITY, FOOD ENVIRONMENTS, AND DISPARITIES IN DIET QUALITY AND OBESITY

Yeon Jin Choi, *University of Southern California, Los Angeles, California, United States*

Food insecurity is a public health concern that is associated with poor diet and obesity. Poor food environments with low access to healthy, affordable food may amplify the negative impact of food insecurity on diet and obesity. This study aims to investigate whether food insecurity and food environments are jointly associated with an increased risk of poor diet quality and obesity. We used data from a nationally representative sample of 6,395 older adults in the Health and Retirement Study Health Care and Nutrition Survey and the National Neighborhood Data Archive. Weighted regression models were estimated to examine the relationship between food insecurity and food environments with diet quality and obesity. Both food insecurity and poor food environment were associated with lower healthy eating index scores, indicating poorer quality diet. Food insecure older adults were more likely to be obese than food secure older adults and poor food environments exacerbate the negative impact of food insecurity on obesity risk. However, there was no statistical difference in obesity risk by food environment among food secure respondents. Findings from this study highlight the negative impact of limited access to healthy food due to financial difficulties and/or poor food environments on diet quality and obesity risk. Providing financial or nutritional supports along with efforts to promote healthy food environment may reduce disparities in diet quality and obesity. Special support should be provided to food insecure older adults with poor food environment, those at the greatest risk of poor diet quality and obesity.

GENDER, TOBACCO CONTROL POLICIES, AND RECALCITRANT SMOKING AMONG OLDER ADULTS IN 20 EUROPEAN COUNTRIES

Manjing Gao, Chioun Lee, and Soojin Park, *University of California, Riverside, Riverside, California, United States*

Little is known about sociodemographic and macro-level predictors of “recalcitrant smoking,” defined as persistent smoking when one has developed a health condition that is likely caused by smoking. We aim to investigate the impact of gender, education, and tobacco control policies on recalcitrant smoking among older adults in Europe from 2006 through 2013. Data from 33,839 respondents—aged 50 years and older with a smoking history and at least one smoking-related health condition—were pooled from the 2006–07, 2011, and 2013 waves of three harmonized longitudinal studies on ageing (SHARE, ELSA, and TILDA). We fitted gender-specific logistic regression models with two-way fixed effects and tested interaction terms between gender, tobacco control

policies, and education, adjusting for age, marital status, GDP per capita, smoking prevalence, country, and year-fixed effects. Compared to men and individuals with higher levels of education, women and less educated individuals were more likely to be recalcitrant smokers. The association between education and recalcitrant smoking was stronger for women than men. The inverse association between the TCS and recalcitrant smoking was stronger for those having upper secondary education (for men: OR = 0.905, CI = 0.849–0.965; for women: OR = 0.897, CI = 0.834–0.964) and tertiary education (for men: OR = 0.802, CI = 0.717–0.898; for women: OR = 0.739, CI = 0.603–0.907), compared to those having less than upper secondary. As women and less educated individuals are vulnerable to recalcitrant smoking, future policies targeting these marginalized groups are needed to prevent recalcitrant smoking in old age.

THE ASSOCIATION BETWEEN THE USE OF DIGITAL HEALTH MANAGEMENT TOOLS AND SUBJECTIVE WELL-BEING AMONG OLDER ADULTS

Haowei Wang,¹ Mai See Yang,² and Yong Kyung Choi,³

1. *The Pennsylvania State University, University Park, Pennsylvania, United States*, 2. *UC Davis, UC Davis, California, United States*, 3. *University of California Davis School of Medicine, Sacramento, California, United States*

This study aims to examine the association between the use of digital health management tools and subjective well-being in later life. Research is limited about technology use (e.g., participation in online wellness program, finding medical information, using devices to monitor health) among community dwelling older adults. This study used data from the Health and Retirement study 2012 Module “Technology Use: Barriers and Benefits” (N = 1,416). We used multiple regression methods to test the association between technology use and subjective well-being (i.e., self-rated health, life satisfaction, and depressive symptoms). Over half of the participants reported using technology (58%). The mean age for this group was 68.7 (SD 9.6). Majority of the respondents were female (55%). About 18% were non-Hispanic Blacks, 2% were non-Hispanic other, 11% were Hispanic, and 68% were non-Hispanic Whites. For this sample of technology users, the usage of digital health management included online exercise programs (16%), online wellness programs or health monitoring programs (7%), searching for medical and health information online (43%), digital devices to monitor health (31%), and physical activity-based video game such as Wii Fit (7%). Over 88% of the sample have used at least one of these formats to monitor their health. Results from regression models suggested that the use of any digital health management tools was related to fewer depressive symptoms and better self-reported health. Findings from this study provide insight into how digital health management can protect older adults from poor subjective well-being in later life.

Session 4260 (Symposium)

INTERPRETING THE EMERGING DISCOURSE AROUND ELDERHOOD: LIFE STAGE, ANTI-AGEISM STRATEGY, OR SOMETHING ELSE?

Chair: Jenny Inker

The emerging discourse around elderhood hints at the possibility of a later life stage characterized by a focus on

balancing development and decline, with potential to empower elders. However, little agreement exists about whether elderhood is a valid and useful construct. The first presenter questions the aging “mystique” through an analysis of the concepts of elderhood, sageing, croning, and elderying in popular and academic literature, underscoring the importance of avoiding othering and critically thinking beyond labels, even if positive. The second presenter explores the concept of agency in later life through a feminist philosophical lens, arguing that confrontations with one’s existential vulnerability need not be an obstacle to agency in elderhood, but rather can inspire alternative conceptualizations of it. The third presenter contrasts his personal and professional experiences of studying cultural aspects of aging, concluding that elderhood is neither a stage of a life nor a rite of passage but rather an individual, voluntaristic process. The fourth presenter explores 943 texts written by Finnish older adults, finding that the writers creatively position themselves as a group of older persons with a special contribution to make to society, even where elderhood is not explicitly mentioned, and potentially offer an alternative view to countering ageism. The fifth and final presenter explores a novel elderhood video intervention among first-year medical students (N = 585). Thematic findings of neutrality, elderhood as development, elderhood as othering, and elderhood as an opportunity to reframe stigma suggest that elderhood may be a viable and productive anti-ageism strategy.

THE ELDERHOOD MYSTIQUE

Kate de Medeiros, *Miami University, Oxford, Ohio, United States*

While elderhood recognizes untapped potential and continued growth and creativity in later life, it also risks becoming a dismissive label that positions older people as different, otherworldly, and mysterious. By analyzing the concept of elderhood and similar movements (e.g., sageing, croning, elderying) in popular and academic literature, paying close attention to how elderhood is defined and framed, I found that elderhood has a role in some religious and cultural practices. However, newer approaches to elderhood have emerged from middle aged writers who imagine an idealized role in later life – the elderhood mystique. Often grounded in introspective passivity and selflessness, elderhood parallels Kathleen Woodward’s depiction of wisdom as a disempowering label that discourages activism and resistance by older people. Subsequently, elderhood and wisdom risk becoming new forms of othering or exclusion. Overall, findings underscore the importance of critical analysis of age-related terms, regardless of how positive they seem.

ELDERHOOD, AGENCY AND EXISTENTIAL VULNERABILITY

H.E. Laceulle, *University of Humanistic Studies, Utrecht, Netherlands, Utrecht, Netherlands*

Popular conceptualizations of elderhood often use a spiritually inspired language of personal growth and wisdom. These conceptualizations are rightly critical of the language of activity and productivity that abounds in dominant successful aging discourses. Instead, the emphasis is placed on embracing our diminishing strength and increasing

dependence with an attitude of resignation and gracious acceptance. Problematically, however, this can reinforce the ageist cultural assumption that old age lacks agency. If the emerging discourse about elderhood is truly to serve as a more inspiring cultural image of late life, it requires a reconceptualization of agency in the face of existential vulnerabilities. This paper aims to present a possible philosophical outlook for such a reconceptualization. It will draw on sources from feminist philosophy to argue how confrontations with vulnerability need not be an obstacle, but rather inspire alternative conceptualizations of agency that are a welcome addition to gerontological thinking.

ELDERS OR OLD MEN?

Thomas Cole, *McGovern Medical School, Houston, Texas, United States*

Thomas R. Cole, GSA Abstract, 3.9.2021 Elders or Old Men? My book *Old Man Country* is about 12 successful, respected older men who think back on their lives and current aging. When starting my research, I first questioned my own aspirations for aging: What would my aging be like? Who would I become? What would be my purpose as an old man? Although I expected that strength and resilience would be the common thread of elderhood, it was actually their vulnerabilities that defined them (accepting losses, acknowledging dependency.) More so, these vulnerabilities did not demarcate a descent but rather a continuous uphill struggle that differentiates elderhood from growing old. Ultimately, I argue that elderhood is not a life stage or a right of passage but rather an individual process to be worked through, if one so chooses.

ELDERHOOD IN PROTESTANT RELIGIOUS CONTEXTS: STEPPING STONES IN RELIGIOUS LANGUAGE

Jenni Spännäri, *University of Eastern Finland, Joensuu, Pohjois-Karjala, Finland*

Elderhood is an emerging concept for making meaning in older age, often contextualized in spiritual but not religious traditions. But what kinds of frameworks for elderhood are woven into protestant religious contexts? This paper explores 943 texts written by Finnish older adults in study groups organized by a pensioners' organization. A key finding is that religious language – known through religious songs and prayers learned by heart at school – offers a medium to explore and express their elderhood. The writers creatively use the rhythm and wordings of these textual patterns to position themselves as a group of older persons with a special contribution to make to society. These results will aid examining elderhood and its potential in various contexts where the concept might not be explicitly used. This examination potentially leads to new ways to support experiences of elderhood and thus to offer an alternative view to countering ageism.

ELDERHOOD AS AN ANTI-AGEISM INTERVENTION

Tracey Gendron, Shannon Arnette, Jenny Inker, Sarah Marrs, Maddie McIntyre, and Waters Bert, *Virginia Commonwealth University, Richmond, Virginia, United States*

Ageism is a complex, multi-layered phenomenon impacting feelings, thoughts and behaviors toward self and others. Due to the complexity of ageism, evidence-based

anti-ageism interventions have proved challenging and costly. To date, using the concept of elderhood as a mechanism to mitigate the negative impacts of ageism has not been explored. As an anti-ageism strategy, elderhood reframes later life as a stage that encompasses growth and development and expected loss and decline. The current study evaluated a brief video intervention among first-year medical students before participating in a year-long senior mentoring program. First-year medical students (N = 585) from 2018-2021 responded to open-ended questions after viewing the video. Thematic analysis revealed four themes: neutrality, elderhood as development, reframing stigma and elderhood as othering. Findings suggest that elderhood may be a viable and productive anti-ageism strategy.

Session 4265 (Symposium)

LEVERAGING FREE PUBLIC USE DATA FOR AGING AND LIFE COURSE RESEARCH

Chair: Lara Cleveland

Discussant: Kathleen Cagney

This symposium will showcase life course and aging research that is possible using freely available integrated census and survey data available via IPUMS. This session is organized by the Network for Data-Intensive Research on Aging (NDIRA) initiative at the University of Minnesota's Life Course Center. NDIRA seeks to build and support an interdisciplinary community of scientists leveraging powerful data resources in innovative ways to understand health outcomes at older ages, as well as the demography and economics of aging. The session features papers that illustrate how to examine aging-related topics including health at older ages, work and socioeconomic conditions, and living conditions with a common thread of examining heterogeneity within groups. These papers all leverage freely available census and nationally-representative survey data, highlighting the potential value of these data for studying aging and the life course. By combining papers on an array of topics from a variety of data sources, this symposium highlights exemplar papers that demonstrate the types of novel research possible using public use census and survey data that NDIRA seeks to foster.

DERAILED BY THE COVID-19 ECONOMY? OLDER ADULTS' PAID WORK BY INTERSECTIONS OF AGE, GENDER, RACE-ETHNICITY, AND CLASS

Sarah Flood,¹ Phyllis Moen,¹ and Joseph Pedtke,²

1. *University of Minnesota, Minneapolis, Minnesota, United States*, 2. *University of Minnesota (Life Course Center), Minneapolis, Minnesota, United States*

This paper addresses the uneven employment effects on older Americans (Boomers and Genxers, ages 50-75) of the COVID-19 pandemic. Drawing on monthly CPS data from January through December 2020 (IPUMS) with an intersectional approach, we first chart shifts in employment and non-employment for population subgroups defined by age, gender and race/ethnicity, including explanations for not working (unemployment, retired, disabled, not in the workforce for other reasons – NILF-other). We then examine uneven transitions --monthly individual-level shifts out of and into paid work for population subgroups, considering also disparities by educational level. We find increases in proportions

unemployed, especially for women in their 50s, as well as increases in the proportions reporting they are NILF-Other, especially for Asian and Hispanic women, with small increases for Asian and Hispanic men as well. There is little change in age-graded reports of being retired, regardless of gender or race/ethnicity, though there are education-level effects.

LONG-TERM EFFECTS OF SOCIAL INSURANCE ON ADULT MORTALITY: EVIDENCE FROM THREE SOCIAL PROGRAMS IN MEXICO

Emma Aguila,¹ William Dow,² and Susan Parker,³ 1. *Sol Price School of Public Policy, University of Southern California, California, United States*, 2. *UC Berkeley, Berkeley, California, United States*, 3. *University of Maryland, College Park, Maryland, United States*

Research on the mortality effects of social insurance programs for older adults has generated conflicting results. Some studies suggest important health benefits, others find no effects, and still others find unintended adverse effects potentially linked to pathways such as increased obesity. Evidence has focused predominantly on short-run effects rather than net long-run mortality effects and their effects on the health of older adults has been particularly understudied. Mexico offers a unique opportunity for studying the long-run effects of social programs on adult mortality. Within a ten-year period, Mexico introduced the following influential social insurance programs: Progresa conditional cash transfer (CCT) program in 1997, 70 y más unconditional cash transfer (UCT) program for older persons in 2007, and Seguro Popular, a public health insurance program (PHI) for the uninsured, in 2004. In this paper we analyze effects on mortality for middle-age and older adults, by gender, 10-20 years after program implementation.

CHANGES IN SOCIODEMOGRAPHIC AND DISEASE PREVALENCE AMONG FIVE BIRTH COHORTS OF OLDER LATINOS

Catherine Garcia,¹ and Jennifer Ailshire,² 1. *University of Nebraska - Lincoln, Lincoln, Nebraska, United States*, 2. *University of Southern California, Los Angeles, California, United States*

Latinos are often treated as an amalgamated group without respect to Latinos' composition included in sampling designs in different periods. This matters because the Latino population is continuously changing over time with respect to migration patterns, socioeconomic status, socio-cultural characteristics, and geographic dispersion across the U.S., which may influence disease patterns in later life. We use data from the Health and Retirement Study and the National Health Interview Survey to investigate changes in older Latinos' composition by examining five birth cohorts. Results indicate that there have been significant demographic and health changes over time among older Latinos, with later-born cohorts more racially and ethnically diverse, more educated, and exhibiting a higher prevalence of hypertension, diabetes, and obesity. Understanding these shifting dynamics is imperative for crafting strategies and public policies that meet this group's health needs, reduce the cost of health care, and increase the quality of life for older Latinos.

INFLUENCE OF LABOR MARKET DISPARITIES ON SEX AND GENDER INEQUALITIES IN COGNITIVE DECLINE

Justina Avila-Rieger,¹ Precious Esie,² Jennifer Manly,² 1. *Taub Institute for Research on Alzheimer's Disease and the Aging Brain, New York, New York, United States*, 2. *Columbia University, New York, New York, United States*

State-level labor market disparities have been linked to health outcomes. The current study examines how labor market disparities may shape different patterns of sex/gender inequalities in cognition across race/ethnicity, place, and time. We leverage cognitive outcome data from multiple cohort and nationally representative longitudinal studies, as well as historical data on labor force participation and occupational status from IPUMS CPS. Multilevel modeling analyses was used to examine heterogeneity in sex/gender inequalities in cognitive trajectories within and between race/ethnicity and U.S. state of birth and determine whether such variability is explained by a state-level labor market opportunity composite. We expect women to demonstrate an advantage over men on cognitive measures. Women's advantage will be more pronounced in states with a small sex/gender gap in labor market opportunities and less pronounced in states with a large gap. The magnitude of this advantage will be greater for White women compared with Black women.

HOUSEHOLD STRUCTURE AND OLDER PERSONS

Sainan Zhang,¹ Sandile Simelane,² Tapiwa Jhamba,² and Rachel Snow,² 1. *UNFPA, New York, New York, United States*, 2. *United Nations Population Fund, New York, New York, United States*

This research explores the life circumstances of older persons (aged 60 years and above), focusing on the sociodemographic and socioeconomic conditions of those who live alone. We situate the living arrangements of older persons within the global context of changing household structures in 76 countries from all regions of the world. Older persons who live alone are among those most likely to need governmental and other forms of social support. The analysis presented here is crucial for supporting policy responses to the needs of older persons, including the special attention they require during the current COVID-19 crisis. It also supports the operationalization of the Madrid International Plan of Action on Ageing (MIPAA)(United Nations, 2002), the realization of United Nations Principles for Older Persons (United Nations, 1991), and the broader framework of the Programme of Action of the International Conference on Population and Development(ICPA-POA).

Session 4270 (Paper)

Local, State, and Federal Policies

COMMUNITY OPTIONS TO FUND AGING SERVICES: A NATIONAL STUDY TO TRACK LOCAL INITIATIVES

Athena Koumoutzis, Jennifer Heston-Mullins, Pamela Mayberry, and Robert Applebaum, *Miami University, Oxford, Ohio, United States*

The majority of federal support for older people needing in-home services and supports comes from the Medicaid

program. However, less than 10% of older people are eligible for Medicaid and to receive long-term services, a person must have a severe disability. Many older people with moderate levels of disability or those who are not impoverished are not eligible. In response to these system limitations, some counties across the nation have developed alternative funding strategies, such as property tax levies, to better serve older members of their communities. After identifying 15 states with such initiatives, a survey was distributed to 414 contacts within these states, with a response rate of 55%. Respondents included organizations such as area agencies on aging, councils on aging, and county departments on aging. Local funding varied within and across states, with annual funding ranging from \$8,000-\$47 million. Most commonly provided services with local funds include home-delivered (81%) and congregate (73%) meals, transportation (61%), and homemaker services (49%). A majority of programs (63%) indicated that local funds are used to provide at least one family or friend caregiver service. This study is the first compilation and description of locally-funded elder service initiatives in the U.S. Locally-funded initiatives can help older people with long-term services needs continue to live in their own homes and communities. On the other hand, some have raised questions about whether this is a good approach to funding aging services, raising concerns that this will lead to further inequities across states and communities.

DISTINGUISHING FEATURES OF AAA-HEALTHCARE PARTNERSHIPS: BUSINESS ACUMEN IS NECESSARY BUT NOT SUFFICIENT

Leslie Curry,¹ Emily Cherlin,² Adeola Ayedun,¹ Chris Rubeo,³ Traci Wilson,⁴ Amanda Brewster,³ and Jane Straker,⁵ 1. *Yale School of Public Health, New Haven, Connecticut, United States*, 2. *Yale School of Public Health, Yale Global Health Leadership Initiative, New Haven, Connecticut, United States*, 3. *University of California, Berkeley School of Public Health, Berkeley, California, United States*, 4. *USAgings, Washington, District of Columbia, United States*, 5. *Miami University, Oxford, Ohio, United States*

Stronger relationships among service providers in the health care and social service sectors may contribute to positive outcomes such as lower health care use and spending. Such partnerships have grown in recent years, including Area Agencies on Aging (AAAs) contracting with health care organizations, and their impact on health care utilization has been demonstrated. Nevertheless, knowledge about how AAAs establish and manage successful collaborations is limited. This study was designed to understand how AAAs in regions with low levels of avoidable health care utilization develop and sustain partnerships with health care organizations. We conducted an explanatory sequential mixed-methods, positive deviance study. In the quantitative phase, we identified 8 AAAs with multiple health care partners serving areas with little utilization of nursing homes by residents with low-care needs, and 3 with few partners and high utilization for comparison. In the qualitative phase, we identified key informants within AAAs and their partners for in-depth interviews (total n = 123). We used the constant comparative method of analysis to identify 5 factors that characterized partnerships in the highly-partnered, low-utilization

sites: 1) Regional context (e.g., breadth of health care provider market, cross-sectoral coalitions), 2) AAA human resource assets (e.g., community expertise, business acumen), 3) AAA organizational culture (e.g., visionary leadership, risk taking), 4) Interdependence among organizations (e.g., mutual benefit, alignment), and 5) Interpersonal dynamics (e.g., trust, relationships). The importance of these regional, organizational, and relational factors suggests that AAA business acumen is necessary but not sufficient to build and sustain robust cross-sectoral partnerships.

FEDERAL INTERVENTIONS TARGETING SOCIAL ISOLATION AND LONELINESS: AN EXPLORATORY REVIEW

Lauren Palmer,¹ Jennifer Howard,² Helena Voltmer,³ Abigail Ferrell,⁴ Natalie Mulmule,⁵ Abbie Levinson,³ and Sarita Karon,³ 1. *RTI International, RTI International, Massachusetts, United States*, 2. *RTI International, Durham, North Carolina, United States*, 3. *RTI International, Waltham, Massachusetts, United States*, 4. *Lake Erie College of Osteopathic Medicine, Erie, Pennsylvania, United States*, 5. *RTI International, RTI International, North Carolina, United States*

Even prior to the COVID-19 Public Health and Medical Emergency, the experiences of chronic social isolation and loneliness (SIL) were growing among older adults. Countries began increasing national visibility for these issues and implementing programs and services focused on addressing them. In the United States (US), however, little is known about successful national interventions or their effectiveness in tackling SIL among older Americans. We conducted a rapid review of the peer-reviewed and grey literature from 2009-2019, focusing on existing federal programs, health systems, and health care models in the US that address SIL among older adults. Of the 110 articles identified, 36 met the inclusion criteria and were synthesized. Our review found few federal interventions that directly address SIL; several may be addressing SIL as an auxiliary outcome to addressing social determinants of health, such as group exercise, transportation support, or food insecurity. While these interventions may provide a promising opportunity, implementation and evaluation challenges were identified. Thus, federal and state agencies face significant obstacles to understanding the impact of existing interventions and their effectiveness in addressing SIL, hampering progress toward large scale implementation. As SIL receives increasing attention, we add another voice to existing literature that indicates significant heterogeneity among existing programs; we found that few evidence-based, scalable federal initiatives exist in the US that target SIL. Without resources from federal and state agencies, the ability of health entities, community-based organizations, and direct care providers to implement effective interventions is significantly diminished.

THE EFFECT OF INCREASING STATE MINIMUM WAGE ON FAMILY CAREGIVING

Eric Jutkowitz,¹ Derek Lake,¹ and Peter Shewmaker,² 1. *Brown University, Brown University, Rhode Island, United States*, 2. *Brown University, Brown University, Rhode Island, United States*

Paid long-term care workers, such as personal care aides, compliment family caregivers in the delivery of care

for people with long-term care needs. Nearly 12% of paid long-term care workers live in poverty. There is a call to raise the federal minimum wage from \$7.25/hr to \$15/hr. Long-term care workers may financially benefit from an increase in minimum wage, but families that rely on paid long-term care may be unable to afford higher wages. We obtained Health and Retirement Study (HRS; 2006-2014) respondents' state of residence which we linked with state minimum wage data. Between 2006 and 2010 the federal minimum wage increased from \$5.15 to \$7.25. We identified 25 states in which the 2006 to 2010 (pre period) increases in federal minimum wage increased the state's effective minimum wage (higher of state and federal minimum wage). Seven of these states continued to increase their minimum wage from 2010 to 2014 (post period). The remaining 18 matching control states did not increase their minimum wage after 2010. We used a difference-in-differences design and ordinary least squares regression to compare hours of unpaid and paid caregiving HRS respondents received in treatment and control. There was no statistically significant change in unpaid (-2.15; 95%CI: -8.53, 4.23) or paid (2.42; 95%CI: -1.33, 6.20) caregiving hours received between HRS respondents that lived in states that did and did not increase their minimum wage. Increasing state minimum wage may improve the economic wellbeing of long-term care workers without adversely affecting people with long-term care needs.

THE EFFECT OF MEDICAID ENROLLMENT ON FAMILY CAREGIVING

Eric Jutkowitz,¹ Peter Shewmaker,² Derek Lake,¹ and Momotazur Rahman,² 1. *Brown University, Brown University, Rhode Island, United States*, 2. *Brown University, Brown University, Rhode Island, United States*

Most people with long-term care needs rely on family caregivers. People with long-term care needs are also more likely to be eligible for Medicaid, which is the largest public payer of home and community based long-term care services. Whether enrolling in Medicaid compliments or substitutes for family caregiving is unknown. We linked Health and Retirement Study (HRS) respondents with their Medicaid enrollment data (2002-2012), to determine the effect of enrolling in Medicaid on family caregiving hours. We identified 130 people that participated in the HRS interview prior to enrolling in Medicaid in the same year (i.e., untreated) and 142 people that participated in the HRS interview after recently enrolling in Medicaid (i.e., treated). Untreated and treated respondents had similar demographic characteristics (age, sex, race). We estimated a series of inverse probability weighted linear regression adjusted models to determine the difference in monthly family caregiving hours between individuals that newly enrolled in Medicaid compared to people that had yet to enroll. We controlled for HRS respondents' demographics, health care utilization, and nursing home utilization. HRS respondents interviewed after enrolling in Medicaid received 5.98 (95%CI: -27.60, 39.57) fewer monthly hours of family caregiving than respondents that had yet to enroll in Medicaid. HRS respondents interviewed after enrolling in Medicaid were not statistically more likely to receive any family caregiving (risk difference 0.05% 95%CI: -0.16, 0.06) than HRS respondents that had yet to enroll in Medicaid. Initial enrollment in Medicaid does not substitute for family caregiving.

Session 4275 (Paper)

Long-Term Care Policy

DISCRIMINATION IN LONG-TERM CARE FACILITIES: LEGAL CONSCIOUSNESS AND PROBLEM-SOLVING AMONG STAFF

Angela Perone, *National Academy of Medicine, Washington, District of Columbia, United States*

Over half of direct care workers in long-term care facilities are women of color. Building on legal consciousness theory—which explains how individuals invoke legal principles to define everyday experiences—this study examines how staff understand and resolve discrimination between residents and staff and among staff. This study employs a multi-method qualitative extended comparative case approach. Data includes in-depth semi-structured interviews (n=80) and participant and non-participant observation (n=8 months) at two facilities that vary in staff racial composition. Findings reveal rampant unreported instances of race and sex discrimination toward Black staff by white staff and residents. Black staff at all levels did not invoke rights or discrimination rhetoric when they experienced overt race discrimination by residents but engaged in significant emotional labor to respond to race discrimination by residents. Black staff, however, perceived microaggressions and unequal treatment by white staff as discrimination. At both facilities, floor staff and management adopted diverse team approaches across race and staff hierarchy for responding to race discrimination by residents toward Black female staff. These findings suggest the need for new and targeted policy and practice approaches that recognize extensive emotional labor expended by staff of color when addressing discrimination by residents and challenges from white staff when addressing race discrimination by staff. These findings have theoretical implications by extending legal consciousness theory to multi-level staff understandings of discrimination. Findings also provide useful tools and case examples for policymakers and practitioners interested in racial justice, particularly given how COVID has exacerbated racial inequities in long-term care.

HOW LONG-TERM CARE QUALITY ASSURANCE MEASURES ADDRESS DEMENTIA IN AUSTRALIA, ENGLAND, JAPAN, AND THE UNITED STATES

Michael Lepore,¹ David Edvardsson,² Ayumi Igarashi,³ and Julienne Meyer,⁴ 1. *LiveWell Alliance, Southington, Connecticut, United States*, 2. *La Trobe University, La Trobe University Melbourne, Victoria, Australia*, 3. *The University of Tokyo, Bunkyo, Tokyo, Japan*, 4. *City, University of London, Guildford, England, United Kingdom*

The prevalence of people with dementia living in long-term care (LTC) is high and rising internationally, and the need to improve LTC for people with dementia is widely recognized. In some countries, LTC quality assurance programs use quantitative measures of LTC quality, and international bodies emphasize the importance of person-centered care and healthy ageing outcomes. To better understand how LTC quality assurance programs address dementia, programs were reviewed in four countries—Australia, England, Japan, and the United States. Quality measures from each program

were identified ($n = 38$) and examined to determine how they address dementia. Most measures did not address dementia, but four risk-adjusted for dementia (antipsychotic use, fractures, falls, mobility), one was dementia-specific (dementia/delirium hospitalizations), and one excluded people with dementia (losing bowel/bladder control). The other 32 measures were calculated equally regardless of the prevalence of dementia among LTC residents. Overall, LTC quality measurement differs internationally, but few measures address dementia. When dementia is addressed in quality measure calculations, it is most often as a risk-adjustor. Risk adjustment can help with attributing performance on these measures to the LTC setting rather than to the types of residents that the setting serves, but risk adjustment factors also are highly amenable to fraud, and thus require ongoing monitoring. Although LTC quality assessment programs and measures can help ensure people with dementia have access to quality LTC, adoption of measures that are meaningful to people with dementia—including measures of person-centered care and healthy ageing outcomes—remains needed.

LONG-TERM CARE INSURANCE POLICY INTENSITY AND THE POLICY MATCHING DEGREE OF PILOT CITIES IN CHINA

Rong Peng,¹ and Bei Wu,² 1. *School of Economics, Guangzhou, Guangdong, China (People's Republic)*, 2. *New York University, New York, New York, United States*

Since China launched long-term care insurance (LTCI) pilot in 15 cities in 2016, the LTCI policy schemes have been developed gradually. Based on the 61 LTCI policy documents, this study evaluated the LTCI policies intensity in each pilot area by building a PMC index model with 10 primary variables and 44 two-level variables. Using the coupled coordination model, the coordination development indexes were calculated to evaluate the level of matching between LTCI policies and economy development and population structure. The results showed that the PMC index valued between 0.646 and 0.922. The three cities having the highest level of policy strength ($PMC > 0.8$) were as follows: Qingdao, Nantong, and Jingmen. The three cities having the lowest level ($PMC < 0.7$) were Ningbo, Qiqihar and Chongqing. The indexes of the coordination degree varied from 0.263 to 0.594. Shanghai, Qingdao and Guangzhou had the highest level of coordination degree, while Anqing, Chende and Qiqihaer are the lowest. The difference of financing mechanism of pilot cities was one of the main determinants of policy intensity. The matching degree was relatively low. Qingdao was a unique city having both high policy intensity and matching degree. It was suggested that the intensity and matching degree of LTCI policies should be improved to develop a national LTCI system in China.

PROVIDING NURSING HOME CARE IN AN ERA OF INCREASING SCARCITY: THE CASE OF PENNSYLVANIA

Elizabeth Simpson,¹ Edward Miller,² Molly Wylie,³ and Marc Cohen,¹ 1. *University of Massachusetts Boston, University of Massachusetts Boston, Massachusetts, United States*, 2. *University of Massachusetts Boston, Boston, Massachusetts, United States*, 3. *University of Massachusetts Boston, University of Massachusetts boston, Massachusetts, United States*

Medicaid financing of nursing home (NH) care provides the strongest safety net for low income older adults, persons who have high-intensity long-term care (LTC) needs, and consumers with exorbitant LTC costs. Yet, NHs currently face serious threats to their financial viability, particularly in the context of the COVID-19 pandemic, where the costs of caring for residents in a safe way have increased significantly, even as the ability to recoup these costs from the Medicaid program has been constrained. The purpose of this study is to assess key demand and supply factors affecting the performance of the NH industry in Pennsylvania over time. It draws from several large, national data sources, including NH Compare, LTCFocus.org, the U.S. Bureaus of the Census and Labor Statistics, and Certification and Survey Provider Enhanced Reports, as well as state-level population projections and Departments of Health and Human Services data. An aggregate database was constructed with historical data points at the facility, regional, and state level. Annual total and regional trends were examined from 2010 to 2020. Findings suggest a growing gap between what NHs require to meet the needs of residents and the level of reimbursement paid by the largest funder: Medicaid. Considering demographic trends, this gap will only grow over time in the absence of policy change. The pandemic has further highlighted the existing challenges resulting from an underfunded service infrastructure and the need for additional investment if NHs are to provide high quality care to a growing cohort of older adults requiring support.

USING POPULATION-LEVEL DATA TO ASSESS NEED FOR AND USE OF LONG-TERM SERVICES AND SUPPORTS IN CALIFORNIA

Kathryn Kietzman,¹ Lei Chen,² and Rebecca Allen,³ 1. *University of California, Los Angeles, Center for Health Policy Research, UCLA Center for Health Policy Research, California, United States*, 2. *University of California, Los Angeles, Los Angeles, California, United States*, 3. *California State University, Long Beach, Long Beach, California, United States*

In response to aging and disability stakeholder advocacy in California, the state's 2018-19 budget included support for the development of a study of Californians with needs for long-term services and supports (LTSS). Existing data on LTSS most typically represents those who already use specific programs or services. Yet many programs do not uniformly collect and report data, or have little capacity to share data across different delivery systems. In response to these gaps, we developed a 15-minute follow-on survey to the 2019-2020 California Health Interview Survey (CHIS), gathering statewide population-level data to assess LTSS needs and use by Californians 18 years of age and older. This paper reports on preliminary findings from the 2019 CHIS-LTSS survey conducted with a sample of 1097 respondents. Screening questions identified respondents reporting difficulties with concentrating, remembering, or making decisions (60%), performing basic daily activities such as dressing or bathing (26%), or getting out of the house to shop or to see the doctor (52%). Nearly half of respondents (45%) reported needing help with routine care needs while 16% needed help with personal care needs. Additional findings illustrate specific LTSS needs, service use, consequences of

unmet needs, financial concerns, and consumer experiences. At a time when California policy makers, program planners, and advocates are engaged in implementing a 10-year Master Plan for Aging, these findings can be used to identify and address gaps in the types of services and supports that are essential to meet the LTSS needs of older adults and people with disabilities.

Session 4280 (Paper)

Mental Health and Aging

AN INNOVATIVE MENTAL HEALTH MODEL FOR TREATING CULTURALLY DIVERSE OLDER ADULTS

Tobi Abramson,¹ Jacquelin Berman,² and Madison Gates,¹
 1. NYC Department for the Aging, NYC, New York, United States, 2. NYC Department for the Aging, New York, New York, United States

The mental health needs of older adults are largely unmet, a finding even more prevalent within culturally diverse older adult populations. Added to this is the high rate of social isolation. Research has indicated increased connection to mental health services when services are embedded within physical health care settings. For those attending community centers, 85% indicate that they are socially isolated, 68% indicate they are lonely, and 53% have a mental health need (compared to 20% nationally). The need for innovative programming is evident. When examining the needs of diverse older adults, it is increasingly important that new and innovative approaches address social isolation, loneliness, and mental health problems experienced by this cohort. Utilizing this knowledge an innovative model of embedding and integrating mental health services, provided by bilingual and bicultural clinicians, into congregate sites (older adult centers) was implemented. Those that participated were mainly female (72.1%), 68.5% English-speaking, 14.5% Spanish-speaking, 13.6% Chinese-speaking and 3.4% other. Spanish-speakers had more depression than English-speakers and both had more depression than Chinese-speakers. English and Spanish-speakers reported more social isolation and Chinese-speakers compared were more likely to participate in engagement. Chinese-speakers were less likely to be in clinical services with a positive screen compared to English-speakers. Overall, 75% engaged in treatment; 37.3% and 41% showed a 3-month improvement of depression and anxiety, respectively. This presentation focuses on the innovative components of this model, how to engage diverse older adults to utilize treatment, steps needed for replication, and policy implications around integrated mental health treatment.

ASSOCIATION OF SOCIAL RELATIONSHIPS AND DEPRESSION AMONG OLDER MEXICAN ADULTS: DOES A RURAL OR URBAN CONTEXT MATTER?

Paige Downer, and Rebeca Wong, *University of Texas Medical Branch, Galveston, Texas, United States*

Social characteristics such as strong community and family ties have been associated with positive mental health outcomes in older adults. However, this evidence is based primarily on non-Hispanic White populations and may vary

according to living in a rural versus urban community. We hypothesize that the positive impact of available social networks, perceived support, and social participation on older Mexican adults' likelihood for high depressive symptoms (i.e., depression) will be greater for those living in rural (community < 2,500 people) than urban communities. Data came from the 2012 Wave of the Mexican Health and Aging Study. Depressive symptoms were measured using a 9-item version of the Center for Epidemiologic Studies Depression Scale. Social participation is the respondent's self-reported participation in hobbies, religious activities, volunteering, and visits with neighbors. Available social network is measured as having relatives and/or good friends living in the neighborhood. Perceived support is the respondent's perception of friends/family's willingness to help with finances and personal care. The final sample of 6,266 respondents was majority (62.4%) female, mean age of 69 years, 17.8% lived in a rural community, and 34.5% with depression. Logistic regression models stratified by rural/urban indicated that available social network and perceived social support were not associated with depression in rural or urban communities. In general, the social participation activities were associated with significantly lower odds of depression for older adults living in urban but not rural communities. This research highlights the influence of older adults' community on their social relationships and mental health.

THE EFFECTS OF ASSETS AND DEBT ON THE DEPRESSION TRAJECTORY OF LOW-INCOME OLDER ADULTS IN SOUTH KOREA

Jihee Woo,¹ and Hyojin Choi,² 1. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2. *Sungkyunkwan University, Seoul, Seoul-t'ukpyolsi, Republic of Korea*

Evidence suggests that assets and debt are among the most significant factors affecting older adults' mental health. This study focuses specifically on South Korea, where the poverty rate of older adults is the highest among all OECD countries. Given that low-income older adults with fewer assets and more debt may be at greater risk for depression, we investigated how assets and debt affected the depression trajectory of low-income older adults in South Korea. We used the six most recent waves of data from the Korean Welfare Panel Study (2014-2019) to estimate the longitudinal effects of assets and debt on depression in low-income older adults. Our sample was restricted to low-income Korean heads of household aged 55 and above (N=2,832). Using latent growth curve modeling, the unconditional model revealed decreasing trends in depression over time, while the conditional model, controlling for sociodemographic variables (i.e., age, gender, education, general health, marital status, employment status, income), suggested that assets and debt had contrasting impacts on depression. Specifically, although it did not impact the depression trajectory, debt did have a positive impact on depression at baseline. Most notably, assets negatively affected both depression at baseline (B=-1.911, SE=0.284, p<.001) and its trajectory (B=-0.235, SE=0.081, p<.01). These findings highlight the importance of holding assets over time as a protective factor against depression and thus the need for interventions such as savings programs and financial education for low-income older adults.

THE LONG ARM OF CHILD MALTREATMENT AND MENTAL HEALTH IN LATER LIFE: THE EFFECTS OF MALTREATMENT AND FAMILY CONTEXT?

CHENGMING Han,¹ Tirth Bhatta,² Eva Kahana,¹ and Brian Gran,¹ 1. *Case Western Reserve University, Cleveland, Ohio, United States*, 2. *University of Nevada, Las Vegas, Nevada, United States*

Purpose. This article examines the role of family context in shaping the influence of childhood maltreatment on later life psychological well-being in the cultural context of Chinese society. **Method.** Data were drawn from the China Health and Retirement Longitudinal Study (CHARLS) baseline. Maltreatment was measured by corporal punishment by either mother or father in childhood. We used family violence, parents' family socioeconomic status (SES) and mental health to represent family context. **Result.** Our ordinary least square regression analysis shows that corporal punishment administered by a mother was associated with higher depressive symptoms ($b=0.308$, $p<0.05$) in later life while being hit by father did not result in higher depressive symptoms. Family contexts had residual ("long arm") influence on respondents' mental health: violence in the family, including being hit by siblings ($b=0.657$, $p<0.001$) and witnessing violence between parents ($b=0.658$, $p<0.001$) contributed significantly to higher depressive symptoms. **Conclusion.** Corporal punishment by parents had long term effects on mental health of their children in later life. Cultural values, such as filial piety did not eliminate the negative impacts of being hit in childhood on mental health in later life. Family contexts including violence between parents also played important roles in shaping the relationship between child maltreatment and mental health in later life. **Implication.** Our study offers important insights about the complex matrix of cultural traditions, social circumstances and diversity in dealing with child rearing stress and their consequences for later life mental health.

USE OF COMMUNITY-BASED PARTICIPATORY RESEARCH IN MENTAL HEALTH STUDIES WITH OLDER ADULTS: A SYSTEMATIC REVIEW

Jessie Ho-Yin Yau,¹ Walker Siu Hong Au,¹ Tianyin Liu,¹ Anna Y Zhang,² Gloria HY Wong,¹ and Terry YS Lum,¹ 1. *The University of Hong Kong, Hong Kong, Hong Kong*, 2. *The University of Hong Kong, The University of Hong Kong, Hong Kong*

Community-based participatory research (CBPR), a bottom-up approach that community stakeholders and academics are involved equitably, is an effective approach for enhancing relevance and value in public health research and has gained popularity in recent decades. However, little is known about how CBPR can be used in mental health studies with older adults. This systematic review examined the current state of knowledge about how CBPR approach has been adopted in mental health research among older adults in different societies. According to the PRISMA guidelines, we searched five major databases and screened the literature using these criteria: 1) journal articles reporting use of CBPR in mental health research among older adults, 2) articles published in English language, 3) studies conducted in any settings with any mental health research. Initial search found 3,227 articles and preliminary screening identified 23 eligible

articles. We found that around 90% of studies were conducted in the West. Most studies adopted CBPR to develop community-based mental health interventions or to revise current interventions or models while addressing the cultural needs of their studied population. Few studies adopted CBPR to evaluate existing mental health workshops or programmes. The extent of involvement of older adults in the CBPR approach varied across studies, from questionnaire design to programme evaluation. Our review uncovered ways of CBPR implementation across different societies and elements of successful implementation in CBPR practices in mental health research among older adults.

Session 4285 (Symposium)

PODCASTS AND YOUTUBE VIDEOS: INNOVATIVE TOOLS FOR DISSEMINATING MENTAL HEALTH AND DEMENTIA EDUCATION TO THE PUBLIC

Chair: Regina Koepp

Co-Chair: Natali Edmonds

This symposium will discuss two examples of innovative public education tools used to disseminate evidence-based information to the general public about mental health and aging and Alzheimer's Disease and related dementias. The first is the Psychology of Aging Podcast hosted by Regina Koepp, Clinical Geropsychologist. Since its launch in April 2020, there have been 50 weekly episodes and more than total 25,000 downloads. The goal of the Psychology of Aging podcast is to facilitate access to information and education about mental health and brain health among older adults with the hope of de-stigmatizing mental health care for older adults, reducing ageism, and promoting access to mental health and dementia care for older adults and their families. The second is Dementia Careblazers, created and hosted by Dr. Natali Edmonds, board certified Geropsychologist. The goal of Dementia Careblazers videos is to offer easy to access information to family members who care for someone with dementia. In her weekly videos, Dr. Edmonds provides actionable, evidence-based information and resources focused on dementia caregiving in brief videos. Since its launch on YouTube November 2016, Dementia Careblazers, has 65,000 subscribers, has posted 231 videos, and has had more than 4 million views nationally and internationally. Drs. Koepp and Edmonds will discuss the role podcasts and YouTube videos play in public education and share tips for professionals wanting to start an evidence-based program of their own. This virtual modality may be of increased interest considering recent health risks through face to face interactions and advancements in technology.

PSYCHOLOGY OF AGING PODCAST: PUBLIC EDUCATION TOOL FOR SHARING EVIDENCE-BASED MENTAL HEALTH AND AGING INFORMATION

Regina Koepp, *Center for Mental Health & Aging, Brookhaven, Georgia, United States*

Psychology of Aging Podcast, created and hosted by Dr. Regina Koepp, Clinical Geropsychologist, is the first podcast of its kind devoted solely to mental health and aging. The goal of the Psychology of Aging podcast is to facilitate access to information and education about mental health and brain

health among older adults with the hope of de-stigmatizing mental health care for older adults, reducing ageism, highlighting diversity, and promoting access to mental health and dementia care. The format includes a combination of expert interviews and “solo-casts”. Topics range from depression and suicide prevention to Alzheimer’s Disease and related dementias to the unique needs of LGBTQ older adults and caregivers to health disparities experienced by African American and Latin-X communities related to dementia and the COVID-19 pandemic. During this session, Dr. Koepp will discuss the role podcasts play in public education and share tips for starting an evidence-based podcast.

DEMENTIA CAREBLAZERS YOUTUBE: PUBLIC EDUCATION TOOL FOR SHARING EVIDENCE-BASED DEMENTIA CARE INFORMATION

Natali Edmonds, *Dementia Careblazers, Phoenix, Arizona, United States*

Dementia Careblazers, created and hosted by Dr. Natali Edmonds, board certified Geropsychologist, offers weekly YouTube videos to family caregivers of people living with dementia. These free brief videos provide actionable, evidence-based information and resources focused on dementia caregiving. This virtual modality is particularly relevant for caregivers of people living with dementia given the difficulty family caregivers have in finding supervision and care for the person with dementia in their absence and considering recent health risks through face to face interactions. Furthermore, the free archive of Dementia Careblazers videos allows for access to evidence-based dementia care information at any time, regardless of geographic location or time zone. During this session, Dr. Edmonds will discuss the role YouTube videos play in public education and share tips for starting an evidence-based YouTube channel.

Session 4290 (Symposium)

PUBLIC POLICY PANEL INTERDISCIPLINARY SYMPOSIUM

Chair: Lori Simon-Rusinowitz

Co-Chair: Phillip Rozario

Discussant: Brian Lindberg

Chair: Lori Simon-Rusinowitz;Panelists: Representatives of GSA Sections - Phillip Rozario (SRPP), Stephen Helfand (BS), Tamara Baker (BSS), Cynthia Brown (HS), Judith Howe (AGHE), Darina Petrovsky (ESPO); Discussant: Brian Lindberg. This interactive session is an interdisciplinary look at policy issues in aging with the speakers representing views from their sections. This session, organized by the GSA Public Policy Panel, will provide both GSA section leadership and attendees an opportunity to have an open dialogue on important public policy issues of significance in the field of aging. Presentations will likely address the COVID-19 pandemic, how GSA, each section and its members, and the federal government responded during the past year; how the policy work has been influenced by the increased acknowledgement of institutional and societal racism; and member experiences with the influx of additional economic relief, research funding, and funding for aging supports and services programs.

TBD

Felipe Sierra, *Bethesda, Maryland, United States*

Chair: Lori Simon-Rusinowitz;Panelists: Representatives of GSA Sections - Phillip Rozario (SRPP), Stephen Helfand (BS), Tamara Baker (BSS), Cynthia Brown (HS), Judith Howe (AGHE), Darina Petrovsky (ESPO); Discussant: Brian Lindberg. This interactive session is an interdisciplinary look at policy issues in aging with the speakers representing views from their sections. Session 4295 (Paper)

Religion and Spirituality

A MULTIDIMENSIONAL CONSTRUCT OF RELIGIOSITY AMONG BABY BOOMERS AND TRAJECTORIES OF SOCIAL ATTITUDES

Joonsik Yoon,¹ Woosang Hwang,² Maria Brown,² and Merrill Silverstein,² 1. *Syracuse University, Syracuse, New York, United States*, 2. *Syracuse University, Syracuse, New York, New York, United States*

Although a number of studies have examined relationships between religiosity and social attitudes, less is known about how these relationships change over the life course using a multidimensional construct of religiosity among Baby Boomers. A multidimensional construct of religion allowed us to take a more person-centered approach to religiosity, whereby we examine the association between Baby Boomers with different types of religiosity and the trajectories of their political and gender role attitudes over a period of transition from early to later adulthood. We selected 798 young-adult Baby Boomers from the 1971 wave (mean age: 19 years) of the Longitudinal Study of Generations (LOSG) and tracked their political and gender role attitudes through until the 2016 wave (mean age: 64 years). Using latent class analysis, we identified four latent religious typologies: strongly religious, weakly religious, liberally religious, and privately religious. We found that Baby Boomers in the strongly religious class reported the most conservative political and gender role attitudes among the four classes over this period of transition. Baby Boomers in the privately religious class were conservative in their political and gender role attitudes than those in the weakly religious class. The liberally religious group generally reported the second most conservative political attitudes among the four identified groups, but reported the least conservative gender role attitudes of the four groups. Findings suggest that early religiosity may serve as a significant predictor affecting political and gender role attitudes throughout the adult life course.

FAMILY CAREGIVERS OF PERSONS WITH MILD DEMENTIA SHARE THEIR SPIRITUAL STRUGGLES

Jocelyn McGee,¹ Davie Morgan,² and Dennis Myers,² 1. *Baylor University, United States*, 2. *Baylor University, Waco, Texas, United States*

The lives of family caregivers of persons with Alzheimer's disease and related dementias (ADRD) may change dramatically with disease progression in their loved one. Many rely on spirituality as a resource for coping. There is evidence that persons experiencing transition/losses, as a consequence of disease/illness, can experience spiritual struggles or a crises in meaning. However, there is limited research related to spiritual struggles among family caregivers of persons with ADRD, particularly in the beginning stages of the disease process. In this study, three domains of spiritual struggle were identified after analyzing 27 caregiver interviews using the constant comparative method: 1) changes in relationship with their higher power (e.g., feelings of anger towards, feeling punished by, feeling disconnected from, and questioning); 2) changes in spiritual practices (e.g., decreased participation as a consequence of feeling unsupported, judged, or misunderstood by spiritual communities); and 3) dissonance between previously held core beliefs and current life circumstances (e.g., feelings of shame, doubt, and guilt as well as cessation of self-care activities due to the belief that they must sacrifice everything for their loved one). Notably, 74% experienced spiritual struggle in one domain; 33% in two domains, and 11% in three domains. The majority of participants had come to resolution of these spiritual struggles by the time they were interviewed. However, 40.7% were experiencing ongoing spiritual struggles, at the time of interview, suggesting the importance of identifying and addressing

spiritual struggles in this population over time in order to enhance coping and adaptation.

HMONG OLDER ADULTS' END-OF-LIFE CARE PREFERENCES: PHYSICAL, PSYCHOSOCIAL, CULTURAL, RELIGIOUS, AND SPIRITUAL

Youhung Her-Xiong, *William S. Middleton Memorial Veterans Hospital, Altoona, Wisconsin, United States*

As the Hmong community continues to grow and age in the United States (US), mainstream healthcare providers may encounter Hmong older adults who prefer their cultural end-of-life (EOL) care. The challenge for these providers is to offer culturally sensitive EOL care to Hmong older adults within the realm of the Western healthcare system. One factor contributing to this challenge may be the lack of knowledge regarding Hmong older adults' EOL care preferences. Another is Hmong EOL care is interwoven with care from domains such as culture, religion, and spirituality. The purpose of this study is to garner an understanding of the care preferences of Hmong older adults during the dying process. A qualitative study using inductive content analysis was conducted. Thirty Hmong older adults who reside in Wisconsin participated in semi-structured interviews that were audio recorded and transcribed. Data was analyzed using inductive content analysis by Elo & Kyngäs (2008). The findings revealed that participants preferred care at EOL in the domains: physical, psychosocial, cultural, religious, and spiritual. Physical care included ADL's while psychosocial care related to communication and companionship. Cultural care included children as caregivers and decision-makers. Religious and spiritual care surrounded Animism and Christian beliefs such as soul calling and prayers. Findings also suggest Hmong older adults' care preferences as heterogenous and holistic. The findings have implications for the Hmong community and formal care services to collaborate on how culturally sensitive care can be provided to Hmong older adults at end of life.

RELIGIOSITY AMONG YOUNG-ADULT BABY BOOMERS: ASSOCIATIONS WITH PSYCHOLOGICAL WELL-BEING OVER 45 YEARS

Kent Jason Cheng,¹ Maria Brown,² Woosang Hwang,² and Merrill Silverstein,² *1. Syracuse University, Syracuse, New York, United States, 2. Syracuse University, Syracuse, New York, New York, United States*

Past studies on the influence of religiosity on psychological well-being tended to be cross-sectional in nature and neglected generational differences. In this study, we assess how religiosity in early adulthood (mean age = 19) affects baby-boomers' psychological well-being over the life course. We used waves 1 to 9 or 45 years of survey data from the Longitudinal Study of Generations (LSOG) (N=798), a sample of Southern Californians. First, we used latent class analyses on five domains to identify three typologies of baby boomers' religiosity in early adulthood. We call these typologies "strongly religious," "weakly religious," and "personally religious." Then, we used latent growth curve modelling to ascertain the influence of these religiosity typologies on psychological wellbeing from waves 1 to 9, controlling for time-invariant (religious affiliation, age, sex, race, parental income) and varying (religious salience, education, marital status, and

annual income) factors. We found that the strongly religious have a consistently upward psychological wellbeing trend throughout the study period whereas wellbeing started to decline for the weakly religious and personally religious at around wave 6, on when they were about mid-40s to almost 50. We provide evidence that religiosity in early adulthood – a period in life characterized by the exploration of various options for the future brought about by greater personal freedom – positively influences baby boomer's psychological wellbeing over the life course.

Session 4300 (Symposium)

STRUCTURE AND CHANGE: NEW DEVELOPMENTS IN RESEARCH ON CUMULATIVE DIS/ADVANTAGE

Chair: William Dannefer

Discussant: Carroll Estes

In a time of heightened social inequality and concern to reckon with its sources and consequences, the relevance of cumulative dis/advantage (CDA) to understanding patterns of aging has become even clearer, and CDA research has continued to expand in several fresh directions. Papers in this symposium will review the current state of knowledge regarding CDA and will present new analyses addressing key questions of its intersections with social change and its structural patterning. We will begin with a review of knowledge on comparative evidence regarding cumulative dis/advantage and its cross-national patterning. With regard to change, will examine the compare the effect of the 2008 recession and subsequent recovery across generational cohorts through a comparative examination of trajectories of income inequality. We will also present evidence on the impact of gender, focusing on women's late-life health.

CUMULATIVE DIS/ADVANTEGE, STRUCTURE, AND CHANGE: THREE NEW DIRECTIONS FOR CDA RESEARCH

William Dannefer, and Chengming HENGMING Han, *Case Western Reserve University, Cleveland, Ohio, United States*

Over the past several decades, evidence for cumulative dis/advantage as a regular feature of cohort aging has continued to cumulate, while new questions concerning the underlying dynamics continue to emerge. This paper reviews the accumulated knowledge base, and focused on three recently emerging lines of inquiry that hold great promise for expanding more fully our understanding of CDA processes: 1) the intersection of class stratification and race in the operation of CDA processes, 2) factors accounting for cross-national variations, and 3) the intersection of robust intracohort processes that generate cda with intercohort processes and the impact of historical and social change. These three new directions are briefly discussed.

IMPACT OF ECONOMIC SHOCKS ON CUMULATIVE ADVANTAGE PROCESSES: RECESSION, RECOVERY, AND TRAJECTORIES OF INEQUALITY

Stephen Crystal, *Rutgers University, Princeton, New Jersey, United States*

This study compares the effect of the 2008 recession and subsequent recovery across generational cohorts by evaluating age-cohort trajectories of income inequality.

Using data from the 2007 to 2016 waves of the Survey of Consumer Finances, we examine the trajectory of inequality for the overall population and by cohort in years spanning the Great Recession and subsequent recovery. We find that increases in per-capita income and wealth observed at the population-level during the recovery were not reflected among households below the median, leading to increasing inequality. Within cohorts, we observe growing inequality within cohorts in their primary working years. Findings are consistent with a model of integrative cumulative disadvantage, which predicts increasing within-cohort inequality over the life course influenced both by persistent micro- and macro-level processes of increasing heterogeneity. Our analyses highlight the potential role of extreme business cycle fluctuations, booms and busts, to exacerbate this underlying process.

TRAJECTORIES, TURNING POINTS, AND INTERRUPTIONS: HOW SOCIAL INEQUALITY SHAPES WOMEN'S LATER-LIFE HEALTH

Jessica Kelley,¹ and Marissa Gilbert,² 1. *Case Western Reserve University, Cleveland, Ohio, United States*, 2. *Case Western Reserve University, Cleveland, Ohio, United States*

We explore women's health in midlife and later life at the nexus of structural sexism and the life course perspective, applying Dannefer's (2018) concept of life course reflexivity, which emphasizes social dynamism with potential health-changing 'input' at all ages. We present three types of reflexive changes in the gendered life course that shape women's health as they age: (1) trajectories of lifetime labor market disadvantage leading to limited health-protective resources in later life; (2) turning points in family structure and need, with draining caregiving demands; (3) interruptions in midlife, such as divorce, erasing the social and economic benefits of marriage. We provide support for critical arguments that theoretical work on the life course has too-often utilized the 'privileged' or the 'male' life course with insufficient attention to structural sexism as a fundamental cause of women's health disparities in later life.

Session 4305 (Paper)

Successful Aging in Place

FUNCTIONAL MRI TO ASSESS DECISION-MAKING CAPACITY OF OLDER ADULTS WITH DEMENTIA: A PROOF OF CONCEPT STUDY

Thomas TANNOU, *Besançon University Hospital, Besançon, France*

Assessment of decision-making capacity is essential to respect older adult dignity, particularly concerning major decision such as ageing in place. To date, it is the clinician's assessment, based on a global analysis of his clinical evaluation and neuropsychological tasks, which enables decision-making assessment. Given the difficulty it represents, and the ethical and societal issues raised, the research question concerns the contribution of neuro-imaging technologies as an aid to the evaluation of decision-making capacity. We included in our proof-of-concept study 4 healthy older patients and 2 older patients with dementia (mild stage) followed in a memory clinic. Each of the participants completed

neuropsychological tests with a focus on executive functions, anosognosia and judgemental skills. Next, they performed a decision-making task, the Balloon Assessment Risk Task (BART) in functional MRI, and, finally, they participated in a semi-structured interview completed with interview of their caregiver. For both patients, their referring geriatrician was questioned a priori on his assessment of their decision-making capacity. The results showed a common activation pattern in functional MRI between the patient considered competent in decision-making and the healthy subjects, unlike the patient who was not clinically competent. The qualitative analysis highlighted major anosognosia in both pathological situations, but decision-making in everyday life situations differed between the 2 patients. This study shows the feasibility, on a sensitive topic, to explore the potential contribution of functional neuroimaging and semi-directed interviews as tools. It also demonstrates the value of conducting mixed research, combining neurosciences and social science to explore complex clinical issues.

I WOULDN'T SEARCH THAT WITH MY MOBILE PHONE: CREDIBILITY AND TRUST IN OHIRS AMONG LOWER-INCOME BLACK OLDER ADULTS

Christina Harrington,¹ and Amanda Woodward,² 1. *DePaul University, Chicago, Illinois, United States*, 2. *Michigan State University, East Lansing, Michigan, United States*

Online health information resources (OHIRs) such as conversational assistants and smart devices that provide access to consumer health information in the home are promoted as viable options for older adults to independently manage health. However, there is question as to how well these devices are perceived to meet the needs of marginalized populations such as lower-income Black older adults who often experience lower digital literacy or technology proficiency. We examined the experiences of 34 lower-income Black older adults aged 65-83 from Chicago and Detroit with various OHIRs and explored whether conversational resources were perceived to better support health information seeking compared to traditional online web searching. In a three-phase study, participants tracked their experiences with various OHIRs and documented health-related questions in a health diary. Participants were then interviewed about their diaries in focus groups and semi-structured interviews, followed by a technology critique and co-design session to re-envision a more usable and engaging conversational device. We present preliminary results of the themes that emerged from our analysis: cultural variables in health information seeking practices, perceptions of credibility, likelihood of use, and system accessibility. Participants indicated that their trust of different resources depended on the type of information sought, and that conversational assistants would be a useful resource that require less technology proficiency, even among those with lower e-health literacy. Although our findings indicate that familiarity and trust were salient constructs associated with perceptions of OHIRs, these devices may address digital literacy and technology familiarity with certain design considerations.

MIGRATION AND AGING IN THE RIGHT PLACE: OLDER PUERTO RICAN ADULTS' NARRATIVES

Brooke Jespersen, *Case Western Reserve University, Cleveland, Ohio, United States*

This research examines meanings of aging in the “right” place (Golant, 2015) among older adults who have grown up and grown older in migratory contexts. This qualitative research is based on semi-structured and life history interviews with 30 low socio-economic status Puerto Rican adults over the age of 60 who reside in Cuyahoga County, Ohio and have engaged in Puerto Rico-US migration throughout the life course. Inductive thematic analysis of interviews revealed fraught, multi-scalar narratives of aging in the “right” place. At the level of residence type, older adults’ narratives exhibited a tension between interdependence and independence. That is to say, they struggled to reconcile cultural preferences for family-based living arrangements with fears of becoming a burden. At the level of nation, a similar tension manifested. Older adults reported navigating differential citizenship rights, access to healthcare and social services, natural disasters, and experiences of social inclusion and exclusion via migration between Puerto Rico and the US mainland. Thus, aging in the “right” place was complex, if not altogether elusive, as inequitable circumstances obliged older adults to make tradeoffs regardless of where they lived. These findings extend scholarship on aging in the “right” place, which has focused on residence type, by considering how older adults negotiate aging within and across households, communities, and nations. Moreover, these findings highlight how challenging aging in the “right” place can be for migrating and disadvantaged populations.

MOVING THE NEEDLE ON OUTCOME MEASUREMENT: A LONGITUDINAL ANALYSIS OF FRAILTY AMONG HOME-DELIVERED MEAL RECIPIENTS

Lisa Juckett,¹ Haley Oliver,¹ Leah Bunck,² Crystal Kurzen,² Andrea Devier,² and Fannisha Page,² *1. The Ohio State University, Columbus, Ohio, United States, 2. LifeCare Alliance, Columbus, Ohio, United States*

Frailty is a complex condition highly associated with malnutrition and can lead to the devastating loss of independence among older adults. Home-delivered meals (HDMs) aim to combat frailty and malnutrition and provide nutritional support to nearly 10 million older adults each year. Though self-reported metrics indicate that HDMs help older adults maintain their independence, few studies have systematically collected longitudinal data that objectively represent the health benefits of HDMs. The present study implemented two evidence-based instruments designed to measure frailty levels of HDM recipients (age 60 to 99 years) at two time points. HDM staff at one organization underwent multifaceted training to implement The Home Care Frailty Scale and the Clinical Frailty Scale with HDM recipients at the start of HDM enrollment and at three-month follow-up. Activity of daily living impairments ($B = .46, p < .001$) and instrumental activity of daily living impairments ($B = .28, p < .001$) were significant predictors of higher frailty levels at baseline ($N = 245$). Sixty-two recipients were analyzed at 3-month follow-up. Clinical Frailty Scale scores indicated stable frailty levels from baseline to follow-up (4.08 vs. 4.08). Home Care Frailty Scale scores indicated a slight increase in frailty levels (7.4 vs 7.63) though not statistically significant, $t(61) = -.34, p = .74$. These stable frailty metrics suggest that HDMs contribute to older adults’ ability to

remain living in their own homes and communities and can support the importance of increased financial investments in HDM programs at the state and national levels.

WHAT KEEPS OLDER PEOPLE OUT OF NURSING HOMES? A META-ANALYSIS

Joseph Gaugler,¹ Rachel Zmora,¹ Colleen Peterson,² Lauren Mitchell,³ Robyn Birkeland,² Eric Jutkowitz,⁴ and Sue Duval,¹ *1. University of Minnesota, Minneapolis, Minnesota, United States, 2. University of Minnesota, University of Minnesota, Minnesota, United States, 3. Emmanuel College, Boston, Massachusetts, United States, 4. Brown University, Brown University, Rhode Island, United States*

Perhaps one of the most examined, and costly, health transitions older people experience is nursing home admission. In addition to the financial costs nursing home admission poses to older people, their families, and other payers (e.g., the public), institutionalization is linked with a range of negative outcomes and represents a loss of independence and quality of life to many older persons. The current meta-analysis attempted to synthesize all available randomized controlled trials available to ascertain which intervention approaches appeared to prevent nursing home entry for older adults. The MEDLINE, PsycInfo, CINAHL, Cochrane, and EMBASE databases were searched to August, 2020. Abstracts were screened ($N = 28,120$) to identify randomized controlled trials of interventions to prevent or delay nursing home admission as well as systematic reviews. Identified studies were cross-referenced until the point of saturation, resulting in 1,786 studies for additional inclusion/exclusion screening. Following a consensus-based review among the authors that included risk of bias, 323 randomized controlled trials were included in the meta analysis. Although several intervention modalities appeared protective against nursing home admission and approached statistical significance, preliminary results suggest that comprehensive geriatrics assessment (pooled OR = .69, 95% CI: .50, .95) and specialized, inpatient geriatrics care (pooled OR: .77, 95% CI: .59, .99) were most consistent in helping to prevent institutionalization among older persons. The findings emphasize the importance of geriatrics when delivering optimal care to older persons. Integrating such approaches more effectively into a largely fee-for-service healthcare paradigm remain a critical challenge.

Session 4310 (Symposium)

THE CANNABIS AND OLDER PERSONS STUDY: HAS SCIENCE CAUGHT UP WITH PRACTICE YET?

Chair: Brian Kaskie

Since 2016, the Cannabis and Older Persons Study has examined the increasing use of cannabis among Americans over 60 years old. Our current work dives into particular groups of cannabis users and explores outcomes related to medical conditions and symptoms. This symposium also features a range of methodological approaches from an analysis of the BRFSS caregiving and cannabis modules, a convenience sample of more than 4,000 older cannabis users enrolled in the Illinois Medical Cannabis Program and qualitative interviews conducted with aging veterans. Kanika Arora

examines the association between informal caregiving and marijuana use and whether this association varies by age. Julie Bobitt shares findings from 32 interviews with older Veteran cannabis users. Alton Croker examines cannabis use as a complement or alternative to palliative care. HyoJung Kang clusters negative outcomes experienced by older persons who use cannabis. Brian Kaskie compares cannabis use among persons with Multiple Sclerosis (N=135) and persons diagnosed with arthritis (N=582) or cancer (N=622). While we certainly find reason to remain concerned that cannabis use alone and co-occurring use with prescription opioids may contribute to increased rates of substance misuse and other undesirable outcomes among older adults, we find it increasingly difficult to overlook the benefits many persons derive when taking cannabis as a method to manage pain or address other medical conditions. At this point, public policy officials and program administrator should strive to strike a balance between addressing cannabis harms relative to promoting benefits such as opioid reduction and diversion.

COMPARING CANNABIS USE ACROSS DIAGNOSED CONDITIONS: APPLES AND ORANGES?

Brian Kaskie, *University of Iowa, Iowa City, Iowa, United States*

Although researchers have identified medications that relieve symptoms of Multiple Sclerosis (MS), none are entirely effective and some persons with multiple sclerosis (PwMS) use alternatives. Our study compared cannabis use among PwMS (N=135) and persons diagnosed with arthritis (N=582) or cancer (N=622) who participated in the Illinois medical cannabis program. We tested for significant differences across psychological well-being, quality of life and three behavioral outcomes, and also considered effects of co-occurring prescription opioid use. A majority of all individuals used cannabis to address pain and improve quality of sleep. PwMS reported lower levels of productivity, exercise and social activity, and cannabis was less helpful with improving these particular outcomes. Most persons used cannabis for sleep or digestive problems and we found no differences across groups in terms of well-being and quality of life. This comparative evaluation suggests cannabis mechanisms are not specific as much as they impact common processes.

CAREGIVERS' CANNABIS USE: DOES BURDEN LEAD TO BLUNTS?

Kanika Arora, *University of Iowa, Iowa city, Iowa, United States*

Research on risky health behaviors among caregivers is limited. In this paper, we examine the association between informal caregiving and marijuana use and whether this association varies by age. Using data from Behavioral Risk Factor Surveillance System (2016-2019), a multivariable logistic regression model compared marijuana use in “caregivers” and “expectant caregivers.” We stratified the analyses by age and also assessed the association between caregiving intensity and marijuana use. Among younger individuals (18-49 years), informal caregiving was associated with higher odds of marijuana use. In this group, higher prevalence of marijuana use was positively associated with care intensity. There was no detectable association between caregiving and marijuana use

among older individuals (50 years or older). Health behaviors among caregivers differ by age. Combined exposure to informal caregiving and marijuana in young adulthood may lead to adverse long-term health consequences. Immediate effects of marijuana use may negatively influence care recipient outcomes.

CANNABIS USE AMONG VETERANS: IT SHOULD BE EASIER TO GET SOME

Julie Bobitt, *Center for Dissemination and Implementation Science, University of Illinois at Chicago, Illinois, United States*

and PTSD. From December 2020 – February 2021 we conducted 32 semi-structured interviews with Veterans who responded to our initial and follow-up surveys and agreed to discuss their cannabis use. We coded and themed the interviews using inductive thematic analysis. We found that many Veterans are using cannabis in place of other medications such as opioids and benzodiazepines and often do so to avoid the negative side effects. However, barriers such as Veterans Administration policies and cost of medical cannabis affect Veterans ability to obtain medical cannabis. Our results inform clinicians and policy makers on the use of cannabis as an alternative to prescription medications for treating chronic pain and other conditions in older Veterans.

CANNABIS AT THE END OF LIFE: A ROAD MORE TRAVELED

J Alton Croker, *CTCRE, CVRI, UCSE, Chicago, Illinois, United States*

This study examines medical cannabis as a complement or alternative to palliative care (PC). Using cross-sectional survey data from 708 terminal patients in the Illinois Medical Cannabis Program, we compare those in PC (n = 115) to those who are not (n = 593). Increased odds of PC utilization were observed for prior military service, cancer diagnosis, low psychological wellbeing, and medical complexity. PC was positively associated with improvement scores for pain, and ability to manage health status. Higher pain levels were also observed for PC patients who indicated concurrent use of cannabis and opioids, compared to those not using opioids. While most terminal patients use cannabis as an alternative to PC, medical cannabis does operate as a therapeutic complement for individuals in PC to help manage pain and overall health status, and is used at higher levels of pain when patients are also using opioids.

NEGATIVE CLUSTERS ASSOCIATED WITH CANNABIS USE: TANGLED UP IN BLUES

Hyojung Kang, *University of Illinois, University of Illinois, Illinois, United States*

Previous studies concerning older adults have focused on whether cannabis use leads to positive or negative outcomes. In this study, we identified clusters of negative health outcomes associated with medical cannabis use. In total, we examined eight health outcomes: pain, sleep, falls, memory, digestive issues, mental health conditions, exercise, and general productivity reported by 2,968 persons over 60 who participated in the Illinois Medical Cannabis Program. We used association analysis to simultaneously identify groups of negative outcomes reported by participants. The distribution

of non-positive outcomes shows a bell-shaped curve: 1.4% of participants responded that cannabis use improved all outcomes, while 4.1% of participants answered that cannabis use did not. When looking at negative outcomes, 86% of participants reported none worsened, and 11% reported one of the outcomes was affected. Only a small fraction of the participants (3%) claimed more than one negative outcome after cannabis use.

Session 4315 (Symposium)

THE HALLMARKS OF AGING: LEVERAGING ON THEIR INTERACTIONS

Chair: Ana Maria Cuervo
Co-Chair: Ronald Kohanski
Co-Chair: Viviana Perez

SELECTIVE AUTOPHAGY: A LINK ACROSS THE HALLMARKS OF AGING

Ana Maria Cuervo, *Albert Einstein College of Medicine, Bronx, New York, United States*

Autophagy function has been closely linked with the loss of proteostasis that characterizes most old organisms and tissues. However, the cellular functions of selective types of autophagy such as chaperone-mediated autophagy (CMA) go beyond cellular quality control. CMA can degrade fully functional proteins to terminate their function and thus contribute to regulation of multiple cellular processes. To fully understand the consequences of loss of CMA function with age, we have developed genetic and pharmacological ways to modulate this pathway in old mice. Our data supports involvement of CMA in other hallmarks of aging such as metabolism, senescence, cellular response to stress, epigenetics and cellular stemness. This interconnection among the cellular processes that drive aging highlights the potential of acting on only some of them with geroprotective effects.

ANTI-AGING INTERVENTIONS TARGETING THE HALLMARKS OF AGING

Brian Kennedy, *National University of Singapore, Singapore*

EFFECTS OF CALORIC RESTRICTION ON THE EPIGENETIC LANDSCAPE OF HEMATOPOIETIC STEM CELLS

Isabel Beerman, *NIA, Baltimore, Maryland, United States*

During aging, alterations of hematopoietic stem cells are associated with functional decline of the blood system. Caloric restriction (CR) interventions have been reported to improve adult stem cells in other tissue types during aging so we sought to evaluate the effects of CR on the aged HSC compartment. We find significant epigenetic alterations in HSCs isolated from aged mice after life-long CR compared to ad libitum fed aged mice. We further evaluated the epigenetic landscapes and functional potential of aged HSCs shortly after allowing life-long CR mice access to ad libitum food. We uncover epigenetic modification associated with functional alterations of the HSCs, defining potential mechanisms by which restrictions in food consumption affect the aging hematopoietic compartment.

CALORIC RESTRICTION MIMETICS ATTENUATE THE HALLMARKS OF AGING

Guido Kroemer, *University of Paris, Villejuif/Paris, Ile-de-France, France*

Nutrient depletion, which is one of the physiological triggers of autophagy, results in the depletion of intracellular acetyl coenzyme A (AcCoA) coupled to the deacetylation of cellular proteins. We found that there are at least 4 possibilities to mimic these effects, namely (i) the depletion of cytosolic AcCoA by interfering with its biosynthesis, (ii) the stimulation cytosolic AcCoA consumption, (iii) the inhibition of protein acetyltransferases, or (iii) the stimulation of protein deacetylases. Thus, AcCoA depleting agents, AcCoA-consuming agents, acetyltransferase inhibitors or deacetylase activators are highly efficient inducers of autophagy and reduce aging-associated diseases including diabetes, obesity, cardiac failure and failing cancer immunosurveillance. Hence, we classify them as "caloric restriction mimetics" (CRM). We have initiated the systematic search for CRMs based on their cellular effects in vitro. We built screening assays amenable to high-throughput technology for the identification of CRMs. These results will be discussed.

Session 4320 (Symposium)

WELL-BEING DURING THE COVID-19 PANDEMIC: THE ROLES OF AGE, RACE, AND GENDER

Chair: Nicky Newton
Discussant: Jennifer Lodi-Smith

In the early months of COVID-19, behavioral modifications (i.e., social distancing) were the only means available to ameliorate contagion. These had widespread ramifications for well-being, although older adults showed relatively less disruption and high resilience than their younger counterparts (Carney et al., 2021). Early findings highlight the need for a life course perspective when examining reactions to COVID-19, based on social structure, personal agency, and individual differences such as age, gender, and personality (Settersten et al., 2020). The presentations in this symposium contribute to a developing body of research that delves deeper into individual lived experiences during COVID-19. Using data from the Health and Retirement Study, Ryan examines cohort and age differences in pandemic-related social contact, communication, loneliness, and well-being for women in the US, revealing that the impact of pandemic-attributed psychosocial experiences on well-being differed by age group. Newton et al. examine associations between perceptions of future time, COVID-19 disruption, and psychological well-being among older Canadian women, finding that COVID-19 disruption moderated the relationship between constrained time horizons and well-being. Birditt and colleagues assessed racial disparities in relationships between COVID-related stress, social isolation, and depression among adults aged 18-97 from the Survey of Consumers, and found ethnic/racial minorities reported greater pandemic-related stress and that stress and social isolation had detrimental effects on well-being. A discussion by Lodi-Smith will emphasize the necessity to include individual differences – age, race, gender, cohort, cultural context – when examining pandemic-related well-being in order to provide a more nuanced body of research.

COVID-RELATED PERCEPTIONS OF THE FUTURE AND WELL-BEING AMONG OLDER CANADIAN WOMEN

Nicky Newton, Hua (Poppy) Huo, Lauren Hytman, and Cara Ryan,, *Wilfrid Laurier University, Waterloo, Ontario, Canada*

Socioemotional Selectivity Theory (SST; Carstensen, 1993) posits that time horizons - or Future Time Perspective (FTP) - change with age and/or the priming of endings. Fung and Carstensen (2006) found that SARS-CoV in 2003 naturalistically primed fragility, with consequences for both FTP and well-being. The current SARS-CoV-2 (COVID-19) pandemic provides a similar context: During the early months of COVID-19, age and time horizon were related to greater emotional well-being for American adults (Carstensen et al., 2020); Dozois (2020) found that, for Canadian adults, anxiety and depression rose. The current study examines relationships between FTP, COVID-19 impact, and psychological well-being in older Canadian women (N = 190; Mage = 70.38). We found that COVID-19 impact and FTP were both related to well-being; additionally, COVID-19 impact moderated the relationship between FTP and well-being. The complexity of what remains or becomes increasingly important for older women during a global health crisis is discussed.

THE PANDEMIC AND OLDER WOMEN IN THE UNITED STATES: IMPACTS ON SOCIAL NETWORKS AND WELL-BEING

Lindsay Ryan, *University of Michigan, Ann Arbor, Michigan, United States*

The current study examines the unique impacts of the ongoing COVID-19 Pandemic on the well-being of middle aged to older women from the 2020 Health and Retirement Study (n = 1252) and how their reports of social contact during the pandemic compare to age-matched women from 2018 (n = 2063). Although up to a third of women across age categories reported changes in social contact due to the pandemic, their rates of communication with friends and family were not significantly different from their counterparts in 2018. Results find expected age patterns in satisfaction with life during the pandemic), where the young-old report the highest levels. However, the association of life satisfaction with the extent to which women reported more loneliness during the pandemic was only significant among the young old and oldest old. Age differences in pandemic-specific experiences in relation to well-being are discussed within a life course developmental framework.

RACE DIFFERENCES IN COVID-19 STRESS AND SOCIAL ISOLATION: IMPLICATIONS FOR DEPRESSIVE SYMPTOMS

Kira Birditt,¹ Akari Oya,¹ Angela Turkelson,¹ Courtney Polenick,¹ and Karen Fingerma,² *1. University of Michigan, Ann Arbor, Michigan, United States, 2. The University of Texas at Austin, Austin, Texas, United States*

The experience of the COVID-19 pandemic may vary widely by race. This study examined race differences in pandemic-related stress, social isolation and the implications for well-being. Participants included 1260 adults (45% women) ages 18 to 97 from the May and June 2020 nationally representative Survey of Consumers and 562 who

completed a 6 month follow up in November/December. A total of 76% were White, 10% were Black, 3% were Asian, and 11% were Hispanic. Participants reported experiences of pandemic-related stress, social isolation and depressive symptoms in the last month. Analyses showed that minority groups reported greater pandemic related stress that had negative implications for depressive symptoms over time. The implication of social isolation for the stress-depressive symptoms link also varied by race. Overall this study showed racial inequities in the implications of COVID-19 pandemic and that reducing social isolation may only be beneficial for certain racial/ethnic groups.

Session 4325 (Symposium)

A MODEL TO TRANSFORM COMMUNITIES TOWARD BECOMING DEMENTIA INCLUSIVE

Chair: Jennifer Drost

Discussant: Margaret Sanders

As the US population ages, the prevalence of people living with dementia will also increase. It is estimated that by 2050, 13.8 million American's 65 and older will be diagnosed with dementia, and currently only 40% of those living with dementia receive an official diagnosis. 70% of people living with dementia live in the community. In order to optimize quality of life and extend each person's ability to remain living in their homes for as long as possible, it is important for communities to educate consumers and providers alike about Alzheimer's Disease and related dementias, focusing on behaviors and interventions. This education must cross multiple sectors to effectively increase awareness, decrease stigma, and enable participation in community living for people living with dementia and their caregivers. Dementia Friends USA offers a framework for implementation of dementia friendly inclusive community initiatives that spans professions and incorporates patient and caregiver perspectives. The four symposia will 1) lead us through the evidence that supports the Dementia Friends USA approach, 2) demonstrate how this approach can be operationalized in a truly integrated fashion at the community level using HRSA's Geriatric Workforce Enhancement Program (GWEP), 3) provide step-by-step instructions for implementing Dementia Friends Community sessions, focusing on one sector at a time (in this case the Developmental Disability population), and 4) discuss the individual and community level outcomes of Dementia Friends implementation.

CREATING DEMENTIA-INCLUSIVE COMMUNITIES USING A GERIATRIC WORKFORCE ENHANCEMENT PROGRAM FRAMEWORK

Jennifer Drost,¹ and Margaret Sanders,² *1. Summa Health System, Akron, Ohio, United States, 2. Northeast Ohio Medical University, ROOTSTOWN, Ohio, United States*

The Geriatric Workforce Enhancement Program (GWEP) sponsored by HRSA provides an organizing framework around which dementia inclusive community initiatives can be successfully implemented and sustained. The overarching goal of all GWEPs is to improve outcomes for older adults by promoting evidence-based education that spans the continuum of care. This includes integration of academic, clinical, and community-based providers. By their very nature, all GWEPs partner across agencies throughout the state to deliver

interprofessional education that will impact people living with dementia and their caregivers at the community, primary care, and acute care levels. Dementia inclusive community initiatives must have this kind of high-level interagency coordination. Our GWEP has successfully implemented Dementia Friends sessions across multiple sectors (Veterans, EMS, clergy, libraries, developmentally disabled, living alone) both in-person and virtually due to COVID-19. This symposium will share the methods to organize at the community level to deliver a unified message community-wide.

FROM AWARENESS TO SOCIAL ACTION: THE ROLE OF DEMENTIA FRIENDS IN SUSTAINING DEMENTIA INCLUSIVENESS

Bonnie Burman, and Martha Williman, *Ohio Council for Cognitive Health, New Albany, Ohio, United States*

According to the World Dementia Council, three components are important to effectively engage a community to become dementia inclusive, 1) raising awareness and consequently decreasing stigma, 2) enabling participation, and 3) providing support—including in health and care settings. Too many times these components are separate initiatives thus limiting their effectiveness and sustainability. By applying the collective impact model and utilizing the Dementia Friends program as the link between the three, all dementia inclusive efforts can be enhanced and sustained regardless of the range of activities and approaches a community chooses to adopt. This symposium provides both evidence and examples of how to personalize and employ the Dementia Friends program to optimize the process, outcome, and impact of dementia inclusive initiatives. By engaging the entire community, awareness is raised, the structure is in place to enable action, and cross-sector collaboration will ensure continuation and sustainability of these important efforts.

IMPROVING CARE FOR INDIVIDUALS LIVING WITH INTELLECTUAL DEVELOPMENTAL DISABILITIES AND DEMENTIA

Donna Barrett, *Summit County Public Health, Akron, Ohio, United States*

Ultimately, transformation of communities can only occur through educational efforts delivered to specific community sectors. Although the portion of people with Intellectual Developmental Disabilities who develop dementia as they age is equal to that of the general population, individuals with Down syndrome are at a much higher risk. This symposium will describe how a county health department partnered with the local County Board of Developmental Disabilities to systematically incorporate Dementia Friends for Intellectual Developmental Disabilities with Alzheimer's disease training to their staff and provider network. We will describe who to get on board with the idea, how to organize, and how to deliver specific trainings. Outcomes related to increase in participant knowledge, increases in service provision and outcomes related to staff mentoring will be discussed.

ESTABLISHING A DEMENTIA-INCLUSIVE COMMUNITY: THE EVALUATION OF DEMENTIA FRIENDS IN CLEVELAND HEIGHTS

Jessica Bibbo, Jennifer Cardellini, and Sarah Nicolay, *Benjamin Rose Institute on Aging, Cleveland, Ohio, United States*

Cleveland Heights, in northeast Ohio, is currently working towards becoming a member of the Dementia Friendly America National Network. Utilizing the Dementia Friends curriculum to raise community members' awareness of issues related to dementia is a key component of this initiative. Our initial efforts toward this goal targeted two sectors, namely community member and libraries. Participants completed on-line surveys at the beginning and end of each session. The surveys include the Brief Tool for Dementia-Friendly Education and Training Sessions developed by the Administration for Community Living. Of the 22 participants, nine had not previously attended a Dementia Friends session and completed both pre- and post-session surveys. Results indicated participants felt more confident interacting with people living with dementia at post-session compared to pre-session ($t = -2.83, p = .022$). Changes at the individual level may create more inclusive communities for people living with dementia and those who care for and about them.

Session 4330 (Paper)

Aging and Health and Social Services

COMPARISON OF ASSOCIATION BETWEEN DIVORCE AND ACCESS TO HEALTHCARE SERVICES AMONG MARRIED IMMIGRANTS

Suyeong Bae,¹ James Graham,² Sanghun Nam,¹ and Ickpyo Hong,¹ *1. Yonsei University, Wonju, Kangwon-do, Republic of Korea, 2. Colorado State University, Colorado State University, Colorado, United States*

The number of married immigrants is increasing in Korea, and family dissolution is also growing in this population. Although divorce could impact immigrants' health status, it is unclear whether they have difficulties accessing healthcare and medical services. Thus, we examined whether divorce in married immigrants is independently associated with access to healthcare services. A retrospective analysis of 11,778 adults who participated in the 2018 National Multicultural Family Survey. We used three different covariate adjustment methods (multivariate logistic regression, inverse probability of treatment weighting, 1:1 greedy propensity score matching) to examine the association between divorce and access to healthcare services after accounting for various demographic and clinical characteristics. Overall, 5.8% ($n = 691$) of married immigrants reported a history of divorce. The divorce group included 107 (15.5%) males and 584 (84.5%) females, with an average age of 45.17 years ($SD = 10.9$). The non-divorced group included 1992 males (18.0%) and 9095 (82.0%) females, with an average age of 39.1 years ($SD = 10.5$). After propensity score matching, all variables were balanced (all $p > 0.05$). Individuals who experienced divorce were more likely to have difficulties in healthcare service access than those who did not experience divorce (adjusted odds ratio 1.423, 95% CI [1.075, 1.882]). Our findings revealed that divorce increased the risk of limited healthcare services among immigrants in Korea. Healthcare policymakers should be aware of the healthcare access issues in this minority population. In addition, to improve the lifestyles of minority populations, it is necessary to study their overall lives.

FACTORS IMPACTING TREATMENT DECISION MAKING IN OLDER ADULTS WITH INDOLENT NON-HODGKIN LYMPHOMA

Kelly Trevino,¹ Peter Martin,² and John Leonard,²

1. *Memorial Sloan Kettering Cancer Center, New York, New York, United States*, 2. *Weill Cornell Medicine, New York, New York, United States*

Indolent non-Hodgkin lymphomas (NHL) are among the most common lymphomas and up to two-thirds of diagnoses are made in older adults (age \geq 65 years). Initial treatment options include cancer-directed therapy or active monitoring by the oncologist for disease progression. Despite the disparate nature of these treatments, the factors impacting older adults' treatment decisions are unknown. This study examines the reasons older adults chose their initial treatment, factors influencing this decision, shared decision-making preferences, and differences in these factors relative to younger adults (age $<$ 65 years). Adult patients (\geq 21 years) with a new diagnosis of indolent NHL in the past six months completed electronic self-report measures. The final sample consisted of 86 patients; 43.0% (n=37) were older adults. Over two-thirds of older adults (n=25, 67.6%) were being monitored by their oncologist with no age differences in current treatment (p=.55). Most older adults chose their treatment plan to "maximize my long-term health" (n=24, 64.9%) which did not differ from younger adults (p=.77). The primary factors impacting older adults' treatment decisions were their doctor's recommendation (M=3.92, SD=.28, Range=0-4) and their personal preference (M=2.88, SD=1.68, Range=0-4). Factors impacting treatment decisions did not differ by age (all p's $>$.05). Most older adults (n=25, 69.4%) expressed a preference for shared decision-making with their oncologist which did not differ from younger adults (p=.17). Treatment planning for older adults should consider long-term health, consistent with older adults' values. Older adults may view treatment decision-making similarly to younger adults; assumptions about patients' values and decision-making preferences based on age are likely inappropriate.

HEART FAILURE AND HOSPITAL UTILIZATION TRAJECTORIES BEFORE AND AFTER HIP FRACTURE SURGERY

Sijia Wei,¹ Wei Pan,² Chiyoung Lee,³ Hideyo Tsumura,⁴ Tingzhong (Michelle) Xue,⁴ and Eleanor McConnell,⁴

1. *Duke University School of Nursing, Apex, North Carolina, United States*, 2. *Duke University, Duke University School of Nursing, North Carolina, United States*, 3. *University of Washington, Bothell, Bothell, Washington, United States*, 4. *Duke University School of Nursing, Durham, North Carolina, United States*

Long-term hospital utilization trajectories in the context of surgery are understudied. Heart Failure (HF) is associated with an increased risk for rehospitalization after hip fracture surgery. This study aimed to examine whether older adults (\geq 65 years old) have distinct patterns of long-term hospital utilization trajectories and whether HF influences these trajectories before and after hip fracture surgery. An initial cohort of 1,172 older adults hospitalized for hip fracture surgery between October 2015 and December 2018 was extracted from electronic health records. To adjust selection bias in baseline characteristics, we used propensity score 1:1

ratio matching to identify a final cohort of older adults with (n = 288) and without (n = 288) HF. Monthly frequencies of emergency department (ED) and inpatient encounters 1-year before and after the hip fracture surgery were used to identify distinct utilization trajectories from group-based trajectory analysis. Logistic regression models were used to compare the differences in ED and inpatient trajectories among patients with and without HF. High ED users (9.5%) had constant high ED use, and high inpatient users (20.1%) had significantly higher inpatient usage around the index hip fracture surgery hospitalization. Both low ED (90.5%) and inpatient (79.9%) users had low but slightly increased use around the index hospitalization. Compared with older adults without HF, older adults with HF were more likely to be long-term high inpatient user (OR = 1.94, 95% CI 1.25-3.01, p = 0.003), but not significantly different in long-term ED utilization (OR=1.87, 95% CI 0.97-3.59, p = 0.62).

PSYCHOMETRIC PROPERTIES OF THE HEALTH LITERACY SURVEY EUROPEAN QUESTIONNAIRE-12

Suyeong Bae,¹ Sung-Ji Park,² Hee-Soon Woo,² and Ickpyo Hong,¹ 1. *Yonsei University, Wonju, Kangwon-do, Republic of Korea*, 2. *Wonkwang university, Wonkwang University/Iksan, Cholla-bukto, Republic of Korea*

The importance of health literacy has increased as the public awareness of health has increased. Health Literacy Survey European Questionnaire-47 (HLS-EU-Q47) is a representative assessment tool for evaluating health literacy, and its psychometric properties have been examined in various countries. This study analyzed the item-level psychometric properties of a short version of the HLS-EU-Q47 using a Rasch measurement model. We collected 254 Korean adults who completed the 12 items of the HLS-EU-Q47 in hospital settings. We used confirmation factor analysis (CFA) to examine the unidimensionality assumption of the HLS-EU-Q12. We analyzed item fit, precision, and differential item functioning (DIF) across sex, age and education groups. The CFA model confirmed that HLS-EU-Q12 satisfies the unidimensionality assumption (CFI = 0.96, TLI = 0.96, RMSEA = 0.09) and no local independence in the 12 test items (residual correlations ranged from -0.16 to 0.19). The HLS-EU-Q12 demonstrated high reliability (Cronbach's α = 0.90) and no DIF across sex, age and education groups (p > 0.05). The person strata by the instrument were 3.80, which is equivalent to a traditional reliability value of 0.87. In short, the study findings indicate that the HLS-EU-Q12 has good psychometric properties with the 254 Korean adults. Since the HLS-EU-Q12 can accurately and precisely evaluate the health literacy of Korean adults, this instrument could be used in clinical settings.

THE OCCUPATIONAL NARRATIVES OF OLDER ADULTS PARTICIPATING IN MUSIC-BASED OCCUPATIONS

Penelope Moyers Cleveland, Cassidy Beckstein, Allie Gartner, Lexy Hay, Mackenzie King, Sammy McLeish, and Courtney Romatz, *University of Indianapolis, Indianapolis, Indiana, United States*

The purpose of this study was to implement an occupational therapy intervention that could be used for telehealth services with an emphasis on participants learning ways to independently choose and sustain engagement in meaningful

music activities, known as occupations. The researchers' aim was to examine how music occupation interventions lower risks of occupational deprivation (i.e., prolonged restriction from participation in necessary or meaningful activities) that could occur due to the COVID-19 pandemic. Eight adults participated who were 65 years or older, lived in the community, and enjoyed music. The researchers used narrative qualitative methodology to analyze pre- and post-intervention focus group data. The participants completed seven intervention sessions designed to increase and sustain music engagement outside of the sessions. The pre-intervention focus group data resulted in an occupational pattern analysis and a single occupational narrative. Triangulation of data post-intervention included the two focus groups and their pattern analyses and narratives, field notes from each intervention session, and documents produced through group completion. The final analysis produced an occupational change pattern analysis and narrative. The focus of the change narrative was on the participant's management or prevention of occupational deprivation. The researchers identified several common themes involving change in routines and habits to include regular engagement in meaningful music activities, skills for using occupational participation as an important method of coping with COVID-19, and developing new technological skills to access music to replace in-person participation of attending live concerts and shows when deemed unsafe because of potential for virus transmission.

Session 4335 (Paper)

Aging and Technology Interventions II

ACTIVITY SPACE AND FUNCTIONAL OUTCOMES IN FRAIL OLDER PERSONS USING GPS ANALYSIS

Sandra Lau,¹ Frerk Mueller-von Aschwege,² Tania Zieschang,¹ Juergen Bauer,³ Andreas Hein,¹ and Rebecca Diekmann,¹ 1. *Carl von Ossietzky University Oldenburg, Oldenburg, Niedersachsen, Germany*, 2. *OFFIS e.V. - Institute for Information Technology, Oldenburg, Niedersachsen, Germany*, 3. *Heidelberg University, Heidelberg, Baden-Wurtemberg, Germany*

With increasing age, walking becomes a main functional ability to participate in activities of daily living and supports independence and mobility. Frailty in older, multimorbid patients has a negative impact on physical activity and may reduce the personal activity space (AS). In this pilot study, GPS data were used to identify walking tracks to define individual AS and to compare functional performance in frail older persons. GPS data of 20 community-dwelling adults (84.5(±5.2) years, 85% women, mean frailty phenotype 1.9 (70% ≥2) points) were analyzed using a customized software to assess individual AS over a ten-months period. A geriatric home assessment including Short Physical Performance Battery (SPPB), gait speed (GS) and Timed-up-and-Go (TUG) was conducted monthly. GPS analysis revealed three different walking types presenting AS similarities: Type A walkers prefer smaller short walks nearby the home while Type B can be characterized by taking larger regular walks. Type C presents the widest AS using different transportation modes, but only a moderate number of walks. Mean group difference

in functional performance of Type A walkers showed significantly reduced GS (0.45(±0.1)m/s), TUG (23.4s(±4.9)) and SPPB scores (3.8(±0.8) points; $p < 0.05$) compared to Type C (0.82(±0.1)m/s (GS); 13.2(±1.4)s (TUG); 7.0(±1.3) points (SPPB)). Functional performance of Type B walkers (0.63(±0.2)m/s (GS); 17.1(±4.4)s (TUG); 6.5(±2.4)points (SPPB)) revealed significantly higher SPPB scores compared to Type A ($p < 0.05$). Walks and individual AS can be mapped via GPS under everyday conditions. High heterogeneity within frail older people was observed. Persons with lower functional performance showed a reduced AS and physical activity.

DEVELOPING, TESTING, AND IMPLEMENTING A FALLS PREVENTION AND HEALTHY AGING APP (KEEP-ON-KEEP-UP) FOR OLDER ADULTS

Emma Stanmore, *University of Manchester, Manchester, England, United Kingdom*

Falls are a common and costly concern for older adults. Digital technologies can offer new, inexpensive approaches to increase access and engagement with falls prevention programmes. Keep-On-Keep-Up is a personalised, falls prevention App with strength and balance exercises plus health literacy games. This study reports on the user-centred design, usability testing and implementation of the KOKU App. Older adults aged 55 years and older in the UK were invited to take part in the study. Data collection included focus groups; baseline and 6 week questionnaires and assessments; semi-structured interviews and one focus group with falls prevention therapists to explore App usability. Thirty older adults were invited to use KOKU unsupervised, 3 times a week for 6 weeks. Data were analysed using thematic content analysis. Focus groups (n=11) with 66 older users and 11 therapists informed development. Thirty older adults (mean age = 75) were recruited for the in-depth testing. Mean SUS score was 71 indicating high usability. Qualitative themes included: ease of use (app usability; iPad properties; exercise presentation), usefulness (physical/psychological benefits; falls education), attitude towards the App and intention to use (technological barriers; flexibility of use; exercise class versus App). Therapists (n=6) viewed the KOKU platform positively and suggested extensions for further progression. No adverse events were reported during the study. This research demonstrates that KOKU is an acceptable and easy to use falls prevention intervention that facilitates older adults' ability to access falls prevention training at a time, and in a location, that suits them.

FEASIBILITY AND ACCEPTABILITY OF AN MHEALTH ACP TOOL IN PRIMARY CARE

Desh Mohan,¹ Katelin Cherry,¹ Tatiana Fofanova,¹ Taylor Huffman,¹ Glenn Davis,² Anthony Comito,³ and Elissa Kozlov,⁴ 1. *Koda Health, Houston, Texas, United States*, 2. *Cypress Physicians Association, Spring, Texas, United States*, 3. *FOUNDRY41, Houston, Texas, United States*, 4. *Rutgers University, Piscataway, New Jersey, United States*

With only 7% of Medicare beneficiaries having completed Advance Care Planning with their physicians, engagement in Advance Care Planning in the clinical setting has been historically low. This study investigated the feasibility of introducing the Koda Health Advance Care Planning software platform in

the primary care setting, and whether patients would engage in advance care planning through this medium. The Koda platform is a video-driven, web application that guides patients through advance care planning concepts, including values and quality of life exploration, surrogate decision maker selection, life-support treatments, and advance directive completion. The study was completed over a six-month period in two primary care clinics in the Houston, Texas area. Inclusion criteria were age 55 or older, English-speaking, and capacity for medical decision making. 339 patients met eligibility criteria and had a median age of 73 (range 59-89). All participants were offered the platform, and 262 (77%) created an account and began planning for their care. Of the patients that created an account, 87% completed all ACP steps on the platform and 72% identified a surrogate decision maker. The median time spent on the platform was 18 minutes. The Koda platform appears to be a useful tool for patients and providers to improve engagement in advance care planning and improve surrogate decision maker identification. Further research is needed to understand whether the Koda platform aids in providing goal-concordant care.

IMPROVING STAFF-FAMILY END-OF-LIFE COMMUNICATION AT ISRAELI GERIATRIC FACILITIES BY USING A MOBILE APP

Rinat Cohen,¹ Gal Maydan,² Shai Brill,³ and Jiska Cohen-Mansfield,⁴ 1. *Tel-Aviv University, Hadera, Hefa, Israel*, 2. *Beit Rivka, Petah-Tikva, HaMerkaz, Israel*, 3. *Clalit Health Services, Tel-Aviv, Tel Aviv, Israel*, 4. *Tel-Aviv University, Tel-Aviv, Tel Aviv, Israel*

Family caregivers (FCs) of persons institutionalized at geriatric facilities present significant unmet communication needs regarding receiving regular updates about their loved one's condition and having available healthcare professionals (HPs) to approach when needed. We developed and tested a mobile-app for staff-family communication with both parties having active roles in app planning to tailor it to their needs and abilities. The app includes a daily-update module for FCs and a chat option for FCs and HPs. App use was piloted at one geriatric-medical-center for 15 months (unit-level randomization resulted in one complex-care and one assisted-ventilation unit in each group- intervention and control) and one single-unit nursing-home for three months. Personal interviews were conducted with 55 FCs (28 from intervention-group and 27 FCs from control-group) before-and-after app use (with mean duration of use 1.6[S.D.=.6] months. Most participants were women and the children of the patients; their mean age was 55.9 years (S.D.=12.4). Repeated-measures Analysis-of-Variance for the end-of-life communication sub-scale on the Quality-of-communication questionnaire yielded a main effect for time ($F(1,53)=8.31$, $p=.006$) with both groups' ratings increasing over time and an interaction effect ($F(1,53)=4.78$, $p=.033$) with a greater increase for intervention-group compared to control-group. Intervention-group participants rated the app as convenient to use. Qualitative data revealed that FCs perceived app use as improving quality of communication with the HPs who used it and improving their own well-being. The app offers a feasible and an effective mode of communication that incorporates technology in daily communication between FCs and HPs while addressing FCs' unmet needs.

TEXT-MINING IN LONG-TERM CARE: EXPLORING THE USEFULNESS OF COMPUTER-AIDED ANALYZING METHODS

Sil Aarts,¹ Coen Hacking,² Hilde Verbeek,² Jan Hamers,² and Katya Sion,² 1. *Maastricht university, Maastricht, Limburg, Netherlands*, 2. *Maastricht University, Maastricht, Limburg, Netherlands*

In nursing homes, narrative data are collected to evaluate quality of care as perceived by residents or their family members. This results in a large amount of textual data which exceeds the capability of humans to analyse it. This study aims to explore the usefulness of text-mining approaches regarding narrative data gathered in a nursing home setting. Data has been collected as part of the project 'Connecting Conversations': assessing experienced quality of care by conducting individual interviews (n=125) with residents of nursing homes, family members and care professionals. Several pre-processing steps were applied to the textual data. Finally, a variety of text-mining analyses were conducted: individual and bigram word frequencies, correlation analysis and sentiment analysis. A survey was conducted to establish a sentiment analysis model tailored to text collected in long-term care for older adults. Residents, family members and care professionals uttered respectively 285, 362 and 549 words per interview. Word frequency analysis showed that words that occurred most frequently in the interviews are often positive. Although there are some differences in wording such as the use of 'mother' and 'breakfast', correlation analysis displayed that similar words are used by all three groups to describe quality of care. The majority of interviews displayed a neutral sentiment. Care professionals are more diverse in their sentiment than residents and family members: while some express a more positive sentiment, others express more negativity. This study demonstrates the usefulness of text-mining to extend our knowledge regarding quality of care in a nursing home setting.

Session 4340 (Paper)

Black Caregivers' Health

MASTERY GOALS FOR BLACK AMERICAN DEMENTIA CAREGIVERS

Kalisha Bonds Johnson,¹ Fayron Epps,¹ Glenna Brewster,² Carolyn Clevenger,³ Gaea Daniel,³ Victoria Pak,³ Sudeshna Paul,³ and Kenneth Hepburn,¹ 1. *Emory University, Atlanta, Georgia, United States*, 2. *Emory University, Stonecrest, Georgia, United States*, 3. *Emory University, Emory University, Georgia, United States*

About 5.8 million older American adults live with Alzheimer's disease and related dementias; Black American older adults' prevalence is more than twice that of non-Hispanic white older adults. The Black American dementia caregiving experience can be pictured within the Black Family Social-Ecological Context Model, which provides a conceptual basis for examining social determinants of health at individual, family, community, and societal levels with careful consideration for how the intersecting identities of race, gender, and class of Black American caregivers influence the multiple dimensions of their caregiving experiences.

Family dynamics, community setting, and healthcare systems have a potentially bidirectional influence on these caregivers, which is informed by the larger historical reality of systemic racism and general disenfranchisement. This paper outlines how Stress Process and Perceived Control frameworks offer ways for Black American dementia caregivers to achieve a sense of mastery within the complicated and fraught ecology within which their caregiving occurs. We propose a research and development agenda to create a program for enhancing a sense of mastery among Black American dementia caregivers. Two concepts in particular, “constraints” and “efficacy expectations,” provide ways to develop a systematic approach to developing successful coping strategies for the constraints perceived by individuals as they undertake and function in the caregiving role. The recognition of the complexity of the caregiving ecosystem and intersectionality of caregivers’ experience emphasize the importance of individualization: each caregiver’s experience of this ecosystem— and therefore each Black American caregiver’s way to mastery within it— will be uniquely shaped and experienced.

MY FAITH GIVES ME STRENGTH: BLACK CHURCHES SUPPORTING DEMENTIA CARE PARTNERS

Danetta Sloan,¹ Valerie Cotter,² Quincy Samus,³ Morgan Spliedt,⁴ Samuel Means,⁵ Janice Bowie,¹ and Darrell Gaskin,¹ 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 2. *Johns Hopkins School of Nursing and School of Medicine, Baltimore, Maryland, United States*, 3. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*, 4. *The Johns Hopkins University, Baltimore, Maryland, United States*, 5. *Baltimore, Maryland, United States*

Inequities in dementia care require an in depth understanding of dementia care partner life experiences, care needs, sources of support and ways to improve those experiences at the community level. In partnership with Black Churches in Baltimore, MD and rural Pennsylvania, we facilitated three focus groups (n=30) with Black dementia care partners to understand: 1) unique dementia care-related needs and challenges, and 2) how the church can be a supportive care partner. Participants noted three overarching themes related to challenges and needs: 1) unique challenges in caregiving - assuming various roles to provide comprehensive care, working within policies of support services, environmental challenges (neighborhood safety), and family conflicts; 2) lack of dementia education and educational materials; and 3) unmet needs of the care recipient – lack of dementia friendly neighborhoods, lack of meaningful activities, and undiagnosed dementia. Regarding the supportive role of the church, the theme of perceived role of the church included providing emotional and social support for care partners and recipients, reducing burden through providing respite, support groups, networking/ connections to resources, and promoting health events.

PAIN AMONG AFRICAN AMERICAN FAMILY CAREGIVERS: ASSOCIATION WITH HEALTH OUTCOMES

Lyndsay DeGroot,¹ Janiece Taylor,² Thomas Trivison,³ Richard Skolasky,⁴ Sarah Szanton,² Haera Han,⁵ and Martha Abshire Saylor,⁶ 1. *Johns Hopkins University School*

of Nursing, Baltimore, Maryland, United States, 2. *Johns Hopkins University, Baltimore, Maryland, United States*, 3. *Harvard Medical School, Boston, Massachusetts, United States*, 4. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*, 5. *Nursing, Baltimore, Maryland, United States*, 6. *Johns Hopkins School of Nursing, Baltimore, Maryland, United States*

African Americans experience high rates of undermanaged pain as they age. African Americans often become family or informal caregivers, and undermanaged pain may have implications for their overall health and ability to perform caregiving tasks. The purpose of this study was to examine if pain was related to overall health and number of caregiving activities among African American caregivers. We used data from round 7 of the National Study of Caregiving (N= 646 African American caregivers, mean age= 57 years [SD=15]). Pain over the prior month was participant-assessed. Of this sample, 451 (69.7%) were women, 324 (50.1%) had pain, and 309 (47.8%) had multiple comorbidities. The number of caregiving activities ranged from 8 to 14 with mean of 11.6 (SD= 1.4). In a logistic regression model, controlling for income, education, and comorbidities, we found having pain in the last month was associated with lower likelihood of very good or excellent health (Adjusted OR 0.48; 95% CI 0.33 to 0.69) and greater likelihood of having depressive symptoms (Adjusted OR 2.04; 95% CI 1.34 to 3.10). In a linear regression model, however, pain was not significantly related to the number of caregiving activities (R² = 0.04). Findings suggest that while pain is related to poorer physical and mental health outcomes among African American caregivers, even pain does not deter them from providing care for care recipients. Management of pain among African American caregivers may be beneficial for improving their own overall health and mental health.

TRANSCENDING INEQUITIES IN DEMENTIA CARE IN BLACK COMMUNITIES: LESSONS FROM THE MIND CARE COORDINATION PROGRAM

Danetta Sloan,¹ Deirdre Johnston,² Chaneé Fabius,¹ Inga Antonsdottir,³ Morgan Spliedt,⁴ Tabitha Pyatt,⁵ Melissa Reuland,⁵ and Quincy Samus,² 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 2. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*, 3. *Johns Hopkins School of Nursing, Baltimore, Maryland, United States*, 4. *The Johns Hopkins University, Baltimore, Maryland, United States*, 5. *Johns Hopkins University, Baltimore, Maryland, United States*

Resolution of ongoing inequities in dementia care requires careful examination of how care is delivered to ensure we are aware of, and meeting needs for all people affected, especially those most vulnerable and in under-resourced communities. Maximizing Independence at Home (MIND) is a multicomponent, home-based dementia care program designed to provide high quality, wholistic care coordination for to persons and families living with dementia. Program goals are to delay transition from home, improve life quality, and reduce unmet care needs. We completed three focus groups (n = 25) with Black (e.g., African American) dementia caregivers who received the intervention to understand (1) the unique dementia related needs of Black dementia

caregivers and barriers and challenges to caregiving experienced within the Black community, (2) perceived benefits of MIND, and (3) ways to improve the MIND intervention. Participants noted three overarching themes related to needs and challenges in dementia care in the Black community: difficulty finding and accessing dementia information, help, and related services; familial conflict/lack of sibling and familial support; and lack of effective communication about dementia within Black Communities. Regarding benefits of the program, four themes emerged including that the program helped find resources (formal and informal); provided caregivers an opportunity for socialization and interaction; included comprehensive assessments and helpful linked information; and resulted in a “much needed break.” Increased diversity of MIND personnel and greater clarity and consistency in MIND program promotion and communications were themes for how the program could be improved.

WORSHIP EXPERIENCES OF BLACK FAMILIES AT DEMENTIA-FRIENDLY CHURCHES: A MULTIPLE-CASE STUDY DESIGN

Fayron Epps,¹ Janelle Gore,¹ Mayra Sainz,¹ and Glenna Brewster,² 1. *Emory University, Atlanta, Georgia, United States*, 2. *Nell Hodgson Woodruff School of Nursing Emory University, Atlanta, Georgia, United States*

Literature supports the significance of religiosity as a protective factor to promote well-being for Black families facing dementia; However, minimum reports exist on the worship experiences of these families. The purpose of this multiple-case study was to report the experiences of Black families facing dementia who attended worship services at dementia-friendly churches. Data were collected through participant observations of family caregivers (n = 4) and persons living with dementia (n = 4) during worship services and semi-structured interviews with the family caregivers over six months. Data were analyzed case by case followed by a cross-case analysis. Four overarching themes emerged: welcoming church culture, the significance of support with differences in perceived and actual support, engagement during worship service, and connectedness between the caregiver and their family member living with dementia. Family caregivers reported that their family member with dementia was attentive and expressed moments of clarity during and immediately after worship services. Religious worship can play an essential role in the quality of life among Black families affected by dementia. Health practitioners are encouraged to acknowledge the influences of religion among dementia families and integrate religious practices within interdisciplinary care plans and programs.

Session 4345 (Paper)

Cognitive Aging II

CHILDHOOD SOCIOECONOMIC STATUS AND COGNITIVE AGING: AN INTERSECTIONAL LIFE COURSE PERSPECTIVE

Addam Reynolds,¹ Emily Greenfield,² Sara Moorman,³ and Laurent Reyes,⁴ 1. *Rutgers, the State University of New Jersey, Brick, New Jersey, United States*, 2. *Rutgers,*

The State University of New Jersey, New Brunswick, New Jersey, United States, 3. *Boston College, Chestnut Hill, Massachusetts, United States*, 4. *Rutgers University, Rutgers University, New Jersey, United States*

Greater childhood socioeconomic status (cSES) is associated with better later life cognition. Largely absent from this literature is how structural racism potentially influences this relationship. Guided by intersectional life course theory, we examined if the influence of cSES and region of schooling on later life cognitive outcomes differs among non-Hispanic White (NHW) and Black older adults. We used data from the 2010-2016 waves of the Health and Retirement Study for participants ages 65 and older in 2010. Using growth mixture modeling, we estimated the associations between race, cSES (parental education, social, and financial capital), and region of schooling at age 10 (southern versus not) on cognitive performance. Consistent with prior research, there was a main effect of race on cognitive performance levels (but not with decline over time), with lower scores among older Black adults, on average. Among NHWs, higher cSES was protective for later life cognition, especially for NHW participants from the South. Although Black older adults who attended school outside of the South had higher levels of cognitive performance than their counterparts who attended school at age 10 in the South, Black older adults who attended school outside of the South--regardless of cSES--still had lower average scores on cognition at baseline than the most disadvantaged NHW participants. This paper implicates the effects of structural racism on cognitive performance among older Black adults, indicating the need for heightened attention to structural racism within interventions for optimizing brain health and promoting equitable cognitive aging across the life course.

CUMULATIVE STRESS BURDEN AND COGNITIVE FUNCTION IN AFRICAN AMERICAN ADULTS LIVING IN LOW-INCOME NEIGHBORHOODS

Erica Fan,¹ Tamara Dubowitz,² Wendy Troxel,² Andrea Weinstein,¹ Tiffany Gary-Webb,³ Meryl Butters,¹ Bonnie Ghosh-Dastidar,⁴ and Andrea Rosso,¹ 1. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2. *RAND Corporation, Pittsburgh, Pennsylvania, United States*, 3. *University of Pittsburgh, Graduate School of Public Health, Pittsburgh, Pennsylvania, United States*, 4. *RAND Corporation, Arlington, Virginia, United States*

African Americans (AA) are more likely to experience stressors due to racial discrimination and segregated neighborhoods, potentially contributing to higher risk for dementia. We investigated the association between stressors and cognitive function in older AA adults through cumulative stress burden (CSB) indices. Stressors and cognitive domains were measured in 253 participants >50 years, recruited from primarily AA neighborhoods in Pittsburgh, PA. CSB included perceived and psychological distress, unfair treatment, post-traumatic stress disorder, and neighborhood-level stressors such as walkability, safety, satisfaction, and social cohesion. Indices were formed by dichotomizing stressor scores and summing. Cognitive domains were z-scores adjusted for age, sex, and education. Adjusted generalized linear models assessed the relation between CSB indices and cognition, and between specific stressors and cognition.

Interactions with age were tested. Greater individual-level CSB index was associated with lower language ($\beta = -0.11$, $p = 0.03$) and executive function ($\beta = -0.087$, $p = 0.04$). The neighborhood-level CSB index was not associated with any cognitive domain. The combined index was marginally associated with language in adjusted models ($\beta = -0.07$, $p = 0.05$). There were no significant associations between specific stressors and cognition, except for neighborhood safety with 3MS ($\beta = -0.28$, $p = 0.001$) and language ($\beta = -0.16$, $p = 0.02$). Age interactions indicate that findings were stronger for younger participants. Greater cumulative stress is associated with poorer cognitive function in some domains in older AA. A comprehensive assessment of cumulative stress is vital in understanding the dimensionality of racialized stress for older adults potentially experiencing cognitive decline.

GREATER ADOLESCENT COGNITIVE ABILITY LINKED TO LOWER RISK OF EARLIER MORTALITY

Tara Gruenewald,¹ Molli Grossman,² Catalina Zavala,² Thalida Arpawong,² Gwen Fisher,³ Kenneth Shultz,⁴ Margaret Gatz,² and Carol Prescott,² 1. *Chapman University, Orange, California, United States*, 2. *University of Southern California, Los Angeles, California, United States*, 3. *Colorado State University, Fort Collins, Colorado, United States*, 4. *California State University, San Bernardino, San Bernadino, California, United States*

There have been few investigations of the role that adolescent cognitive ability might play in predicting physical resilience across the life course, including decreased risk of early mortality. Our limited knowledge of how multiple cognitive ability domains shape trajectories of longevity is due, in part, to a lack of aging cohorts with early life cognitive assessments, and family data that allow for examination of shared family and genetic characteristics that may play a role in cognitive ability-health links. We capitalized on data from the 1960 Project Talent high school cohort ($n > 360,000$, born 1942-1946) and mortality data ($n = 22,584$; 5,497 deceased) collected as part of two recent follow-ups, the Project Talent Twin & Sibling Study and the Project Talent Aging Study, to examine these potential associations. In 1960, ability was assessed in multiple cognitive domains (e.g., general aptitude, quantitative, reasoning). Mortality status was ascertained through 2016. Binary logistic generalized estimating equations with race, age, sex, and adolescent family SES covariates, indicated that each 1 standard deviation higher ability in multiple cognitive domains in adolescence predicted lower odds of earlier mortality (ORs of 0.79 - 0.87). Co-sibling control models indicated a similar pattern, suggesting that benefits associated with higher cognitive performance do not simply reflect shared environmental and genetic background, but may represent a direct protective effect. These findings indicate that better performance in multiple cognitive domains in adolescence, above and beyond the influence of genetic and family environmental factors, may be or point to modifiable protective factors against risk of early mortality.

LONG-TERM COGNITIVE EFFECTS FROM A REAL-WORLD MULTI-SKILL LEARNING INTERVENTION IN OLDER ADULTS

Leah Ferguson,¹ Debaleena Sain,¹ Esra Kürüm,¹ Carla Strickland-Hughes,² George Rebok,³ and Rachel Wu,⁴

1. *University of California, Riverside, Riverside, California, United States*, 2. *University of the Pacific, University of the Pacific, California, United States*, 3. *Johns Hopkins University, Baltimore, Maryland, United States*, 4. *University Of California - Riverside, Riverside, California, United States*

Previous cognitive learning interventions have focused primarily on learning one or two novel real-world skills at a time, or utilizing computer-based programs to enhance specific cognitive skills (Ball et. al 2002; Park et. al, 2014). While these studies yielded immediate cognitive improvements in participants, the long-term benefits of continuing to learn several real-world skills in older adulthood is unclear. In the present two studies, the long-term (1-year post-intervention) benefits of a multi-skill learning intervention were investigated with older adult participants. Study 1 (a pilot sample) included 6 participants (67% female, $M = 66.33$ years, $SD = 6.41$, range = 58-74 years old) and Study 2 included 27 participants (67% female, $M = 69.44$ years, $SD = 7.12$, range = 58-86 years old). Following a three month intervention which entailed simultaneously learning at least three real-world skills, such as photography, drawing, and Spanish, participants' cognitive abilities were assessed using four tasks (Flanker, Set-Shifting, Dot Counting, and N-Back), as well as RAVLT and Digit Span. Follow-up assessments were completed at three-, six-, and 12-month follow-ups after the interventions. Linear mixed-effects regression models revealed significant cognitive improvements across time points up to one year following the intervention compared to baseline assessments. These promising results support the idea that intense learning experiences may lead to considerable cognitive growth in older adulthood, as they do earlier in the lifespan.

THE DUAL-LANGUAGE SEMANTIC COMPUTERIZED PROGRAM (DISC) MAINTAINED LOCAL SWITCH COSTS IN MCI OLDER ADULTS

W. Quin Yow,¹ Hui-Ching Chen,² and Tharshini Lokanathan,² 1. *Singapore University of Technology & Design, Singapore, Singapore*, 2. *Singapore University of Technology and Design, Singapore University of Technology and Design, Singapore*

It has been proposed that switching cost deficit in executive control (Velichkovsky et al., 2020) could be used as an early marker for abnormal aging processes. Although research with technology-based intervention has shown benefits in improving cognitive performance with older adults, the overall results are mixed (Ge et al, 2018). This study aims to investigate whether computerized intervention program (e.g., DISC) would help to reduce the switching costs deficits in mild-to-moderate cognitively-impaired older adults (MCI-OA). Fourteen MCI-OA (79.75 ± 6.94) and 9 cognitively-healthy OA (age 77.25 ± 6.9) were randomly assigned to an experimental group or a control group (a final sample size of 30 MCI and 40 cognitive-healthy older adults would be ready by conference time). All participants first completed a set of cognitive tasks as part of a larger study (i.e., pre-tests) (e.g., MMSE, Ravens, cued-base Task Switching Task). The experimental group then played cognitive games on a touch-screen tablet for about 30-40 minutes per session with a total of 24 sessions over 8-12 weeks. The control group continued their daily activity as per

usual for 8-12 weeks. Participants were then asked to complete the same set of cognitive tasks again post-test. Control group MCI-OA performed worse for the local costs in the cued Task Switching task ($p < .05$), whereas experimental group MCI-OA maintained their performance ($p = .40$) post-test compared to pre-test. All cognitively-healthy OA did not show any difference in performance irrespective of condition. This suggests that the DISC program could be an effective tool in slowing down the abnormal accelerated aging process.

Session 4350 (Paper)

Cognitive Impairment and Caregiving

DYADIC RELATIONSHIPS BETWEEN SELF-RATED HEALTH AND COGNITION AMONG OLDER ADULTS AND THEIR SPOUSAL CAREGIVERS

Ruotong Liu,¹ Iris Chi,² and Shinyi Wu,³ 1. *University of Southern California, Marina del Rey, California, United States*, 2. *University of Southern California, University of Southern California, California, United States*, 3. *University of Southern California, SANTA MONICA, California, United States*

This study examines spouses who are in a caregiving situation to discern how they influence each other's health. Previous studies reported health concordance and cross-domain effects among caregiver and care-recipient dyads. However, it is less understood of the health dyadic relationships among spouses who are in a caregiving situation. No studies have specifically looked into the relationship between self-rated health (SRH) and cognitive functioning among spousal caregiving dyads over time. In this study we analyzed the longitudinal reciprocal relationships between SRH and cognitive functioning measured by the Telephone Interview for Cognitive Status among older adults and their spousal caregivers, and whether the relationship differed by whether husband or wife was the caregiver. Longitudinal data from the Health and Retirement Study (2010-2016) on 540 dyads were pooled and analyzed using structural equation modeling under an actor-partner interdependence model. Results revealed cognitive concordance among older spouses in which caregivers' cognition is associated with care-recipients' cognition subsequently ($\beta = 0.05$, $p < .05$). SRH concordance was not significant. Cross-domain results showed only one significant direction, that is, care-recipients' cognition in the subsequent time was significantly correlated with caregivers' SRH, regardless of whether husband ($\beta = 0.09$, $p < .05$) or wife ($\beta = 0.08$, $p < .05$) was the caregiver. Our study found that married couples in a spousal caregiving situation displayed cognitive but not overall health concordance, and cross-domain effects of caregiver's SRH on spousal care recipient's cognition subsequently. The reciprocal associations suggest that addressing and improving either partner's physical health and cognition may benefit both dyad members.

EXPLORING THE EXPERIENCES OF PERSONS LIVING WITH DEMENTIA AND THEIR CARE PARTNERS DURING THE COVID-19 PANDEMIC

Jeanine Yonashiro-Cho,¹ Elizabeth Avent,² Laura Mosqueda,³ and Zachary Gassoumis,³ 1. *University of Southern California, Alhambra, California, United*

States, 2. *University of Southern California, Los Angeles, California, United States*, 3. *Keck School of Medicine of USC, Alhambra, California, United States*

Public health measures implemented to mitigate the spread of COVID-19 have transformed the physical and social environments in which we live. The effects of these policies on persons living with dementia (PLWD) and their care partners (CPs) are not fully understood. This study explores the experiences, attitudes, and perceptions of caregiving dyads during the COVID-19 pandemic. Cross-sectional survey data were drawn from a larger longitudinal study examining the relationship between PLWD aged 65+ and their CPs being conducted in a metropolitan city significantly affected by COVID-19. Interviews with were conducted remotely via videoconferencing and telephone. Data on sources and types of care provided for the PLWD, relationship quality and conflict, and caregiver stress were collected and analyzed using descriptive statistics and tests of independence. Preliminary results from PLWD ($n = 8$) and CPs ($n = 13$) confirmed a reduction in social interaction with family members and friends. CPs reported they ($n = 5$) or other family members ($n = 2$) changed their schedules to provide care for the PLWD. CPs reported increased conflict with the PLWD regarding care provision, going out or welcoming visitors, and home management. In contrast, PLWD reported a lack of conflict among household members ($n = 6$) and the perception of good changes ($n = 2$) and increased quality time with CPs. Preliminary findings provide empirical evidence of the effects of pandemic public health policies on dyads enrolled in this study and reveal differences in perceived relational conflict between PLWD and their CPs. Further research is needed to better understand the experiences of dyads and develop supportive interventions.

GAPS IN THE SYSTEM: SUPPORTING PEOPLE LIVING WITH DEMENTIA AND THEIR CAREGIVERS

Madeline King,¹ Allie Peckham,² Monika Roerig,¹ Husayn Marani,¹ and Gregory Marchildon,¹ 1. *University of Toronto, Toronto, Ontario, Canada*, 2. *Arizona State University, Phoenix, Arizona, United States*

As individuals are living longer, the prevalence of older adults living with dementia and other complex health and social care needs is on the rise (Alzheimer's Association, 2020; CIHI, 2020). Correspondingly, efforts to develop supportive programming and policies for persons living with dementia (PLWDs) are of paramount importance (CIHR, 2019). The challenges faced by PLWDs and other complex health and social needs are widely known (CIHR, 2019), however, a systematic understanding of how and if current and long-standing efforts are adequately meeting the needs of these individuals remains elusive. This research sought to understand how program administrators, decision makers, PLWD, and caregivers across five North American jurisdictions (British Columbia, Ontario, Newfoundland and Labrador, New York State, and Vermont) perceived specific dementia care programs and support services within their respective jurisdictions. We performed an inductive analysis of semi-structured interviews ($N = 37$) and identified on-going care gaps experienced by participants. We present three main gaps: 1) disconnected and uncoordinated system infrastructure, 2) lack of comprehensive services to meet the diverse needs of PLWD and their caregivers, and 3) inconsistency in

how dementia is understood; with associated perceived remedies. The results suggest that even when attempts to address the needs of PLWD and their caregivers are put in place there remains significant limitations of systems. The perspectives of decision makers, program administrators and individuals with lived experience offer unique insight into how these experiences may be improved to better support the complex needs of PLWD and their caregivers.

REFINING CARE TO PLAN: DELIVERING PERSONALIZED RECOMMENDATIONS TO SUPPORT DEMENTIA CAREGIVERS

Jinhee Cha,¹ Colleen Peterson,¹ Ashley Millenbah,¹ Katie Louwagie,¹ Zachary Baker,² Christine Jensen,³ and Joseph Gaugler,⁴ 1. *University of Minnesota, University of Minnesota, Minnesota, United States*, 2. *University of Minnesota, University of Minnesota/Minneapolis, Minnesota, United States*, 3. *Riverside Center for Excellence in Aging & Lifelong Health, Williamsburg, Virginia, United States*, 4. *University of Minnesota, Minneapolis, Minnesota, United States*

Caregivers of persons living with Alzheimer's disease and Alzheimer's disease-related dementias (PLWD; AD/ADRD) benefit from unique interventions to address their different needs. While information on which interventions best meet specific needs exists, less is known about how to match caregivers with those interventions. To address this research gap, we tested Care to Plan (CtP) within a large healthcare system. After care navigators guided caregivers through twenty CtP tailoring questions to identify caregivers' greatest needs, the online tool provided the intervention type best suited to meet their needs, along with region-specific information on available programs. This mixed methods analysis evaluated the utility of the CtP tool with 20 family caregivers of PLWD after a 1 month follow-up. Most caregivers agreed that the CtP tool was helpful (85%) and would recommend the tool to other caregivers (90%). Caregivers also said they valued being able to discuss the CtP recommendations with the care navigator (95%). However, only 65% said they found services that met their needs or planned on using services recommended by CtP. Interview data indicate time constraints and restricted availability of resources due to COVID-19 precautions reduced caregivers' abilities to pursue some recommendations. In addition, the stage of dementia experienced by their care recipient may explain why others found CtP less useful. However, these caregivers noted the potential utility of the resources for their future care planning needs. A larger evaluation of the CtP tool within the healthcare system is ongoing.

THE EDUCATION OF FAMILY MEMBERS AND OLDER ADULT COGNITIVE HEALTH: DIFFERENCES ACROSS RACIAL GROUPS

Sindhu Vasireddy,¹ Jenjira Yahirun,² and Mark Hayward,³ 1. *International Institute for Population Sciences, India, Hyderabad, Telangana, India*, 2. *Bowling Green State University, Bowling Green State University, Ohio, United States*, 3. *University of Texas at Austin, University of Texas at Austin, Texas, United States*

Education is a strong predictor of cognitive health among older adults, and recent research indicates that apart from

one's own education, the educational resources of family members also play a crucial role in shaping cognitive health over the life course. We add to this literature by investigating whether the advantages of highly educated family members matter for both Blacks and Whites in the U.S. Specifically, we ask whether the resources of family members—parents and offspring—partially explain the racial gap in both the prevalence and incidence of cognitive health across both groups. For this, we employ logistic regression models to examine the prevalence of cognitive impairment at baseline, and discrete-time event history models to assess the incidence of cognitive impairment, using data from the Health and Retirement Study (HRS) for the years ranging from 2000 to 2012. Preliminary results indicate that at the baseline, respondent's own education is predictive of cognitive impairment among Whites, but not Blacks. Once respondent-level health conditions and behaviors are taken into consideration, parental or offspring education is not associated with the prevalence of cognitive impairment. For respondents who are not impaired at the baseline, our results from the incidence models align with the "adjacent generations" literature suggesting that both parental and offspring education has a salient positive effect on later-life cognitive health. However, we find notable differences across groups to suggest that the education of parents and offspring may play a larger role in mitigating cognitive decline among African Americans, compared to Whites.

Session 4355 (Paper)

COVID-19 and Mortality in Nursing Homes

COVID-19 DEATH IN HIGH-MEDICAID NURSING HOMES: THE ROLE OF EMPLOYMENT EMPOWERMENT

Justin Lord,¹ Ganisher Davlyatov,² Akbar Ghiasi,³ and Robert Weech-Maldonado,² 1. *Louisiana State University at Shreveport, Bossier City, Louisiana, United States*, 2. *University of Alabama at Birmingham, Birmingham, Alabama, United States*, 3. *University of the Incarnate Word, San Antonio, Texas, United States*

This study examines the association between COVID-19 death and employee empowerment in under-resourced nursing homes (70% or higher Medicaid census). Employee empowerment captures elements of participative decision making, autonomy, responsibility, open communication, decentralization, and decision-making flexibility within an organization. Survey data from 391 Directors of Nursing (response rate of 37%) from 2017-2018, were merged with secondary data from CMS Nursing Home COVID-19 Public File, LTCFocus, Area Health Resource File, and Nursing Home Compare. A Poisson regression was used to examine reported COVID-19 death and employee empowerment. The independent variable employee empowerment was the mean score of summated Likert scale questions. Control variables included organizational (size, location, ownership, chain affiliation, quality, payer mix, acuity, occupancy, and race/ethnicity, staffing mix), and county factors (Medicare Advantage penetration, per capita income, poverty, unemployment, education, 65+ population, and competition). Employee

empowerment was associated with a lower number of COVID-19 cases ($p < 0.05$). Rural, not-for-profit, and payer-mix were also significantly associated with a lower number of COVID-19 deaths. Employee empowerment captures the decentralization of authority and an employee's ability to make decisions without approval. In light of this crisis, empowerment may have helped under-resourced nursing homes be more agile and faster in their response. High-Medicaid nursing homes may need to consider different decision-making practices when faced with a crisis, such as, COVID-19.

COVID-19 MORTALITY IN ADULT CONGREGATE LIVING SETTINGS ACROSS FIVE U.S. STATES

David Rein,¹ Lindsey Shapiro,² Mairin Mancino,³ and Caroline Pearson,³ 1. NORC, Atlanta, Georgia, United States, 2. NORC, NORC, Chicago, Illinois, United States, 3. NORC, NORC, Maryland, United States

The magnitude of COVID-19 mortality in adult congregate living settings other than nursing homes (NH) is unknown. To address this, we created an individual property level dataset for five U.S. states (Colorado, Connecticut, Florida, Georgia, and Pennsylvania) using multiple public and private sources. The data included information on each observation's state and county, level of care (LOC), the estimated number of residents, COVID-19 deaths through December 31, 2020, and county-level cases of COVID-19 per 100,000. We restricted our sample to market grade properties with 25+ residents, for which we able to estimate resident and LOC information. We defined LOC as County, non-congregate (CN), Independent Living (IL), Assisted Living (AL), Memory Care (MC), and Nursing Home (NH). We used multilevel, multivariable logistic regression models to estimate the expected death rate for each LOC controlling for differences in reported COVID-19 infections and county and state reporting differences. We identified 3,059 properties that met our inclusion criteria (69 CN, 477 IL, 1,118 AL, 179 MC, and 1,216 NH). We estimated deaths per 1,000 persons of 4.4 (95% CI: 4.0-4.8) for CN, 4.4 (3.9-4.9) for IL, 16.2 (14.7-17.9) for AL, 50.3 (44.4-56.8) for MC, and 32.0 (29.3-34.9) for NH. The order of death rate severity was the same in each state, except MC in Georgia. Additional research is needed to evaluate whether death rate differences resulted from congregate living risks, from COVID mortality risk factors at each LOC, or a combination of factors.

COVID-19 NURSING HOME DEATHS IN COOK COUNTY: PREDICTORS AND MODIFIABLE RISKS

Andrew DeMott,¹ Susan Hughes,² Michael Gelder,² and Sage Kim,² 1. UIC, Chicago, Illinois, United States, 2. University of Illinois at Chicago, Chicago, Illinois, United States

Investigators at the University of Illinois Chicago, the Illinois Department on Aging (IDOA), the Illinois Department of Public Health, and the Health and Medicine Policy Research Group are collaborating to examine comparative rates of Covid-19-related deaths among older adults who reside in nursing homes vs. the community in Illinois. As a first step, we have examined data from the Cook County Medical Examiner's office to compare nursing home resident

fatalities to those who died in the community. Deaths with Covid-19 listed as primary or secondary cause of death that occurred between January 1, 2020 to September 30, 2020 among older adults ages 60 and over were identified from the Cook County Medical Examiner's Office case archive file. Location at death and race/ethnicity were obtained from the same source. Location at death was matched with data in the Center for Medicare and Medicaid Services (CMS) Covid-19 Nursing Home Data to identify persons who died in skilled nursing facilities (SNFs) as well as facility and staff characteristics. We found that the 3,937 deaths among persons over the age of 60 comprised 75% of total deaths in Cook County. Of the total older adult deaths, 2,090 (53%) died in the community and 1,837 (47%) died in SNFs. Regression analyses that controlled for CMS quality ratings found that larger, for-profit nursing homes, with high levels of staff infected with Covid-19 were associated with higher mortality. The policy implications of these findings will be discussed.

DISPARITIES IN COVID-19 MORTALITY IN HIGH-MINORITY NURSING HOMES

Justin Lord,¹ Robert Weech-Maldonado,² Ganisher Davlyatov,³ Akbar Ghiasi,⁴ and Gregory Orewa,² 1. Louisiana State University at Shreveport, Bossier City, Louisiana, United States, 2. University of Alabama at Birmingham, Birmingham, Alabama, United States, 3. Birmingham, Alabama, United States, 4. University of the Incarnate Word, San Antonio, Texas, United States

Racial/ethnic disparities in healthcare have been highlighted by the recent COVID-19 pandemic. Minorities continue to utilize nursing home services at a higher rate than White residents, contributing to existing health inequity concerns. This study examined the relationship between nursing home racial/ethnic mix and COVID-19 resident mortality using the CMS Nursing Home COVID-19 Public File. As of October 25, 2020, high minority nursing homes reported 6.5 COVID-19 deaths as compared to 2.6 deaths for nursing homes that had no racial/ethnic minorities. Four nested sequential negative binomial regressions were used to model the relationship between racial/ethnic disparities in COVID-19 deaths and the separate contributions of facility-level resident characteristics (percent of females, percent of residents 65 years and older, percent of residents with congestive heart failure, hypertension, and obesity, and the average level of residents' acuity), resource availability (nursing homes' payer-mix, occupancy rate, county-level Social Deprivation Index, and nursing home location), and other organizational characteristics (nursing home for-profit status, chain affiliation, and self-reported nursing, clinical, aides, and other staff shortages). After controlling for interstate differences, facility-level resident characteristics, resource availability, and organizational characteristics, high-minority nursing homes had 61% more COVID-19 deaths (Incidence Rate Ratio [IRR] = 1.61; $p < 0.001$) as compared to nursing facilities with no minorities. From a policy perspective, nursing homes, that serve primarily minority populations, may need additional resources, such as, funding for staffing and equipment in the face of the pandemic. The COVID-19 pandemic has sharpened the focus on healthcare disparities and societal inequalities in the long-term care.

Session 4360 (Paper)

Cultivating More Age-Friendly Campuses

BRINGING TRANSDISCIPLINARY AGING RESEARCH FROM THEORY TO PRACTICE

Lana Sargent,¹ Tracey Gendron,² Marissa Mackiewicz,³ Ana Diallo,⁴ Faika Zanjani,² Elvin Price,⁵ Pamela Parsons,² and Gregory Ford,⁶ 1. *VCU School of Nursing, Ashland, Virginia, United States*, 2. *Virginia Commonwealth University, Richmond, Virginia, United States*, 3. *VCU Institute for Inclusion, Inquiry, and Innovation (iCubed): Health and Wellness in Aging Populations, Richmond, Virginia, United States*, 4. *Virginia Commonwealth University School of Nursing, Richmond, Virginia, United States*, 5. *Virginia Commonwealth University/ School of Pharmacy, Richmond, Virginia, United States*, 6. *Beacon Housing Communities, Richmond, Virginia, United States*

There is a growing emphasis to use a transdisciplinary team approach to accelerate innovations in science to solve complex conditions associated with aging. However, the optimal organizational structure and process for how to accomplish transdisciplinary team science are unclear. In this study, we illustrate our team's experience using transdisciplinary approaches to solve challenging and persistent problems for older adults living in urban communities. We describe our challenges and successes using the National Institutes of Health four-phase model of transdisciplinary team-based research. Using a de-identified survey, the team conducted an internal evaluation to identify features that created challenges including structural incongruities, interprofessional blind spots, group function, and group dynamics. The team then identified responses to address the features that created challenges and determined indicators for success. Indicators for success were identified by the team as a place for continued evaluation of the teams' collaborative effectiveness, transdisciplinary integration, and impact on the university and aging community. This work resulted in the creation of the team's Transdisciplinary Conceptual Model. This model became essential to understanding the complex interplay between societal factors, community partners, and academic partners. Conducting internal evaluations of transdisciplinary team processes is integral for teams to move beyond the multi- and interdisciplinary niche and to reach true transdisciplinary success. More research is needed to develop measures that assess team transdisciplinary integration. Once the process of transdisciplinary integration can be reliably assessed, the next step would be to determine the impact of transdisciplinary team science initiatives on aging communities.

IMPLEMENTING AGE-FRIENDLY UNIVERSITY PRINCIPLES: INSTITUTIONAL SUPPORTS, BARRIERS, AND OUTCOMES

Katarina Felsted,¹ and Jacqueline Eaton,² 1. *University of Utah, Salt Lake City, Utah, United States*, 2. *University of Utah, University of Utah, Utah, United States*

The University of Utah Gerontology Interdisciplinary Program received an Age-Friendly University (AFU) seed grant through GSA's Academy of Gerontology in Higher

Education, funded by AARP, to develop a model for promoting lifelong learning in partnership with university and community stakeholders. We designed and instituted a targeting marketing campaign that supported our goals: 1) to implement AFU principles; 2) to promote awareness of HB60, a legislative bill allowing people 62+ to audit courses at public universities for a minimal cost; 3) to enhance HB 60 enrollment through increased communication of online course options and tuition waiver support; and 4) to improve university and community stakeholder engagement. This presentation describes project benefits, including increased awareness of AFU initiatives, promoting age diversity, safe participation through online coursework, and enhanced community partnerships. The initiative garnered strong departmental support for marketing, communications, and structure for the post-award process. Barriers occurred due to a lack of HB60 infrastructure at the university level, which inadvertently obstructs organizational engagement. This initiative targeted AFU principles while supporting the university's strategic goal of engaging communities and preparing to pursue membership in the AFU Global Network. Future AFU goals include developing advocacy channels within the university to improve organizational support.

OLDER STUDENT EXPERIENCES: A CRITICAL EXAMINATION OF AGING ON CAMPUS

Cassandra Barragan,¹ and Sarah Walsh,² 1. *Eastern Michigan University, Ypsilanti, Michigan, United States*, 2. *Eastern Michigan University, Eastern Michigan University, Michigan, United States*

There is overwhelming evidence that the number of older learners on college campuses has been steadily increasing since the 1970s. The needs of older learners differ from traditional students, and many services and resources available at higher education institutions are geared towards students aged 18-25 (Silverstein, Choi, & Bulot, 2001). Age Friendly University (AFU) principles highlight the need to consider older learners at a university and provide structure to evaluate programs and practices and to enhance inclusion and diversity based upon age. This study examined how an AFU designated university is working to better understand their older students. Methods: A web-based pilot survey of older learners (N=248) asked all students ages 40 and older a series of questions regarding motivation to attend school, barriers and supports, campus environment, and connection with AFU principles. Analysis: A regression analysis found that older learners who felt more welcomed by faculty ($p=.001$), administration ($p=.002$), and student organizations ($p=.026$) were more likely to feel connected to campus, and younger-older students ($p=.031$) and those who did not feel their job was a barrier to attending school ($p=.037$) were more likely to feel satisfied with their level of engagement on campus. Additionally, older learners felt the AFU principles were demonstrated by their university. Discussion: The experiences of older learners are important as we continue to see higher numbers of students over the age of 40. Our results demonstrate the need to engage older learners as part of diversity and inclusion efforts to facilitate connection to the campus community.

THE INTERSECTION OF OLDER STUDENTS AND DISABILITY: HOW AGE-FRIENDLY UNIVERSITIES CAN BOOST VISIBILITY AND ACCESSIBILITY

Cassandra Barragan,¹ and Sarah Walsh,² 1. *Eastern Michigan University, Ypsilanti, Michigan, United States*, 2. *Eastern Michigan University, Eastern Michigan University, Michigan, United States*

The needs of older learners differ from traditional students, and many services and resources available at higher education institutions are geared towards students aged 18-25 (Silverstein, Choi, & Bulot, 2001). Age Friendly University (AFU) principles highlight the need to consider older learners at a university. Older learners face various barriers to education including balancing schoolwork with responsibilities and accessibility of campus resources (Silverstein et al., 2001). This study examined how an AFU designated university is working to better understand their older students. Methods: A web-based pilot survey of older learners (N=248) asked all students ages 40 and older a series of questions regarding motivation to attend school, barriers and supports, campus environment, and connection with AFU principles. Analysis: A t-test analysis explored differences in motivation, barriers and challenges, and connection to campus between students who identified as having a disability and those who did not. Findings: We found there were significant differences between the groups in how health impacted their education ($p=.001$), being able to physically access campus ($p=.014$), the availability of online classes ($p=.047$), and the hours of operation of student support services ($p=.045$). There were also differences between groups in how connected they felt to campus based on feeling welcomed by faculty ($p = .033$) and feeling satisfied with their level of engagement at the university ($p = .002$). Discussion: Our results demonstrate the need to fully engage older learners with a disability as part of diversity and inclusion efforts to facilitate connection to the campus community.

TOWARD AGE-FRIENDLY HIGH EDUCATION: AN INTERGENERATIONAL PARTICIPATORY CO-DESIGN APPROACH

Vivian, W. Q. Lou,¹ Esther Woo,² Nicol Pan,² Peter J. Cobb,² Xiao Hu,² and Michael Cheng,² 1. *The University of Hong Kong, Hong Kong, Hong Kong*, 2. *The University of Hong Kong, The University of Hong Kong, Hong Kong*

Objective: When aging becomes a global challenging, we believe it is timely important to equip aging knowledge among university students regardless of their disciplinary study subjects. This study aims to describe principles and process of development an aging-related curriculum in high education entitled “Intergenerational Participatory Co-design Project (IPCP)” and evaluate its impacts. Methodology: Guided by a key principle of involving participants of any learning context as co-creators of both the learning process and learning outcomes, IPCP went through four stages of development including capacity building, co-creation on learning objectives, deliberated content learning, and learning outcome dissemination. Mixed methodology including qualitative in-depth interview and quantitative questionnaire were applied in evaluation. A total of 26 participants, from three generations recruited from one university, one secondary school, and a pool of senior champions

under a geron-infusion initiative participated. Findings: after attaining capacity building workshops applying Optimal Quality Intergeneration Interaction Framework, three learning groups formulated. A common theme “preserving cultural heritage” emerged, while each group has identified a specified focus (e.g., food, Tai Ji, and historic sites guide). Quotes collected and survey data revealed positive impacts in reducing stereotype and enhancing learning experiences. Conclusion: IPCP demonstrated good practices in role models in multi-disciplinary collaboration in pedagogy innovation. It also paved solid way towards a learning community interwoven with continuous innovation: IPCP becomes a pioneer contributor of library’s digital data hub solution; common core office starts to develop a human life-span cluster; two research team members started new collaboration on geron-infusion in Faculty of Education.

Session 4365 (Symposium)

CURRENT RESEARCH ON SUICIDE IN OLDER ADULTS

Chair: Montgomery Owsiany

Discussant: Yeates Conwell

Rates of suicide are elevated in middle- and late-life, yet studies focusing on suicidal ideation and behavior in older adults are limited compared to research in younger adults. The studies included in the present symposium offer valuable findings on suicide in older adults across the span of late-life. Owsiany et al. focus on age differences between older and younger adults in the association between anxiety symptoms and suicide risk. In Heisel et al., an online intervention is assessed for improving the outcomes of psychological well-being and suicide risk in older adult men who are transitioning into retirement during the COVID-19 pandemic. Crnek-Georgeson and Wilson reviewed the link between retirement patterns and psychological effects, including suicidal behaviors, among older adults. Additionally, this review includes recommendations for policy makers and employers in an effort to assist older adults with the transition into retirement. Utilizing baseline data from the Helping Older Adults Engage study, Fenstermacher et al. research the association between volunteering and suicidal ideation in a predominantly lonely older adult sample across the span of late-life. Together, these studies provide foundation for future research on suicide in late-life to build upon. Future studies should continue to focus on risk and protective factors for suicide in older adults and aim to improve screening and intervention for suicidal thoughts and behaviors in this population. Yeates Conwell, M.D., Director of Geriatric Psychiatry and Co-Director of the Center for the Study and Prevention of Suicide at the University of Rochester Medical Center, will serve as discussant.

AGE DIFFERENCES IN THE ASSOCIATION BETWEEN ANXIETY SYMPTOMS AND SUICIDE RISK

Montgomery Owsiany,¹ Ruifeng Cui,² and Amy Fiske,¹

1. *West Virginia University, Morgantown, West Virginia, United States*, 2. *VA Pittsburgh Healthcare System, Pittsburgh, Pennsylvania, United States*

Suicide rates increase over the life-span, necessitating concern in older adults. Recent studies suggest that anxiety disorders are associated with suicidal thoughts and behavior.

The present study examined the association between anxiety symptoms (General Anxiety Disorder-7) and suicide risk (Suicide Behaviors Questionnaire-Revised), testing whether the association differs between younger and older adults. Depression symptoms (Patient Health Questionnaire-8) were controlled for in the analyses. In a sample of 944 participants (46% 60+ years), anxiety symptoms, depression symptoms, and suicide risk were lower among older adults (60+ years) than younger adults (all $p < .01$). Age moderated the significant association between anxiety symptoms and suicide risk ($\Delta R^2 = .008$, $p < .01$). Results indicate that an increase in anxiety is associated with a smaller increase in suicide risk for older adults than younger adults. The need for suicide risk screening among individuals with elevated anxiety symptoms is critical, especially for younger adults.

RELATION BETWEEN VOLUNTEERING AND SUICIDAL IDEATION AMONG OLDER ADULTS

Erika Fenstermacher,¹ Montgomery Owsiany,¹ Amy Fiske,¹ and Kim Van Orden,² 1. *West Virginia University, Morgantown, West Virginia, United States*, 2. *University of Rochester School of Medicine & Dentistry, Rochester, New York, United States*

Suicide disproportionately affects older adults, necessitating further investigation into potential protective factors for suicide in late life. Volunteering is associated with psychological well-being in older adults. However, there is scant literature examining the association between volunteering and suicidal ideation or behavior in this age group. The present study involved a cross-sectional examination of volunteering and suicidal ideation using baseline data from the Helping Older People Engage study. This sample ($N = 245$, 88% White, 68% female, 60-92 years old) was recruited from primary care practices. Inclusion criteria included clinically significant loneliness (UCLA loneliness scale $M = 49.5$; $SD = 5.7$). Forty-three percent of the sample reported engaging in recent volunteer activity. Passive and active suicidal ideation in the past month were endorsed, respectively, by 20% and 9% of the sample. Results of hierarchical linear regression analyses examining the association between volunteering and suicidal ideation, controlling for covariates, will be discussed.

RETIREMENT AND SUICIDAL BEHAVIOURS: A REVIEW OF THE INTERNATIONAL LITERATURE

Montgomery Owsiany,¹ Kylie Crnek-Georgeson,² and Leigh Wilson,³ 1. *West Virginia University, Morgantown, West Virginia, United States*, 2. *The University of Sydney, Camperdown/Darlington, New South Wales, Australia*, 3. *The University of Sydney, Camperdown, New South Wales, Australia*

This scoping review maps published literature on retirement patterns and the effect retirement has on individuals. Recommendations are provided for future research, including changes to retirement policies, to decrease the prevalence of suicidal behaviours for older adults. A literature search (2014 - 2020) was conducted in Medline, PubMed, Cinahl and Scopus, using the terms retirement, transition, redundancy, and pathways. A rapid review of global literature was undertaken, identifying 204 articles, with 27 papers chosen for full review. Search terms included retirement, transition,

redundancy and pathways to retirement. Themes arising from the data were experience of retirement, planning, health (physical and psychological), and levels of social participation. This review provides information for policy makers, health workers and employers to assist individuals with retirement, emphasising the need to maintain competency in a complex set of skills to improve health literacy and decrease psychological stress/ suicidal behaviours in older adults.

TESTING ONLINE MEN'S GROUPS TO PROMOTE PSYCHOLOGICAL WELL-BEING AND REDUCE DESPAIR DURING THE COVID-19 PANDEMIC

Marnin Heisel,¹ Paul Links,² Sisira Sarma,³ Gordon Flett,⁴ Kimberly Wilson,⁵ Simon Hatcher,⁶ Sylvie Lapierre,⁷ and David Conn,⁸ 1. *Schulich School of Medicine & Dentistry, The University of Western Ontario, London, Ontario, Canada*, 2. *McMaster University, Hamilton, Ontario, Canada*, 3. *The University of Western Ontario, London, Ontario, Canada*, 4. *York University, Toronto, Ontario, Canada*, 5. *University of Guelph, Guelph, Ontario, Canada*, 6. *University of Ottawa, Ottawa, Ontario, Canada*, 7. *Universite du Quebec a Trois-Rivieres, Trois-Rivieres, Quebec, Canada*, 8. *Baycrest; University of Toronto, Toronto, Ontario, Canada*

Suicide prevention is a healthcare and social justice priority. Older adults have the highest rates of suicide and the highest COVID-19 fatality rates in North America. The combined impacts of social isolation, fear of infection, apathy, and hopelessness could amplify suicide risk among older adults, as appears to have been the case during the 2003 SARS epidemic in Hong Kong. Innovative interventions are thus needed to promote social interaction and reduce risk for suicide in these challenging times. We are currently testing an online version of our Meaning-Centered Men's Group (MCMG; Heisel et al., 2020), an upstream psychological intervention designed to promote psychological well-being and reduce suicide risk among men struggling with the transition to retirement, in the context of pandemic-related public health restrictions. This presentation will focus on adaptations to MCMG for online delivery, and share participant experiences and findings on positive and negative psychological outcomes.

Session 4370 (Symposium)

DISRUPTION TO SUBSTANCE AND OPIOID USE DISORDER: THE DEEP SOUTH SUBSTANCE AND OPIOID USE RURAL TRAINING GRANT

Chair: Rebecca Allen

Co-Chair: Lindsey Jacobs

Discussant: Bruce Rybarczyk

The primary objective of this symposium is to describe our integrated, interprofessional behavioral health training program in substance use and opioid use disorders (SUD/ OUD) across the adult lifespan (19 to 80) within our clinical psychology graduate program in the Deep South. Due to the COVID-19 pandemic, our assessment, treatment, and prevention delivery has occurred via telehealth. The first paper describes our Clinical Training Model in two federally qualified health centers (one peri-urban and one rural) and one residential drug and alcohol rehabilitation program. Graduate and

undergraduate students provide prevention, assessment, and treatment with an emphasis on 1) mindfulness-based relapse prevention, 2) literacy-adapted treatment for chronic pain, and 3) trauma and recovery. The second paper describes the participant population. Specifically, participants (N = 105) receiving prevention, assessment and treatment services report high levels of substance and opioid use and are underserved, impoverished, and have low levels of education and health/mental health literacy. The third paper explores the relation of age, adverse childhood experiences, and PTSD symptoms within the context of substantial or severe SUD/ OUD. The final paper describes issues surrounding telehealth delivery in the rural south with underserved populations. The discussant, an expert in integrated, interprofessional telehealth delivery across the adult lifespan, will provide insight on program sustainability and dissemination. Given the pronounced need for SUD/OUD treatment in underserved populations with attention to the intersection of age and urban/rural residence, this project is poised to make a substantive impact across the adult lifespan.

INTEGRATING PSYCHOLOGICAL SERVICES INTO COMMUNITY-BASED CLINICS

Lindsey Jacobs, *The University of Alabama, The University of Alabama, Alabama, United States*

In Alabama, where mental health stigma is a critical barrier to care, integrated behavioral health services are vital to address the mental health needs that underlie substance use disorder (SUD) and opioid use disorder (OUD). Since October 2019, our team has developed partnerships with one rural and two peri-urban primary care clinics to offer behavioral health services with an emphasis on SUD/ OUD prevention, screening, and treatment. The patient populations receiving services at these three facilities are under-resourced with multiple disadvantages placing them at risk for morbidity, mortality, SUD/OUD, and poor behavioral and mental health outcomes. Behavioral health services have been delivered primarily via telehealth due to the COVID-19 pandemic. This presentation will describe the process, current status, and future goals for implementing integrated behavioral health care, with a focus on identifying the barriers and facilitators during the COVID-19 pandemic era.

CHARACTERISTICS OF OUR PATIENT POPULATION

Kyrsten Hill, *The University of Alabama, Tuscaloosa, Alabama, United States*

To date, 106 patients have completed behavioral health assessments across three sites: a rural primary care clinic (n = 32), urban federally qualified health center (n = 33), and state-certified residential rehabilitation facility (n = 41). Patients ranged from 18 to 65 years of age (M = 38.6, SD = 11.4). Approximately 51% were female and 75% were non-Hispanic White (followed by 22% African American). Over 60% had a high school degree or less and found it at least somewhat difficult to pay for basic needs. Most patients endorsed substantial (44%) or severe (39%) drug use, with 40% endorsing opioid use. There were no significant differences in substance use by age group. Moderate to severe symptoms of depression (43%) and anxiety (49%)

were common. Approximately 70% endorsed adverse childhood experiences, and 44% reported clinically significant post-traumatic stress symptoms. Measures of cognitive functioning and objective health literacy are currently being collected.

AGE, CHILDHOOD TRAUMA, POST-TRAUMATIC STRESS DISORDER, AND SUBSTANCE USE DISORDER IN THE DEEP SOUTH

Candice Reel,¹ and Rebecca Allen,² *1. The University of Alabama, Tuscaloosa, Alabama, United States, 2. University of Alabama, Tuscaloosa, Alabama, United States*

We examined the relationship of reported childhood trauma and PTSD symptoms in a sample (N = 105) of individuals aged 19 to 80 receiving treatment for substance use and opioid use disorders in federally qualified health centers. Fifty-two percent of the sample was age 39 or younger, 30% were in their 40s and 18% were aged 50 and older. Thirty-two percent did not graduate high school and 36% had a high school education or equivalent. Seventy percent reported experiencing adverse childhood experiences (ACES). Although harmful alcohol use was low, 83% of the sample reported substantial or severe substance use, with 41% of the total reporting opioid use. ACES predicted current PTSD symptoms. Telehealth treatment considerations include: 1) internet access, 2) health and mental health literacy, and 3) monitoring for dissociation when using mindfulness-based relapse prevention treatment.

Session 4375 (Symposium)

DIVERSITY AND VARIATION IN ASSISTED LIVING CARE, NATIONALLY AND OVER TIME

Chair: Portia Cornell

Discussant: Tetyana Shippee

Assisted living is generally understood to offer a greater degree of privacy and independence than a nursing home; most residents pay privately, with some receiving support from state subsidies and Medicaid; regulation and oversight are the purview of state agencies. Within these broad parameters, however, one assisted living community may look quite different from another across the country, or down the street, in its resident population and the regulations that govern its operating license. The purpose of this symposium is to explore that variation. The papers leverage an in-depth review of changes in assisted-living regulation from 2007 to 2019 and a methodology to identify Medicare beneficiaries in assisted living using ZIP codes. To set the stage, the first paper examines variation across assisted living licenses to identify six regulatory types and compare their populations' characteristics and health-care use. The second paper analyzes trends over time in the clinical acuity of assisted living residents associated with changes in nursing home populations. The third paper investigates racial disparities in assisted living associated with memory-care designations and proportions of Medicaid recipients. The fourth investigates how regulation of hospice providers in assisted living affect end-of-life care and place of death. The final paper describes requirements related to care for the residents with mental illness in seven states. The symposium concludes with an

expert in long-term care disparities and quality discussing the implications for policymakers, providers, and the population needing long-term care in assisted living.

A TYPOLOGY OF HEALTH SERVICES REGULATED IN U.S. ASSISTED LIVING COMMUNITIES

Paula Carder,¹ Lindsey Smith,¹ Wenhan Zhang,² Sheryl Zimmerman,³ Philip Sloane,⁴ and Kali Thomas,⁵
 1. OHSU-PSU School of Public Health, Portland, Oregon, United States, 2. Brown University, Providence, Rhode Island, United States, 3. Cecil G. Sheps Center for Health Services Research, Chapel Hill, North Carolina, United States, 4. UNC Medical School, Sheps Center, Chapel Hill, North Carolina, United States, 5. Brown University, Brown University/Providence, Rhode Island, United States

State agencies regulate assisted living (AL) with varying approaches across and within states. The implications of this variation for resident case mix, health service use, and policy, are not well described. We collected health services-relevant AL regulatory requirements for all 50 states and DC and used a mixed-methods approach (thematic analysis; k-means cluster analysis) to identify six types: Housing, Affordable, Hybrid, Hospitality, Healthcare, and Hybrid-Healthcare. We stratified Medicare claims data by regulatory type, identifying variation in resident case mix and health service use. Housing and Affordable clusters have larger proportions of dual-eligible beneficiaries, Black residents, and residents of Affordable had more long-term nursing home use compared to other clusters. Dual-eligible beneficiaries account for 26.6% of Housing cluster residents compared to 8.1% of Hybrid Healthcare cluster residents. We provide other examples and explain the implications in terms of sampling AL for single and multi-state studies, racial disparities, and health-related policies.

RACIAL DISPARITIES IN USE OF MEMORY CARE AND PREVALENCE OF DUALS IN ASSISTED LIVING

Portia Cornell, *Providence VA Medical Center, Providence, Rhode Island, United States*

Assisted living (AL) communities with memory care licenses are disproportionately located in affluent and predominantly White communities and Black older adults are underrepresented in AL. But little is known about characteristics of AL that care for Black residents. We estimated the association of facility-level characteristics as proxy measures for AL resources, such as memory care designations and percentage of dual-eligible residents, across low (0-5%), medium (5-10%) and high (>10%) percentages of Black residents. We found broad differences among communities in the three levels of Black-resident prevalence. High percentage of Black residents was associated with large differences in the percentage of Medicaid-enrolled residents (high 54% duals [s.d.=34], med 28% [31], low=13% [22], $p<0.001$). ALs with high Black populations were less likely to have a memory-care designation than ALs with medium and low percentages of Black residents (high 4.7% memory care, med 11%, low 17%).

TRENDS IN ACUITY OF RESIDENTS IN ASSISTED LIVING

Cassandra Hua, *Brown University, Providence, Rhode Island, United States*

Assisted living serves as a substitute for nursing home residents with low care needs, especially in markets with a high proportion of dually eligible Medicare beneficiaries. This study examines trends in the acuity of residents in assisted living communities over time in comparison to nursing homes to characterize how substitution has affected the resident compositions of both settings. We also examine how trends in acuity are shaped by dual eligibility. Using Medicare claims data, we identify cross-sectional samples of beneficiaries in each setting from 2007-2017. The proportion of residents in assisted living with high care needs has increased 18% in assisted living communities compared to 8.7% in nursing homes. Acuity levels are higher among dually eligible assisted living residents compared to assisted living residents who are not dually eligible. Policy makers and administrators should examine whether assisted living is prepared to provide care for an increasingly acute population.

PLACE OF DEATH AMONG ASSISTED LIVING RESIDENTS AS A FACTOR OF HOSPICE REGULATIONS

Emmanuelle Belanger,¹ Joan Teno,² David Dosa,³ Wenhan Zhang,³ Pedro Gozalo,³ and Kali Thomas,⁴
 1. Brown University School of Public Health, Providence, Rhode Island, United States, 2. Oregon Health and Science University, Portland, Oregon, United States, 3. Brown University, Providence, Rhode Island, United States, 4. Brown University, Brown University/Providence, Rhode Island, United States

Our objective was to examine the likelihood of dying in RC/AL among a national cohort of fee-for-service Medicare beneficiaries who died in 2018 (N=31,414) as a factor regulations allowing hospice care. We estimated multivariable logistic regression models to examine the association between RC/AL as place of death and supportive hospice regulations, controlling for demographic characteristics, dual Medicare/Medicaid eligibility, years in AL, and hospital referral region (HRR) to control for hospice practice patterns. A majority of beneficiaries in our cohort died in RC/AL; more than half while receiving hospice services. In unadjusted models, the odds of remaining in RC/AL communities until death were significantly higher in the presence of regulations supportive of hospice care. This relationship was no longer significant once adjusting for covariates and an HRR fixed effect, suggesting important variation in end-of-life experiences for AL residents not explained by hospice regulations.

INTER- AND INTRASTATE VARIATION OF MENTAL HEALTH REQUIREMENTS FOR ASSISTED LIVING IN SEVEN STATES

Sarah Dys, *Portland State University/Vital Research, Oregon, United States*

Little is known about states' approaches to regulating mental health (MH) services in assisted living (AL) settings. Yet, one in nine AL residents are diagnosed with serious mental illness (Hua et al, 2020). This study describes the MH regulatory requirements in AL regulations within Arkansas, Louisiana, New Jersey, New York, Oklahoma, Pennsylvania, and Texas. Using health services regulatory analysis (Smith et al, 2021), we reviewed 2018 regulations for the 45 identified AL licenses within these states sourced from Nexis Uni.

We summarize 16 MH requirements related to admission, care transitions, resident assessment, third-party services access, and staff training. Each state explicitly addressed at least one of the identified MH requirements, though few states have consistency across all AL types within a state. The most commonly addressed requirements related to admission limitations, assessment, and transfer to psychiatric units. Understanding these requirements promotes a holistic approach to practices that meet residents' needs.

Session 4380 (Paper)

Dyadic Research (BSS Paper)

FUTURE ELDERCARE PLANNING AMONG CHINESE AGING FAMILIES IN HONG KONG

Xue Bai,¹ Joanne Luk,² Ranran He,² and Yanyee Kwong,² 1. *The Hong Kong Polytechnic University, Hong Kong, Hong Kong*, 2. *The Hong Kong Polytechnic University, Hong Kong, Hong Kong*

Increasing attention has been paid to the potential role of care planning in buffering future eldercare challenges. However, little is known about the characteristics of care planning among Chinese ageing families. It is also of interest to reflect how recent events such as COVID-19 pandemic may affect their views of the future care planning. From a family systems perspective, this study explored the extent, processes, and contents of intergenerational care planning of Chinese ageing families in Hong Kong. Dyadic interviews were conducted with 60 adult child-older parent pairs, and individual interviews were conducted with another 33 adult children. Intergenerational discrepancies in extent and processes of care planning, intergenerational congruence of care expectations and struggles, facilitating role of family capital and hindering role of cultural capital in care planning were primary themes. Although both generations demonstrated strong awareness of future eldercare needs, they were found engaged in different levels and processes of care planning. Adult children's level of engagement in planning activities may influence parents' extent and contents of care planning. Intergenerational transmission of eldercare values contributed to intergenerational congruence of care expectations but also led to similar struggles and ambivalent attitudes toward future care. Moreover, family capital was found to facilitate family care planning while Chinese cultural values that emphasize family care may hinder both generations' efforts in care planning. The findings will deepen our understanding on characteristics of intergenerational care planning in Asian Chinese communities and inform services to improve adult children and ageing parents' preparation for future eldercare.

MEASURING DYADIC INTERACTIONS AND DINING ENVIRONMENT IN DEMENTIA MEALTIME CARE: A SYSTEMATIC REVIEW OF INSTRUMENTS

WEN LIU,¹ and Sohyun Kim,² 1. *The University of Iowa College of Nursing, Iowa City, Iowa, United States*, 2. *University of Iowa, Iowa City, Iowa, United States*

It is critical to use validated instruments to assess mealtime dyadic interactions and dining environment for people with dementia to evaluate the process and efficacy of

mealtime interventions. However, the quantity and psychometric quality of such instruments are unknown. This systematic review aimed to synthesize the quantity and quality of instruments that assess dyadic interactions, physical environment, and/or social environment during dementia mealtime care. We searched Pubmed, CINAHL, AgeLine, PsychINFO, and Cochrane Library for records published between 1980-2020. Records were eligible if they included any instrument assessing concepts of interest (i.e., mealtime dyadic interactions, physical and/or social dining environment). From eligible records, eligible instruments originally developed or later modified to measure concepts of interest were identified, and instruments' characteristics were extracted: 1) development process, 2) concept/construct assessed, 3) sample/setting, 4) administration method, 5) item description, 6) scoring format/interpretation, 7) reliability, and 8) validity. A newly developed tool was used to evaluate instruments' psychometric quality. In total, 26 eligible instruments were identified. Seventeen instruments assessed dyadic interactions, 1 assessed only physical environment, and 8 assessed physical & social environment. All instruments were observational tools and scored as having low psychometric quality. Reasons for low psychometric quality included use of small sample size compared to the number of items, limited psychometric testing, and inadequate estimates. A number of instruments were developed and/or used to assess dyadic interactions, physical and/or social environment in dementia mealtime care. All instruments warrant further testing to accumulate psychometric evidence in larger diverse samples in different care settings.

PATTERNS OF INTERGENERATIONAL CARE PLANNING AMONG CHINESE AGING FAMILIES IN HONG KONG

Xue Bai,¹ Chang Liu,² and Tongling Xu,² 1. *The Hong Kong Polytechnic University, Hong Kong, Hong Kong*, 2. *The Hong Kong Polytechnic University, Hong Kong, Hong Kong*

Care planning before the onset of intensive care needs can increase families' ability to manage caregiving crises and cope with care transitions. However, future care planning has not been substantially examined in a family context. Drawing on the model of Preparation for Future Care Needs and a family systems perspective, this study investigated patterns of intergenerational care planning across multiple planning domains (awareness, avoidance, information gathering, decision making, and concrete planning) among Chinese intergenerational pairs. Quantitative data of 213 pairs of aging parents and adult children were collected in Hong Kong. Latent Profile Analysis was conducted to examine typological structure underlying care planning patterns. Three patterns were discovered: filial-maximal, dyadic-moderate, and filial-minimal. Profile 1 contained approximately 9.9% of pairs, which demonstrated a relatively higher level of avoidance on considering the need of care preparation and engaged less in concrete planning activities. Profile 2 contained 68.5% of intergenerational pairs that had a moderate preparation level. Profile 3 contained 21.6% of intergenerational pairs that were comparatively active in care planning. The findings also indicated that although older adults across three groups demonstrated a similar level of awareness to prepare for future care, their engagement in the

concrete planning activities may be driven by their children's awareness and preparation toward future care. The findings will enhance care professionals' and service providers' awareness of diverse care planning patterns among Asian aging families, and inform targeted policies and programmes to alleviate unpreparedness for eldercare through intergenerational care planning which can be more effective than unilateral preparation.

SPILOVER EFFECTS OF RETIREMENT ON PHYSICAL AND MENTAL HEALTH OF A SPOUSE OR PARTNER: DO GENDER AND SEXUALITY MATTER?

Jingwen Liu, *University of Maryland, college park, college park, Maryland, United States*

While the health implication of retirement on retirees has been widely discussed in social sciences, less is known about its spillover effects on one's spouse or partner. Indeed, large quantities of studies have shown that retirement is a joint decision of couples that may influence the time use of spouses and the incidence of divorce, and so leaving the cross-spouse effects unexplored may underestimate the influence of retirement and social security policies. Using ten waves of Health and Retirement Survey (HRS 1996-2014, N = 85039 observations), this research adopts fixed effects models and instrumental variable methods to examine the causal effects of a retiree's retirement on the physical and mental health outcomes of his/her spouse or partner, with particular attention paid to the gender and sexuality differentials. Regression results suggest that transitioning into retirement is associated with enhanced self-reported health and cognitive function and decreased depressive symptoms, physical limitation, and BMI among the retirees' spouses or partners. However, the timing when retirement occurs also matters that retirement at the culturally expected retirement age leads to beneficial spillover effects, while late retirement brings about detrimental effects. Further comparison analysis indicates that retirement's spillover effects are more prominent among females and heterosexual couples than among their male and gay and lesbian counterparts. These findings inform policymakers of the cross-couple spillover effects of postponing retirement ages and the increasing physical and psychological disparities of females and gay and lesbian couples within families in middle and later life.

WE SHOULD HAVE TALKED ABOUT HOSPICE: TRANSFORMING COMMUNICATION WITH BEREAVED LGB AGING WOMEN

Korijna Valenti,¹ and Leah Janssen,² *1. University of Colorado--Denver, Denver, Colorado, United States, 2. Scripps Gerontology Center, Oxford, Ohio, United States*

Because of historical discrimination, discomfort disclosing information, and differing definitions of family, lesbian, gay, bisexual, and transgender (LGBT) older adults with serious illness need both improved palliative and end-of-life (EOL) care communication with clinicians and recognized inclusion of spouses/partners. Communicating about palliative and EOL care may improve the care goals and emotional trajectory for patients and significant others. Using a descriptive qualitative approach, this study's aim was to analyze the communication experiences during a spouse's/partner's EOL care for bereaved LGB women (n=16) 60 and older. Drawing on queer gerontology, issues relating to access to

resources and information and the systemic silencing of older LGB women illuminate areas where policy and practice may be improved. Semi-structured, one-on-one interviews were used to provide deep and meaningful information about palliative and EOL care communication between participants, their spouse or partner, and clinicians. While results reflect certain outcomes found in prior studies with non-LGBT adults, thematic analysis revealed three main findings with evidence specific to this population: 1) avoiding deep discussions about EOL; 2) lack of understanding about palliative or EOL care; and 3) limited communication with clinicians. Findings illuminate the need for better understanding among clinicians regarding palliative and EOL communication with LGBT dyads as well as communication strategies based on recognition and acceptance. Further dyadic communication research may improve care goals for LGBT older adults. Understanding couples' interactions and examining different communication behaviors may lead to improved palliative and EOL care goals for older LGBT adults with serious illness and their spouses/partners.

Session 4385 (Symposium)

ENVIRONMENT STILL MATTERS: EXAMINING PERSON-PLACE-RELATIONSHIPS IN THE OLD AND THE NEW NORMAL ACROSS SETTINGS

Chair: Frank Oswald

Co-Chair: Habib Chaudhury

Discussant: Amanda Grenier

In environmental gerontology, the home and the neighborhood have always been of particular interest for empirical research. Issues such as orientation and safety, place attachment and biographical bonding, have proven to be important for community dwellings older adults and for those living in care homes. However, with Covid-19, the seemingly stable person-place-relationships have been challenged. This symposium provides a set of applied research contributions that demonstrate the persistent salience of the environment by examining person-place-relationships in the old and the new normal in private homes and care homes. Contributions draw from ideas of "precarious ageing" (Grenier & Phillipson) and "pandemic precarity", for instance to understand housing insecurity, while concepts from environmental gerontology are used to explain processes of environmental agency and belonging. The first contribution by Mahmood and colleagues introduces an environmental audit tool for people at risk of homelessness to assess built environmental features of housing and neighborhood that support housing stability in the face of insecurity. Second, Wanka provides data from people framed as 'risk-groups' through the Covid-19 pandemic and how they dealt with contact restrictions, showing the role of intergenerational neighborhood relations to mediate risks of pandemic precariousness. Third, Elkes examined mobility and wayfinding challenges for residents in a long-term care home and subsequent environmental interventions to improve orientation. Forth, Leontowitsch and colleagues present findings from long-term care home residents during the pandemic to gain understanding of their experiences of social isolation and a biographical sense of resilience. Finally, Amanda Grenier will serve as the session's discussant.

ENVIRONMENTAL ASSESSMENT OF HOUSING FOR OLDER ADULTS FACING HOUSING INSECURITY

Shreemouna Gurung,¹ Shelby Elkes,¹ Atiya Mahmood,¹ Muhammad Qureshi,¹ Habib Chaudhury,¹ Sarah Canham,² and Rachel Weldrick,¹ 1. *Simon Fraser University, Vancouver, British Columbia, Canada*, 2. *University of Utah, Salt Lake City, Utah, United States*

The Aging in the Right Place Environmental Audit (AIRP-ENV) and Secondary Observation (AIRP-ENV-SO) tools were developed to conduct observation-based audit of the built environment in shelters, transitional housing, independent housing with offsite/onsite supports, and permanent supportive housing with onsite medical and/or specialized services for older adults experiencing (or at risk of) homelessness. The 241 item AIRP-ENV tool is used to audit the presence/absence of exterior and interior built environmental features that support housing stability. The seven open-ended questions in the AIRP-ENV-SO tool is used to collect contextual data on function, safety and land-use of surrounding neighborhood. Data were collected at four sites of a transitional housing program in Vancouver, Canada as part of a multi-year, multi-city partnership project on aging and homelessness. Preliminary results demonstrate that built environment and urban design features (e.g., access, privacy, flexible and supportive spaces) contribute towards tenants' residential resiliency and aging in place.

THE ROLE OF INTERGENERATIONAL NEIGHBORHOOD RELATIONS FOR PRECARIOUS AGING DURING THE COVID-19 PANDEMIC IN GERMANY

Anna Wanka, *Goethe University Frankfurt, Frankfurt, Hessen, Germany*

Throughout the Covid-19 pandemic, the immediate living environment has significantly gained importance - particularly for people framed as 'risk-groups', such as older adults. Effects of contact restrictions to contain the spread of the virus have affected inequalities, uncertainties and loneliness in later life differently depending on the intergenerational relations, informal infrastructures of provisioning and networks of solidarity given in a certain neighborhood. The paper presents findings from a recent mixed-methods study in Frankfurt, Germany, combining a quantitative survey (n=1.000) with a longitudinal qualitative study (n=60). Results show how intergenerational neighborhood relations can play a crucial role in mediating risks of pandemic precariousness in later life, but also how older adults themselves significantly contributing to neighborhood networks of provisioning. Strengthening such very local relations is key to protecting all age groups from the effects of crises beyond the pandemic, and, in conclusion, ways to do so are being discussed.

RESIDENTS' WAYFINDING CHALLENGES AND ENVIRONMENTAL INTERVENTIONS IN A CARE HOME

Shelby Elkes, and Habib Chaudhury, *Simon Fraser University, Vancouver, British Columbia, Canada*

This study evaluated the role of the built environment on residents' wayfinding behaviours at Louis Brier Home in Vancouver, British Columbia, Canada. The goal of this study was to explore baseline mobility challenges for the residents

traveling between their bedrooms and social spaces. In response to this, low-cost environmental interventions were proposed and implemented to support safe and independent wayfinding for the residents. The project consisted of three phases. First phase involved a mixed methods approach using behavior mapping and spatial observations of the residents interacting with their physical environment, combined with one focus group with the staff members. In the second phase, researchers presented actionable environmental interventions for the care home administration to consider and implement. The final phase involved post-implementation behaviour mapping, spatial observations and a focus group session. The implemented environmental interventions influenced in improved resident wayfinding and orientation in the long-term care home.

DOING TIME: EXPERIENCES OF CARE HOME RESIDENTS IN GERMANY DURING THE EARLY PHASE OF THE COVID-19 PANDEMIC

Miranda Leontowitsch,¹ Frank Oswald,² Arthur Schall,³ and Johannes Pantel,³ 1. *Goethe University Frankfurt, Frankfurt / Main, Hessen, Germany*, 2. *Goethe University Frankfurt, Frankfurt am Main, Hessen, Germany*, 3. *Goethe University Frankfurt, Frankfurt, Hessen, Germany*

Residents of care homes across the globe are affected by the spread of SARS-CoV-2 as they have been identified as a high-risk group and because they experienced strict social isolation regulations during the first wave of the pandemic. Social isolation of frail older people is strongly associated with negative health outcomes. The aim of this research project was to investigate how residents in care homes experienced social isolation during the first phases of contact ban in Germany. This paper draws on structured interview data collected from 22 residents in two care homes during early June 2020 in Frankfurt/Main. The findings show that their experiences were shaped by three factors: care home staffs' approach to handling the contact ban; biographical sense of resilience; and a hierarchy of life issues. The findings highlight the importance of locally specific response mechanisms in care homes, and the need to contextualize residents' experiences.

Session 4390 (Paper)

ESPO and Biological Sciences Section Symposium: Bedside to Bench: Clinically Relevant Models of Aging

CHARACTERIZATION OF A MOUSE MODEL OF INDUCIBLE FRAILITY: THE HUMANIZED IL-6 MOUSE

Lolita Nidadavolu,¹ Peter M. Abadir,² Jeremy Walston,² Anne Le,¹ Gayane Yenokyan,³ Liliana Florea,¹ Corina Antonescu,¹ and D. Brian Foster,¹ 1. *Johns Hopkins University, Baltimore, Maryland, United States*, 2. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*, 3. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

The cytokine interleukin-6 (IL-6) has pleiotropic effects in aging and is elevated in frail older adults. We have developed a conditional mouse model to better characterize the

role of IL-6 in promoting frailty and age-related mitochondrial dysregulation. The human IL-6 (hIL-6) knock-in mouse (TetO-hIL6) was developed utilizing CRISPR/Cas9 technology with transgene donor vector containing a tetracycline response element promoter driving expression of hIL-6 cDNA. Male TetO-hIL6 mice were treated with doxycycline-containing water for six weeks starting at 8 months old. RNAseq analysis of whole blood demonstrated significant upregulation of pro-inflammatory related markers at 6 weeks compared to baseline and upregulated cell proliferation and metabolism pathways. Physical testing of TetO-hIL6 mice before and after hIL-6 induction demonstrated decreased grip strength ($p = 0.003$), decreased running capacity ($p = 0.02$), and 40% increase in falls off of the treadmill ($p = 0.001$). Induced mice also demonstrated decreased basal body temperature ($p < 0.001$). Given the significant dysregulation of metabolism-related genes in RNAseq analysis and changes in basal body temperature following hIL-6 induction, we next performed untargeted metabolomics on plasma from mice at baseline and 6 weeks post-induction to better evaluate metabolic changes associated with hIL-6 elevation. We found changes in key serum metabolites, including circulating adenosine triphosphate (56% reduction, $p = 0.02$), pyruvate (35% reduction, $p = 0.0006$), alpha-ketoglutarate (47% reduction, $p = 0.04$), and succinate (306% increase, $p = 0.001$). The TetO-hIL6 mouse model allows for induction of hIL-6 at various timepoints across the lifespan and demonstrates features of a frailty phenotype.

EFFECTS OF AGE AND SOCIAL ADVERSITY ON IMMUNE CELL POPULATIONS IN A NON-HUMAN PRIMATE MODEL OF HUMAN AGING

Mitchell Sanchez-Rosado,¹ Noah Snyder-Mackler,² James Higham,³ Lauren Brent,⁴ Nicole Marzan-Rivera,⁵ Melissa Pavez-Fox,⁴ Marina Watowich,⁶ and Carlos A. Sariol,¹ 1. *University of Puerto Rico Medical Sciences Campus, San Juan, Puerto Rico, United States*, 2. *Arizona State University, Tempe, Arizona, United States*, 3. *NYU, New York University, New York, United States*, 4. *University of Exeter, Exeter, England, United Kingdom*, 5. *UPR-Medical Sciences Campus, UPR-Medical Sciences Campus, Puerto Rico, United States*, 6. *University of Washington, Tempe, Arizona, United States*

Significant hallmarks of aging are immune function decline and rising cumulative inflammation. These immunosenescent signatures are also found in individuals who experience chronic social adversity, independently of age. However, no studies to date have examined how social adversity alters immune function across the lifespan – data that are essential to identify the molecular routes through which social adversity might lead to increased aging-related disease. Over a two-year period, we investigated how age and social adversity (quantified by low social status) affected immunity. We measured immune cell proportions at baseline and their gene regulation after *in vitro* stimulation with pathogen molecules that stimulated both Th1 and Th2 immune responses in a population of free-ranging rhesus macaques. We first performed flow cytometry on peripheral whole blood to quantify changes on immune cell proportions across the lifespan ($n=235$) and in animals of different social statuses ($n=141$).

We found significant decreases in CD20+ B cells and CD3+/CD4+ T cell proportions with age, suggesting diminished antibody production and adaptive immune responses in older individuals. Age-associated increases in CD3+/CD8+, CD3+/CD4+/CD25+ T regulatory cells and CD14-/CD16+/HLA-DR+ non-classical monocytes indicated heightened baseline inflammation in older animals. Social adversity recapitulated the effects of aging in CD14+/CD16-/HLA-DR+ classical monocytes, indicating immune deficits in phagocytosis and pathogen clearance in older and lower status individuals. Using RNA-seq, our stimulations ($n=1,320$) will allow us to identify molecular immune pathways that are disrupted by age and social adversity, similarities in response between age and adversity, and how the effect of adversity varies across the lifespan.

LOSS OF AWARENESS OR URINARY DYSFUNCTION? INVESTIGATING AMYLOIDOSIS AND URINARY PHYSIOLOGY IN A TRANSGENIC MOUSE

Cara Hardy,¹ Ramalakshmi Ramasamy,¹ Dawn Rosenberg,¹ Philip Scarpa,¹ Xiangyou Hu,¹ George Kuchel,² and Phillip Smith,¹ 1. *UConn Health, Farmington, Connecticut, United States*, 2. *University of Connecticut Health, Farmington, Connecticut, United States*

Alzheimer's disease (AD) is a devastating disorder primarily affecting older adults and is the most common neurodegenerative disease in the US. More than one in three AD patients experience AD-associated urinary dysfunction (ADUD), which directly contributes to their institutionalization. While ADUD has been clinically regarded as a result of poor cognitive control over urinary function, the physiology underlying loss of urinary control remains unknown. We hypothesize that amyloidosis in the CNS results in pathologic changes in urinary structure and function. Tg-APP/PS1DE9 mice were used before plaque deposition (4-6 months) and after plaque accumulation (8-10 months) and compared to WT littermates. Behavioral assays (open field testing and voiding spot assays) were performed to assess cortical function. Pressure-flow cystometry was conducted under urethane anesthesia to assess autonomic control of urinary function without cortical influence. Pharmacomyography of bladder strips was used to determine tissue-level changes in the absence of CNS input. In Tg-APP/PS1DE9 mice, plaque accumulation resulted in significant cystometric changes to voiding phase parameters, but not storage phase parameters. Pharmacologic studies showed decreased sensitivity to adrenergic stimulation without change in muscarinic sensitivity. Behavioral assays demonstrated significant differences between transgenic animals and WT in locomotion and voiding spot sizes. We interpret our data to support AD-related pathology of A β accumulation results in a distinct urinary phenotype in our model, analogous to the ADUD observed in AD patients. Establishing and verifying models of ADUD may improve the efficacy of treating ADUD and increase quality of life for patients and their caregivers.

METABOLIC ADAPTATIONS TO AEROBIC EXERCISE IN AGED MICE

Tyler Marx, Anastasiia Vasileva, Stephen Hutchison, and Jennifer Stern, *University of Arizona, Tucson, Arizona, United States*

Aerobic exercise training is a potent intervention for the treatment and prevention of age-related disease, such as heart disease, obesity, and Type 2 Diabetes. Insulin resistance, a hallmark of Type 2 Diabetes, is reversed in response to aerobic exercise training. However, the effect of aerobic exercise training on glucagon sensitivity is unclear. Glucagon signaling at the liver promotes fatty acid oxidation, inhibits De novo lipogenesis, and activates AMP Kinase, a key mediator of healthy aging. Like humans, aging in mice age leads to a decline in physical and metabolic function. To understand the role of glucagon signaling in exercise-induced improvements in physical and metabolic function in the mouse, we implemented a 16-week aerobic exercise training protocol in young and aged mice. 16 weeks of exercise training initiated at 6 months of age increased markers of physical function ($P < 0.01$) and attenuated age-related weight gain ($P < 0.05$) and fat mass ($P < 0.0001$). Additionally, exercise training improved glucose clearance ($P < 0.01$), enhanced glucose-stimulated insulin secretion ($P < 0.01$) and decreased hepatic lipid accumulation ($P < 0.05$). Importantly, exercise training decreased hypoglycemia stimulated glucagon secretion ($P < 0.01$), with no effect on hepatic glucagon receptor mRNA expression or serum glucagon. Thus, we propose that aerobic exercise training enhances glucagon sensitivity at the liver, implicating glucagon as a potential mediator of exercise-induced improvements in aging. Studies initiating the same aerobic exercise training intervention at 18 months of age in the mouse are currently underway to establish the role of glucagon receptor signaling in exercise-induced improvements in aging.

Frailty Measurement

CONSTRUCTION AND VALIDATION OF A FRAILTY INDEX IN PRIMARY CARE IN ITALY: THE HEALTH-SEARCH FRAILTY INDEX

Davide Vetrano,¹ Alberto Zucchelli,² Graziano Onder,³ Roberto Bernabei,⁴ Laura Fratiglioni,⁵ Alessandra Marengoni,⁶ and Francesco Lapi,⁷ 1. *Karolinska Institutet, Solna, Stockholms Lan, Sweden*, 2. *Università degli Studi di Brescia, Karolinska Institutet, Stockholms Lan, Sweden*, 3. *Italian National Institute of Health, Rome, Lazio, Italy*, 4. *Catholic University of Rome, Rome, Lazio, Italy*, 5. *Karolinska Institutet 17175, Stockholms Lan, Sweden*, 6. *University of Brescia, Brescia, Lombardia, Italy*, 7. *Health Search, Florence, Toscana, Italy*

Recognizing frailty in primary care is important to implement personalized care pathways and for prognostication. The aim of this study was to build and validate a frailty index based on routinely collected primary care data in Italy. We used clinical data from 308,280 Italian primary care patients 60+ with at least 5 years of follow-up, part of the Health Search Database. A heuristic algorithm was used to select the deficits to be included in a highly performant frailty index. The fitness of the index was assessed through the c-statistics derived by survival models. Results were externally validated using the Swedish National Study on Aging and Care in Kungsholmen (SNAC-K). After testing 3.4 million of deficits

combinations, 25 deficits were selected to be included in the Health Search Frailty Index (HS-FI). After adjusting by sex, age and geographical area, the HS-FI was associated with 5-year mortality (HR per 0.1 increase 1.99; 95%CI 1.95-2.02) and hospitalization rate (HR per 0.1 increase 1.25; 95%CI 1.23-1.27). In the external validation cohort, HS-FI independently predicted mortality, hospitalization, incident disability, incident dementia, and incident falls. This is the first frailty index built following a data-driven approach, using national representative primary care data. The implementation of such tool – derived by routinely collected data – in primary care software will ease the prompt, comparable and reliable recognition of frailty at the population level.

METABOLOMICS-BASED BIOMARKERS FOR FRAILTY IN CHINESE OLDER ADULTS

Yiming Pan,¹ Pan Liu,² Yun Li,² and Lina Ma,² 1. *Capital Medical University Xuanwu Hospital, Beijing, Beijing, China (People's Republic)*, 2. *Xuanwu Hospital, Capital Medical University, National Research Center for Geriatric Medicine, Beijing, Beijing, China (People's Republic)*

Background: Frailty is a clinical state characterized by decline in physiological function, and increased vulnerability to adverse outcomes. The biological mechanisms underlying frailty have been extensively studied in recent years. Advances in the multi-omics platforms have provided new information on the molecular mechanisms of frailty. Thus, identifying omics-based biomarkers is helpful for both exploring the physiological mechanisms of frailty and evaluating the risk of frailty development and progression. Objective: To identify metabolomics biomarkers and possible pathogenic mechanisms for frailty with untargeted-metabolomics profiling. Methods: LC-MS-based untargeted metabolomics analysis was performed on serum samples of 25 frail older inpatients and 49 non-frail older controls. The metabolomics profiling was compared between the two groups. Results: We identified 349 metabolites belonging to 46 classes, in which 2 were increased and 3 were decreased in frail older adults. Citrate cycle (with up-regulated cis-Aconitic acid, Fumaric acid, L-Malic acid, and Isocitric acid), fatty acid metabolism (with up-regulated Palmitic acid and L-Palmitoylcarnitine) and tryptophan metabolism (with up-regulated 5-Hydroxy-L-tryptophan, L-Kynurenine, Kynurenic acid, and 5-Hydroxyindoleacetic acid) were significantly associated with frailty phenotype. Conclusions: Our results revealed characteristics of metabolites of frailty in Chinese older adults. The citrate cycle related metabolites (Isocitrate, (s)-Malate, Fumarate and cis-Aconitate), saturated fat (Palmitic acid), unsaturated fatty acid (Arachidonate and Linoleic acid), and some essential amino acid (Tryptophan) might be candidate biomarkers for early diagnosis of frailty. Disorders of energy metabolism, lipotoxicity of saturated fatty acids, disturbances of unsaturated fatty acid metabolism, and increased degradation of tryptophan were potential mechanisms and therapeutic targets of frailty.

THE ASSOCIATION BETWEEN METABOLIC SYNDROME AND FRAILTY IN HEALTHY COMMUNITY-DWELLING OLDER ADULTS

A R M Saifuddin Ekram,¹ Sara Espinoza,² Michael Ernst,³ Lawrence Beilin,⁴ Nigel P. Stocks,⁵ Joanne Ryan,⁶ and

Robyn Woods,⁶ 1. Monash University, Monash University, Melbourne, Victoria, Australia, 2. University of Texas Health Science Center San Antonio, San Antonio, Texas, United States, 3. University of Iowa, Iowa City, Iowa, United States, 4. The University of Western Australia (M570), Perth, Western Australia, Australia, 5. University of Adelaide, Adelaide, South Australia, Australia, 6. Monash University, Melbourne, Victoria, Australia

This study examined the association between metabolic syndrome (MetS) and frailty status in relatively healthy community-dwelling older adults. Participants included 19,114 individuals from the “ASpirin in Reducing Events in the Elderly” (ASPREE) trial. The diagnostic criteria for MetS were according to the International Diabetes Federation Task Force on Epidemiology and Prevention and the American Heart Association/National Heart, Lung, and Blood Institute (2009); and comprised any three of five parameters: waist circumference, triglycerides, fasting blood glucose, high-density lipoprotein cholesterol or hypertension. Frailty and prefrailty were defined using a modified Fried phenotype (FP) comprising exhaustion, body mass index, grip strength, gait speed and physical activity and a deficit accumulation frailty index (FI) of 66 items. The association between MetS and frailty was examined using multinomial logistic regression. At baseline, 51.1% of participants met the criteria of MetS; of those, 41.8% and 2.5 % were prefrail and frail, respectively, according to Fried phenotype, while 49.6% and 11.8 % were prefrail and frail, respectively, according to FI. MetS at baseline was associated with an increased likelihood of prefrailty (RRR: 1.25; 95% CI: 1.17, 1.33) and frailty (RRR: 1.60; 95% CI: 1.28, 2.01) compared to no frailty after adjustment for potential confounders according to Fried phenotype, while the association was stronger for prefrailty (RRR: 2.74; 95% CI: 2.55, 2.94) and frailty (RRR: 5.30; 95% CI: 4.60, 6.11) according to FI. Overall, at baseline, more than half of the participants had MetS, and the presence of MetS was significantly associated with pre-frailty and frailty.

TRANSPLANT CENTERS THAT MEASURE FRAILTY AS PART OF CLINICAL PRACTICE HAVE BETTER OUTCOMES

Xiaomeng Chen, Yi Liu, Nadia Chu, Jeremy Walston, Dorry Segev, and Mara McAdams-DeMarco, Johns Hopkins University School of Medicine, Baltimore, Maryland, United States

Frailty predicts adverse outcomes for kidney transplant (KT) patients; yet the impact of clinical assessments of frailty on center-level outcomes remains unclear. We sought to test whether KT centers that measure frailty as part of clinical practice have better pre- and post-KT outcomes. We conducted a survey of US transplant centers (11/2017-4/2018), 132 KT centers (response rate=65.3%) reported frequencies of frailty assessment at candidacy evaluation and KT admission. Center characteristics and clinical outcomes were gleaned from the national registry (2017-2019). Poisson regression was used to estimate incidence rate ratios (IRRs) of waitlist mortality rate and transplantation rate in candidates and graft loss rates in recipients by frequency of frailty assessment. All models were adjusted for case mix and center characteristics. Given similar center characteristics, centers assessing frailty at evaluation had a lower waitlist mortality

rate (always=3.5, sometimes=3.2, never=4.1 deaths per 100 person-years). After adjustment, centers assessing frailty at evaluation had a lower rates of waitlist mortality (always IRR=0.91, 95% CI:0.84-0.99; sometimes=0.89, 95% CI:0.83-0.96) and transplantation (always IRR=0.94, 95% CI:0.91-0.97; sometimes=0.88, 95% CI:0.85-0.90) than those never assessing frailty. Centers that always assessed frailty at KT admission had 0.71 (95% CI:0.54-0.92) times the rate of death-censored graft loss than their counterparts never assessing frailty. Assessing frailty at evaluation is associated with lower transplantation rate but better waitlist survival; centers always assessing frailty at admission are likely to have better graft survival. Research is needed to explore how routine assessment of frailty in other clinical practices benefits broader patient populations.

VALIDATION OF PERCEIVED MENTAL FATIGABILITY USING THE CHINESE VERSION OF THE PITTSBURGH FATIGABILITY SCALE

Yixin Hu,¹ Hangming Zhang,² Weihao Xu,¹ siyue wang,³ Woei-Nan Bair,⁴ Li Fan,¹ Yujia (Susanna) Qiao,⁵ and Nancy W. Glynn,⁶ 1. Chinese PLA General Hospital, Beijing, Beijing, China (People's Republic), 2. Peking university shougang hospital, Beijing, China (People's Republic), 3. Peking university School of Public Health, Beijing, China (People's Republic), 4. University of the Sciences in Philadelphia, Philadelphia, Pennsylvania, United States, 5. University of Pittsburgh, University of Pittsburgh, Pennsylvania, United States, 6. University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania, United States

Background: Recently we validated the simplified-Chinese version of the Pittsburgh Fatigability Scale (PFS) Physical subscale. Next step is to validate the PFS Mental subscale in order to introduce a reliable measure of perceived mental fatigability among Chinese community-dwelling older adults. Methods: This cross-sectional study was conducted in an urban community in Beijing. Internal consistency of the PFS Mental subscale was evaluated by Cronbach's alpha. The participants were divided in half to evaluate the factor structure validity by exploratory factor analyses and confirmatory factor analysis. Convergent validity and discriminant validity were evaluated against cognitive function (assessed by MOCA) and global fatigue from FRAIL Scale. Results: Our study included 370 participants (mean=83.8 years). The simplified-Chinese version of PFS Mental subscale showed strong internal consistency (total Cronbach's alpha=0.82, each items Cronbach's alpha ranged from 0.78 – 0.83). The results of exploratory factor analysis showed all 10 items loaded on two factors: moderate to high and low intensity activities, which explained 60.8% of the total variance. Confirmatory factor analysis showed fit indices: SRMSR = 0.090, RMSEA = 0.120, CFI = 0.89. PFS Mental scores demonstrated moderate concurrent and construct validity against cognitive function ($r = -0.24$, $P < .001$). Additionally, the PFS Mental subscale had strong convergent validity, discriminating according to established cognitive impairment or FRAIL Scale fatigue testing cut points, with differences in PFS Mental scores ranging from 3.2 to 8.4 points. Conclusions: The PFS Mental subscale

simplified-Chinese version is a valid tool to assess perceived mental fatigability in Chinese-speaking older adults.

Session 4405 (Paper)

Home Health Care

FAMILY CAREGIVER TRAINING DURING MEDICARE HOME HEALTH CARE: CLINICIAN PERSPECTIVES

Julia Burgdorf,¹ and Alicia Arbaje,² 1. *Center for Home Care Policy & Research, New York, New York, United States*, 2. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*

During Medicare home health care, providers often rely on family caregivers to help meet patients' care needs. Beginning in 2018, CMS requires home health agencies to provide training to family caregivers. This qualitative study is the first research to examine current patterns of family caregiver training, and related facilitators and barriers, during Medicare-funded home health care. We conducted semi-structured key informant interviews with home health nurses and physical therapists (n=19) from 4 diverse agencies, then performed thematic analysis of interview transcripts using a hybrid inductive and deductive coding approach. Clinicians described family caregiver education as a dynamic and cyclical process: simultaneously providing patient care, training family caregivers, and gathering additional information about patient needs and caregiver capabilities, then adjusting the care plan accordingly. We present a model of this cyclic process and describe its four major stages: Initial Assessment, Education, Reassessment, and Adjustment. Additionally, clinicians identified a range of structural, individual, and interpersonal factors which impact their ability to successfully train family caregivers. We define each factor and, using illustrative quotes from our interviews, elucidate its role as a facilitator and/or barrier to clinicians' educational efforts. Findings provide the first model of caregiver training during home health care and highlight policy and practice changes to better support clinicians in these efforts; including greater visit flexibility, access to more experienced clinical mentors, and standardized caregiver assessment tools designed for this unique care setting.

HOME HEALTH AGENCIES WITH MORE SOCIALLY VULNERABLE PATIENTS HAVE LOWER EXPERIENCE-OF-CARE RATINGS

Jinjiao Wang, Meiling Ying, and Yue Li, *University of Rochester, Rochester, New York, United States*

Little is known about the disparities in patient experience of home health (HH) care related to social vulnerability. This study examined the relationships of patient Medicare-Medicaid dual eligible status and race and ethnicity with patient experience of HH care. We analyzed national data from the Home Health Care Consumer Assessment of Healthcare Providers and Systems (HHCAHPS), Outcome and Assessment Information Set, Medicare claims and Area Health Resources File for 11,137 Medicare-certified HH agencies (HHA) that provided care for Medicare beneficiaries in 2017. Patient-reported experience of care star ratings (1-5)

in HHCAHPS included 3 domains (professional care delivery, effective communication, and specific issues in direct patient care) with each dichotomized into high (4-5) and low (1-3) experience of care. The proportion of patients with dual eligibility and the proportion of racial/ethnic minorities were summarized at the HHA level. HHA with higher proportion of dual eligible patients were less likely to have high experience of care rating in professional care delivery (smallest Odds Ratio [OR]=0.514; 95% CI: 0.397, 0.665; p<0.001), effective communication (smallest OR=0.442, 95% CI: 0.336, 0.583; p<0.001), and specific direct care issues (smallest OR=0.697, 95% CI: 0.540, 0.899; p=0.006). HHA with higher proportion of racial/ethnic minorities were also less likely to have high patient experience of care rating across all three domains (smallest OR=0.265, 95% CI: 0.189, 0.370; p<0.001). Disparities in patient experience of HH care exist and they are associated with low income and racial/ethnic minority status, indicating substantial unmet needs among these socially vulnerable patients.

PATIENT-RATED PERFORMANCE OF HOME HEALTH AGENCIES AND HOSPITALIZATION RISK: A PROPENSITY-SCORE MATCHED ANALYSIS

Chenjuan Ma,¹ Lisa Groom,² Shih-Yin Lin,³ Daniel David,² and Abraham Brody,⁴ 1. *NYU, NYU Rory Meyers College of Nursing, New York, United States*, 2. *NYU, New York, New York, United States*, 3. *New York University, New York, New York, United States*, 4. *NYU Hartford Institute for Geriatric Nursing, New York, New York, United States*

Home health care is the most commonly used home- and community-based service to older adults "Aging in Place". Patient experience of healthcare services is a critical aspect of patient-centered care. Indeed, policymakers have linked patient-rated quality of care to payment to healthcare providers. This study aimed to examine the association between patient-rated care performance of home health agencies and risk for hospitalization among Medicare beneficiaries. This study used several national datasets from 2016 and included 491,718 individuals from 8,459 home health agencies. Home health agencies' performance was measured using patient experience star rating from the Home Health Consumer Assessment of Healthcare Providers and Systems (HHCAHPS). Propensity score matching was used to balance the differences in patient characteristics at baseline between those receiving care from high-performing home health agencies and those in lower-performing agencies. On average, patients were 80.5 years old, 65% female, 81% White, 10% Black, and 6% Hispanic, with 90% taking 5 or more medications. Patients had a mean score of 1.73 (SD=1.69) on the Charlson Index. Respectively, 10% and 16% of patients were hospitalized within 30 and 60 days of home health care initiation. Estimates of logistic regression after propensity score matching found that patients receiving care from lower-performing agencies were at similar risk for both 30-day (OR=0.99, p=0.817) and 60-day (OR=1.02, p=0.616) hospitalization following the start of home health care, compared to those in high-performing agencies. Our findings suggest discrepancies (or no relationship) between patient experience and objective outcomes of home health care.

Session 4410 (Symposium)

HOME-BASED CARE IN THE CONTEXT OF COVID-19: DISRUPTIONS, INNOVATIONS, AND LESSONS FOR THE FUTURE

Chair: Emily Franzosa

Discussant: Katherine Ornstein

During the initial surge of the COVID-19 pandemic, home-based primary and palliative care (HBPC) practices played a valuable role in maintaining access to health-related services and keeping older, medically complex patients out of hospitals and congregate settings that could heighten their risk for COVID-19. At the same time, these practices faced unique challenges in adapting a traditionally hands-on model of care to accommodate restrictions on in-person contact. In this symposium, we present innovative research highlighting the challenges faced by HBPC practices and patients during spring 2020, as well as their rapid innovations and adaptations. First, Ritchie et al. provide national context with findings from a survey of U.S. home-based primary care practices that highlights the field's most pressing challenges and successful strategies. Shifting to the initial epicenter of the pandemic in New York City, Reckrey et al. present a qualitative study of the perspectives of paid and unpaid caregivers of dementia patients served by an HBPC practice, while Franzosa et al. describe care disruptions among individuals with dementia who died during the initial surge, using a novel chart-based abstraction technique. Finally, two studies (Gorbenko et al. and Kalicki et al.) explore HBPC practices' experience of rapidly transitioning to telehealth through qualitative interviews with NYC-based practices and a provider survey exploring telehealth adoption and readiness in the homebound population. Together, these studies yield important insights into the challenges of providing community-based care for at-risk populations during a pandemic, and practical strategies for home-based models of care moving forward.

DISRUPTIONS AND ADAPTATIONS IN END-OF-LIFE CARE DELIVERY FOR HOMEBOUND PATIENTS DURING COVID-19

Emily Franzosa,¹ Patricia Kim,² Meng Zhang,² Jennifer Reckrey,¹ Sara Lubetsky,³ Emily Xu,² and Katherine Ornstein,² 1. *Icahn School of Medicine at Mount Sinai, Icahn School of Medicine at Mount Sinai, New York, United States*, 2. *Icahn School of Medicine at Mount Sinai, New York, New York, United States*, 3. *Icahn School of Medicine at Mount Sinai, New York, New York, United States*

The initial COVID-19 pandemic surge in New York City caused widespread delays and disruption in end-of-life services. This study examined the impact of disruptions among homebound adults in an HBPC practice who died between March-June 2020. Through an in-depth mixed-methods chart review, we identified 113 patient deaths (mean age: 87, 73% female, 67% with dementia). Forty-nine (43%) of deaths occurred in April 2020. Through a content analysis of clinician notes, we identified key COVID-related themes, including a shift to intensive phone-based care and to a lesser degree, telehealth; delays in hospice referrals and admissions; and an increase in treatment for behavioral symptoms. Our analysis also demonstrated the central role of family and paid caregivers in coordinating care, and efforts by patients,

caregivers and providers to avoid hospital admissions. These findings demonstrate the importance of care coordination across medical, home and community partners to support end-of-life care in emergencies and beyond.

COVID CHALLENGES AND ADAPTATIONS AMONG HOME-BASED MEDICAL PRACTICES: LESSONS FOR AN ONGOING PANDEMIC

Christine Ritchie,¹ Orla Sheehan,² Naomi Gallopyn,¹ Shanaz Sharieff,³ Abraham Brody,⁴ and Bruce Leff,⁵ 1. *Massachusetts General Hospital, Boston, Massachusetts, United States*, 2. *Johns Hopkins University School of Medicine, Johns Hopkins University, Maryland, United States*, 3. *Massachusetts General Hospital, Boston, Massachusetts, United States*, 4. *NYU Hartford Institute for Geriatric Nursing, New York, New York, United States*, 5. *The Center For Transformative Geriatric Research, Johns Hopkins School of Medicine, Baltimore, Maryland, United States*

Home-based primary care (HBPC) practices rapidly adapted to maintain care during the COVID-19 pandemic. This mixed-methods national online survey of HBPC practices probed responses to COVID-19 surges, COVID-19 testing, the use of telemedicine, practice challenges due to COVID-19, and adaptations to address these challenges. Seventy-nine practices across 29 states were included in the analyses. Eighty-five percent of practices continued to provide in-person care and nearly half cared for COVID-19 patients. Most practices also pivoted to concurrent use of video visits. The top five practice challenges were: patient familiarity with telemedicine, patient and clinician anxiety, technical difficulties reaching patients, and supply shortages. Practices also described creative strategies to physically support the needs of patients. These findings illustrate the need to balance in-person and virtual care for this population, and attend to the emotional needs of patients and staff.

WHO PROVIDES CARE IN A CRISIS? FAMILY CAREGIVERS' EXPERIENCES OF HOME CARE DURING THE COVID-19 PANDEMIC

Jennifer Reckrey,¹ Sasha Perez,² and Katherine Ornstein,³ 1. *Icahn School of Medicine at Mount Sinai, Icahn School of Medicine at Mount Sinai, New York, United States*, 2. *Icahn School of Medicine at Mount Sinai Hospital, Icahn School of Medicine at Mount Sinai, New York, United States*, 3. *Icahn School of Medicine at Mount Sinai, New York, New York, United States*

Many homebound individuals with dementia rely on both paid caregivers (e.g., home health aides, home attendants, other homecare workers) and family caregivers to live safely at home. We conducted semi-structured interviews with 15 family caregivers of individuals with severe dementia receiving home-based primary care in NYC to explore how caregiving changed during the COVID pandemic. Most individuals with long-standing paid caregivers experienced infrequent home care disruptions. In fact, paid caregivers were often the primary and sometimes only individuals to provide direct care; family caregivers themselves often stayed away and managed care from a distance. While most family caregivers described heightened attention to infection control, guidance about COVID prevention and safety rarely

came from home-based primary care providers or home care agencies and instead was considered “common sense.” These findings confirm the essential role paid caregivers play in home-based dementia care teams.

PROVIDER PERCEPTIONS OF VIDEO TELEHEALTH IN HOME-BASED PRIMARY CARE DURING COVID-19

Ksenia Gorbenko,¹ Emily Franzosa,² Abraham Brody,³ Bruce Leff,⁴ Christine Ritchie,⁵ Bruce Kinoshian,⁶ Alex Federman,¹ and Katherine Ornstein,¹ 1. *Icahn School of Medicine at Mount Sinai, New York, New York, United States*, 2. *Icahn School of Medicine at Mount Sinai, Icahn School of Medicine at Mount Sinai, New York, United States*, 3. *NYU Hartford Institute for Geriatric Nursing, New York, New York, United States*, 4. *The Center For Transformative Geriatric Research, Johns Hopkins School of Medicine, Baltimore, Maryland, United States*, 5. *Massachusetts General Hospital, Boston, Massachusetts, United States*, 6. *University of Pennsylvania Perelman School of Medicine, Philadelphia, Pennsylvania, United States*

The COVID-19 pandemic accelerated the adoption of virtual care. In this qualitative study, we sought to determine provider perceptions of video telehealth during the first wave of COVID-19 in NYC to inform practice for home-based primary care providers nationwide. We conducted semi-structured interviews with clinical directors, program managers, nurse practitioners, nurse managers, and social workers at 6 NYC practices (N=13) in spring 2020. We used combined open and focused coding to identify themes. Participants employed both hospital-supported and commercial technological platforms to maintain care during COVID-19. Benefits of video telehealth included improved efficiency, capacity and collaboration between providers. Barriers included patients’ physical, cognitive or technological abilities, dependence on caregivers and aides to facilitate video visits, challenges establishing trust with new patients and addressing sensitive topics over video, and concerns over missing important patient information. Considering patient, clinical, and technological conditions can help optimize telehealth implementation among older homebound adults.

PROVIDERS’ PERCEPTIONS OF TELEHEALTH BARRIERS AMONG HOMEBOUND ADULTS IN A HOME-BASED PRIMARY CARE PRACTICE

Kate Moody,¹ Alex Kalicki,¹ Peter Gliatto,¹ Emily Franzosa,² and Katherine Ornstein,¹ 1. *Icahn School of Medicine at Mount Sinai, New York, New York, United States*, 2. *Icahn School of Medicine at Mount Sinai, Icahn School of Medicine at Mount Sinai, New York, United States*

The COVID-19 pandemic resulted in a dramatic shift to video-based telehealth use in home-based primary care. We conducted an online 11-item survey exploring provider perceptions of patients’ experience with and barriers to telehealth in a large HBPC program in New York City. More than one-third (35%) of patients (mean age of 82.7; 46.6% with dementia; mean of 4 comorbidities/patient) engaged in first-time video-based telehealth encounters between April and June 2020. The majority (82%) required assistance from a family member and/or paid caregiver. Among patients who had not used telehealth, providers deemed 27% (n=153) “unable to interact over video” for reasons including

cognitive or sensory ability. Fourteen percent lacked caregivers. Physicians were not knowledgeable about patients’ internet connectivity, ability to pay for cellular plans, and video-capable device access. These findings highlight the need for novel approaches to facilitating telehealth and systematic data collection before targeted interventions to increase video-based telehealth use.

Session 4415 (Symposium)

IMPLEMENTATION SCIENCE TRANSLATION: PROGRAM SUSTAINMENT FOR MANAGING DISTRESS BEHAVIOR IN DEMENTIA

Chair: Kim Curyto

Discussant: Ann Kolanowski

Distress behaviors in dementia (DBD) are common in nursing home settings, are distressing, and result in poorer outcomes for residents and staff. We present on the implementation of STAR-VA, an interdisciplinary intervention for effective management of DBD in Veterans Health Administration (VA) nursing home settings, called Community Living Centers (CLCs). A primary focus of this symposium is the use of implementation science concepts to improve and sustain evidence-based programs through tailored implementation strategies and key partnerships. Key implementation science concepts from conceptual frameworks, including the Consolidated Framework for Implementation Research (CFIR) and the use of organizational Knowledge Reservoirs (KR) for sustaining new clinical practices, formed the basis of this work. Their application in health care practice will be discussed using STAR-VA as an exemplar. Interdisciplinary CLC staff feedback during STAR-VA implementation and sustainment is presented, including feedback regarding barriers to integrating new program interventions into usual care processes. Mapping key implementation strategies onto reported barriers informed development of implementation tools and strategies designed to guide adaptations tailored to the needs of the residents and frontline staff, increasing the chances of successful sustainment. Finally, we highlight the importance of key leadership partnerships in implementation of evidence-based programs to improve care of residents with DBD and present strategies for developing these partnerships. Discussion will include the importance of using implementation science to implement evidence-based interventions for effective management of DBD and strategies for sustainment of these effective practices into usual care.

TRANSLATING SCIENCE INTO PRACTICE AND MAKING IT STICK: SYSTEM-LEVEL APPROACHES

Laura Wray,¹ Kim Curyto,² and Jennifer Sullivan,³ 1. *VA Center for Integrated Healthcare, Buffalo, New York, United States*, 2. *VA Western New York Healthcare System, Batavia, New York, United States*, 3. *VA Providence Medical Center LTSS COIN and Brown University, Providence, Rhode Island, United States*

The delay between establishing evidence-based practice and implementing this evidence base is well documented. This presentation will focus on the application of implementation science principles to real-world clinical programs. A VA priority is to implement evidence-based practice for management of DBD in CLCs. Key implementation science

concepts will be introduced, along with a description of how these conceptual models facilitate application of roll-out and sustainment of complex evidence-based interventions. Conceptual frameworks that contributed to intervention selection and facilitation of STAR-VA implementation, including the Consolidated Framework for Implementation Research (CFIR) and Knowledge Reservoirs (KR) framework, and their application in health care practice, will be discussed. The CFIR Expert Recommendation for Implementing Change (ERIC) Mapping Tool will be introduced as useful to identify strategies that address barriers to sustaining implementation. Attendees will be provided with resources to support implementation and sustainment efforts.

BARRIERS TO SUSTAINED IMPLEMENTATION OF STAR-VA AND STRATEGIES TO OVERCOME THEM

Jennifer Sullivan,¹ Omonyeye Adjognon,² Jacquelyn Pendergast,³ Laura Wray,⁴ Michele Karel,⁵ and Kimberly Curyto,⁶ 1. *VA Providence Medical Center LTSS COIN and Brown University, Providence, Rhode Island, United States*, 2. *CHOIR, VA Boston Healthcare System, Boston, Massachusetts, United States*, 3. *CHOIR, VA Boston healthcare System, Boston, Massachusetts, United States*, 4. *VA Center for Integrated Healthcare, Buffalo, New York, United States*, 5. *Veterans Health Administration, Washington, District of Columbia, United States*, 6. *Center for Integrated Healthcare, VA Western NY Healthcare System, Batavia, New York, United States*

STAR-VA is an evidence-based, interdisciplinary program helping CLC teams effectively manage DBD. We conducted interviews with 42 key informants involved with STAR-VA implementation in 20 CLCs, guided by a sustainment framework, to understand facilitators and barriers to sustained implementation. We used directed content analysis to identify barriers and mapped them to the CFIR-ERIC Mapping Tool to identify associated implementation strategies. We identified six barriers: 1) staffing issues, 2) lack of written policies, 3) staff buy-in, 4) limited leadership support, 5) exclusion of STAR-VA criteria in performance evaluations, and 6) service line silos. We identified six strategies to overcome these barriers, three strategies most frequently mapped to reported barriers to STAR-VA sustainment: 1) assessing local CLC readiness, facilitators and addressable barriers; 2) identifying and preparing new champions; and 3) altering incentive/allowance structures. The identified strategies can be packaged to further integrate STAR-VA into usual CLC care processes to optimize program sustainability.

LISTENING TO CLINICAL TEAMS: DEVELOPING STRATEGIES TO SUPPORT SUSTAINED STAR-VA IMPLEMENTATION

Kim Curyto,¹ Kyle Page,² Karen Benson,³ Laura Wray,⁴ and Michele Karel,⁵ 1. *VA Western New York Healthcare System, Batavia, New York, United States*, 2. *Edward Hines Jr VA Hospital, Hines, Illinois, United States*, 3. *Home Based Primary Care - Kernersville, W.G. Bill Hefner VA Medical Center, Salisbury, North Carolina, United States*, 4. *VA Center for Integrated Healthcare, Buffalo, New York, United States*, 5. *Veterans Health Administration, Washington, District of Columbia, United States*

Feedback obtained from program evaluations and interviews with CLC team members who participated in

STAR-VA helped to inform the development of sustained implementation strategies guided by the CFIR-ERIC Mapping Tool. A CLC readiness assessment was developed to guide selection of new champions and assess for local team readiness to implement STAR-VA. Virtual training materials were developed along with a champion training checklist to prepare additional champions and support team training. We identified key implementation steps and optional strategies to support sustained implementation, developed a sustained implementation guide, associated sustained implementation checklist, and sustainability toolkit. We are piloting a regional community of practice model, encouraging development of and building on relationship networks to promote use of program tools, collaborative problem-solving, feedback, and a shared vision for implementation. We will discuss the importance of tailored strategies for integrating new practices into usual care.

SUPPORT FROM THE TOP: DIVERSE LEADERSHIP PARTNERS FOR SUSTAINED STAR-VA IMPLEMENTATION

Michele Karel,¹ A. Lynn Snow,² Christine Hartmann,³ Jenefer Jedele,⁴ and Lisa Minor,⁵ 1. *Veterans Health Administration, Washington, District of Columbia, United States*, 2. *Tuscaloosa VA Medical Center, Tuscaloosa, Alabama, United States*, 3. *VA Bedford Healthcare System, VA Bedford Healthcare System, Massachusetts, United States*, 4. *Veterans Health Administration, Ann Arbor, Michigan, United States*, 5. *Geriatrics and Extended Care, Washington, District of Columbia, United States*

The STAR-VA program was an initiative out of what is now called the VA Office of Mental Health and Suicide Prevention, partnering with the national Offices of Geriatrics and Extended Care and Nursing Services. Ongoing collaboration with these national, as well as regional and medical-center-level leaders, has been critical for informing program implementation and dissemination strategies. We will discuss several key partnered strategies, including (1) linking STAR-VA to national CLC systematic quality improvement efforts; (2) engaging national inter-office program leaders in decisions about outreach to and inclusion of facilities in STAR-VA training and implementation; (3) training local STAR-VA champions on strategies for engaging local leadership support; (4) briefing leaders across the system with program updates; and (5) using national VA data to inform STAR-VA sustained implementation. Discussion will address challenges and opportunities for engaging leadership stakeholders in facilitating sustained implementation of evidence-based programs.

Session 4420 (Paper)

Loneliness and Isolation

CHANGES IN MODES OF SOCIAL CONTACT AND THEIR LINKS WITH MENTAL HEALTH DURING THE COVID-19 PANDEMIC

Laura Finch,¹ and Louise Hawkey,² 1. *NORC at The University of Chicago, Chicago, Illinois, United States*, 2. *NORC at the University of Chicago, Chicago, Illinois, United States*

Amid the COVID-19 pandemic, social distancing has been emphasized for older adults because of their greater physical health risks. Using data from the National Social Life, Health and Aging Project (NSHAP), we examined how older adults may have changed their frequency of contact with others via various modes (i.e., in-person, phone calls, messages, and video calls) since the pandemic started, and how these choices may be impacting their mental health. From September 2020 through January 2021, NSHAP respondents (N=2,554 age 50-94 with data from 2015-16) completed a survey via web, phone, or paper-and-pencil. Although some older adults reported reducing their in-person contact with out-of-household family (38%) and friends (40%) since the pandemic started, some also increased contact with them via remote modes such as phone calls (25% and 16% with family and friends respectively); emails, texts, or social media messages (26 and 21%); and video calls (24 and 18%). Net of demographics, living alone, survey mode, and 2015-16 levels of the respective mental health variables, those who decreased in-person contact with family were less happy ($B=-0.12$, $SE=0.06$, $p=.035$), had higher loneliness scores ($B=0.23$, $SE=0.09$, $p=.011$), and more frequently felt depressed ($B=0.10$, $SE=0.05$, $p=.055$). In the presence of decreased in-person contact, increases in remote modes of contact had no net remediating impact—a pattern also found when analyzing contact with friends. Results indicate a persistent adverse effect of reduced in-person contact on mental health despite increased contact with family and friends via remote means.

LONGITUDINAL ANALYSES INDICATE BIDIRECTIONAL ASSOCIATIONS BETWEEN LONELINESS AND SELF-RATED HEALTH IN ADULTHOOD

Deborah Finkel,¹ Dianna Phillips,² and Chandra Reynolds,²
 1. *Indiana University Southeast, New Albany, Indiana, United States*, 2. *University of California Riverside, Riverside, California, United States*

Loneliness is a potent stressor that increases in prevalence with age in late life and has been linked with numerous adverse physical health outcomes and lower scores on measures of self-rated health (SRH). The association between loneliness and SRH is likely bidirectional—for example, experiencing loneliness may result in physiological changes that alter how individuals perceive their health, and worsening perceptions of one's own health or mobility may act in an increasingly restrictive manner with respect to social interaction. Despite this, limited longitudinal work has examined temporal dynamics between loneliness and SRH. Recently completed harmonization of 9 loneliness items across three longitudinal twin studies of aging in Sweden resulted in sample of 1939 participants aged 40 to 98 at intake (mean age = 74.64) with up to 25 years of follow-up (mean = 7.63) across up to 8 waves (mean = 3.29). Univariate analysis indicated that SRH decreased with age up to age 82 and then leveled off, whereas loneliness continued to increase across the age span. Bivariate dual change score models were used to examine lead-lag relationships across time: which variable contributes to subsequent changes in the other variable. Results indicated a bi-directional relationship: loneliness does not increase after age 82 when SRH is included in the

model, and SRH does not level off after age 70 when loneliness is included in the model. Thus, declining SRH may lead to reduced participation in social activities and also feelings of loneliness may intensify perceptions of poor health.

SOCIAL CONNECTEDNESS RISK AMONG MIDDLE-AGED AND OLDER BLACK MEN WITH CHRONIC CONDITIONS

Matthew Smith,¹ Ledric Sherman,² Kirby Goidel,² and Thomas Cudjoe,³
 1. *Texas A&M School of Public Health, College Station, Texas, United States*, 2. *Texas A&M University, College Station, Texas, United States*, 3. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*

Social connectedness is a multi-factorial concept encompassing structural, functional, and quality aspects. For those with chronic conditions, threats to social connectedness can exacerbate illness symptomatology and impose barriers to disease self-management. This study identified factors associated social connectedness risk among Black men ages 40+ years with one or more chronic conditions. Data from 2019 were analyzed from a national sample of 1,200 Black males collected with an internet-delivered questionnaire. Three logistic regression models were fitted to assess factors associated with not having enough people to call for help (structural), feeling isolated from others (functional), and not being content with friendships/relationships (quality). All regression models were adjusted for age, education, marital status, number of chronic conditions, self-reported barriers to disease self-management, and having cut-down or skipped social activities because of health problems. On average, participants were age 56.7 (± 9.7) years and self-reported 4.0 (± 2.9) chronic conditions. Approximately 23% were ages 65+ years, 45.4% cut-down or skipped social activities because of health problems, 25.2% did not have enough people to call for help, 26.0% felt isolated from others, and 23.8% were not content with friendships/relationships. Across the three regression models, men who were middle-aged ($P<0.05$), never married ($P<0.01$), cut-down or skipped social activities because of health problems ($P<0.001$), and reported more barriers to disease self-management ($P<0.001$) were significantly more likely to report social connectedness risk. Findings suggest that efforts to improve the self-management of illness symptomatology may mitigate threats to structural, functional, and quality aspects of social connectedness among this male population.

SOCIAL ISOLATION AMONG OLDER MILITARY VETERANS

Zainab Suntai, and Kirsten Laha-Walsh, *University of Alabama, Tuscaloosa, Alabama, United States*

Social isolation is an increasingly critical issue among older adults and has been found to affect several domains of well-being, including physical, psychological, and cognitive health. Research has found that military veterans often experience hardships in the transition back to civilian life including emotional trauma, depression, substance misuse and pain from combat-related injuries, which have been shown to persist well into older adulthood. As such, this study aimed to examine the prevalence of social isolation among older military veterans and determine which veterans are most at-risk of experiencing

social isolation, using the Berkman-Syme Social Network Index as a framework. Data were derived from Round 1 of the National Health and Aging Trends Study (NHATS), an annual longitudinal panel survey of adults aged 65 and older living in the United States. Results showed that about 4.5% of veterans in the NHATS are severely socially isolated while another 20.9% are socially isolated. After controlling for other explanatory variables, being White, being 85 and older, having lower educational attainment, being unmarried/unpartnered and having lower income were associated with an increased risk of experiencing social isolation. Interventions aiming to improve the well-being of older veterans should consider employing both preventative and amendatory measures. These may include the creation and administration of a standardized social isolation scale during visits to veterans' affairs (VA) medical centers and a general effort to address stressors from military service by destigmatizing and improving access to mental health services.

THE IMPACT OF STRUCTURAL AND FUNCTIONAL SOCIAL RESOURCES ON LONELINESS AMONG AMERICANS AGE 50 YEARS AND OLDER

Jillian Minahan Zucchetto, *Fordham University, United States*

Social isolation and loneliness have many negative consequences (e.g., Cacioppo et al., 2006; Griffin et al., 2018; Uchino, 2006), especially among older adults (Perissinotto et al., 2012). According to the cognitive discrepancy theory (CDT), loneliness is the negative psychological state resulting from the perceived discrepancy between one's desired level of social resources and one's actual level of social resources (Peplau & Perlman, 1982; Perlman & Peplau, 1998). Social resources have both structural (e.g., objective) and functional (e.g., perceptions of the quality) aspects (Holt-Lunstad, 2017). The relationship between structural and functional social resources has been described as a filtration process in which functional aspects mediate the association between structural aspects and loneliness (Cacioppo et al., 2016; Hawkley et al., 2008, Hawkley & Kocherginsky, 2018). However, this filtration model has not been empirically tested within the CDT. This study examined the relationship among structural social resources (SSR), functional social resources (FSR), and loneliness cross-sectionally and longitudinally using a sample of 3,345 Americans aged 50 years and older from the 2008 and 2012 waves of the Health and Retirement Study. Results showed that there was a significant indirect effect both cross-sectionally ($\beta = -.07$) and longitudinally ($\beta = -.06$) such that FSR mediated the relationship between SSR and loneliness. Ultimately, the CDT is useful in explaining the complex relationship between structural and functional aspects of one's social resources with loneliness, and interventions may seek to target the functional aspects of one's social network to improve loneliness, rather than focusing solely on structural aspects.

Session 4425 (Paper)

Long-Term Care Policy and Unmet Needs

A PILOT OF A SUSTAINABILITY-EXTENDING INTERVENTION IN CANADIAN NURSING HOMES

Lauren MacEachern,¹ Yuting Song,² Liane Ginsburg,³ Adrian Wagg,² Matthias Hoben,⁴ Malcolm Doupe,⁵

Carole Estabrooks,² and Whitney Berta,⁶ 1. *University of Toronto, Toronto, Ontario, Canada*, 2. *University of Alberta, Edmonton, Alberta, Canada*, 3. *York University, York University, Alberta, Canada*, 4. *University of Alberta at Edmonton, Edmonton, Alberta, Canada*, 5. *University of Manitoba, Winnipeg, Manitoba, Canada*, 6. *University of Toronto, University of Toronto, Ontario, Canada*

Understanding of intervention sustainability processes is limited. Failure to sustain evidence-based innovations means that intended improvements are short-lived, scale-up and spread are unlikely, and real losses are incurred on research investments. We explored the sustainability of a health care aide (HCA)-led quality improvement (QI) initiative, Safer Care for Older Persons (in residential) Environments (SCOPE), that was implemented in long-term care homes (LTCHs) in Manitoba, Canada. Based on our understanding of factors influencing post-implementation sustainability processes, we developed and piloted a "low-dose" and "high-dose" "Booster" intervention to extend the two-year post-implementation period over which SCOPE was naturally sustained. Both versions of the "Booster" involved the following components: a HCA-led team with management support, a workshop to review SCOPE QI approaches and tools, a binder of QI resources, and supports from an experienced Quality Advisor (QA). We collected data from various sources to depict the most accurate account of QI sustainability and conducted thematic analysis to understand each team's experience with sustainability processes. We used a qualitative assessment rubric to evaluate the impact of the "Booster" conditions on the teams' performance against core SCOPE components. Our results suggest that the "Booster" served to establish more relaxed expectations and generally renew interest in LTCH QI initiatives. The calibre of management support was associated with teams' performance and management support varied with the level of QA support. These pilot results will inform the next study phase, which examines longer-term sustainability of QI initiatives in LTCHs beyond the initial 2-year post-implementation period.

AGING INTO DISABILITY: A CONCEPTUAL CHALLENGE FOR GERONTOLOGY

Jeffrey Kahana,¹ Timothy Goler,² and Lawrence Force,³ 1. *Mount Saint Mary College, Newburgh, New York, United States*, 2. *Norfolk State University, Newport News, Virginia, United States*, 3. *Mount Saint Mary College / Center on Aging and Disability Policy, Mount Saint Mary College, New York, United States*

One of the most fraught subjects facing a fast growing aging population is the subject of aging into disability. This paper examines the processes of aging into disability as a distinct challenge for not only older persons, but also for the field of gerontology, and public policy-makers. Disability in youth and in middle age has largely defined the disability rights agenda, and elders aging into disability have not been the subject of much attention from scholars in the field of disability. Surprisingly, however, scholars and policy-makers in gerontology have also by and large avoided the subject of older persons aging into disability—a complex process that involves impairment, environmental disablement, and changes in social relationships. This process accelerates with advancing age, and disproportionately affects women.

Moreover, when older adults develop mobility limitations, experience falls, become hard of hearing, or experience other such impairments of age related disability, they do not think of themselves as aging into disability, or being disabled. This lack of disability identity may protect them from stigma and from low self-esteem. At the same time, it stands in the way of seeking accommodations and from developing a bond with other older adults who are aging into disability. This paper explores the dynamics of disability avoidance as an ideal that can harm older adults and their caregivers. It aims to bring disability more fully into the normal life-course, and to suggest lines of inquiry for gerontological research, to broaden the field, and to make service communities more inclusive .

EVALUATION OF MINNESOTA'S LONG-STAY NURSING HOME QUALITY INDICATORS

Dongjuan Xu,¹ Teresa Lewis,² Marissa Rurka,¹ and Greg Arling,¹ 1. *Purdue University, West Lafayette, Indiana, United States*, 2. *Minnesota Department of Human Services, Saint Paul, Minnesota, United States*

The Minnesota Nursing Home Report Card provides 19 clinical quality indicator (QI) ratings. Currently, face validity and expert opinions are employed to group the 19 long-stay QIs into 10 different domains. However, we do not know whether these domains are supported by the data. Under the current scoring program, some QIs may not discriminate very well between facilities. The objective was to evaluate the dimensionality of the QIs and the current scoring approach used to assign points to the domain and total QI scores. Risk-adjusted facility-level rates for the 19 QIs over the 2012-2019 period were used. Our findings indicate it is reasonable to categorize these QIs into 4 domains. Moreover, the current scoring approach is best suited for a facility QI distribution that is approximately normal. However, 11 QIs display a skewed distribution with facilities tightly grouped at the very bottom (floor) or top (ceiling) of the QI distribution. Our findings suggest that the current scoring approach may distort or exaggerate the differences in the QI rates with skewed distributions, assigning widely varying points to facilities that vary little in their QI rates. We recommend a zero-error approach for highly skewed QIs where the QI outcome is achievable and it reflects a serious quality problem. Our study of the QI scoring system is part of a package of recommendations to improve the Minnesota Nursing Home Report Card and value-based reimbursement system. Lessons learned from the study are readily applicable to Medicare's Nursing Home Compare report.

PREFERABLE USE OF INFORMATION AND COMMUNICATION TECHNOLOGIES IN LONG-TERM CARE SETTINGS: A VIGNETTE SURVEY OF JAPAN

Tomoko Wakui,¹ Tomoko Ikeuchi,¹ Sakiko Itoh,² Hiroyasu Miwa,³ and Kentaro Watanabe,³ 1. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Tokyo, Japan*, 2. *Osaka University, Osaka, Osaka, Japan*, 3. *National Institute of Advanced Industrial Science and Technology, Chiba, Chiba, Japan*

The remarkable development of information and communication technologies (ICT), considering the rapidly aging global population, could eliminate the physical and mental burdens involved in caregiving and enhance the perceived

dignity and autonomy of older adults. However, the introduction of ICT in long-term care (LTC) in Japan has not yielded good results yet, and the social acceptance of ICT remains understudied. This study aimed to understand and examine people's views on ICT use in LTC settings. An online vignette survey was conducted in August 2020, among community-dwelling persons between the ages of 40–89 years, throughout Japan. A set of four vignettes of different physical and cognitive functional situations, at either a home or nursing home, with or without ICT use, was presented to select a preferred care setting. Multinomial regression analyses were used to examine the relationships between participants' choices and individual characteristics. A total of 4,457 participants (52.8% of whom were women) were analyzed (mean age = 60.8 years). Participants were more likely to choose nursing homes in cognitively dependent situations. Participants who were women, relatively younger, and had higher education were more likely to choose care settings employing ICT for physically and cognitively dependent situations. Those who experienced either informal or formal caregiving were more likely to choose care settings that used ICT. This study revealed that individuals preferred different levels of ICT use based on physical and cognitive situations. Barriers to introducing ICT in LTC settings will be discussed.

Session 4430 (Paper)

Mental Health Interventions

ANALYSIS OF 29 ITEMS OF THE MEANINGFUL ACTIVITY PARTICIPATION ASSESSMENT-MEANINGFUL SCALE THROUGH RASCH ANALYSIS

Sanghun Nam, Suyeong Bae, and Ickpyo Hong, *Yonsei University, Wonju, Kangwon-do, Republic of Korea*

Individuals find meaning in their personal activities. Meaningful activities can improve an individual's emotional and physical health and quality of life. The Meaningful Activity Participation Assessment-Meaningful Scale (MAPA-M), which can measure these meaningful activities, is measured in 29 items. In this study, the psychometric properties of 29 items of MAPA-M were investigated through Rasch analysis. The data used in this study was the Well Elderly Study 2 data among public data provided by the Inter-university Consortium for Political and Social Research (ICPSR). We used 480 randomized samples from the Well Elderly Study 2 data. Before proceeding with the Rasch analysis, as a result of checking the unidimensionality assumption of 29 items, 19 items satisfied the unidimensionality assumption. As a result of Rasch analysis of 19 items, the Driving item was removed as misfit (infit mean-square = 2.04, infit z-standardized fit statistics = 9.90, outfit mean-square = 1.86, outfit z-standardized fit statistics = 8.99). The 18 items with the misfit items removed show a conceptual item-difficulty hierarchy, and there was no differential item functioning that worked for sex and age groups. The person strata value is 3.97, which corresponds to the confidence value of 0.88. These results indicate that the 18 items in MAPA-M show appropriate item-level psychometric properties. In other words, the modified MAPA-M 18 indicates that meaningful activities can be accurately and stably measured.

DEVELOPING MULTIMODAL IOMT MONITORING SYSTEM OF GERIATRIC DEPRESSION: A FEASIBILITY STUDY

Heejung Kim,¹ Youngshin Cho,¹ Kyuhee Lim,¹ Sunghee Lee,² Yuntae Kim,³ and Mijung Kim,³ 1. *Yonsei University, Seoul, Seoul-t'ukpyolsi, Republic of Korea,* 2. *BRFrame Inc., Seoul, Seoul-t'ukpyolsi, Republic of Korea,* 3. *Mapo Senior Welfare Center, Seoul, Seoul-t'ukpyolsi, Republic of Korea*

The Internet of Medical Things (IoMT) is a promising tool to monitor depression and relevant symptoms. However, the multimodal IoMT monitoring system has been rarely developed considering the characteristics of older adults, particularly living in the community. Therefore, it is necessary to know how to develop multimodal IoMT monitoring systems tailored for older adults and evaluate the feasibility for research and practice. We developed a multimodal IoMT monitoring system that included a smartphone for facial and verbal expressions, smartwatch for activity and heart rates, and ecological momentary assessment (EMA) application. A convenience sample of 21 older Korean adults aged over 65 years was recruited from a community center, and 19 participants completed it. The data were collected in four weeks using self-report questionnaires, IoMT devices, and semi-structured interviews between July and December 2020 and were analyzed in mixed methods. Based on the Geriatric Depression Scale-Short Form scores, eight participants were classified in the depressive group (38.1%) and 13 in the non-depressive group (61.9%). A total of 1,505 (70.72%) EMA data were collected, and 1,277 (60.00%) were analyzed. Furthermore, 1,421 (66.78%) facial expression data were collected and labeled, including anger, happiness, neutral, sadness, surprise, and exception. Voice dialogues were transformed into 5,264 scripts. The depressive group showed lower user acceptance relative to the non-depressive group. However, both groups experienced positive emotions, had regular life patterns, and increased their self-interest. Thus, our multimodal IoMT monitoring system is a feasible and useful measure for acquiring mental health information in older adults' depression.

IMPLEMENTING BEHAVIORAL HEALTH SOCIAL WORKERS' INCREASED MENTAL HEALTH CARE AMONG OLDER ADULTS

Elizabeth Pfoh, Jessica Hohman, Kathleen Alcorn, Nirav Vakharia, and Michael Rothberg, *Cleveland Clinic, Cleveland, Ohio, United States*

Depression is underdiagnosed and undertreated among older adults. Health systems can screen patients to identify depression, but systemic linkages to treatment are required to ensure care. We used a retrospective stepped-wedge study to identify the impact of implementing behavioral health social workers (BHSWs) on receipt of treatment after a new depression diagnosis. We included adults over 65 years of age with a primary care visit between 2016 and 2019 at a large integrated health system. We excluded patients who were diagnosed with or treated for depression in 2015. Patients were categorized into control (diagnosed before implementation) and intervention (diagnosed after implementation) groups. From our electronic health record, we collected prescriptions for pharmacotherapy and behavioral health visits.

Patients were considered treated if they received pharmacotherapy or had a behavioral health visit within 30 days of diagnosis. We used multilevel logistic regression models to identify the association between implementation period (pre versus post) and treatment, adjusted for demographic variables and clustering within site. Our population included 4,475 people. The percent of patients that received treatment increased from 47% to 54% after implementation and the percent of patients with ≥ 1 behavioral health visit within 30 days increased from 3% to 8% ($p < 0.01$, respectively). The adjusted odds ratio of receiving treatment (AOR: 4.13, 95%CI: 2.84-6.01) and having a behavioral health visit (AOR: 3.12, 95%CI: 2.31-4.24) was significantly higher in the post-implementation period. In conclusion, implementation of BHSWs was associated with increased treatment for older patients with depression.

LITHIUM RECEIPT AND RISK OF DEMENTIA IN OLDER VETERANS WITH BIPOLAR DISORDER IN THE VA HEALTH SYSTEM

Benjamin Szymanski,¹ Eileen Ahearn,² Eric Smith,³ Jenefer Jedele,⁴ John McCarthy,¹ and Ira Katz,⁵ 1. *Department of Veterans Affairs, Ann Arbor, Michigan, United States,* 2. *William S. Middleton Memorial Veterans Hospital, Madison, Wisconsin, United States,* 3. *Edith Nourse Rogers Memorial Veterans Hospital, Bedford, Massachusetts, United States,* 4. *Veterans Health Administration, Ann Arbor, Michigan, United States,* 5. *Department of Veterans Affairs, Philadelphia, Pennsylvania, United States*

Older adults with bipolar disorder are at increased risk of developing dementia. The literature suggests lithium treatment may reduce the incidence of dementia. This study sought to inform clinical practice in the Veterans Affairs (VA) health system by estimating the effect of past year lithium receipt on dementia incidence among Veterans with bipolar disorder. Divalproex receipt was used as a comparison. Using VA medical records, 121,094 Veterans aged 50 and older with a diagnosis of bipolar disorder but no dementia diagnosis were identified in fiscal years 2005-2019. Follow-up continued until dementia diagnosis, 36 months from the index date, death, or the end of fiscal year 2020, whichever came first. 4347 (3.6%) were diagnosed with dementia during follow-up. Time-varying indicators of receipt of lithium and divalproex in the prior 365 days were calculated for each day, categorized as 301-365, 61-300, 1-60, or 0 days of receipt. Unadjusted Cox proportional hazards regression analyses indicated reduced dementia incidence with 301-365 (HR=0.86, 95% Confidence Interval [95%CI] 0.75-0.99) and 61-300 (HR=0.75, 95%CI 0.65-0.87) days of lithium receipt, compared to 0 days. For divalproex, 301-365 (HR=1.34, 95%CI 1.23-1.47) and 61-300 (HR=1.13, 95%CI 1.03-1.23) days of receipt were each associated with increased dementia incidence. Lithium effects were not statistically significant after adjusting for age, sex, race, ethnicity, medical comorbidities, and antidepressant, antipsychotic, and anxiolytic medication receipt. Divalproex effects remained statistically significant. Past year divalproex, but not lithium, receipt was significantly associated with dementia incidence among VA patients with bipolar disorder when adjusting for demographics and medical comorbidities.

MENTAL AND PHYSICAL HEALTH IN SWISS OLDER SURVIVORS OF ENFORCED CHILD WELFARE PRACTICES

Myriam Thoma,¹ Florence Bernays,² Carla Eising,³ Andreas Maercker,⁴ and Shauna Rohner,⁵ 1. *University of Zurich, Zurich, Zurich, Switzerland*, 2. *University of Zürich, University of Zurich, Zurich, Switzerland*, 3. *University of Zürich, Zurich, Zurich, Switzerland*, 4. *University of Zurich, University of Zürich, Zurich, Switzerland*, 5. *University of Zurich, Zürich, Zurich, Switzerland*

It is the purpose of child welfare practices to provide a protective environment for minors. However, welfare practices for children and adolescents have also been linked to a higher risk for maltreatment, trauma, and deprivation. Due to such early-life adversity, affected individuals often report a life course depicted by further trauma, socio-economic disadvantage, mental and physical ill-health. Examination of the long-term health correlates of enforced child welfare practices, as well as potential mediators, have previously been neglected in later life. It was therefore the purpose of these studies to examine the long-term correlates of enforced child welfare practices; the associated maltreatment, trauma, and deprivation; and the physical and mental health outcomes in Swiss older survivors ($n=132$, $MAGE=71$ years) and an age-matched control group ($n=125$). These studies further examined the mediating role of socio-economic factors (e.g., education, income), self-esteem, and self-compassion. Mental health was assessed with a structured clinical interview; physical health, self-esteem, and self-compassion with psychometric instruments. Survivors reported significantly more types and severity of childhood maltreatment, trauma, and deprivation than the control group. They also reported significantly more lifetime and current mental health disorders and more physical illnesses. Socio-economic factors and self-esteem, but not self-compassion, acted as significant mediators. Exposure to maltreatment, trauma, and deprivation in childhood and adolescence is linked to poorer mental and physical health in later life. Potential targets for intervention and health-protective measures include socio-economic factors and self-esteem, which were found to diminish the detrimental long-term impact of early-life adversity and disadvantage into later life.

Physical Functioning

Session 4435 (Paper)

ASSOCIATIONS OF PHYSICAL FUNCTION AND PHYSICAL ACTIVITY WITH COVID-19-LIKE SYMPTOMS

Marguerita Saadeh,¹ Amaia Calderón-Larrañaga,² Davide Vetrano,² Philip Von Rosen,³ and Anna-Karin Welmer,⁴ 1. *Aging Research Center, Karolinska Institutet, Stockholm, Stockholms Lan, Sweden*, 2. *Karolinska Institutet, Solna, Stockholms Lan, Sweden*, 3. *Physiotherapy, Stockholm, Stockholms Lan, Sweden*, 4. *Karolinska Institutet 17175, Stockholms Lan, Sweden*

Physical function and physical activity have been associated with health outcomes related to the cardiopulmonary

and immune systems, but the extent to which they are related to the risk of developing COVID-19-like symptoms remains unclear. We aimed to explore these associations among Swedish older adults. We analyzed data from 904 individuals aged ≥ 68 years from the population-based Swedish National study on Aging and Care in Kungsholmen. COVID-19-like symptoms were assessed by phone interview (March-June 2020) and included fever, cough, sore throat and/or a cold, headache, pain in muscles, legs and joints, loss of taste and/or odour, breathing difficulties, chest pain, gastrointestinal symptoms and eye inflammation. Muscle strength, mobility, and physical activity were objectively examined in 2016-2018. Data were analyzed using logistic regression models and stratifying by age. During the first outbreak of the pandemic, 325 (36%) individuals from our sample developed COVID-19-like symptoms. Those with longer time to perform the chair stand test had an odds ratio (OR) of 1.5 (95% confidence interval [CI] 1.1-2.1) for presenting with COVID-19-like symptoms compared to those with a faster time to perform the test, after adjusting for potential confounders. The risk was even higher among people aged ≥ 80 years (OR: 2.6; 95% CI 1.5-4.7). No significant associations were found for walking speed or moderate-to-vigorous physical activity. A weaker muscle strength, especially among the oldest-old adults, may contribute to higher odds of developing COVID-19-like symptoms, emphasizing the need to maintain sufficient levels of muscle strength in old age.

BACK TO LIFE, BACK TO REALITY: PARTICIPATION AND FUNCTION AFTER ACUTE HOSPITALIZATION IN OLDER ADULTS

Maya Arieli,¹ Racheli Kizony,¹ Efrat Gil,² and Maayan Agmon,³ 1. *Department of Occupational Therapy, University of Haifa, Israel, Haifa, HaZafon, Israel*, 2. *Clalit health services, Haifa and West Galilee, Israel, Haifa, HaZafon, Israel*, 3. *The Cheryl Spencer Department of Nursing, University of Haifa, Israel, Haifa, HaZafon, Israel*

This study aims to describe and compare functional trajectories (i.e., participation versus basic daily function) from pre-hospitalization period to one and three-months post-discharge, among older adults hospitalized for acute medical illness, of two age groups: ages 65-75, $n=39$, >75 , $n=38$. A Prospective longitudinal study was conducted, starting during hospitalization in internal ward and followed by home visits (1 month) and telephone interviews (3 months). Participation was measured by the Activity Card Sort (ACS) that queries about instrumental (e.g. shopping), leisure (e.g. physical activity), and social activities. Basic daily function was measured by the Modified Barthel Index (mBI). Wilcoxon test was used to compare between the ACS and mBI total retained scores within age groups. A mixed model repeated measures ANCOVA was used to compare time by group effects in ACS total scores. The results showed that basic function in both age groups was preserved, and both groups experienced a significantly greater decrease in participation level compared with basic function at one month ($z=-4.1$, $p=.001$, $z=-4.5$, $p=.001$) and at three months ($z=-4.1$, $p=.001$, $z=-4.1$, $p=.001$) in the "younger" and "older" groups, respectively. Participation trajectories were similar among age groups, however, the "older" group experienced a significantly greater decrease in participation ($F(1)=(4.3)$,

$p=.042$, $\eta^2=.056$). Findings indicate that the traditional measure of basic function does not capture the broad spectrum of older adults' full life and overshadows the reduced participation in meaningful activities. Health care professionals should adopt a comprehensive approach toward functional assessment to encompass participation beyond basic daily function.

COMPARISONS OF DIFFERENT MULTIMORBIDITY MEASURES TO PREDICT PHYSICAL FUNCTION AMONG MIDDLE-AGED AND OLDER CHINESE

Hui-wen Xu,¹ Yan Luo,¹ Zi-Ting Huang,² zi-shuo Chen,¹ He-Xuan Su,¹ and Beibei Xu,³ 1. *Peking University School of Public Health, Beijing, Beijing, China (People's Republic)*, 2. *Peking university School of Public Health, Beijing, Beijing, China (People's Republic)*, 3. *Peking University Medical Informatics Center, Beijing, Beijing, China (People's Republic)*

Multimorbidity has been associated with declined physical function. Several methods have been used to measure multimorbidity. However, few studies have compared the associations between different multimorbidity measures and physical function. We aimed to examine and compare the associations between different multimorbidity measures and physical function. We included 16,117 participants aged ≥ 45 from China Health and Retirement Longitudinal Survey (CHARLS) 2011-2018. Multimorbidity was defined as the co-existence of two or more of fifteen chronic conditions in an individual and measured by condition count at penultimate, multimorbidity patterns at penultimate (examined by exploratory factor analysis) and multimorbidity trajectories from baseline to penultimate living interview (examined by the group-based trajectory model). Physical function was assessed by activities of daily living or instrumental activities of daily living at the last follow-up. Logistic regression models were conducted for establishing prediction models in the training set. We used c-statistic, Integrated Discrimination Improvements (IDI) and Net Reclassification Index (NRI) to compare the performance of different models in the testing set. After adjusting for age and gender, compared with those without any conditions, participants with multimorbidity measured by three methods all had higher risks of poor physical function in the training set. Compared with the model using condition count (c-statistic=0.749), models using multimorbidity trajectory (c-statistic=0.712, IDI=-0.03, NRI=-0.31) and the multimorbidity pattern (c-statistic=0.739, IDI=-0.01, NRI=-0.16) showed poor predictive power (all $p < .05$). In our study, condition count has the best predictive performance for poor physical function over short time period. It is a simple and useful tool to assess multimorbidity.

GAIT SPEED MAINTENANCE IS ASSOCIATED WITH SENSORIMOTOR AND FRONTOPIRIETAL NETWORK CONNECTIVITY AMONG OLDER ADULTS

Chun Liang Hsu,¹ Brad Manor,² and Lewis Lipsitz,³ 1. *Hinda and Arthur Marcus Institute for Aging Research, Harvard Medical School, Burnaby, British Columbia, Canada*, 2. *Hinda and Arthur Marcus Institute for Aging Research, Harvard Medical School, Boston, Massachusetts,*

United States, 3. *Hebrew SeniorLife, Boston, Massachusetts, United States*

Mobility impairment is a geriatric giant. Particularly, slow gait is associated with elevated risk for cognitive decline, disabilities and dementia. Gait is the product of complex neural network interactions and changes in their connectivity pattern may negatively impact gait speed. However, mechanistic neural correlates for gait speed maintenance and decline remained unclear. As such, the aim of this study is to investigate differences in neural network connectivity in older adults with and without gait speed decline over 24 months. This sub-analysis included 35 community-dwelling older adults age >70 years from the MOBILIZE Boston Study. Baseline assessments included four-meter gait speed test and resting-state fMRI. Gait speed was reassessed at a 24-month follow-up. Participants were stratified to "Maintainer" and "Decliner" groups based upon a cut-off of >0.05 m/s decline in gait speed from baseline to follow-up. A priori selected functional network included sensori-motor network (SMN) and frontoparietal network (FPN). Multivariate analysis of variance was performed to determine between group differences in network connectivity. Discriminant analysis was conducted to identify relative contribution of network connectivity to group classification. Between the 14 Maintainers and 21 Decliners (mean age 83.9 years), Maintainers were younger ($p=0.088$). After adjusting for age, Maintainers exhibited lower SMN premotor-precentral gyrus connectivity ($p=0.023$), greater FPN ventral visual-supramarginal gyrus connectivity ($p=0.025$), and trend level greater SMN-FPN cerebellum-occipital connectivity ($p=0.053$). Premotor-precentral gyrus connectivity showed greatest contribution to discriminant function. These preliminary findings suggest aberrant connectivity patterns of the SMN and FPN may be predictive of older adults' ability to maintain gait speed.

THE SEX DIFFERENCE IN PHYSICAL FUNCTIONING: HOW DO RISK FACTORS CONTRIBUTE?

Lena Sialino,¹ Susan Picavet,² Hanneke Wijnhoven,¹ Anne Loyen,² Monique Verschuren,² Marjolein Visser,¹ Laura Schaap,¹ and Sandra van Oostrom,³ 1. *Vrije Universiteit Amsterdam, Amsterdam, Noord-Holland, Netherlands*, 2. *National Institute for Public Health and the Environment, Bilthoven, Utrecht, Netherlands*, 3. *National Institute for Public Health and the Environment, Amsterdam, Noord-Holland, Netherlands*

This study explores whether sex differences in the sensitivity to risk factors (strength of the association) and/or in the exposure to risk factors (prevalence) contributes to the sex difference in physical functioning, with women reporting more limitations. Data of the Doetinchem Cohort Study was used ($n=5971$, initial ages 26-70 years), with follow-up measurements every 5 years (up to 20). Physical functioning (subscale SF-36, range:0-100) and a number of socio-demographic, lifestyle and health-related risk factors were assessed. Mixed-model multivariable analysis was used to investigate sex differences in sensitivity (interaction term with sex) and in exposure (change of the sex difference when adjusting) to risk factors. The physical functioning score among women was 6.75 (95% CL:5.65,7.85, age-adjusted) points lower than among men. In general, men and women

had similar risk factors, but pain was more strongly associated with physical functioning (higher sensitivity), and also more prevalent among women (higher exposure). The higher exposure to low educational level and not having a paid job also contributed to the lower physical functioning score among women. In contrast, smoking, mental health problems and a low educational level were more strongly associated with a lower physical functioning score among men and lower physical activity and higher BMI were more prevalent. So, few risk factors seem to contribute the more reported limitations in physical functioning among women aged 26 to 90 years. Our findings provide no indications for reducing this sex difference by promoting a healthy lifestyle but stress the importance of sex differences in pain, work and education.

Session 4440 (Symposium)

PSYCHOLOGICAL IMPACTS AND IMPLICATIONS OF AGING DURING A PANDEMIC

Chair: Joseph Mikels

Co-Chair: Laura Carstensen

Discussant: Susan Charles

Despite numerous losses associated with advanced age, older adults typically fare better than their younger counterparts in terms of psychological well-being. However, the COVID-19 pandemic has disproportionately threatened the physical and mental well-being of older adults. How have older versus younger adults been doing? The goal of our symposium is to shed light on this question through presentations of intriguing research findings regarding the psychological impacts of the pandemic on older adults. Stone and Mak will describe their work examining momentary changes in affect, activities, locations, and social interactions over time during the first several months of the pandemic for older individuals. Mikels and colleagues will report on completed and ongoing work illuminating the complex ways in which certain older adults have been faring well during the pandemic, whereas others not so much, with attention to underlying factors. Jeste will discuss a diverse line of research that has examined the relationships between loneliness, social isolation, and compassion in older adults before and during the pandemic. Chi and Carstensen will report on completed and ongoing research that links work and prosocial behavior to wellbeing with consideration of associated age differences. Collectively, these presentations will describe the complex and multifaceted psychological impact that the COVID-19 pandemic has had on older individuals, revealing the multiple ways in which they are resilient as well as vulnerable.

CHANGES IN MOMENTARY EXPERIENCE WERE ASSOCIATED WITH THE ONSET OF THE COVID PANDEMIC

Arthur Stone,¹ and Hio Mak,² 1. *University of Southern California, University of Southern California/Los Angeles, California, United States*, 2. *University of Southern California, University Of Southern California, California, United States*

We explored the COVID-19 pandemic's effects on daily experience using momentary recordings of affect, activities,

locations, and social interactions, documenting changes in the pandemic's early stages. 123 individuals 50 years or older from an ongoing panel study completed 1-week bursts of Ecological Momentary Assessment (6/day) in March, May, and July. A pronounced spike in negative affect and decrease in positive affect was observed in late March compared with early March, which in May and June returned to early March levels. Levels of fatigue, however, did not follow this pattern. Being with one's spouse/significant other and family also increased, then decreased. Working and interacting with others dropped from early to late March and then remained steady; doing chores had the opposite pattern. Regarding location, being at the workplace dropped from early to late March and remained steady, and being at home had the opposite pattern. Additional analyses explored these patterns.

AGE DIFFERENCES IN EMOTION AND COPING DURING THE COVID-19 PANDEMIC

Joseph Mikels, Nathaniel Young, and Alyssa Minton, *DePaul University, Chicago, Illinois, United States*

The COVID-19 pandemic unleashed a relentless stressor on the human species with numerous deadly risks. These risks have been disproportionately threatening to the health and wellbeing of older adults. Since April 2020, we have been studying how the pandemic has affected the emotional experiences of older and younger adults broadly in several studies. For instance, in one study, we found that older adults (N=176) experienced fewer negative emotions and coped with greater levels of agency than younger adults (N=181). In additional work, we have been examining how these age differences differ for older workers versus retirees as well as in minority populations. This work broadly supports and illuminates our recent theoretical framework that focuses on how evaluative appraisal processes underlie and contribute to age differences in emotional experience generally, but especially in the context of the stress experienced during a global pandemic.

LONELINESS AND ISOLATION VERSUS WISDOM AND COMPASSION DURING THE PANDEMIC

Dilip Jeste, *University of California San Diego, La Jolla, California, United States*

Our studies of US national-level samples across adult lifespan as well as older adults in California and in Italy's Cilento region have found a consistently strong inverse correlation between loneliness and wisdom, especially its compassion component. Loneliness and social isolation are associated with worse physical and mental health while the reverse is true for wisdom and compassion. Follow-up of older adults in San Diego during the Covid-19 pandemic showed no change in this pattern. While the effects of the pandemic and the necessary social distancing were heterogeneous, older adults generally handled these stresses better than younger adults, with less loneliness and greater compassion. Our recent studies assessing EEG responses to emotional stimuli as well as alpha and beta diversity in gut microbiome showed opposing biological patterns characterizing loneliness and wisdom. I will also present preliminary data from a compassion training intervention to reduce loneliness among older adults.

WORKPLACE PROSOCIAL ACTIVITIES AND DAILY WELL-BEING DURING COVID-19

Kevin Chi,¹ and Laura Carstensen,² 1. *Stanford University, Stanford, California, United States*, 2. *Stanford University, Stanford University, Stanford, California, United States*

Workplace prosocial activities, such as providing unpaid assistance to colleagues, has been linked to better well-being. However, little is known about how these associations unfold in daily life. This study examines how prosocial activities at work are associated with daily well-being during the COVID-19 pandemic. A sample of 22 employees (aged 22-69 years) from a wealth management firm reported their daily activities and well-being on 10 consecutive workdays. On days when individuals provided help to someone they work with, they experienced higher positive affect, and greater enjoyment and interest at work, compared to days when they did not provide help. Individuals who provided more help reported greater meaning at work. Initial findings suggest that workplace prosocial activities have positive implications for daily well-being during the pandemic. Subsequent analyses will examine whether these findings replicate in a separate sample of working adults. Age differences in helping and meaning will be discussed.

Session 4445 (Symposium)

SLEEP, ACTIVITY, AND WELL-BEING IN PERSONS WITH DEMENTIA: FINDINGS FROM THE HEALTHY PATTERNS TRIAL

Chair: Nancy Hodgson

Discussant: Darina Petrovsky

Irregular sleep-wake patterns are common in persons living with dementia (PLWD), pose a great burden to caregivers, and are the principal causes of distress and institutionalization of PLWD. A growing body of research supports the importance of activity-based interventions to reduce the frequency and intensity of sleep wake disruption, reduce neuropsychiatric symptoms, and improve quality of life. To date, there are no studies linking sleep disruption and well-being with the nature and timing of activity. This session focuses on lessons learned from the Healthy Patterns Study - a randomized trial of a home-based activity intervention in 200 dyads of PLWD and their caregivers (NCT03682185). Session 1 focuses on the main findings from the clinical trial. Session 2 focuses on the cultural adaptation of the timed activity protocol to improve quality of life (QOL), improve sleep and reduce neuropsychiatric symptoms in older Latinos Session 3 describes the community outreach efforts used over a one-year period to recruit a diverse sample of PLWD and their caregivers for the Healthy Patterns trial. Session 4 examine the relationship between caregiver mastery and neuropsychiatric symptoms in PLWD. Together these findings highlight the complex role of sleep and wake activity in promoting well-being in persons with dementia.

EFFICACY OF A TIMED ACTIVITY INTERVENTION TO IMPROVE SLEEP: FINDINGS FROM THE HEALTHY PATTERNS STUDY

Nancy Hodgson,¹ Miranda McPhillips,² Darina Petrovsky,³ and Subhash Aryal,⁴ 1. *University of Pennsylvania, School of Nursing, Philadelphia, Pennsylvania, United States*,

2. *University of Pennsylvania, University of Pennsylvania, Pennsylvania, United States*, 3. *Rutgers University, Philadelphia, Pennsylvania, United States*, 4. *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania, United States*

We conducted a two-arm RCT with dyads of 200 persons living at home with dementia (PLWD) who reported sleep disruption and family caregivers. Components of the Healthy Patterns intervention included: 1) assessing PLWD functional status, preferences and interests; 2) educating caregivers on environmental cues to promote activity and sleep; and 3) training caregivers in timed morning, afternoon, and evening activities. Outcomes included: PLWD quality of life, sleep, and neuropsychiatric symptoms. Sleep-wake patterns were assessed using wrist actigraphy and proxy-reported measures. The main intervention effects were tested using ANCOVA. The average age of participants was 73.4 years, 67% were female, 80% were African American/Black). At 4 weeks, the intervention group demonstrated less sleep-related impairment ($p = 0.0031$) and reported higher quality of life than the control group ($p = 0.0074$). These results provide new fundamental knowledge regarding the effects of timing activity on sleep and well-being.

A CULTURALLY ADAPTED TIMED-ACTIVITY RCT FOR LATINOS WITH ADRD AND CAREGIVERS: FEASIBILITY, ACCEPTABILITY, AND EFFECTS

G. Adriana Perez,¹ and Liming Huang,² 1. *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania, United States*, 2. *University of Pennsylvania, Philadelphia, Pennsylvania, United States*

Latinos are twice as likely to develop Alzheimer's disease (AD) compared to non-Latino whites, yet, account for <2% of clinical trial participants in AD research. This randomized controlled trial examined the feasibility, acceptability and effects of a culturally-adapted timed-activity intervention designed to promote quality of life (QOL) and reduce behavioral symptoms in older Latinos with AD and their caregivers. Healthy Patterns [Pautas Saludables] was implemented among 40 Spanish-speaking dyads. Measures assessed at baseline and 4 weeks post-intervention, indicate improvements in sleep efficiency ($p=.06$) and QOL ($p=.01$) among intervention participants. Pautas Saludables was found to be feasible and acceptable. Intervention attendance rate was >90% with low attrition ($n=0$); no adverse events. Most (74%) rated timed-activity sessions as helpful and appropriate; 58% recommended refreshers. Results provide evidence that Latinos with AD will participate in clinical trials and can improve on key health outcomes, when interventions are adapted to meet their cultural needs.

EFFECTIVE RECRUITMENT STRATEGIES FOR COMMUNITY-DWELLING PERSONS LIVING WITH DEMENTIA AND THEIR CAREGIVERS

Miranda McPhillips,¹ LaShauna Connell,² Augustine Boateng,² Darina Petrovsky,³ Justine Sefcik,⁴ and Nancy Hodgson,⁵ 1. *University of Pennsylvania, University of Pennsylvania, Pennsylvania, United States*, 2. *University of Pennsylvania, Philadelphia, Pennsylvania, United States*, 3. *Rutgers University, Philadelphia, Pennsylvania, United States*, 4. *Drexel University, College of Nursing and Health*

Professions, Philadelphia, Pennsylvania, United States, 5. University of Pennsylvania, School of Nursing, Philadelphia, Pennsylvania, United States

Recruitment of diverse community-dwelling persons living with dementia (PLWD) and their caregivers (dyads) into randomized controlled trials (RCT) is challenging, time consuming and expensive. This presentation will describe community outreach efforts used over a one-year period to recruit dyads of PLWD and their caregivers in Healthy Patterns RCT. Community outreach yielded 296 inquiries, such that people expressed interest in joining the study. Of the 296 inquiries, almost all (95.6%) identified as African American, and 91(30.7%) consented to join the study. Presentations at senior centers yielded the highest number of inquiries (n=148), followed by staff presence at various community events such as health fairs and senior galas (n=145) and referrals (n=3). We found that community outreach was an effective recruitment strategy to generate inquiries among diverse PLWD and their caregivers to enroll in Healthy Patterns. We will discuss these strategies and provide suggestions for recruiting diverse dyads into clinical trials.

THE ROLE OF CAREGIVER MASTERY IN ANXIETY SYMPTOMS IN PEOPLE LIVING WITH DEMENTIA

Yeji Hwang,¹ and Nancy Hodgson,² 1. *University of Pennsylvania, School of Nursing, Philadelphia, Pennsylvania, United States*, 2. *University of Pennsylvania, School of Nursing, Philadelphia, Pennsylvania, United States*

Anxiety symptoms in people living with dementia (PLWD) are the most distressing symptoms for caregivers. While caregiving is bidirectional relationship, little is known how caregivers can influence anxiety in PLWD. The purpose of this study was to examine the relationship between caregiver mastery and anxiety symptoms in PLWD. Secondary data analysis was conducted using baseline data from Healthy Patterns Study. The conceptual model of Factors Associated with Behavioral and Psychological Symptoms of Dementia guided this study. Among the 169 study PLWD, 23.1% (n=39) reported having anxiety symptoms. In a multivariate logistic regression, adjusting for age, dementia stage, sleep, and depression, better caregiver mastery was significantly related to lower odds of having anxiety in PLWD (OR=0.87, p=0.046). These results suggest that interventions aimed at improving caregiver mastery may improve anxiety symptoms in PLWD.

Session 4450 (Paper)

Social and Health Equity

ADDRESSING SYSTEMIC RACISM BY CREATING A DIVERSITY, EQUITY, AND INCLUSION DEPARTMENT INITIATIVE

Stephanie Chow,¹ Katherine Brown,² Martine Sanon,² Sasha Perez,² Amy Kelley,¹ and Noelle Marie Javier,² 1. *Icahn School of Medicine at Mount Sinai, New York, New York, United States*, 2. *Icahn School of Medicine at Mount Sinai Hospital, Icahn School of Medicine at Mount Sinai, New York, United States*

Background: Catalyzed by social injustice and worsening racial inequities highlighted by the COVID-19 pandemic, a

diverse academic geriatrics and palliative medicine department in NYC launched a DEI initiative. This report presents key program components and lessons learned in launching this initiative in the interprofessional academic medicine setting. Methods: First, DEI core and departmental administration met 2-4 times/month to plan and review program activities, vision, and mission. The team conducted confidential roundtable discussions about DEI issues and 1:1 interviews to assess needs. A monthly Humanities, Arts, and Books (HAB) Initiative provided a safe space for discussion and learning. The HAB platform supported a longitudinal curriculum emphasizing (1) group discussion and self-reflection on DEI concerns, (2) knowledge dissemination including a "Learning Pathway" series, and (3) skill-based workshops. With each event, we collected anonymous feedback. Comments were systematically recorded and an engagement evaluation was conducted to iteratively shape future sessions. Departmental administration was engaged to track DEI-focused measures of recruitment, career advancement, and retention. Finally, we centralized DEI activities on a departmental website, including an anonymous online feedback box. Results: Quantitative and qualitative assessment of DEI initiatives are forthcoming. Metrics include DEI and professional development surveys, departmental demographic and diversity measures, increase in DEI-related projects and grants, and individual participation in DEI programs. Conclusions: Creating a strong and sustainable DEI initiative within an academic medical setting requires a passionate and diverse core team, deliberate backing by administration, and thoughtful dissemination of sensitive content in the midst of a highly charged social justice landscape.

OLDER VIETNAMESE HAVE THE HIGHEST PREVALENCE OF DISABILITY COMPARED TO WHITE AND OTHER ASIAN GROUPS

Hoang Nguyen,¹ Christina Miyawaki,² and Kyriakos Markides,³ 1. *University of Texas Medical Branch at Galveston, Galveston, Texas, United States*, 2. *University of Houston, Houston, Texas, United States*, 3. *University of Texas Medical Branch, Galveston, Texas, United States*

The COVID-19 pandemic has highlighted the vulnerability of older adults with pre-existing health conditions and disabilities. A 2011 study reported that Asian older adults had lower prevalence of disability compared to non-Hispanic white. We revisited the estimate a decade later using the recently released 2015-2019 Public Use Microdata Sample (PUMS) from the American Community Survey (ACS). We estimated the prevalence of six types of disability in adults aged 60 years and older who self-identified as Vietnamese, Chinese, Filipino, Japanese, Korean, Asian Indian, or non-Hispanic White. We also compared the risk for each disability type between Vietnamese and non-Hispanic White (reference group) using the adjusted (age, sex, marital status, education and poverty level) odds ratios. All analyses used survey weights for point estimate and the jackknife method for standard error. Significantly higher prevalence of limitations in independent living, self-care, cognitive function, and blindness were reported by Vietnamese than by non-Hispanic White. Vietnamese also had the highest prevalence in all six types of disability of the Asian groups examined. The adjusted odds ratio of limitations in independent living,

self-care, and cognitive function was significantly higher for Vietnamese than non-Hispanic White. These findings suggest a possible negative outcome trend with the aging of the Vietnamese population. We discuss the historical accounts of Vietnamese in the United States as war refugees and family reunion migrants, provide possible explanations for these new findings including changing demographic structures, and make recommendations for policy and practice that incorporate existing social and cultural resources in the Vietnamese community.

RACIAL-ETHNIC DISPARITIES IN ACCESS TO PREVENTIVE SERVICES AMONG PRIVATELY INSURED ADULTS WITH DISABILITIES

Elham Mahmoudi,¹ Lauren Groskaufmanis,² Neil Kamdar,² Anam Khan,³ and Mark Peterson,⁴ 1. *University of Michigan, Commerce Township, Michigan, United States*, 2. *University of Michigan, Ann Arbor, Michigan, United States*, 3. *University of Michigan School of Public Health, Ann Arbor, Michigan, United States*, 4. *University of Michigan, University of Michigan, Michigan, United States*

Introduction: Cerebral palsy (CP) and spina bifida (SB) are congenital disabilities. Due to life-long disability, adults with CP/SB are with greater needs for preventative care. Little is known about racial/ethnic disparities in use of preventative services in this population. Our objective was to examine racial/ethnic disparities in use of preventative care. **Methods:** Using 2007-2017 private claims data, we identified White, Black, and Hispanic adults (18+) with CP/SB [n=11,635; White=8,935; Black=1,457; Hispanic=1,243]. We quantified the National Institute of Medicine (NAM) definition of disparity by matching health related variables (age, sex, comorbid conditions, and Elixhauser index) between Whites and each minority subpopulation. Generalized estimating equations were used and all models were adjusted for age, sex, comorbidities, income, education, and U.S. Census divisions. Outcomes of interest were: (1) any office visit; (2) any physical therapy/ occupational therapy (PT/OT); (3) annual wellness visit; (4) bone density screening; (5) cholesterol screening; (6) diabetes screening. **Results:** Rate of recommended services for all adults with CP/SB were low and no significant results were found for most preventative services across race/ethnicity. Compared with Whites, Hispanics had lower odds of annual wellness visit (OR: 0.71; 95% CI: 0.53, 0.96) but higher odds of diabetes screening (OR: 1.48; 95% CI: 1.13, 1.93). Blacks had lower odds of bone density screening (OR: 0.54; 95% CI: 0.31-0.95), and annual wellness visit (OR: 0.50; 95% CI: 0.24-1.00). **Conclusions:** There were no substantial racial/ethnic disparities in use of preventative services among privately insured adults with CP/SB who had a higher-than-average income and education level.

TRACKING PROGRESS ON PERSON-CENTERED CARE FOR OLDER ADULTS: ARE WE DOING RIGHT BY RACIAL AND ETHNIC MINORITIES?

Jane Tavares,¹ Marc Cohen,² and Ann Hwang,³ 1. *LeadingAge LTSS Center @UMass Boston, Boston, Massachusetts, United States*, 2. *University of Massachusetts Boston, University of Massachusetts Boston, Massachusetts, United States*, 3. *Commonwealth Care Alliance, Boston, Massachusetts, United States*

Person-Centered care is integral and necessary to high-quality systems of care, providing a holistic approach and addressing the needs and preferences of individuals. Analyzing the 2014 and 2016 Health and Retirement Survey we measure the extent to which the health care system provides person-centered care, to whom and how its receipt affects satisfaction levels and service utilization. About one-third of individuals' report that their preferences were only rarely or sometimes takes account. Results vary greatly by race, highlighting great disparities in person-centered care. One in four Hispanics and one in six Blacks report never having their preferences taken into account compared to roughly one in ten Whites. When people report that their preferences are ignored, they are more likely to forgo medical care and report lower satisfaction with the system. Strategies exist to strengthen and assure advancements in person-centered care, something particularly needed for people of color and low-income populations.

VIRTUAL INTERDISCIPLINARY COLLABORATION IN STATEWIDE IMPLEMENTATION OF THE MIND AT HOME DEMENTIA CARE PROGRAM

Deirdre Johnston,¹ Jennifer Bourquin,² Morgan Spliedt,³ Inga Antonsdottir,⁴ Cody Stringer,⁵ Noemi Smithroath,⁶ Melissa Reuland,⁷ and Quincy Samus,¹ 1. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*, 2. *Superior HealthPlan, Austin, TX, Texas, United States*, 3. *The Johns Hopkins University, Baltimore, Maryland, United States*, 4. *Johns Hopkins School of Nursing, Baltimore, Maryland, United States*, 5. *Centene Corporation, Clayton, Missouri, United States*, 6. *Superior HealthPlan, San Antonio, Texas, United States*, 7. *Johns Hopkins University, Baltimore, Maryland, United States*

MIND at Home, a well-researched holistic, family-centered dementia care coordination program, provides collaborative support to community-dwelling persons living with dementia (PLWD) and their informal care partners (CP). Through comprehensive home-based assessment of 13 memory-care domains covering PLWD and CPs, individualized care plans are created, implemented, monitored, and revised over the course of the illness. Non-clinical Memory Care Coordinators (MCCs) working with an interdisciplinary team provide education and coaching to PLWD and their identified CP, and serve as a critical liaison and resource and between families, medical professional, and formal and informal community resources. This paper will describe a statewide pilot implementation of the program within a health plan across diverse sites in Texas and will present qualitative and quantitative descriptions of a key component of the program's effective translation to practice, the virtual collaborative case-based learning sessions. Health plan teams completed online interactive training modules and an intensive in-person case-based training with the Johns Hopkins team prior to program launch, and then engaged in weekly, hour-long virtual collaborative sessions that included health plan teams (site-based field teams, health plan clinical supervisory and specialty personnel [RNs, pharmacists, a geriatric psychiatrist, behavioral health specialists] and Johns Hopkins MIND program experts and geriatric psychiatrists. To date, the program has enrolled 350 health plan members, conducted 65 virtual collaborative sessions, and provided

423 CME/CEU units to team members. We will provide an overview of virtual collaborative session structure, participant contributions and discussion topics, case complexity, as well as didactic learning topics covered.

Session 4455 (Symposium)

STAKEHOLDER-DRIVEN METHODS CAN ENHANCE CARE DELIVERY FOR NURSING HOME RESIDENTS WITH DEMENTIA

Chair: Natalie Leland

Co-Chair: Felicia Chew

Discussant: Jenny Martínez

The ongoing COVID-19 pandemic has underscored the need to optimize care for one of the most affected sectors: older adults in nursing homes and more specifically highly vulnerable populations such as residents with dementia. Research developed in collaboration with stakeholders can optimize impact, relevance, and trustworthiness of study findings thereby informing advances in care. Yet, evidence on stakeholder driven research for enhancing dementia care is limited. This symposium will provide examples of stakeholder-driven research questions that were addressed with stakeholder engagement. First, we will present current evidence about the perspectives of caregivers, including those from communities of color. The second presentation will discuss the perspective of clinical training stakeholders responsible for supporting system-wide clinical program implementation and their experiences with early and later adopter nursing homes within the context of a clinical trial. The third presentation will address the perspective of policy makers and payers via the effect of state-mandated dementia training on resident outcomes. The fourth and final present the findings from a study that examined how nursing home stakeholders responded to a payor requirements for pharmacy services and the relationship between that response and patient outcomes. We will conclude the session with a discussion of stakeholder-engagement methods and recommendations for future nursing home research, which champions stakeholder collaboration.

EXPLORING INFORMAL CAREGIVERS' PRIORITIES OF NURSING HOME DEMENTIA CARE FROM COMMUNITIES OF COLOR

Stephanie Rouch,¹ Marybeth Moscirella,¹

Alexandra Harper,¹ Cara Lekovitch,¹ Rose Turner,²

Catherine Piersol,³ and Natalie Leland,¹ 1. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2.

University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 3. *Thomas Jefferson University, Philadelphia, Pennsylvania, United States*

Informal caregivers are critical stakeholders in nursing home (NH) care for individuals with dementia. Given racial and ethnic disparities in United States NHs, there is a need to understand informal caregivers' perspectives, particularly among those that identify as members of a community of color. We conducted a scoping review of informal caregiver priorities of nursing home dementia care. Included studies exclusively examined priorities of informal caregivers identifying as Black, Indigenous, or people of color.

The final sample (n=12) included two United States studies representing African American and Korean informal caregivers. The remaining studies were conducted in other countries. Informal caregivers expressed a desire for professional support during the nursing home transition, increased staff knowledge of dementia, and improved resident engagement. These findings highlight the paucity of informal caregivers identifying as Black, Indigenous, or people of color represented in US nursing home dementia research. Future efforts must include communities of color.

IMPLEMENTATION IN NURSING HOMES: DESCRIBING EARLY AND LATE ADOPTERS OF AN EVIDENCE-BASED DEMENTIA CARE PROGRAM

Cara Lekovitch,¹ Pamela Toto,¹ Felicia Chew,² Dawn Bieber,³ and Natalie Leland,¹ 1. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2. *Thomas Jefferson University, Mount Royal, New Jersey, United States*, 3. *Genesis HealthCare, Kennett Square, Pennsylvania, United States*

Despite national efforts to improve nursing home (NH) quality, care remains variable. Health system efforts to drive improvement often begin with a sub-group of NHs before scaling up across the organization. Yet, there is limited evidence on who to target for the first group. This study addressed this gap by examining facility characteristics of early and late adopters within a multi-site pragmatic clinical trial. Data were obtained from the Organizational Readiness to Change Assessment (ORCA), which was completed by expert trainers, and Nursing Home Compare. Early and late adoption was operationalized according to Roger's Diffusion of Innovations. Sixty-percent of NHs (n=12) were late adopters and 40% (n=8) were early adopters. Between group differences (p<.01) were found in number of health inspection citations and context domain within the ORCA. These findings equip health systems with evidence on how to strategically target partners for initial quality improvement efforts prior to system-wide implementation.

THE IMPACT OF STATE DEMENTIA TRAINING REQUIREMENTS FOR NURSING HOMES ON RESIDENT OUTCOMES

Victoria Shier,¹ Yuna Bae-Shaaw,² Cara Lekovitch,³ Felicia Chew,⁴ Natalie Leland,³ and Neeraj Sood,¹ 1. *University of Southern California, Los Angeles, California, United States*, 2. *University of Southern California, Placentia, California, United States*, 3. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 4. *Thomas Jefferson University, Mount Royal, New Jersey, United States*

Stakeholders, including policymakers, have prioritized the need to educate nursing home (NH) staff about Alzheimer's disease and dementia. Despite this prioritization and the relationship between staff training and outcomes, dementia-specific knowledge is variable. This study examined state-level training policies between 2011-2016. During this time 12 states (regulators and payers) implemented NH dementia training requirements, creating an opportunity for a natural experiment between states with and without new requirements. We estimated difference-in-differences models to determine the effect of state requirements on outcomes.

Data from Nursing Home Compare and LTCFocus.org were linked to data on state policies. Training requirements were associated with 0.39 and 0.17 percentage point reductions in antipsychotics use and restraint use, respectively, and no impact on falls or need for help with daily activities. State requirements for dementia training in NHs are associated with a small, but significant reduction in the use of antipsychotic medication and physical restraints.

THE IMPORTANCE OF THE PHARMACIST'S ROLE AND THE QUALITY OF PHARMACY SERVICES IN NURSING HOME CARE

Yuna Bae-Shaaw,¹ Geoffrey Joyce,² Seth Seabury,² Victoria Shier,² and Neeraj Sood,² 1. *University of Southern California, Placentia, California, United States*, 2. *University of Southern California, Los Angeles, California, United States*

The Centers for Medicare & Medicaid Services requires nursing homes (NHs) to provide pharmacy services to ensure the safety of medication use, such as minimizing off-label medication use for residents with dementia. This study examined NH's response to this requirement and its relationship to medication-related outcomes. The contemporaneous relationship between the quality of pharmacy services and outcome measures were modeled using facility-level longitudinal data from 2011-2017 and facility fixed-effects. The results revealed that deficiency in pharmacy services increased medication-related issues by: 11% in inappropriate medication regimen, 5% in medication error rate >5%, and 3% in any serious medication errors. Additionally, deficiency in pharmacy services was associated with small but statistically significant increases in antipsychotic use, residents with daily pain, number of hospitalizations and rehospitalization rate. The results suggest that pharmacy services have a direct and immediate impact on medication outcomes. The results underscore the importance of pharmacy services in NHs.

Session 4460 (Paper)

Subjective Aging and Health

DAILY PERCEPTIONS OF AGING AND IMPLICATIONS FOR STRESS REACTIVITY

Bethany Wilton-Harding, and Tim Windsor, *Flinders University, Adelaide, South Australia, Australia*

Awareness of one's own aging has received increasing attention in the field of gerontology over the last decade. This study examines the role awareness of age-related change (AARC) may play in the association between daily stressors and well-being. Recently, individuals' awareness of both age-related gains and age-related losses has been shown to vary on a day-to-day basis (Neupert & Bellingtier, 2017). We expected that increases in daily AARC-losses may be associated with increased emotional reactivity to daily stressors, whereas increases in AARC-gains may be associated with decreased reactivity. Data were collected in a daily diary study from a community-based sample of 152 Australian participants aged 53 to 86 ($M = 69.18$, $SD = 5.73$). Participants completed daily assessments of AARC, stressors and emotional affect (positive and negative) on their smartphones

for 10 consecutive days. Analysis of within-person coupling using multilevel models indicated that daily increases in AARC-losses were associated with increased reactivity to daily stressors (represented by high negative affect and low positive affect). On the other hand, daily increases in AARC-gains were associated with decreased reactivity to daily stressors (represented by low negative affect). Results indicate that even short-term fluctuations in perceptions of aging may be an important factor to consider when investigating associations between daily stressors and well-being in older adulthood. Specifically, greater daily AARC-losses may contribute to lower emotional well-being, whereas an appreciation of positive age-related changes (AARC-gains) may play a role in mitigating emotional reactivity to daily stress experiences in older adulthood.

DIFFERENCES IN SELF-RATED MEMORY BY RACE/ETHNICITY

Yujin Franco,¹ Joseph Saenz,² Yuri Jang,² and Jessica Ho,² 1. *University of Southern California, University of Southern California, California, United States*, 2. *University of Southern California, Los Angeles, California, United States*

Self-rated memory is an important dimension of well-being among older adults that has also been linked to cognitive impairment over the long term. However, few studies based on nationally-representative samples have examined differences in self-rated memory by race/ethnicity. This study explores differences in self-rated memory across non-Hispanic White, non-Hispanic Black, and Hispanic older adults in the United States. Data were drawn from the 2011 wave of the National Health and Aging Trends Study (NHATS). The sample consisted of older adults aged 65 and older ($N=4,753$ non-Hispanic Whites, $N=1,442$ non-Hispanic Blacks, and $N=388$ Hispanics). Logistic regression was used to examine the association between having poor/fair self-rated memory and race/ethnicity, controlling for socio-demographic characteristics (age, gender, education level, income, and marital status), chronic conditions (heart attack, hypertension, diabetes, stroke, and depressive symptoms), objective memory status, functional limitations (activities of daily living and instrumental activities of daily living), and other social and cultural factors (economic vulnerability, religious practice, and limited English proficiency). I find that non-Hispanic Blacks and Hispanics have significantly higher odds of reporting poor/fair self-rated memory than non-Hispanic Whites. Compared to non-Hispanic Whites, Blacks and Hispanics had 33% and 56% higher odds of reporting poor/fair self-rated memory, respectively, controlling for sociodemographic characteristics, chronic conditions, objective memory status, functional limitations, and social and cultural factors. These results provide evidence that understanding differences in self-rated memory across racial/ethnic groups may have important implications for health professionals, particularly in relation to conducting and interpreting cognitive screening assessments.

INTERGENERATIONAL AMBIVALENCE, LONELINESS, AND WELL-BEING AMONG OLDER ADULTS IN THE UNITED STATES

Xiaoyan Zhang,¹ and Merrill Silverstein,² 1. *Syracuse University, Syracuse, New York, United States*, 2. *Syracuse University, Syracuse, New York, New York, United States*

Intergenerational relationships are important sources of informal social support for older people to maintain their emotional well-being. Previous research has extensively investigated the relationship between intergenerational support and older adult's psychological well-being. However, the existing research has not adequately examined intergenerational ambivalence – mixed or contradictory feelings toward a family member in another generation or explored the mechanism that links intergenerational ambivalence and psychological well-being. Further, most studies are cross-sectional, which prevents us from establishing causality. This study utilized data from 2006, 2008, 2010, 2012, 2014, and 2016 waves of Health and Retirement Study (HRS), a national representative sample of U.S. adults aged 50 and more (N=8,017). Structural equation models were used to examine the longitudinal relationship between intergenerational ambivalence, loneliness, depression, and life satisfaction. The final model indicated very good fit ($\chi^2 = 113.31$, $p < .0001$, CFI = 0.97, RMSEA = .05). The results revealed that ambivalence in older parent-adult child relationships predicted higher subsequent loneliness ($\beta = 0.21$, $p < .0001$), which in turn predicted depressive symptoms ($\beta = 0.25$, $p < .0001$) and life satisfaction ($\beta = -0.30$, $p < .0001$). The results demonstrated that loneliness mediated the relationship between intergenerational ambivalence and depression, and life satisfaction. Multiple group analysis was performed to test whether the study relationships varied by gender. Gender differences were found. Findings have implications for prevention and intervention initiatives targeting improving relationships between parents and children, thereby protecting against mental problems.

SOCIOCULTURAL DIFFERENCES IN ACCEPTING TECHNOLOGY FOR OLDER ADULTS BETWEEN SOUTH KOREA AND THE UNITED STATES

Jeungkun Kim,¹ and Suk-Young Kang,² 1. *Kangnam University, Yongin-si, Kyonggi-do, Republic of Korea*, 2. *Binghamton University, State University of New York, Binghamton, New York, United States*

In recent years, Western-originated technology products for older adults are rapidly spreading in Korea, but discussions on technology acceptance taking into account the socio-cultural characteristics of older adults in Korea are relatively insufficient. The purpose of this study is to analyze the influence of the socio-cultural characteristics of Korean older adults on their intention to use technology compared to the United States. Due to Covid-19, a telephone and non-face-to-face survey was conducted for older adults aged 65-95 residing in New York State in the U.S. and the metropolitan area of South Korea from September 2020 to January 2021 (N=155 in South Korea, N=180 in the U.S.). In this study, the expanded technology acceptance model for older adults was conceptualized, and socio-cultural factors were used as mediators or modulators. Results show that Korean older adults had higher expectations that technology use would have a positive impact on their lives, and their product purchase intentions were higher than those in the United States ($p < 0.001$). The main reason was that Korean older adults were less anxious about the leakage of personal information, had higher national trust and were relatively less resistant to robots than American older adults. In

addition, Korean older adults were more confident that they could receive help in case of problems with technology products than their counterparts in the United States. This study suggests practical and policy alternatives for securing technology acceptance of older adults, taking into account the social and cultural factors of Korea and the United States.

VARIATION IN SUBJECTIVE AGING AMONG MIDDLE-AGED AND OLDER LGBTQ+ PEOPLE: AN EXPLORATORY STUDY

Harry Barbee, and Tara McKay, *Vanderbilt University, Nashville, Tennessee, United States*

Studies suggest that women and men have different experiences of subjective aging—including interpretations of age norms, timing of life course stages, and aging anxieties—but few have addressed variation within sexual and gender diverse communities. Drawing on a sample of middle-age and older LGBTQ+ people from Alabama, North Carolina, and Tennessee (n=923), we analyze how four dimensions of subjective aging (age-related self-perceptions, generalized views of aging, aging bodies, and aging anxieties) vary within the LGBTQ+ population by comparing gay and bisexual cisgender men (GBCM), lesbian and bisexual cisgender women (LBCW), and transgender, gender nonconforming, and non-binary (T/GNC/NB) people. Using multivariate regression models, we find that LBCW reported younger ideal ages, more elongated perceptions of the life course, more negative predictions of prospective health, and less aging anxiety compared to GBCM. Regarding self-perceptions and generalized views of aging, T/GNC/NB people reported younger ideal ages and more condensed perceptions of the life course compared to GBCM. Regarding perceptions of aging bodies, T/GNC/NB people reported more positive views of physical changes within the last five years and more negative predictions of prospective health compared to GBCM. Finally, T/GNC/NB people were less anxious than GBCM about future sex lives but were more anxious about not being able to support other people in the future. Overall, while some results align with studies of the general population, we find that sexual and gender diverse people may have different subjective aging trajectories, and thus experience differential physical and mental health outcomes, compared with cisgender heterosexual adults.

Session 4465 (Symposium)

THE CHALLENGES OF BEING A FAMILY CAREGIVER DURING THE COVID-19 PANDEMIC IN CANADA

Chair: Gwen McGhan

Co-Chair: Deirdre McCaughey

The COVID-19 pandemic has impacted all of our lives, but the population most at risk are older adults. Canadians over the age of 60 account for 36% of all COVID-19 cases but 95% of the deaths, and over two-thirds of ICU admissions. Older adults with chronic health conditions are especially at risk. Prior to COVID-19, family caregivers (FCGs) for older adults were managing their caregiving duties at the limits of their emotional, physical and financial capacity. As such, FCGs need special consideration during these times of uncertainty to support them in their role and enable the continuation of care for their older adult family members.

This symposium will report on independently conducted studies from across Canada that have examined how the pandemic and associated public health measures have influenced resource utilization by FCGs and the older adults for whom they provide care. McAiney et al's study examines the deleterious effect of reduced services on community dwelling FCGs and the wellbeing of their family member with dementia. Parmar & Anderson examined the effect of pandemic restrictions on FCGs of frail older adults and found they were experiencing increased distress and decreased wellbeing. Flemons et al report on the experiences of FCGs managing caregiving without critical services and the effect of restrictive visiting policies and the well-being of the caregiving dyad (FCGs and family member with dementia). Finally, McGhan et al will share how FCGs evaluated the efficacy of public health measures and the public health messaging about the pandemic.

PUBLIC HEALTH MESSAGING AND MEASURES DURING COVID-19: THE EXPERIENCES OF FAMILY CAREGIVERS

Gwen McGhan, Deirdre McCaughey, Kristin Flemons, and Whitney Hindmarch, *University of Calgary, Calgary, Alberta, Canada*

To mitigate the effects of COVID-19, Health Ministries across Canada have enacted numerous public health measures. Our mixed methods study examined the effect of COVID-19 related public health messaging and measures for family caregivers (FCGs) of people living with dementia (PLWD). Of the 230 FCGs completing the survey, most frequently used information sources were television, family/friends, and websites. FCGs over 60 more often used television, newspaper and radio versus websites and social media. FCGs rated public health messaging as good-excellent (64%) especially messaging around the disease spread, symptoms, and finding information. 46% believe the restrictions in long-term care facilities went beyond necessary with 97% reporting restrictions have negatively impacted them. 84% were willing to undertake personal protective equipment and infection control training to ensure continued access to PLWD. Focus groups highlighted concerns about continued access to PLWD, quality of care provision, and increased social isolation's impact on dementia progression.

EXPLORING THE IMPACT OF COVID-19 ON FAMILY CAREGIVERS OF PERSONS LIVING WITH DEMENTIA IN THE COMMUNITY

Carrie McAiney,¹ Emma Conway,¹ Melissa Koch,¹ Laura Middleton,¹ Heather Keller,¹ Sherry Dupuis,¹ Kate Dupuis,² and Jennifer Boger,³ *1. University of Waterloo, Waterloo, Ontario, Canada, 2. Schlegel-UW Research Institute for Aging, Waterloo, Ontario, Canada, 3. Waterloo University, Waterloo, Ontario, Canada*

COVID-19 public health measures have significantly impacted persons living with dementia (PLWD) and family caregivers (FCGs). Given the restrictions on in-person services, many PLWD were not able to access their usual supports and activities, resulting in FCGs stepping in to support exercise, leisure, socialization, spirituality, and activities of daily living. At the same time, FCGs' own support networks were significantly reduced or no longer available. We conducted

in-depth qualitative interviews with 20 FCGs of PLWD in the community to explore the impact of COVID-19 on their well-being. Data were analyzed using thematic analysis. Caregiving during COVID-19 was described as 'draining' and 'stressful', with the support needs of PLWD increasing at a time when fewer supports were available. Reaching out to others, using technology, and setting boundaries were strategies FCGs used to cope. Despite the considerable impacts of COVID-19, FCGs of PLWD demonstrated their resilience in supporting themselves and their PLWD.

THE IMPACTS OF THE COVID-19 PANDEMIC ON FAMILY CAREGIVERS' CARE WORK, ANXIETY, AND LONELINESS

Jasneet Parmar,¹ and Sharon Anderson,² *1. Department of Family Medicine, University of Alberta, Edmonton, Alberta, Canada, 2. Faculty of Medicine & Dentistry University of Alberta, Edmonton, Alberta, Canada*

Our study examined the effects of COVID-19 pandemic and public health measures on family caregivers (FCGs) of frail older adults; specifically, their care work, anxiety, and loneliness all of which are associated with decreased wellbeing. Approximately 604 FCGs completed the survey and findings evidenced COVID-19 creating two solitudes. First, 73% of FCGs for individuals living with them were providing significantly more care during COVID-19. Second, those caring for residents in congregate settings were unable to care. Both situations, community-dwelling and congregate care, increased FCG distress and decreased wellbeing. Anxiety significantly increased from 36% pre COVID-19 to 54% during COVID-19. Loneliness increased from 46% to 85%. FCGs report their mental (58%) and physical (48%) health deteriorated. The detrimental impact of the pandemic and public health measures on FCGs caring at home and in congregate care, and their related needs, need immediate attention from both the health and social systems of care.

BEYOND THE LOCKDOWN BINARY: FAMILY CAREGIVER NEEDS FOR CREATIVE SOLUTIONS DURING A GLOBAL PANDEMIC

Gwen McGhan, Kristin Flemons, Deirdre McCaughey, and Whitney Hindmarch, *University of Calgary, Calgary, Alberta, Canada*

As COVID-19 lockdowns began in Canada last spring, family caregivers (FCGs) of people living with dementia (PLWD) found themselves facing a catch-22: they and their family members were often most at risk of severe outcomes should they contract the virus, yet the public health measures put in place also detrimentally affected their ability to continue providing care. To understand the nuances of caregiver experiences during the pandemic, we conducted 9 focus groups with 19 FCGs of PLWD in the Calgary region in summer 2020. Caregivers reported negative outcomes resulting from decreased services for both themselves and the PLWD, including increased isolation, poor mental health, and accelerated dementia progression. Caregivers also emphasized the importance thinking beyond the binary of either locking down or opening up; rather, we must find creative solutions to safely continue providing supports to caregivers. This presentation explores FCG suggestions for balancing COVID-19 risk against caregiver needs.

Session 4470 (Symposium)

THE DEVELOPMENT OF A SMART REMINDER SYSTEM TO PROMOTE ADHERENCE TO TECHNOLOGY-BASED INTERVENTION AND ASSESSMENT

Chair: Walter Boot

Co-Chair: Neil Charness

The overarching aim of the National Institute on Aging funded Adherence Promotion with Person-centered Technology (APPT) Project is to promote adherence to technology-based solutions designed to enhance the early detection and treatment of cognitive decline. The goal is to build and evaluate adaptive, tailored, and integrated technology-based adherence support systems for mobile software platforms that assess and train cognitive skill. The symposium describes the various steps of the development process of the APPT smart adherence support system. N. Charness will present an overview of the APPT project, its aims, and the clinical trials designed to assess the effectiveness of the APPT smart reminder system compared to typical reminder systems. S. Chakraborty will present detailed analyses of past cognitive intervention data to inform understanding of who is likely at risk for poor adherence and how adherence lapses might be predicted in advance to provide just-in-time adherence support. D. Carr will present an exploration of motivating factors for participants to engage in research, and these motivations will be tapped to help develop motivational messages for the APPT adherence support system to be used in the two planned clinical trials. M. Dieciuc will provide additional insights into motivations for engaging in home-based cognitive assessment and training derived from a focus group study. Finally, S. Zhang will describe the results of an initial pilot study examining the effectiveness of motivational reminder messages that match vs. mismatch participants' own motivations. All results inform the design of the APPT system to maximize adherence.

AIMS OF THE ADHERENCE PROMOTION WITH PERSON-CENTERED TECHNOLOGY (APPT) PROJECT

Neil Charness,¹ Walter Boot,¹ Dawn Carr,¹ Shayok Chakraborty,¹ Zhe He,¹ Mia Lustria,² and Antonio Terracciano,³ 1. *Florida State University, Tallahassee, Florida, United States*, 2. *School Of Information, Florida State University, Florida, United States*, 3. *FLORIDA STATE UNIVERSITY, Florida State University, Florida, United States*

The APPT project supports the early detection and treatment of age-related cognitive decline and dementia by 1) enhancing adherence to cognitive intervention and assessment protocols, 2) improving understanding of barriers to long-term adherence, and 3) developing algorithms for predicting and preventing adherence failures. Two randomized controlled trials will test an adaptive technology support system predicted to boost adherence to cognitive protocols over a period of six months within samples of older adults with and without cognitive impairment. These studies will provide insight into the benefits of adherence support, and individual difference factors that should shape the adherence protocol, informing the process of identifying individuals

who would benefit from additional support and predicting and preventing extended adherence failures before they happen. These studies should improve early detection and treatment of cognitive decline, extend functional independence, and improve lives of those with cognitive impairment as well as the lives of their families.

MACHINE LEARNING APPROACHES TO UNDERSTANDING AND PREDICTING PATTERNS OF ADHERENCE

Shayok Chakraborty,¹ Aditya Bhattacharya,¹ Shubo Tian,¹ Nelson Roque,² Zhe He,¹ and Walter Boot,¹ 1. *Florida State University, Tallahassee, Florida, United States*, 2. *University of Central Florida, Orlando, Florida, United States*

In cognitive training of older adults, adherence is a major challenge, but appropriate just-in-time adaptive interventions can improve adherence. To understand adherence patterns and predictors of adherence lapses, we aggregated data from two previous trials (N > 230) involving home-based cognitive interventions. This dataset, detailing 40,000 intervention interactions, contains information about intervention engagement and measures of objective and subjective cognitive performance, demographics, technology proficiency, and attitudes. Exploratory analyses were conducted to understand patterns and predictors of faltering adherence, using classification models, together with feature selection to remove redundant variables. Adherence behaviors in a week were predictive of quitting the following week. Game parameters such as the time of play were weak indicators of future playing patterns, whereas game success was a strong predictor of adherence. These and other useful observations will be incorporated in the design and development of the smart reminder system to be deployed in the APPT project.

FACTORS THAT MOTIVATE OLDER ADULTS TO PARTICIPATE IN RESEARCH: TYPOLOGIES AND IMPLICATIONS

Dawn Carr,¹ Zhe He,¹ Mia Lustria,² Shubo Tian,¹ Maedeh Agharazidermani,¹ and Walter Boot,¹ 1. *Florida State University, Tallahassee, Florida, United States*, 2. *School Of Information, Florida State University, Florida, United States*

A key challenge for scholars who study aging is identifying a pool of research volunteers willing to participate. Toolkits and strategies acknowledge the differences in recruitment needed for older adults relative to younger adults, but there is little information about variations among older adult research volunteers. Based on a community sample of older adults age 60+, this study evaluates differences across seven specific motivators across three broad categories: values/altruism, personal growth/improvement, and immediate gratification. We then identify and evaluate four typologies of older adult volunteers based on the combinations of motivations the older adults in our sample identify as important to participation in research studies. Based on these analyses, we describe how our results might inform recruitment and retention practices in aging studies. Further, we will discuss how these results will help shape our technology-based reminder system with a greater understanding of motivations.

A QUALITATIVE UNDERSTANDING OF MOTIVATIONS, PREFERENCES, AND ATTITUDES TOWARD ADHERENCE-BASED TECHNOLOGY

Michael Dieciuc,¹ Shenghao Zhang,² Nicholas Gray,³ Andrew Dilanchian,⁴ Dawn Carr,⁴ Mia Lustria,⁵ and Walter Boot,⁴ 1. *Florida State University, Florida State University, Florida, United States*, 2. *Florida State University, Tallahassee, Florida, United States*, 3. *Psychology Department, Florida State University, Florida, United States*, 4. *Florida State University, Tallahassee, Florida, United States*, 5. *School Of Information, Florida State University, Florida, United States*

The future of cognitive assessments and brain-training programs is very likely to involve mobile applications for phones and tablets. However, adherence to these programs over the long haul is notoriously low. In an effort to countervail this trend, we ran online focus groups with both older and younger adults to understand from a user-centered perspective how to better design apps to increase adherence. Using thematic content analysis (Braun & Clarke, 2006) with an inductive bottom-up approach (Frith & Gleeson, 2004), we found a surprising number of common themes across older and younger adults that superseded many of their superficial differences. For instance, both younger and older adults were reluctant to engage in the program unless it had some obvious perceived benefit; both wanted the program personalized to their individual preferences; both wanted the ability to customize features and reminders; and both generally agreed that the tasks had to be fun.

THE EFFECT OF REMINDER MESSAGE TAILORING ON COGNITIVE INTERVENTION ADHERENCE

Shenghao Zhang,¹ Michael Dieciuc,² Andrew Dilanchian,³ and Walter Boot,³ 1. *Florida State University, Tallahassee, Florida, United States*, 2. *Florida State University, Florida State University, Florida, United States*, 3. *Florida State University, Tallahassee, Florida, United States*

To examine the potential impact of tailored messaging on adherence and attitudes toward text message reminders, a pilot study conducted in advance of the APPT randomized controlled trial systematically manipulated the match between text message content and participants' self-reported motivations to participate in a cognitive intervention study. Older adults (n=40) were asked to engage in cognitive training, in the form of gamified neuropsychological tests, 30 minutes a day for 10 consecutive days, and adherence was tracked remotely over time. Critically, each day text message reminders alternated between messages consistent or inconsistent with participants' previously reported motivations for entering the study. This talk presents results, derived from multilevel modeling, that explore the effectiveness of this simple and cost-effective message tailoring approach for facilitating adherence and engendering positive attitudes toward the reminder system, and implications for programs requiring long-term adherence.

Session 4475 (Symposium)

THE IMPORTANCE OF REDEFINING GERIATRIC EXPERTISE IN NURSING HOMES TO REDUCE UNNECESSARY HOSPITALIZATIONS

Chair: Franziska Zúñiga

Co-Chair: Lori Popejoy

Discussant: Amy Vogelsmeier

Unplanned transfers from nursing homes (NHs) are burdensome, associated with adverse outcomes for residents

and costly for health care systems. Internationally, NHs are facing similar issues whereby a lack of geriatric expertise combined with a shortage of NH general practitioners require innovative and adaptable models of care tailored to the organizational context. In this symposium, we will present studies from the MOQI project from the United States, which successfully reduced unnecessary hospitalizations by embedding advanced practice registered nurses (APRN) in 16 US NHs over a 6-year period. We will discuss the influence of race on multiple hospital transfers and present possible interventions to reduce transfers. Next, we will present finding from a study with MOQI APRNs that highlighted their contributions to the COVID-19 pandemic response in NHs and discuss the broader implication or infection control practices. In addition, we will present the INTERCARE project which successfully reduced unplanned hospitalizations in 11 Swiss NHs, by implementing a registered nurse with an expanded role, to compensate for the very limited access to APRNs; which is the case for many European countries. Both MOQI and INTERCARE pinpoint the importance of strategies to support the introduction of a new role in NHs. Both projects will give examples of different models of care which can be feasibly implemented to sustainably decrease unnecessary hospitalizations, in different contexts and with different resources. Finally, data from the INTERCARE study will address the issue of potentially avoidable fall-related transfers and which resources are deemed appropriate to mitigate these.

MULTIPLE HOSPITAL TRANSFERS AMONG MOQI NURSING HOME RESIDENTS: THE INFLUENCE OF RACE

Kelli Canada,¹ Elizabeth Fritz,² Amy Vogelsmeier,³ Marilyn Rantz,³ and Lori Popejoy,³ 1. *University of Missouri, Columbia, Missouri, United States*, 2. *Sinclair School of Nursing, Columbia, Missouri, United States*, 3. *University of Missouri - Columbia, Columbia, Missouri, United States*

Missouri Quality Initiative (MOQI) was a CMS-funded enhanced care and coordination provider demonstration project (2012-2020) that successfully reduced avoidable hospitalizations and improved nursing home (NH) care quality. Little is known about the influence of race in multiple hospital transfers from NHs. Using a mixed-methods approach we analyzed hospitalization root cause analysis data from 2017-2019 for 1410 residents in 16 MOQI NHs. There were 113 residents who were transferred 609 times. Those with multiple transfers (four or more transfers/year) were compared by race and key characteristics (e.g., code status, diagnosis). A subset of residents with multiple transfers were examined qualitatively to identify and describe key cases. Findings suggest that Black residents have a higher probability for multiple transfers. Findings highlight the need for transfer prevention efforts for Black residents including early assessment and intervention, early/frequent discussion about goals of care, advance directives, resuscitation status, and family/resident understanding of treatment effectiveness.

THE INFLUENCE OF MOQI APRNS ON THE COVID-19 RESPONSE IN NURSING HOMES

Lori Popejoy, Megan Hiltz, Marilyn Rantz, and Amy Vogelsmeier, *University of Missouri - Columbia, Columbia, Missouri, United States*

During the COVID-19 pandemic Missouri Quality Initiative APRNs worked in 16 nursing homes (NHs) providing clinical expertise and support. To understand their influence on the NH COVID-19 response, we conducted four group interviews with APRNs from 13 of the 16 NHs. Using thematic analysis, we identified similarities and differences between NH groups and then compared groups by COVID-19 infection rates. Leaders from NHs with high COVID-19 rates were unwilling to report infections and were resistant to resident/staff testing. In contrast, leaders from NHs with low COVID-19 rates were strategic about acquiring supplies, held daily huddles, and initiated CDC recommendations almost immediately. All reported residents lost weight, and experienced mood and physical decline resulting from quarantine/isolation. APRNs worked with providers to identify potentially ill residents/staff, improve isolation/quarantine procedures, manage ill residents, and supported efforts to mitigate viral spread. We will discuss implications for broader infection prevention in NHs.

POSITIVE EFFECT OF A SUCCESSFULLY IMPLEMENTED MODEL OF CARE ON UNPLANNED TRANSFERS TO HOSPITAL

Franziska Zuniga,¹ Raphaëlle Guerbaai,² and Michael Simon,³ 1. *Basel University, Ostermündingen, Basel-Stadt, Switzerland* 2. *Institute of Nursing Science, Department of Public Health, University of Basel, Institute of Nursing Science, Department of Public Health, University of Basel, Basel-Stadt, Switzerland*, 3. *University of Basel, Basel, Basel-Stadt, Switzerland*,

Models of care have shown effectiveness in reducing unplanned transfers in nursing homes (NHs) from 11.7% to 6.1%. These include coordination of care and access to skilled medical providers such as geriatricians, specialist nurses or registered nurses with additional training. A hybrid type-2 effectiveness-implementation project (INTERCARE) was developed to improve intervention uptake and to understand the mechanisms behind results. INTERCARE consisted of six core elements and was rolled-out to 11 Swiss NHs with a stepped-wedge design allowing all NHs to receive the intervention. 942 residents were recruited (June 2018 -January 2020). INTERCARE showed a significant reduction of unplanned transfers during the intervention period compared with baseline. The successful implementation of INTERCARE relied on the use of implementation science, building on stakeholder input and careful theory-driven contextual adaptations. INTERCARE's success was driven by registered nurses with expanded roles, on-site coaching, and the use of tools for clinical decision making.

DEFINING APPROPRIATE RESOURCES FOR NURSING HOMES TO REDUCE POTENTIALLY AVOIDABLE TRANSFERS AFTER A FALL

Raphaëlle Guerbaai,¹ Michael Simon,² and Franziska Zúñiga,² 1. *Institute of Nursing Science, Department of Public Health, University of Basel, Institute of Nursing Science, Department of Public Health, University of Basel, Basel-Stadt, Switzerland*, 2. *University of Basel, Basel, Basel-Stadt, Switzerland*

Falls are common in nursing home (NH) residents and are the predominant reason for an emergency department (ED) transfer. Falls are responsible for 25% - 87% of ED transfers, a proportion of which are potentially avoidable. INTERCARE – an implementation science study reducing unplanned hospitalizations (2018 – 2020) – involved experts to identify potentially avoidable fall-related transfers. Focus group and stakeholder survey enabled identification of resources to safely manage some falls in NHs. 25.9% of fall-related transfers were potentially avoidable based on using root-cause analysis and discharge reports. Avoidability was associated to ED visit, compared to hospitalizations. Appropriate resources identified by stakeholders included timely access to outpatient services for diagnostic imaging (e.g., X-Ray) and clinical skills' training in suturing and wound care for registered or specialist nurses. Although NHs are striving for a home-like environment, better access to basic diagnostic and treatment services within NHs should be possible.

Session 4480 (Symposium)

THE M. POWELL LAWTON AWARD LECTURE: THE PERSON-ENVIRONMENT FIT FRAMEWORK, OLDER ADULTS, AND TECHNOLOGY INTERACTIONS

Chair: Debra Dobbs

The lecture will be given by the 2020 recipient, Sara Czaja, PhD, FGSA of Weill Cornell Medicine. The 2021 M. Powell Lawton Award recipient is David Roth, Phd, FGSA, of Johns Hopkins University. The M. Powell Lawton Award is presented annually to an individual who has made outstanding contributions from applied research that has benefited older people and their care. The Lawton Award is generously funded by the Polisher Research Institute of Abramson Senior Care.

THE M. POWELL LAWTON AWARD LECTURE: THE PERSON-ENVIRONMENT FIT FRAMEWORK, OLDER ADULTS AND TECHNOLOGY INTERACTIONS

Sara Czaja, *Weill Cornell Medicine/Center on Aging and Behavioral Research, New York, New York, United States*

M. Powell Lawton made significant contributions throughout his illustrious career to improve the quality of life of older adults. His landmark theory of person-environment fit (P-E Fit) recognized the importance of understanding the dynamic interactions between older adults and their physical and social environments and the subsequent impact of these interactions on independent living. In today's living environments, technology is ubiquitous and can serve as both a barrier and facilitator to the ability of older people to live independently. This presentation will discuss how the P-Fit Model can be used to clarify potential mismatches between technology systems and the characteristics, abilities, and preferences of older adult and how it can be used to guide design and training interventions to maximize the ability of aging adults to interact successfully with technology systems. Examples will be drawn from the Center for Research and Education on Aging and Technology Enhancement (CREATE) in the domains of social engagement, work, and health from technology design and intervention perspectives. The CREATE conceptual framework, consistent with the P-E

Fit Model posits that users have varying needs, abilities, and attitudes; technology systems and tasks vary in demands; social, physical, and policy environments influence a person's access to and support for technology transactions; and human-technology interactions are dynamic. A focus of the presentation will be on how a user-centered design approach is compatible with the P-E Fit model and can optimize the fit between older adults and technology systems.

Session 4485 (Paper)

Work and Retirement

IQ IN YOUNG ADULTHOOD AND DEPRESSIVE SYMPTOMS OVER THE RETIREMENT TRANSITION

Linn Elena Zulka, Valgeir Thorvaldsson, and Linda B. Hassing, *University of Gothenburg, Gothenburg, Vastra Gotaland, Sweden*

Retirement can be a challenging life transition for mental health. Higher levels of IQ in young adulthood have been shown to be advantageous for different outcomes later in life such as quality of life and well-being. However, it remains unclear whether possessing higher cognitive abilities in early life also favors individuals' mental health when facing challenges related to the retirement transition. In this study, we therefore investigated the relationship between IQ in young adulthood and depressive symptoms over the retirement transition. We used data of six waves from the longitudinal population-based HEalth, Aging and Retirement in Sweden (HEARTS) study, as well as data on IQ in young adulthood from conscription. In a piecewise structural equation model, we modelled trajectories of depressive symptoms (measured by the CES-D scale) before and after retirement and in relation to young adulthood IQ ($n = 1722$ men). Results indicated an average decrease in depressive symptoms over the retirement transition for this sample of men. Higher childhood IQ was associated with further reduction in post-retirement depressive symptoms while controlling for education, retirement age, and memory ability and cardiovascular health at baseline. Our findings support the conclusion that higher IQ in young adulthood may act as a protective factor for mental health in the retirement transition. Individuals with higher IQ in young adulthood may have acquired coping strategies throughout their life-course, which they can apply when handling challenges related to retiring.

LEARNING TO WORK WITH CHRONIC HEALTH CONDITIONS: HOW TIME SINCE DIAGNOSIS AFFECTS OLDER WORKERS' VITALITY AND WORRIES

Anushiya Vanajan,¹ Ute Bültmann,² and Kène Henkens,³
 1. *Netherlands Interdisciplinary Demographic Institute (NIDI), The Hague, Netherlands, Den Haag, Zuid-Holland, Netherlands*, 2. *University Medical Center Groningen (UMCG), Groningen, Groningen, Netherlands*, 3. *Netherlands Interdisciplinary Demographic Institute (NIDI), The Hague, Zuid-Holland, Netherlands*

Background. Chronic health conditions (CHCs) pose stark detrimental effects on the health and abilities of older workers. The extent of these effects depend on the CHC,

the time since its diagnosis and the type of health measure: a rarely explored combination of heterogeneities. Objective. This study examined how four existing and newly diagnosed CHCs influences older workers' vitality and worries about enduring physically and mentally until retirement age. Method. Data from two waves of the NIDI Pension Panel survey conducted in the Netherlands in 2015 and 2018 were used. We analyzed a sample of 1,894 older workers between the ages of 60-62 years at wave 1 using conditional change ordinal least square regression models. Results. Having a CHC at wave 1 was associated with lower levels of vitality and higher levels of worries at wave 2. These effects of CHCs on vitality and worries were much larger for older workers who were newly diagnosed with CHCs compared to those who experienced CHCs for longer. Intriguingly, the new diagnosis of physically disabling conditions increased worries about physical endurance at wave 2, while the new diagnosis of mentally disabling conditions increased worries about mental endurance at wave 2. Conclusion. By distinguishing the effects of four existing and newly diagnosed CHCs on vitality and worries, this study allows the identification of vulnerable groups of older workers. The findings may inform work accommodations and interventions which could improve both the quality and sustainability of work lives, while promoting healthy ageing of older workers.

WORK EXPECTATIONS AND TRAJECTORIES OF DEPRESSIVE SYMPTOMS AND PASSIVE SUICIDAL IDEATION AMONG BABY BOOMERS

Linh Dang,¹ and Briana Mezuk,² 1. *University of Michigan School of Public Health, Ann Arbor, Michigan, United States*, 2. *University of Michigan, Ann Arbor, Michigan, United States*

Expectations regarding work (e.g., probability of retiring at a certain age), whether realized or not, may influence mental health, however there is limited quantitative research on this question. This study examined the longitudinal relationship between expectations of full-time work after age 62 and depressive symptoms and passive suicidal ideation among Baby Boomers, a generation that experienced the Great Recession as they neared retirement. Data came from the Health and Retirement Study, 2008 - 2016 ($N = 8,954$, mean age = 55.3, 52.2% female, 77.8% non-Hispanic White). Clinically-relevant depressive symptoms were indexed by the Composite International Diagnostic Interview (CIDI). Expectation (probability) of working after age 62 was modeled continuously (range: 0 to 1). Multivariate mixed-effects logistic regression models of screening positive on the CIDI and passive suicide ideation were fit, separately, adjusting for demographics, household income and wealth, and health characteristics. Respondents working at baseline were less likely to screen positive on the CIDI longitudinally (OR: 0.36, 95% CI: 0.26 - 0.51), and while expectations were inversely associated with screening positive on the CIDI this was not significant after accounting for work status (OR: 0.68, 95% CI: 0.43 - 1.09, $p=0.104$). Longitudinally, higher expectations of working were inversely associated with passive suicidal ideation (OR: 0.54, 95% CI: 0.32 - 0.92) even after accounting for working status. Future research will examine variation in these relationships by contextual factors like

wealth, sex, and race/ethnicity to clarify how these features shape the association between work and mental health for this generation of older adults.

Session 4490 (Symposium)

(RE)INTRODUCING THE GERONTOLOGY AND GERIATRICS CURRICULAR STANDARDS AND GUIDELINES IN HIGHER EDUCATION

Chair: Tamar Shovali

Co-Chair: Marilyn Gugliucci

Discussant: Nina Silverstein

The Academy for Gerontology in Higher Education (AGHE), the education member group of GSA, is the only national institutional membership organization devoted primarily to gerontology and geriatrics education. Its mission provides for development and sponsorship of initiatives to advance the field of aging through its focus on education in gerontology/geriatrics. AGHE first published the Gerontology and Geriatrics Curricular Standards over three decades ago – a document that has been an integral resource for implementing/revising programs in liberal arts, the sciences, and more recently, health professions. To meet the needs in the field for increased breadth and depth of content, the new 7th edition of the educational guidelines fully embraces competency-based education for gerontology, as the health professions programs have for years. Our first presenter will provide an overview of the new edition. The second presenter will focus on associate degree programs in gerontology and their unique contribution to higher education. The third will present on undergraduate programs in gerontology explaining how these programs give students an edge in today's job market. The fourth presenter will address graduate programs in gerontology, describing master's degree programs and doctoral degree programs in gerontology and aging studies. The fifth presenter will discuss health professions programs including geriatrics curricula for osteopathic medical education, gerontology/geriatrics curricula for health-related programs and the doctor of pharmacy degree programs. Presentations will provide expert recommendations for program development through mapping AGHE's Gerontology Competencies for Undergraduate and Graduate Education to programs in higher education. Nina Silverstein will serve as discussant.

STANDARDS AND GUIDELINES FOR A NEW DECADE

Tamar Shovali, *Eckerd College, Eckerd College, Florida, United States*

As the field evolved, so too, has the Gerontology and Geriatrics Curricular Standards and Guidelines in Higher Education. The 7th edition is focused on the integration of the highly vetted AGHE Gerontology Competencies for Undergraduate and Graduate Education. Through this work we establish a set of standards and guidelines that provides the foundation for excellence in gerontology and health professions education at various levels and across a range of programs in the US and globally. The document provide a model for institutions of higher education in the development of new programs, a basis for program assessment and evaluation, guidance for academic or institutional reviews in existing programs, and a platform for what constitutes a

program of study in gerontology/geriatrics or health professions programs for students, the public, and employers. An overview of the development of the 7th edition and suggestions for its use will be provided.

STANDARDS AND GUIDELINES FOR ASSOCIATE'S DEGREE PROGRAMS IN GERONTOLOGY

Suzie Macaluso,¹ and Michael Faber,² *1. Abilene Christian University, Abilene, Texas, United States, 2. Portland Community College, Portland, Oregon, United States*

Associate degree programs in gerontology occupy a unique space in higher education. They must prepare students for a wide variety of careers and opportunities from technical and vocational training to preparation for further gerontology education at a four-year college. It is widely known that there is great variability among the numerous associate degree programs in gerontology; this presentation gives an overview of the revised standards and guidelines for associate degree programs. Associate degree programs will vary based on the faculty, the leadership, the program, and institutional support, this presentation discusses best practices for a variety of program types paying particular attention to competency-based educational strategies.

STANDARDS AND GUIDELINES FOR UNDERGRADUATE PROGRAMS IN GERONTOLOGY

Carrie Andreoletti,¹ Laura Donorfio,² Karen Kopera-Frye,³ and Robert Maiden,⁴ *1. Central Connecticut State University, New Britain, Connecticut, United States, 2. University of Connecticut, Waterbury, Connecticut, United States, 3. New Mexico State University, Las Cruces, New Mexico, United States, 4. Alfred University, Alfred, New York, United States*

Undergraduate programs (majors, minors, certificates) and continuing education programs in gerontology prepare students for entry-level careers in aging and increase competitiveness for graduate work in a variety of fields. Job growth in the field of gerontology is high, especially for positions requiring a bachelor's degree and less. Gerontology education at this level is essential for meeting the growing demand for workers in social services and health services who understand the opportunities and challenges that come with increased longevity and global aging. This presentation will highlight the new recommendations for competency-based gerontology education for undergraduate and continuing education credentials outlined in the latest edition of AGHE Standards and Guidelines. Whether you are developing a new curriculum or revising an old one, we will offer suggestions for using the AGHE competencies and guidelines to ensure that your program adequately prepares students and offers them a competitive edge in today's job market.

STANDARDS AND GUIDELINES FOR GRADUATE PROGRAMS IN GERONTOLOGY AND GERIATRICS

Julie Masters,¹ and Rona Karasik,² *1. University of Nebraska, Lincoln, Nebraska, United States, 2. Saint Cloud State University, SAINT CLOUD, Minnesota, United States*

Graduate programs in gerontology prepare students for advanced academic and/or applied careers in aging. Programs at this level offer greater depth, breadth, and increased emphasis on theory and research. Persons completing a master's

and/or doctoral degree in gerontology or aging studies have reached the level of “gerontologist” whereby they have completed the necessary coursework in the physical, psychological, social and built environment in order to understand the unique opportunities and challenges of aging in a scholarly manner. While the depth of treatment of each topic will vary across programs, each of the AGHE Core Competencies should be mastered at a level of “analyzation and evaluation” or higher on Bloom’s Taxonomy of Educational Objectives. The current presentation addresses how the AGHE Standards and Guidelines for graduate programs in gerontology were updated as a competency-based curriculum that includes coursework, practicum, and a culminating project (e.g., thesis, comprehensive exam, and/or dissertation).

QUALITY HEALTH PROFESSIONS PROGRAMS: PATH TO PROGRAM OF MERIT DESIGNATION

Marilyn Gugliucci, *University of New England College of Osteopathic Medicine, Kennebunk, Maine, United States*

In 2015, the AGHE Program of Merit was expanded to implement a voluntary evaluation process for health professions programs that integrate gerontology/geriatrics competencies within their curriculum. These competencies augment students’ competence and confidence in the field of aging, preparing them to work with older adults and their care partners. All health professions and medical education programs are eligible to apply for the Program of Merit designation. This international process of evaluation: (1) Verifies program credibility and quality; (2) Informs campus administrators of global guidelines, expectations, and practice in aging for their health professions programs; (3) Assures quality graduates from POM designated programs; and (4) Clarifies for employers the knowledge and skills imparted to student graduates of POM designated health professions programs. Additionally, graduates from POM programs receive a certificate from AGHE stating the health profession program is a designated AGHE Program of Merit.

Session 4495 (Symposium)

AGE-FRIENDLY COMMUNITIES: RESEARCH ON PROMISING AND INNOVATIVE PRACTICES

Chair: Patricia Oh

Co-Chair: Holly Dabelko-Schoeny

Discussant: William Armbruster

Age-friendly community (AFC) leaders engage with community residents, groups, and organizations to enhance social, service, and built environments for aging. Despite the growing number of AFCs, academic research remains in its nascence. During this symposium, U.S. scholars will present research on AFC implementation. The first two papers address promising practices among AFC leaders. The first paper presents results from a content analysis of American AFC progress reports. Results indicate strong evidence of progress achieved and opportunities for improving the evaluation, documentation, and dissemination of accomplishments. The second paper presents findings from a qualitative descriptive study on community events by AFC initiatives in northern New Jersey. Results indicate how age-friendly leaders use community events to enhance older adults’ social participation and inclusion, and as a tactic toward longer-term, multi-domain community change. The third and fourth papers

describe the development and testing of innovative technologies to guide AFC implementation. The third paper provides an overview of Safe Routes to Age in Place, a community-engaged mixed methods study using the app MyAmble to examine the needs and utilization of alternative transportation in Franklin County, Ohio. The fourth paper provides a case overview of a university-community partnership to develop a geographical information system (GIS) analytical mapping tool to evaluate the age-friendliness of public amenities in San Antonio, Texas. The symposium will conclude with remarks from AARP Livable Communities leadership about how these studies contribute to building knowledge about AFC implementation and avenues for academic and private partnerships to translate these findings to practice.

AGE-FRIENDLY COMMUNITY PRACTICE: UNDERSTANDING THE ROLE OF COMMUNITY EVENTS

Natalie Pope,¹ Emily Greenfield,² Althea Pestine-Stevens,¹ and Clara Scher,¹ 1. *Rutgers Social Work, New Brunswick, New Jersey, United States*, 2. *Rutgers, The State University of New Jersey, New Brunswick, New Jersey, United States*

To advance an emerging empirical knowledge base for age-friendly community initiatives (AFCIs), we conducted a qualitative descriptive study to explore one manifestation of age-friendly practice: community events (CEs). We aimed to illuminate how AFCI core teams describe CEs as part of their practice and how they perceive the value of CEs for age-friendly progress. Using inductive coding, we analyzed data from semi-structured interviews (n=24) with eight core teams across three time points spanning the early to mid-implementation phases of the AFCIs. Two predominant themes emerged. First, CEs were described as important for working toward age-friendly goals concerning older residents’ social participation and inclusion. Second, core teams described the longer-term strategic value of CEs, such as building interorganizational partnerships; providing deeper insight on aging in community; and fostering older adults’ leadership as part of the initiative. We discuss implications for advancing transdisciplinary program theory to guide more sustainable and effective AFCIs.

SAFE ROUTES TO AGE IN PLACE: A FOCUS ON ALTERNATIVE TRANSPORTATION

Holly Dabelko-Schoeny,¹ Noelle Fields,² Katie White,³ Christine Highfill,⁴ Qiuchang Cao,⁵ and Ian Murphy,⁵ 1. *The Ohio State University, The Ohio State University, Ohio, United States*, 2. *University of Texas at Arlington, Arlington, Texas, United States*, 3. *Ohio State University, Age-Friendly Columbus and Franklin County, Ohio, United States*, 4. *University of Texas - Arlington, Arlington, Texas, United States*, 5. *The Ohio State University, Columbus, Ohio, United States*

Informed by social cognitive theory, Age-Friendly Columbus and Franklin County conducted a community-engaged mixed methods study that examined the needs and utilization of alternative transportation by older residents in three pilot neighborhoods in Franklin County, Ohio (n = 32). Participants were provided tablets and used an app (MyAmble) developed at the University of Texas-Arlington to document their traveling experiences. During

a 14-day period, 1,190 trips were recorded by older adults and 71.3% of these trips were completed through driving their own personal vehicles. Participants designated 84.5% of trips as important and 72% of the trips improved their mood. Individual (physical and cognitive functioning, cost, time), environmental (lighting, sidewalk conditions, traffic, location of bus stops, weather), and behavioral (no history of bus use, peer to peer information sharing, tracking led to future planning) barriers and facilitators to alternative transportation use such as riding the bus, walking and biking were identified.

ASSESSING AGE-FRIENDLY COMMUNITY PROGRESS: WHAT HAVE WE LEARNED?

Kathy Black,¹ and Patricia Oh,² 1. *University of South Florida, Sarasota-Manatee, Florida, United States*, 2. *UMaine Center on Aging, Bangor, Maine, United States*

The Global Network of Age-friendly Cities and Communities has grown steadily over the past decade across the United States, however surprisingly little is known regarding their accomplishments to date. We utilized content analysis to assess the progress reported by American age-friendly communities (n = 30) that joined by end of year 2015 using the Age-Friendly Community Evidence-based Tool with expanded program evaluation measures including health equity as defined by the World Health Organization. We employed deductive analytic techniques to assess reported community performance in eleven thematic areas across the range of structures and processes that characterize age-friendly efforts. We found strong evidence in the areas of leadership and governance, harnessed resources, application of age-friendly framework, and in multisector collaboration as well as reported provisions. All of the communities reported health equity aims, particularly in promoting accessible physical environments and social inclusion efforts. Our analysis further revealed areas for continued improvement.

Session 4500 (Paper)

Aging in Place (SRPP Paper)

AGE-FRIENDLY COMMUNITIES AND AGING IN PLACE: FINDINGS FROM LATENT PROFILE ANALYSIS

Seon Kim,¹ Kyeongmo Kim,² and Junpyo Kim,³ 1. *Virginia Commonwealth University, Richmond, Virginia, United States*, 2. *Virginia Commonwealth University, Henrico, Virginia, United States*, 3. *Gyeongsang National University, Jinju-si, Gyeongsang-namdo, Republic of Korea*

Older adults prefer to live in their current home or community and 'Aging in place' has been shown to reduce the cost of caring for older adults and help their successful aging. Although age-friendly communities (AFC) initiatives have been helpful to aging in place, little has been known about the relationship between the types of AFC and aging in place. Using the 2017 AARP Age-Friendly Community Survey, we included 1,079 adults aged 65 or older. We measured aging in place as 'move to a different community', 'move into a different residence within your current community', and 'stay in your current residence', and included eight AFC constructs. We identified the type of AFC using Latent Profile

Analysis: low-friendly, mid-friendly, and high-friendly. We also ran multinomial logistic regression to examine whether the types of AFC were associated with aging in place. Of the total participants, 26.0% lived in the low-friendly community, 23.7% in the mid-friendly community, and 50.3% in the high-friendly community. Older adults living in the high-friendly community were more likely to stay in the current residence (64.7%) than those in the low-friendly (47.1%) ($\chi^2=28.680$, $p<.001$). Also, older adults living in the low-friendly community (OR=3.05, $p<.001$) and the mid-friendly community (OR=1.42, $p<.10$) were more likely to move to a different community compared to those living in the high-friendly community. This result suggests that it is important to build an AFC to promote aging in place. For the growing number of older adults' lives, policymakers should consider expanding the AFC initiatives.

HOME AND COMMUNITY FEATURES, PERCEIVED AGE-FRIENDLINESS, AND INTENTION TOWARD AGING IN PLACE

Yeon Jin Choi, *University of Southern California, Los Angeles, California, United States*

Promoting age-friendliness of communities and supporting aging in place (AIP) are of great importance in aging societies. However, little is known about the mechanism linking home and neighborhood features, older adults' global assessment of community, and their willingness to age-in-place despite the importance in developing policies and interventions. This study used the 2015 AARP Age-Friendly Community Survey, which includes 66 home and neighborhood features under the eight domains specified by the WHO's Age-Friendly Cities Guidelines. A series of linear regression models were estimated to examine the interrelationship between the availability of age-friendly features in eight domains, perceived age-friendliness of community, and intention toward AIP. Overall, a greater availability of age-friendly features was positively associated with perceived age-friendliness of community and AIP intention. The relationship between age-friendly features and AIP intention was mediated by perceived age-friendliness of community (50.3% to 96% of the total effects). When perceived age-friendliness of community was introduced to models, the direct effects of housing, outdoor spaces and buildings, and transportation domains remained significant. Findings suggest that a greater availability of age-friendly features influence older adults' perception on their community, leading to the development of a desire to age-in-place. Domains of housing, outdoor spaces and buildings, and transportation may be the most importance features in promoting age-friendliness of community and the key determinants of aging-in-place. Policy makers and practitioners may need to prioritize promoting age-friendly built environment before social environment in building age-friendly communities.

OLDER ADULTS' PERCEPTIONS OF SMART CITY INITIATIVES TO AGE IN COMMUNITY

Jongwoong Kim, *West Chester University of Pennsylvania, West Chester, Pennsylvania, United States*

This project explores older American adults' perceptions of smart city initiatives for them to "age in community" particularly in the northeast region. As the U.S. population

is aging, it is imperative that the American cities can support their citizens to live in their preferred community environments for as long as they want. While there are many definitions of a smart city, some exemplary smart city initiatives can be characterized as actively utilizing information and sensor technologies to promote efficiency and sustainability of city-wide systems, ultimately enhancing the quality of citizens' life. This project examines, in particular, seven smart city initiatives that are implemented globally: smart streetlights, health and fall monitoring system, community ridesharing, enhanced CCTVs, "age-friendly map," contact tracing app, and smart traffic system. By surveying those age 55 and older, with a representative sampling from the nine states in the northeast region, this project found that the vast majority of older Americans in this region would prefer to age in rural and suburban communities, and depending on where they prefer to age in (rural-exurban-suburban communities vs. urban-urban center communities) and gender (female vs. male), they perceive particular sets of smart city initiatives as more important for them to age in community. Furthermore, regardless of the community/location preference and demographic (gender, income level, and age) differences, 40% of the respondents expressed no concern of data or information privacy issues from these initiatives, opening some doors for the municipalities that plan to adopt some of these initiatives in the near future.

THE COST EFFICIENCY OF HOME MODIFICATIONS TO REDUCE HEALTH CARE COSTS

Jesse Abraham, *HomesRenewed, Washington, District of Columbia, United States*

The existing quantity of housing dedicated for older adults is not sufficient to meet the needs of this growing population. And even as the Centers for Medicare and Medicaid Services reimbursement structures are shifting from traditional inpatient and outpatient settings to care in the home, it is a commonplace that most homes were not designed or built to support the needs of aging residents or the provision of healthcare. It is time for America's 100 million existing houses to be made as safe and accessible as possible for aging in place. Falls cost over \$50 billion a year in medical expenses. This paper distills current knowledge regarding healthcare cost reductions from home modifications, and then calculates the cost efficiency to society and to the federal government of providing government subsidies for home modifications for older adults at the ages of 50, 65 and 75. Cost sharing among insurers, government and the beneficiary is one way to achieve the positive social returns.

TYPES OF LATE-LIFE CHALLENGES TO AGING IN PLACE

Kyeongmo Kim, *Virginia Commonwealth University, Henrico, Virginia, United States*

Many older adults prefer to live within their community because they have built strong relationships with their neighbors and neighborhood. Although housing-related factors promote aging in place, findings on the relationships of late-life challenges to aging in place (e.g., cost of living, autonomy) and relocation are mixed. Less is known about the types of challenges to aging in place and about the

relationship between the types of challenges and relocation. Using data from the AARP 2015 Age-Friendly Community Surveys (N=3,190 adults aged 65 and older), this study examined the intersection of challenges to aging in place (e.g., home size, cost, safety, independence, family, transportation) and relocation (i.e., move to a different home outside of their community). Using latent class analysis (LCA), we identified five subgroups of late-life challenges to aging in place: multifaceted challenges, cost of living, independence, social connection, no concern. Findings from LCA with a distal outcome showed that older adults with multifaceted challenges ($b=0.77$, $p<.001$), were more likely to move out of their community, compared to those with lower levels of challenges, even after adjusting for age, sex, education, income, and chronic diseases. Also, those with challenges regarding the cost of living ($b=0.84$, $p<.001$), independence ($b=0.64$, $p<.001$), and family connection ($b=0.45$, $p<.001$) were more likely to expect to move out of their community. The findings highlight that older adults have different types of challenges to aging in place. Practitioners and policymakers should provide more individualized supportive services, considering the types of challenges to promote aging in place.

Session 4505 (Symposium)

AMBULATORY ASSESSMENT OF SOCIO-AFFECTIVE AND COGNITIVE AGING: ZOOMING INTO DAILY PROCESSES

Chair: Tabea Meier

Co-Chair: Andrea Horn

Discussant: Christina Roecke

Ambulatory assessment methods offer new possibilities to study cognitive, emotional, and social processes in the setting in which they naturally occur, namely in the daily life of individuals and couples. This allows to zoom into processes with great relevance for healthy aging and well-being over the lifespan. Research on daily psychological processes opens the door for investigating the interplay with contextual (daily stress, social resources) and stable factors (relationship quality status, accumulated discrimination) that are known to shape these dynamic processes. This symposium will present and discuss innovative contributions investigating daily emotional and cognitive functioning and their interplay with social and individual characteristics over the adult lifespan. The first study by Haas and colleagues will present experience sampling data on daily prospective memory performance in couples. Haas et al. will offer a dyadic perspective on cognitive functioning by examining how prospective memory performance is co-regulated in the daily lives of younger and older couples. Meier et al. will present another study from the same couples project; here the focus is on age differences in couples' "we-ness" and its relationship with daily positive emotional experiences and how they are shared with the partner. The series of talks will be completed by Zavala et al. who examined associations between stress and emotional health in daily life and its interplay with prior discrimination experiences of an age-diverse sample of BIPOC adults. After these individual contributions, Christina Roecke will discuss the presented studies and provide her reflections on the results and their implications.

SHARED POSITIVITY IN DAILY LIFE OF YOUNGER AND OLDER COUPLES: LINKS BETWEEN WE-NESS AND POSITIVE EMOTIONS

Tabea Meier,¹ Zilla Huber,² Olenka Dworakowski,³ Claudia Haase,⁴ Mike Martin,⁵ and Andrea Horn,²

1. *School of Education and Social Policy, Northwestern University, Evanston, Illinois, United States*, 2. *University Research Priority Program (URPP), Dynamics of Healthy Aging & Department of Psychology, University of Zurich, University of Zurich, Zurich, Switzerland*, 3. *University Research Priority Program (URPP), Dynamics of Healthy Aging, & Department of Psychology, University of Zurich, University of Zurich, Zurich, Switzerland*, 4. *School of Education and Social Policy and (by courtesy) Department of Psychology, Northwestern University, Northwestern University, Illinois, United States*, 5. *University of Zurich, Zurich, Zurich, Switzerland*

Positivity resonance, the shared experience of emotional positivity, may contribute to the quality of romantic relationships and foster couples' sense of "we-ness". The present study examined age differences in couples' positive experiences in daily life, how they are shared with the partner, and how they are related with "we-ness". In a 21-day experience sampling study, 62 younger (18-33 years) and 54 older (57-87 years) couples reported their momentary positive emotional experiences and disclosure. We-ness was operationalized as the rate of we-pronouns in couples' audio-sensed daily conversations. As hypothesized, daily positivity was associated with we-ness, and older couples experienced more positive affect than younger couples. Older couples also showed higher manifestations of we-ness, and these age differences in we-ness were partially explained by more positive disclosure in daily life. Our results contribute to the literature on socio-emotional positivity and aging by showing how these processes manifest in daily life.

ASSOCIATIONS BETWEEN STRESS EXPOSURE AND EMOTIONAL HEALTH: THE MODERATING ROLE OF DISCRIMINATION

Daisy Zavala,¹ Elizabeth Muñoz,² Martin Sliwinski,³ and Stacey Scott,⁴ 1. *Stony Brook University, Ridgewood, New York, United States*, 2. *University of Texas at Austin, University Of Texas At Austin, Texas, United States*, 3. *The Pennsylvania State University, University Park, Pennsylvania, United States*, 4. *Stony Brook University, Stony Brook, New York, United States*

The Weathering Hypothesis states BIPOC face more stressors, by which over a lifetime they are subjected to

the negative consequences of stress (e.g., poorer emotional health). Using ecological momentary assessments, we examined whether subtle discrimination moderated the within-person stressor slope on positive and negative affect. We predicted emotional wellbeing would be worse at stressor moments, and those with greater discrimination experience would be more impacted by stressors. Participants were 334 diverse adults (25-65 years, Mage = 47, 63% Female) from Bronx, New York. Positive affect decreased and negative affect increased significantly at stressor moments ($p < .0001$). Unexpectedly, subtle discrimination was not a significant moderator for the within-person stressor slope on positive affect and negative affect. Unlike the predictions of the Weathering Hypothesis, these results show that prior discrimination experiences may not exacerbate responses to stressors and entail additional risk in daily life.

INVESTIGATING EVERYDAY PROSPECTIVE MEMORY IN YOUNGER AND OLDER COUPLES

Maximilian Haas,¹ Tabea Meier,² Zilla Huber,³ Matthias Kliegel,⁴ and Andrea Horn,³ 1. *University of Geneva, University of Geneva, Geneva, Switzerland*, 2. *School of Education and Social Policy, Northwestern University, Evanston, Illinois, United States*, 3. *University Research Priority Program (URPP), Dynamics of Healthy Aging & Department of Psychology, University of Zurich, University of Zurich, Zurich, Switzerland*, 4. *Faculty of Psychology and Educational Sciences & Centre for the Interdisciplinary Study of Gerontology and Vulnerability, University of Geneva, University of Geneva, Geneva, Switzerland*

Daily events are not simply individual concepts, but shared by the social environment we live in. The present study investigates the role of romantic partners in the co-regulation of cognitive functioning by the example of prospective memory (PM), the ability to remember and correctly execute future intentions. In this context, we examined the impact of social proximity (i.e., physical closeness and psychological intimacy) on interpersonal regulation. Over the course of 21 days, 64 younger couples (18-33 years) and 52 couples of older adults (57-87 years) completed an ambulatory assessment comprising a daily pseudo-randomized PM task. Results reveal that couples' PM performance was higher for younger than for older participants. Further, dyadic PM was correlated with psychological intimacy for both age groups, but the impact of time spent together on intimacy and PM performance, respectively, was stronger in older adults. Possible moderating factors and explanations for these findings will be discussed.

BS GSA and AAA Joint Symposium

RIBOSOMAL PROTEIN 6 PHOSPHORYLATION REGULATES TRANSLATIONAL RESPONSES TO DIETARY RESTRICTION

Jarod Rollins, *MDI Biological Laboratory, Salbury Cove, Maine, United States*

Forms of dietary restriction like intermittent fasting (IF) and caloric restriction (CR) promote health and longevity through changes in gene expression. While the transcriptional changes that occur in response to DR have been well described across several species, the role of translational regulation has lagged. Using polysome profiling and mRNA-seq, we quantified changes in actively translated mRNAs that occur in *C. elegans* under CR compared to well-fed conditions. The analysis revealed hundreds of transcripts regulated on the translational level that would have been missed using conventional transcriptomics. Among the translationally down-regulated genes that were pro-longevity when knocked down were regulators of the cell-cycle: *fbx-24*, *sdz-33*, *kbp-1*, and *cdk-2*. In search of the mechanisms regulating selective translation under CR we investigated a role for ribosomal protein 6 (RPS-6) as its phosphorylation status is thought to regulate cell cycle and selective translation of mRNA transcripts. Using RPS-6 phospho-null and phospho-mimetic mutants, we show that phosphorylation and de-phosphorylation of RPS-6 is necessary for the pro-longevity effects of CR and IF. Furthermore, we show that IF is more beneficial for retaining locomotion with age than CR and that endogenously tagged RPS-6::mCherry accumulates in body wall muscle under fasting. However, the benefit of IF on locomotion is lost in RPS-6 phospho-mimetic mutants. Together, results suggest that protein translation is enhanced in the muscle under IF to prevent sarcopenia in a way dependent on RPS-6. Translatome analysis of the phospho-mutant suggested a role for RPS-6 in selective translation of p38 mitogen-activated protein kinases.

AGE-RELATED NEUROPROTECTION BY DIETARY RESTRICTION REQUIRES OXR1-MEDIATED RETROMER FUNCTION

Kenneth Wilson,¹ Sudipta Bar,² George Brownridge,¹ Jennifer Beck,¹ Rachel Brem,³ Hugo Bellen,⁴ Lisa Ellerby,¹ and Pankaj Kapahi,¹ *1. Buck Institute for Research on Aging, Novato, California, United States, 2. Buck Institute for Research on Aging, Buck Institute for Research on Aging, California, United States, 3. University of California, Berkeley, Berkeley, California, United States, 4. Baylor College of Medicine, Houston, Texas, United States*

Dietary restriction (DR) is the most robust method to delay aging and the onset of neurodegenerative disorders across multiple species, though the mechanisms behind this phenomenon remain unknown. To elucidate how DR mediates lifespan extension, we analyzed natural genetic variants that associate with increased longevity under DR conditions in the *Drosophila* Genetic Reference Panel. We found that neuronal expression of the fly homolog of human Oxidation

Resistance 1 (OXR1) is necessary for DR-mediated lifespan extension. Neuronal knockdown of OXR1 also accelerated visual decline but not physical decline, arguing for a specific role of OXR1 in neuronal signaling. Further, we find that overexpression of the TLDc domain from human OXR1 is sufficient for lifespan extension in a diet-dependent manner. Studies from the Accelerating Medicines Partnership - Alzheimer's Disease network show that patients with reduced OXR1 protein levels are more prone to Alzheimer's disease diagnosis, and we find that overexpression of human OXR1 is protective in animal and cell Alzheimer's models. In seeking the mechanism by which OXR1 protects against age-related neuronal decline, we discovered that it provides a necessary function in regulating the neuronal retromer complex, which is essential for the recycling of transmembrane receptors and for maintenance of autophagy. We further discovered that OXR1 deficiency can be rescued by genetic or pharmacological enhancement of retromer function, and that this enhancement extends lifespan and healthspan. Understanding how OXR1 operates could help uncover novel mechanisms to slow neurodegeneration including Alzheimer's disease.

AGING PREDISPOSES B CELLS TO MALIGNANCY BY ACTIVATING C-MYC AND PERTURBING THE GENOME AND EPIGENOME

Anastasia Shindyapina,¹ Jose Castro,² Alessandro Barbieri,³ João Paulo,⁴ Olga Strelkova,⁴ John Sedivy,⁵ John Manis,⁴ and Vadim Gladyshev,⁶ *1. Brigham and Women's Hospital, Harvard Medical School, Brigham and Women's Hospital, Harvard Medical School, Massachusetts, United States, 2. I 3. S, Porto, Porto, Portugal, 3. Boston Children's Hospital, Boston, Massachusetts, United States, 4. Harvard Medical School, Boston, Massachusetts, United States, 5. Brown University, Providence, Rhode Island, United States, 6. Brigham and Women's Hospital, Boston, Massachusetts, United States*

Age is the single major risk factor for human cancer, but naturally occurring cancers are rarely studied in aging models. Like humans, mice spontaneously develop cancer with age, and standard laboratory strains are predisposed for B-cell lymphoma. Here, we uncover how B-cell lymphoma develops as a consequence of the aging immune system. We found that aged B cells acquire somatic mutations in tumor suppressors and oncogenes (e.g. *Trp53*, *Pim1*, and *Myh11*) and undergo monoclonal expansions, with some clones representing 86% of splenic B cells. Clonal B cells had hypermethylated promoters and globally silenced expression, suggesting a role of DNA methylation in clonal selection of premalignant B cells. B-cell size, spleen weight, and a novel population of B cells, which we named Myc+ cells, emerged as convenient markers of malignancy. High-throughput analyses of clonal B cells and the use of genetic mouse models revealed that c-Myc drives B-cell size increase and clonal expansion with age. Phosphoproteome and co-culture experiments revealed that c-Myc is activated by signals from the aging microenvironment. Moreover, single-cell RNA-seq suggested that clonal B cells originate from age-associated B cells, further underlying the importance of aging environment in cancer transformation. Longitudinal analyses demonstrated a negative impact of premalignant B

cells on mouse lifespan and linked it to age-related myeloid bias. Together, our study revealed cell-autonomous changes that cooperate with the aging microenvironment to give rise to preneoplastic B cells. This study established a novel model to study how aging predisposes cells to cancer transformation.

AN EVOLVING ROLE FOR THE LONG NON-CODING RNA H19 IN AGING AND SENEESCENCE

Manali Potnis and Christian Sell, *Drexel University, Philadelphia, Pennsylvania, United States*

The long non-coding RNA (lncRNA) H19 is a maternally imprinted gene transcript that, in conjunction with the neighboring *Igf2* gene, is critical in controlling embryonic growth. Loss of H19 results in fetal overgrowth associated with Beckwith Weidemann syndrome, while elevated H19 occurs in human cancers. In the adult, H19 functions in cancer cells where it promotes migration and is correlated with poor prognosis, and in adult stem cells where it is a key regulator of cell fate decisions during differentiation. While the function of H19 in primary somatic cells has not been defined, a reduction in the abundance of H19 has been reported during senescence in endothelial cells. Given the critical importance of H19 in cell fate decisions, it is likely that understanding the precise function of H19 in somatic cells in general and why reduced levels occur with cellular senescence will provide novel insights into both somatic cell maintenance and the senescence program. Towards this end, we examined the role of H19 in somatic cell growth using cardiac interstitial fibroblasts. Our results indicate that H19 is not only vital for somatic cell proliferation and survival, but that depletion of H19 leads to cell cycle arrest and the formation of abnormal nuclei resulting in senescent cells. We are defining both the upstream regulators of H19 and the downstream mediators of senescence following H19 depletion. Overall, these results indicate an essential role for H19 in cell cycle progression, chromatin structure, and possibly proper mitotic division.

Session 4515 (Symposium)

CHANGE, CORRELATES, AND STRUCTURE OF PERSONALITY ACROSS ADULTHOOD

Chair: Olivia Atherton

Co-Chair: Emorie Beck

Personality is both stable and changing across the lifespan. However, many questions remain about the factors that account for individual differences in change, the consequences of personality for life outcomes, and how best to assess personality at different points in the lifespan. First, Olivia Atherton will discuss research on the development of the Big Five personality traits from young adulthood to midlife with a sample of Mexican-origin individuals, as well as sociodemographic and cultural predictors of personality change in this population. Second, Bill Chopik uses data from 90 countries to examine the consistency of age differences in positive personality traits in the second half of life, from midlife to old age, as well as how cultural characteristics moderate the terminal decline in positive personality traits. Third, Emorie Beck will present research demonstrating that personality traits from the Big Five to beyond are robustly associated with a number of key life events across countries, decades, sociodemographic moderators, and even when

controlling for selection bias. Finally, Josh Jackson uses network psychometric techniques to examine coherence and differentiation among indicators of the Big Five from 14 to 85 in a large multinational sample, tracking age differences with consequences for the assessment of personality traits in older adulthood. We will conclude with a panel discussion of emerging issues in personality change, prediction, and assessment across adulthood, with each speaker providing unique experience and insight into the study of each area.

BIG FIVE DEVELOPMENT FROM YOUNG ADULTHOOD TO MIDLIFE: FINDINGS FROM A LONGITUDINAL STUDY OF MEXICAN-ORIGIN ADULTS

Olivia Atherton,¹ Angelina Sutin,² Antonio Terracciano,³ and Richard Robins,⁴ 1. *Northwestern University, Chicago, Illinois, United States*, 2. *Florida State University College of Medicine, Tallahassee, Florida, United States*, 3. *Florida State University, Florida State University, Florida, United States*, 4. *University of California, Davis, Davis, California, United States*

A large body of research has documented how personality develops across adulthood, yet very little longitudinal work has examined whether these findings generalize beyond predominantly middle-class, highly-educated White American or Western European individuals. This pre-registered study uses longitudinal data from 1,110 Mexican-origin adults who completed a well-validated personality measure, the Big Five Inventory, up to 6 times across 12 years (median age at Wave 1 = 37.7; range = 26 to 65). Individuals generally maintained their rank ordering on the Big Five over time ($r_s = .66-.80$), and all of the Big Five traits showed small, mean-level decreases across adulthood. These trajectories had few associations with sociodemographic factors (sex, education level, IQ) and cultural factors (generational status, age at immigration, Spanish/English language preference, Mexican cultural values, American cultural values, ethnic discrimination). Divergences between the present findings and previous research highlight the need to study personality development across diverse aging samples.

CULTURAL CONSISTENCY IN LATE-LIFE DECLINES IN POSITIVE PERSONALITY TRAITS

William Chopik, *Michigan State University, East Lansing, Michigan, United States*

Personality has elements of both stability and change across the adult lifespan. There has also been evidence for terminal decline—late-life decreases in positive psychological characteristics. However, many of these studies have examined these patterns in primarily Western populations. The current study examined the consistency of age differences in positive personality traits (i.e., character strengths) across cultures. I examined 2,895,051 participants ranging in age from 13 to 100 ($M_{age} = 34.31$; 65.3% women) from 90 different countries. I reproduced patterns of terminal decline across cultures. In addition to mean differences between cultures (e.g., focusing on the present is associated with more positive traits [$M_r = .45$]), cultural characteristics often moderated the effects of age on positive personality traits. For example, terminal decline was more dramatic among people from collectivistic cultures and flatter among people from

individualistic cultures. Results will be discussed in the context of cultural variation developmental processes.

A MEGA-ANALYSIS OF PERSONALITY PREDICTION: ROBUSTNESS AND BOUNDARY CONDITIONS

Emorie Beck,¹ and Joshua Jackson,² 1. *Northwestern University Feinberg School of Medicine, Chicago, Illinois, United States*, 2. *Washington University in St. Louis, St. Louis, Missouri, United States*

Decades of studies identify prospective associations between personality characteristics and life outcomes. However, previous investigations of personality characteristic-outcome associations have not taken a principled approach to sampling strategies to ensure the robustness of personality-outcome associations. In a preregistered study, we test whether and for whom personality-outcome associations are robust against selection bias using prospective associations between 14 personality characteristics and 14 health, social, education/work, and societal outcomes across eight different person- and study-level moderators using individual participant data from 171,395 individuals across 10 longitudinal panel studies in a mega-analytic framework with propensity score matching. Two findings emerged: First, personality characteristics remain robustly associated with later life outcomes. Second, the effects generalize, as there are few moderators of personality-outcome associations. In sum, personality characteristics are robustly associated with later life outcomes with few moderated associations. We discuss how these findings can inform studies of personality-outcome associations.

AGE DIFFERENCES IN PERSONALITY STRUCTURE

Joshua Jackson,¹ David Condon,² and Emorie Beck,³ 1. *Washington University in St. Louis, St. Louis, Missouri, United States*, 2. *University of Oregon, Eugene, Oregon, United States*, 3. *Northwestern University Feinberg School of Medicine, Chicago, Illinois, United States*

Most investigations in the structure of personality traits do not adequately address age, as few studies look at the structure of personality traits a-theoretically, instead presupposing a theoretical structure e.g., Big Five. As a result, the relationship among indicators within a trait (coherence) are often highlighted but relationships across traits (differentiation) are not thoroughly examined. Using a large-scale sample of 369,151 individuals ranging in age from 14 to 90, the present study examines whether personality indicators show differential relationships as a function of age. Results indicate that coherence shows few changes across the lifespan, while differentiation weakens across adulthood into old age. These findings suggest that Big Five indicators only parallel the Big Five structure among young but not older adults. Thus, using standard Big Five personality trait assessments in older adults may, at best, not reflect reality and, at worse, undermine the predictive utility of personality traits.

Session 4520 (Symposium)

COMMUNITY MOBILITY IN OLDER ADULTS: NOVEL METHODOLOGIES, RISK FACTORS, AND INTERVENTIONS

Chair: Andrea Rosso
Co-Chair: Michelle Carlson
Discussant: Jana Hirsch

Community mobility is an individual's movement outside the home. It is essential for the completion of many instrumental activities of daily living, such as shopping and healthcare, and promotes physical function, social engagement, independent living, and quality of life. Mobility research often focuses on gait speed measured in clinical settings, a critical but not sufficient determinant of community mobility. Here we present four talks that assess community mobility and its determinants using novel methodologies to enhance our understanding of how to maintain independence in older ages. First, Andrea Rosso presents characteristics of individuals with the strongest associations between environmental walkability, as assessed by virtual audits, and walking. Second, Kyle Moored demonstrates associations of self-reported fatigability with life space among older men, independent of their physical functioning. Breanna Crane introduces GPS-based objective measures of community mobility and their associations with cognitive and physical function of older adults. Finally, Pam Dunlap presents results of a randomized clinical trial of a physical therapy intervention to improve walking in older adults on subjective and objective measures of life space. These talks will provide a better understanding of the factors related to community mobility, introduce attendees to novel methodologies in the assessment of both community mobility and risk factors associated with the loss of community mobility, and demonstrate approaches to improve community mobility in at-risk older adults. The discussant, Jana Hirsch, will provide perspectives on how these data inform our current view of community mobility and will lead a discussion with the audience.

WHAT DETERMINES VULNERABILITY TO NEIGHBORHOOD WALKABILITY IN OLDER ADULTS?

Andrea Rosso,¹ Caterina Rosano,¹ Alyson Harding,² Stephanie Studenski,¹ and Philippa Clarke,³ 1. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2. *University of Minnesota, Minneapolis, Minnesota, United States*, 3. *Institute for Social Research, Ann Arbor, Michigan, United States*

Environmental influences are recognized as important predictors of walking behaviors in older adults. However, individuals may differ in vulnerability to low environmental walkability. We determined associations of a walkability index (factor analysis of 16 variables; range -1.65 to 2.23) from audits of online images with self-reported walking behaviors in 406 adults mean age=82 (44% male, 39% Black). Effect modification by 12 variables representing sociodemographics, physical and mental health, and neighborhood characteristics was tested in general linear models. Effect modification was evident for knee pain, marital status, and neighborhood socioeconomic status (nSES) (all p-interaction<0.05); associations were present only in those with knee pain, those who were unmarried, and those in the highest race-specific tertile of nSES. For example, a 1 point higher walkability score was associated with 1.06 (CI: 0.78, 1.44) higher odds of walking in those without knee pain compared to 1.91 (CI: 1.25, 2.90) in those with knee pain.

ASSOCIATIONS BETWEEN PERCEIVED PHYSICAL AND MENTAL FATIGABILITY AND LIFE SPACE MOBILITY IN OLDER MEN: THE MROS STUDY

Kyle Moored,¹ Andrea Rosso,¹ Theresa Gmelin,² Yujia (Susanna) Qiao,³ Michelle Carlson,⁴ Peggy Cawthon,⁵

Jane Cauley,¹ and Nancy W. Glynn,⁶ 1. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2. *University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania, United States*, 3. *University of Pittsburgh, University of Pittsburgh, Pennsylvania, United States*, 4. *Johns Hopkins University, Baltimore, Maryland, United States*, 5. *California Pacific Medical Center, San Francisco, California, United States*, 6. *University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania, United States*

Physical performance and fatigue can limit mobility within the larger environment (life-space mobility). It is unknown whether perceived fatigability, fatigue anchored to activity intensity and duration, is independently associated with life-space. We assessed this cross-sectionally in the Osteoporotic Fractures in Men Study (MrOS; N=1,681, Meanage=85±4.1). The Pittsburgh Fatigability Scale (PFS, range: 0-50) measured physical (Mean=16.2±9.5) and mental fatigability (Mean=7.5±8.0). Life Space Assessment scores (range: 0-120, higher=greater life-space) incorporated level, frequency, and assistance used for life-space mobility (Mean=84.3±22.0). Compared to the lowest fatigability strata (Physical: PFS 0-4; Mental: PFS 0-3, modeled separately), men in the two highest physical strata (PFS 20-24: B=-4.10±1.67; PFS≥25: B=-6.23±1.72; p's≤.05) and men in the three highest mental strata reported significantly lower life-space mobility (PFS 13-15: B=-3.42±1.74; PFS 16-19: B=-5.38±1.83; PFS≥20: B=-7.96±1.66, p's≤.05), adjusted for physical performance and health covariates. Our results provide evidence linking fatigability and real-world mobility, independent of physical health, in older men.

METHODS AND RATIONALE FOR USING GPS-DERIVED OBJECTIVE TECHNOLOGIES TO EXAMINE COMMUNITY MOBILITY IN OLDER ADULTS

Breanna Crane,¹ Kyle Moored,² Andrea Rosso,² and Michelle Carlson,³ 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 3. *Johns Hopkins University, Baltimore, Maryland, United States*

Objective measures of community mobility are advantageous for capturing life-space activity. In contrast to subjective, self-reported approaches, GPS-derived objective measures leverage passive, real-time data collection techniques to mitigate recall bias and minimize participant burden. We present methods to quantify community mobility among a sample of 164 community-dwelling older adults (Mean age=77.3±6.5) from a physical therapy intervention aimed at improving walking ability. We characterized community mobility using activity space metrics (e.g., standard deviation ellipse (SDE) area), timing (e.g., time outside home), and shape (e.g., SDE compactness). We will discuss challenges and solutions to generating these metrics as well as their associations with physical and cognitive performance. Time outside of home and SDE area, but not SDE compactness, were correlated with better performance on the 6-Minute Walking Test and Trail-Making Test (Part B) ($\rho=.20-.23$, $p's<.05$). These findings will aid in understanding which community mobility measures are associated with functional capacity.

CHANGES IN GPS-DERIVED COMMUNITY MOBILITY AFTER MOTOR SKILL TRAINING IN OLDER ADULTS

Pamela Dunlap,¹ Breanna Crane,² Kyle Moored,¹ Michelle Carlson,³ Subashan Perera,¹ Jennifer Brach,⁴ Brooke Klatt,¹ and Andrea Rosso,¹ 1. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 3. *Johns Hopkins University, Baltimore, Maryland, United States*, 4. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

The study purpose was to identify the effects of a motor skill training intervention to improve gait speed on community mobility among community-dwelling older adults. The study included 249 participants randomized to standard physical therapy or a standard plus motor skill training program. Community mobility was measured using the Life Space Assessment (LSA) and GPS at baseline, 12 (post-intervention), 24 and 36 weeks. There were 124 participants (M age=77.4±6.7; 68.6% female; LSA: 76.2±17.6) randomized to the standard plus and 125 (M age=77.4±6.4; 62.4% female; LSA: 74.3±18.2) to the standard group. There was no significant between-group difference in pre- or post-intervention LSA scores and no significant pre- to post-intervention change over time in either group. GPS results are pending. While there were no differences in self-reported LSA, we anticipate objective GPS measurement of community mobility will better capture post-intervention changes and differences between groups.

Session 4525 (Symposium)

COVID-19 AND PSYCHOSOCIAL CHANGES: RESULTS FROM THE NATIONAL HEALTH AND AGING TRENDS STUDY (NHATS)

Chair: Laura Samuel

Discussant: Anthony Ong

The COVID-19 pandemic likely altered many aspects of daily life for older adults, including social connectedness, technology use, financial resources and hopefulness. This symposium examines these exposures and changes during the COVID-19 pandemic and tests their associations with health and related factors. Analyses are all conducted among a nationally representative sample of U.S. adults aged ≥65 years who participated in the NHATS COVID-19 supplement, which was a mail-in survey with participant and proxy respondents conducted between June and October of 2020. Additional NHATS participant data collected between 2011 and 2019 was used to account for individual characteristics before COVID-19, including demographic, socioeconomic and relevant health characteristics. Sampling weights were applied to analyses to account for study design and non-response so that inferences can be drawn to the US population of adults aged ≥65 years. This symposium will present results from five COVID-19 pandemic focused studies that examine the associations between 1) financial changes and health, 2) loneliness and behavioral changes, 3) hopefulness with function, sleep and loneliness, 4) technology use and mental health, and 5) predictors of technology use. These results offer insights into the mechanisms that influence health during the COVID-19 pandemic. Results have clinical, policy

and public health implications because they can inform the development of interventions, programs and policies with potential to improve health and health care and advance health equity for older adults.

FINANCIAL CHANGES AND HEALTH DURING COVID-19 IN THE NATIONAL HEALTH AND AGING TRENDS STUDY

Laura Samuel,¹ Melissa Hladek,² Thomas Cudjoe,³ Brittany Drazich,⁴ Qiwei Li,² and Sarah Szanton,¹ 1. *Johns Hopkins University, Baltimore, Maryland, United States*, 2. *Johns Hopkins School of Nursing, Baltimore, Maryland, United States*, 3. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*, 4. *University of Maryland, Baltimore, Baltimore, Maryland, United States*

This study tested associations between income decline and financial difficulty with mental health (lack of feeling anxious/depressed, recurring thoughts/nightmares, avoiding activities/thoughts, feeling jumpy/on guard) and sleep quality during COVID-19 among a national sample of 3,188 older adults. Approximately 8% of US older adults reported income decline and 6% reported financial difficulty. Although income decline and financial difficulty rates were both statistically significantly higher among those financially strained before COVID-19 (19% and 34%, respectively), income decline was more common among those with incomes $\geq 200\%$ of the poverty threshold (9%) whereas financial difficulty was more common among those with incomes $< 200\%$ poverty (10%). Adjusting for sociodemographic, health and depressive symptoms before COVID-19, financial difficulty was associated with worse mental health ($b = -2.39$, $p < 0.001$) and sleep quality ($b = -0.820$, $p < 0.001$), but income loss was not ($b = -0.685$, $p = 0.092$ and $b = -0.405$, $p = 0.082$, respectively). Timely interventions are needed for older adults reporting COVID-19 financial difficulty.

LONELINESS AND BEHAVIORAL CHANGES DURING THE COVID-19 PANDEMIC

Thomas Cudjoe,¹ Qiwei Li,² Brittany Drazich,³ Melissa Hladek,² Laura Samuel,⁴ Carl Latkin,⁵ and Cynthia Boyd,⁴ 1. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*, 2. *Johns Hopkins School of Nursing, Baltimore, Maryland, United States*, 3. *University of Maryland, Baltimore, Baltimore, Maryland, United States*, 4. *Johns Hopkins University, Baltimore, Maryland, United States*, 5. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

Concerns for the health impact of loneliness, a risk factor for morbidity and mortality, have risen amid the COVID-19 pandemic. However, relationships between loneliness and behavioral changes remains unclear. Utilizing data from the National Health and Aging Trends Study COVID-19 Supplement, we examine the cross-sectional relationship between loneliness and self-reported increase in each of the following behaviors during the pandemic ($n = 2,924$): walking, vigorous activity, eating, use of alcohol and tobacco, watching television and sleeping. Adjusting for age, race, education, activity of daily living limitations, and chronic conditions, loneliness was significantly associated with a higher odds of more eating (odds ratio- OR: 1.42, confidence intervals-CI:

1.24,1.62), sleeping (OR: 1.35, CI: 1.18,1.56), and watching television (OR: 1.45, CI: 1.30,1.61). These results indicate that during stressful times like our current pandemic, loneliness may lead to morbidity and mortality through sedentary behaviors.

HOPEFULNESS DURING COVID-19: ASSOCIATIONS WITH FUNCTION, SLEEP, AND LONELINESS IN THE NHATS

Melissa Hladek,¹ Qiwei Li,¹ Laura Samuel,² Brittany Drazich,³ Thomas Cudjoe,⁴ and Sarah Szanton,² 1. *Johns Hopkins School of Nursing, Baltimore, Maryland, United States*, 2. *Johns Hopkins University, Baltimore, Maryland, United States*, 3. *University of Maryland, Baltimore, Baltimore, Maryland, United States*, 4. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*

The associations between hopefulness and function, loneliness, and sleep have not been explored in a nationally representative sample of older adults. Additionally, COVID-19 dramatically increased stress burden, potentially influencing these relationships. This study used National Health and Aging Trends COVID-19 Supplement data ($N = 2,894$ adults aged ≥ 65 years) to evaluate cross-sectional associations between hopefulness about the future during COVID-19 with limitations in activities of daily living (ADLs) using a negative binomial model and one-item sleep and loneliness measures using ordered logistic models. Adjusting for age, race/ethnicity, and education and applying sampling weights, increased hopefulness was associated with better ADLs ($b = -0.11$, $p\text{-value} = 0.021$), less loneliness ($b = -0.32$, $p\text{-value} < 0.001$), and better sleep ($b = -0.27$, $p\text{-value} < 0.001$). In the midst of a world-wide stressor, hopefulness was associated with better function and symptoms. This relationship is likely bidirectional and further longitudinal research is needed.

THE ASSOCIATION BETWEEN OLDER ADULT TECHNOLOGY USE AND MENTAL HEALTH DURING THE COVID-19 PANDEMIC

Brittany Drazich,¹ Qiwei Li,² Nancy Perrin,³ Laura Samuel,⁴ Melissa diCardi Hladek,³ Sarah Szanton,⁴ Thomas Cudjoe,⁵ and Janiece Taylor,⁴ 1. *University of Maryland, Baltimore, Baltimore, Maryland, United States*, 2. *Johns Hopkins School of Nursing, Baltimore, Maryland, United States*, 3. *Johns Hopkins University School of Nursing, Baltimore, Maryland, United States*, 4. *Johns Hopkins University, Baltimore, Maryland, United States*, 5. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*

Physical distancing during the COVID-19 pandemic may impact the mental health of older adults, but technology use may buffer this impact. This study aimed to 1) examine changes in older adult technology use during the COVID-19 pandemic and 2) determine if technology use moderates the relationships between decreased in-person communication/activity and the mental health of older adults during the pandemic. Data were taken from the NHATS COVID-19 Round 10 ($n = 3,188$). Older adults engaged in more technology-based activity ($b = .237$, $p < 0.001$), technology-based healthcare communication ($b = .112$, $p < 0.001$), and technology-based food acquisition ($b = .214$, $p < 0.001$) during the COVID-19 pandemic, compared to before. Technology

use did not moderate the relationship between decreased in person personal communication ($b = .021, p = 0.662$)/activity ($b = .045, p = 0.749$) and mental health during the pandemic. Although older adults are utilizing technology more during the pandemic, it might not be protective against negative mental health outcomes from physical distancing.

PREDICTING TECHNOLOGY USE AMONG OLDER ADULTS DURING THE COVID-19 PANDEMIC WITH COMMUNITY PARTICIPATION

Qiwei Li,¹ Brittany Drazich,² Laura Samuel,³ Thomas Cudjoe,⁴ Melissa Hladek,¹ and Sarah Szanton,³
 1. *Johns Hopkins School of Nursing, Baltimore, Maryland, United States*, 2. *University of Maryland, Baltimore, Baltimore, Maryland, United States*, 3. *Johns Hopkins University, Baltimore, Maryland, United States*, 4. *Johns Hopkins University School of Medicine, Baltimore, Maryland, United States*

Technology use is important for older adults, particularly in the pandemic. The pattern of technology use among older adults varies significantly. We hypothesized that limitations of activities of daily living (ADL), wellbeing, and community participation of community-dwelling older adults before the pandemic would predict technology use during the pandemic. National Health and Aging Trends Study data on 2924 older adults were utilized. Adjusted for age, gender, race, education, marital status, and chronic conditions, previous well-being predicted more online social activities ($OR = 1.03, p = .03$); previous ADL limitations predicted more telehealth use ($OR = 1.11, p = .014$); and previous community participation predicted: learning new technologies ($OR = 1.46, p < .001$), more telecommunication ($OR = 1.12, p = .007$), more online social activity ($OR = 1.58, p < .001$), and more telehealth use ($OR = 1.09, p = .04$). The results of this study imply that high community participation promotes older adults' transition to technology use. Older adults with low participation may need extra attention for such a transition.

Session 4530 (Symposium)

CREATIVE ARTS THERAPIES TO ENHANCE MENTAL HEALTH OVER THE COURSE OF AGING: RESEARCH AND IMPLICATIONS

Chair: Shoshi Keisari
 Co-Chair: Nisha Sajjani
 Discussant: Dovrat Harel

The creative arts therapies (CATs) are health care professions that involve the intentional and systematic use of the creative and expressive process of art making to optimize health and well-being. Visual arts, music, dance-movement, drama and poetry provide means of expression to help individuals understand, make sense of, and cope with life challenges within a therapeutic relationship. Older adults develop a better attitude toward CATs, as the creative processes position them as active productive contributors in their own communities, instead of "patients" or "clients". In this sense, CATs encourage participation, and address the negative attitudes and stigma that are sometimes associated with mental health services. This symposium aims to present a diverse picture of studies on CATs for the aging population. Dr. Nisha Sajjani will present a systematic review of

studies on CATs for older adults experiencing depression; Dr. Dovrat Harel will present findings from a qualitative study that explored poems written by poetry groups of men in residential care facilities; Dr. Shoshi Keisari will present an evidence-based model that integrates life-review and drama therapy; Silvia Piol, Talia Elkarif and Giada Mola will present a cross-cultural study that explored the experiences of Italian and Israeli participants during an online intervention that focused on the creation of digital photo-collages during COVID-19; Finally, Racheli Lital Gvili will present a study focused on intergenerational music intervention, as a vehicle to bridge the gap between grandparents and grandchildren, which was conducted at the onset of the COVID-19 pandemic.

CREATIVE ARTS INTERVENTIONS IN ADDRESSING DEPRESSION IN OLDER ADULTS: A SYSTEMATIC REVIEW

Nisha Sajjani,¹ Kim Dunphy,² Felicity Baker,² Ella Dumaresq,² Katrina Carroll-Haskins,³ Jasmin Eickholt,⁴ Maya Ercole,² and Girija Kaimal,⁵ 1. *New York University, New York City, New York, United States*, 2. *University of Melbourne, University of Melbourne, Victoria, Australia*, 3. *Holy Family University, Philadelphia, Pennsylvania, United States*, 4. *University of Applied Sciences, Würzburg, Bayern, Germany*, 5. *Drexel University, Philadelphia, Pennsylvania, United States*

Depression experienced by older adults is proving an increasing global health burden, with rates as high as 27% in the USA. This is likely to increase in coming years as the number and proportion of older adults in the global population rises. Therefore, it is imperative that the effectiveness of approaches to the prevention and treatment of depression are understood. Creative arts interventions, including art, dance movement, drama, and music, are utilized internationally to reduce depressive symptoms in older adults and promote wellbeing. This includes interventions led by trained arts therapists as well as other health and arts professionals. This presentation will include a report of findings from a recent systematic review of the outcomes of four creative arts modalities (art, dance movement, drama, and music) with particular attention paid to processes of change documented in each modality.

AGING AND MASCULINITY IN BIBLIOTHERAPY AND POETRY GROUPS FOR MEN IN LATE LIFE

Dovrat Harel, *Tel Hai College, Kidron, HaMerkaz, Israel*

The transition to residential care facility may symbolize the joining into the 'community of older people'. This may influence the ways men in late life construct their identities and the intersection of aging and masculinity. Due to some barriers, this experience may be difficult to express explicitly. Bibliotherapy aims to bridge this gap by using literature to address diverse issues in the form of reading and writing activities. In this presentation we will present "The Literary Parliament" project, in which bibliotherapy and poetry groups of men in late life were conducted in residential care facilities in Israel. We will present findings of a qualitative research which explored poems written by group participants, and the way these helped participants to express their perceptions and feelings of ageing and masculinity in the context of

residential care. The use of bibliotherapy to encourage psychological discourse among men in late life will be discussed.

INTEGRATING LIFE-REVIEW AND DRAMA THERAPY FOR COMMUNITY-DWELLING OLDER ADULTS: AN EVIDENCE-BASED MODEL

Shoshi Keisari, *University of Haifa, Department of Gerontology, Faculty of Social Welfare and Health sciences, Mount Carmel, HaZafon, Israel*

Drama therapy is a widely acknowledged way to explore life-stories in late life. This presentation will describe a new model for creative interventions, based on the results of four studies that provide multiple perspectives on the integration of life-review and drama therapy for community dwelling older adults. The results of two quantitative studies (n=55, aged 62-93; n=78, aged 63-96) suggest that the drama therapy interventions have robust therapeutic potential to enhance mental health while aging. The findings of two qualitative studies with therapists (n=8), participants (n=27; aged 63-96) and staff (n=13) provide a better understanding of the process, and support the mechanisms that lead to positive effects on mental health. Combining the results yielded a multidimensional model which points to three potential transformative routes: the evolution of the life-story, the evolution of improvised dramatic expression, and the expansion of social engagement.

ONLINE DIGNITY THERAPY AND PHOTO COLLAGES: THE NARRATIVES OF ISRAELI AND ITALIAN OLDER ADULTS IN THE COVID-19 ERA

Shoshi Keisari,¹ Talia Elkarif,² Giada Mola,³ Ines Testoni,⁴ and Silvia Piol,⁵ 1. *University of Haifa, Department of Gerontology, Faculty of Social Welfare and Health sciences, Mount Carmel, HaZafon, Israel*, 2. *University of Haifa, School of Creative Arts Therapies, Faculty of Social Welfare and Health Sciences, Mount Carmel, HaZafon, Israel*, 3. *Università degli studi di padova, DPSS Department, padova, Veneto, Italy*, 4. *Università degli studi di padova, FISPPA Department, Section of Applied Psychology, Padova, Veneto, Italy*, 5. *Università degli Studi di Padova, Padova, Veneto, Italy*

The social isolation imposed by the Covid-19 pandemic has significantly affected older adults, and has impacted both their physical and mental health. The pandemic has led to an increase in ageism associated with poorer mental health and a lower sense of dignity, self-esteem and contribution to society. This cross-cultural study involved 24 participants from Italy and Israel aged 79 to 92. The aim was to develop a brief art-based online intervention to enhance the participants' sense of dignity and sense of meaning in life during this time of crisis. The process focused on the creation of digital photo-collages that captured the participants' values through three perspectives: their past experiences, legacy, and future perspectives. It employed an arts-based research methodology to explore the participants' experiences by analysing their relationship with the artistic expression, the photo collage, and its creative process.

AN INTERGENERATIONAL ZOOM MUSIC THERAPY GROUP DURING COVID-19

Racheli Lital Gvili, *Bar-Ilan University, Bar-Ilan, University, Ramat Gan, HaMerkaz, Israel*

The COVID-19 pandemic has led to an increase in ageist attitudes and psychological distress and loneliness among older people. The social isolation exacerbated the intergenerational segregation between young and older adults, and has also been expressed within families, since grandparents could not meet their grandchildren in person. The present study involved an intergenerational music intervention, as a vehicle to bridge the gap between grandparents and grandchildren at the COVID-19 pandemic. 41 grandparents aged 56-80, and 45 grandchildren aged 9.9-11.8 took part. Of these, 21 pairs of grandparents and grandchildren participated in a weekly online intergenerational zoom music therapy group for eight weeks, and the rest constituted a waitlist-controlled group. All participants completed the same questionnaires during the same time periods before and after the intervention. The results point to the effectiveness of participation in the sessions in improving intergenerational connections and psychological well-being, and in reducing ageist attitudes and loneliness.

Session 4535 (Symposium)

EMERGING TELEHEALTH ADVANCES FOR MENTAL AND COGNITIVE HEALTH IN LATE LIFE

Chair: Cindy Woolverton

Co-Chair: Patricia Bamonti

Discussant: Lauren Moo

Over the last year, mental health services offered virtually have increased significantly in response to COVID-19. The rapid adoption of telehealth practices has raised many questions about how to develop and deliver effective interventions for older adults targeting their mental and cognitive health. In this symposium, we present on the feasibility of mental and cognitive health interventions for older adults using telehealth methods with particular focus on how adoption of these telehealth tools have been impacted by the current pandemic. Dr. Touchett and colleagues will present data on the telehealth utilization disparities among older veterans with comorbid disabilities and discuss ethical considerations when providing care for older adults. Dr. Kornblith and colleagues will present pilot data on the feasibility of GOALS, a video telehealth cognitive remediation group intervention for older adults with cognitive and emotional dysfunction related to traumatic brain injuries. Dr. Gould and colleagues will present pilot data on the feasibility and preliminary efficacy of a brief video-delivered self-management intervention BREATHE for older veterans with anxiety disorders. Dr. Weiskittle and colleagues will present their work on the development and dissemination of a brief 8-week telephone group intervention for homebound older adults targeting social isolation. Dr. Jacobs and colleagues will share their findings of a telephone delivered mindfulness intervention for caregivers and persons with dementia. Finally, the discussant, Lauren Moo, MD, an expert in assessing the efficacy of telehealth interventions will tie findings together and provide directions for future research and innovation.

TELEHEALTH DELIVERY OF GROUP FORMAT COGNITIVE REHABILITATION TO OLDER VETERANS WITH TBI

Erica Kornblith,¹ Sara Schweizer,² Kristine Yaffe,³ and Tatjana Novakovic-Agopain,¹ 1. *SFVA/UCSF, San Francisco*,

California, United States, 2. SFVA, San Francisco, California, United States, 3. UCSF, UCSF, California, United States

Traumatic brain injury (TBI) is common among older adults, with significant public health costs, and advanced age is a risk factor for poor outcomes after TBI. Older Veterans with TBI-related cognitive and emotional dysfunction without dementia may benefit from cognitive rehabilitation, particularly executive function training, and technology may promote optimal functioning for these patients by increasing access to such treatments. Dr. Kornblith will present pilot data on one such promising group intervention, Goal-Oriented Attentional Self-Regulation (GOALS), administered via in-home video telehealth. Themes gleaned from qualitative feedback collected throughout the intervention and post-treatment feedback questionnaires include the importance of communication and a smooth process with clear instructions for joining study sessions. Preliminary data suggest that only minor adaptations to the existing GOALS protocol are required for telehealth delivery and that delivering group-based executive function training to older TBI-exposed older Veterans with cognitive complaints via telehealth is feasible and acceptable.

BRIEF VIDEO-DELIVERED INTERVENTIONS TO REDUCE ANXIETY IN OLDER VETERANS: A PILOT RCT

Christine Gould,¹ Chalise Carlson,¹ Lauren Anker,¹ Ruth O'Hara,² Julie Wetherell,³ Mary Goldstein,⁴ and Sherry Beaudreau,⁵ 1. VA Palo Alto Health Care System, Palo Alto, California, United States, 2. Stanford University School of Medicine, Palo Alto, California, United States, 3. VA San Diego / UCSD, La Jolla Village, California, United States, 4. VA Central Office, Palo Alto, California, United States, 5. VA Palo Alto / Stanford University School of Medicine, VA Palo Alto, California, United States

Older Veterans with anxiety disorders encounter barriers to receiving mental health services that may be overcome by using brief technology-delivered interventions. To address this, we conducted a pilot randomized controlled trial (RCT) comparing the effects of a guided self-management intervention called BREATHE, a 4-week video-delivered (DVD/internet) intervention and a psychoeducation control (Healthy Living; HL) on anxiety symptom severity. Older Veterans with anxiety disorders (N = 48; 87.5% men; Mean age = 71.77 ± 6.2 years) were randomized to BREATHE or HL. Regarding intervention delivery modality, 67% used DVDs, 23% used the internet, 4% used both to access their assigned intervention. Both groups experienced significant declines in affective anxiety from baseline to 8 weeks followed by an increase in symptoms (i.e., quadratic pattern). HL had significant declines in somatic anxiety, whereas BREATHE did not experience such declines. The longitudinal effects and Veteran satisfaction will be further described in the presentation.

ADJUNCTIVE TELEHEALTH MINDFULNESS THERAPY FOR PERSONS WITH DEMENTIA AND THEIR CAREGIVERS IN THE RURAL DEEP SOUTH

Lindsey Jacobs,¹ Daniel Durkin,² and Michelle Hilgeman,³ 1. The University of Alabama, The University of Alabama, Alabama, United States, 2. The University of Mississippi,

University, Mississippi, United States, 3. Tuscaloosa VA Medical Center, Tuscaloosa, Alabama, United States

The emotional care needs of persons with dementia (PwD) and their caregivers are multitudinous. Multicomponent interventions may be necessary to meet their multiple needs. Mindfulness interventions have a positive impact on well-being but are often only offered as a stand-alone treatment and typically are available only to the caregiver. This presentation will describe a telephone-delivered adjunctive mindfulness intervention that was offered to caregivers and dyads in conjunction with care consultation. Participants were 26 caregivers and 22 PwD living in the Deep South. The adjunctive mindfulness therapy included four core sessions and an additional five sessions that were optional. Mindfulness was deemed to be a "good fit" for almost 75% of the sample. Duration of mindfulness sessions ranged from 30 to 65 minutes. Participants attended more sessions as a dyad (M=10.10) compared to caregivers alone (M=6.5). Information regarding attendance and treatment engagement will be presented.

USHERING IN THE SILVER AGE OF TELEHEALTH: ADDRESSING TELEHEALTH DISPARITIES FOR OLDER ADULTS WITH DISABILITIES

Hilary Touchett, VA, Houston, Texas, United States

One silver lining of COVID-19 has been the ushering in of 'the golden age of telehealth'. However, this unplanned rapid conversion to telehealth left many providers and clinics unprepared to address systemic barriers that adversely affect older adults, particularly those with disabilities. Data from the VA Corporate Data Warehouse suggest that the rapid adoption of telehealth in mental health clinics during COVID-19 widened telehealth utilization disparities for older Veterans (65+) with disabilities. With 4.5 million Veterans 55+ who have at least one disability more attention to addressing this widening gap is needed. For those with hearing, vision, and complex mobility impairments, there are unique challenges to initiating telehealth services. Dr. Touchett will present preliminary findings while discussing ethical and contextual considerations when using telehealth with older Veterans who have disabilities, while discussing ways to facilitate robust clinical encounters for this population.

DISSEMINATION OF A COVID-19 RAPID RESPONSE TELEHEALTH GROUP ADDRESSING WORRY AND SOCIAL ISOLATION AMONG OLDER ADULTS

Rachel Weiskittle, University of Colorado Colorado Springs, Colorado Springs, Colorado, United States

In response to the urgent need for virtual mental health treatments during the COVID-19 pandemic, an 8-week group intervention deliverable over video or telephone was developed and disseminated in March 2020. Manual content addressed social isolation and information related to COVID-19. In August 2020, a national web-based provider feedback survey was disseminated to evaluate feasibility of the manual. Respondents (n = 21) across a variety of geriatric mental health clinics reported this intervention to be effective and clinically useful with their patients in providing social support and in mitigating COVID-19 anxieties. The majority of respondents delivered the group in multiple cohorts and found the manual adaptable beyond the early pandemic period.

Session 4540 (Paper)

Employment, Retirement, and Aging

HEALTH AND WORKING BEYOND RETIREMENT AGE: EXPLORING RACIAL AND GENDER INTERSECTIONALITY

Ronica Rooks,¹ and Allison Leverage,² 1. *University of Colorado Denver, Denver, Colorado, United States*, 2. *McMaster University, Hamilton, Ontario, Canada*

Little longitudinal research exists on health and working among older racial and ethnic minority adults. Following previous cross-sectional research, we examine the Health, Aging, and Body Composition (HABC) study comparing working vs. not working overtime among older adults. We hypothesize: 1) Black vs. White adults are more likely to work; 2) Black vs. White differences in working are greater among women than men; and 3) Working relates to fewer prevalent health problems than not working. We used gender-stratified descriptive statistics and generalized mixed-effects logistic regression with covariate adjustments to analyze the HABC cohort study, with community-dwelling, well-functioning Black (42%) and White older adults aged 70-79 in year 1 (n=3,069) to year 6 (n=2,091). We found support for all three hypotheses. Black vs. White adults were more likely to work overtime. Women were less likely to work overtime compared to men. White women were less likely to keep working compared to men and Black women. Lastly, older adults with fewer chronic conditions were more likely to continue working. Our study finds racial and gender differences among older adults working overtime. Intersectionality plays a role in older adults' health and work disparities, leading us to explore the needs and/or benefits of working past retirement in specific groups. Our policy implication is for society to pro-actively invest in older adults' health and productive activities, which may act as social determinants of health solutions to reduce disparities and growing social safety net program costs.

LOST WORK OPPORTUNITY SCORE PREDICTS HEALTH IN RETIREMENT

Maren Wright Voss,¹ Man Hung,² Iorie Richards,³ Wei Li,³ Pollie Price,³ Alexandra Terrill,³ and Lori Wadsworth,⁴ 1. *Utah State University, Salt Lake City, Utah, United States*, 2. *Roseman University, South Jordan, Utah, United States*, 3. *University of Utah, Salt Lake City, Utah, United States*, 4. *Brigham Young University, Provo, Utah, United States*

Objectives: Under-reporting of unemployment or forced retirement has consequences for measuring the impacts of job changes on health at retirement. We analyzed a comprehensive three-part measure of lost work opportunity for evidence of impact on health.

Methods: We combined variables from the Health and Retirement Study for 2,576 respondents assessing unemployment, forced retirement, and earlier than planned retirement into a single lost work opportunity score (LOS). We evaluated the reliability and unidimensionality of the LOS. We conducted multivariate regression to assess health impacts controlling for age, gender, education, race, ethnicity, and prior health status.

Results: The Cronbach's Alpha for the LOS was $\alpha = 0.76$ and the LOS variables primarily loaded onto a single component demonstrating unidimensionality. The LOS significantly predicted self-reported health ($\beta = .16$; $p < .001$) with higher lost work associated with negative health outcomes (Cox and Snell $R^2 = 0.07$). The LOS score significantly predicted mental health declines ($\beta = .07$; $p = .002$) (Cox and Snell $R^2 = 0.07$).

Discussion: Population-level data indicates that health declines following both unemployment and retirement, but there is ample evidence that early or planned retirements do not show the same negative health impacts. We examined the health impact of retirement using the construct of lost work opportunity rather than voluntary or involuntary retirement, per se. Our findings indicate that as much as 7% of negative health changes in the early retirement years could be attributable to employment changes that were unplanned or experienced as outside the retiree's control.

PROFIT STATUS AND EMPLOYEE TURNOVER IN IOWA NURSING HOMES

Hari Sharma,¹ and Lili Xu,² 1. *The University of Iowa, Iowa City, Iowa, United States*, 2. *University of Iowa, Iowa City, Iowa, United States*

Employee turnover is a huge concern for nursing homes that care for millions of older individuals whose physical and cognitive impairments make them vulnerable, especially in the middle of a pandemic like COVID-19. Existing research has shown that high turnover of employees can lead to poorer quality of care. Low pay is often cited as one of the key reasons for high turnover of employees in nursing homes. For-profit nursing homes may try to maximize profits by limiting wages paid to their employees. In this study, we examine whether profit-status of a facility is associated with high turnover of its employees. We obtain data on 415 nursing homes operating in Iowa between 2013-2017. We descriptively examine the turnover trends in nurse employees and all employees over time by profit status. We evaluate whether profit status is associated with high turnover using pooled linear regressions controlling for nursing home and resident characteristics. Descriptive results show that for-profit facilities had higher turnover of nurse employees (61.1% vs. 49.6%) and all employees (56.6% vs. 45.4%). Results from multivariate regressions show that, compared to non-profit facilities, for-profit facilities had 6.93 percentage points higher ($p < 0.01$) turnover of all employees, and 7.76 percentage points higher ($p < 0.01$) turnover of nurse employees after controlling for facility and resident characteristics. Given existing evidence on the adverse impact of high employee turnover on nursing home quality, we need policies aimed at lowering employee turnover, targeting for-profit nursing homes.

Session 4545 (Paper)

End-of-Life Planning and Bereavement

ADVANCE DIRECTIVE COMPLETION AND HOSPITAL OUT-OF-POCKET EXPENDITURES

Yujun Zhu,¹ and Susan Enguidanos,² 1. *University of Southern California, South Pasadena, California, United States*, 2. *University of Southern California, Los Angeles, California, United States*

Healthcare costs remain high at end of life. Although advance directives (AD) have been shown to improve care congruence with patients' preferences and lower cost of healthcare services, little is known about the relationship between AD completion and hospital out-of-pocket costs. This study examined whether AD completion was associated with lower hospital out-of-pocket spending at end of life. We used the Health and Retirement Study participants who died between 2000 and 2014 (N=9,228) to examine the association through the use of a two-part analytic model that has been widely used in health economics. We controlled for socioeconomic status, death-related characteristics, and health insurance coverage and imputed missing data using multiple imputation by chained equations. Of the 43.9% of decedents who completed an AD, 90.7% chose to limit care or to be kept comfortable; 78.8% indicated that they wanted to withhold treatment, and 5.6% wanted to prolong life. Having an AD was significantly associated with \$632 (95% CI: [-\$1,116.47, -\$146.71]) lower hospital out-of-pocket costs, with greater savings among younger decedents, dropping from \$1,560 (95% CI: [-\$2,652, -\$268]) at age 50 to \$230 (95% CI: [-\$445, -\$14]) at age 110. Decedents who completed an AD 12 months or less before death had higher out-of-pocket spending (\$1,591 on average) than those who completed more than a year before death (\$1,001 on average). Our findings have policy implications for physician-patient communication about costs of care and may provide an opportunity for physicians to involve cost-sharing discussions when completing ADs with patients.

BEREAVEMENT SUPPORT SERVICES IN A NATIONAL SAMPLE OF HOSPICES: A CONTENT ANALYSIS

Todd Becker, and John Cagle, *University of Maryland, Baltimore, Baltimore, Maryland, United States*

Although the Medicare Hospice Benefit mandates that hospices provide bereavement services to families for 1 year following death, it does not stipulate what services should be offered or how. Thus, this study aimed to explore the range of hospice bereavement services. This study stems from Cagle et al.'s (2020) prior study surveying 600 randomly selected agencies, stratified by state and profit status. Most participants (N = 76) worked as clinical supervisors or directors of patient services (41.6%) for medium-sized (53.2%), for-profit hospices (50.6%). Responses to "What types of bereavement support does your hospice provide to families?" were content analyzed. Analyst triangulation and peer debriefing enhanced trustworthiness. Four domains emerged: timing of support, providers of support, targets of support, and formats of support. Each domain reflected substantial variability. All hospices offered postdeath bereavement support. A minority described offering predeath support, often through bereavement risk assessment and supportive services targeting those at risk. Providers frequently included trained bereavement counselors, social workers, and chaplains. Less often, hospices leveraged familiar members of the decedents' care team to encourage family participation. Although bereavement services predominantly targeted surviving adult family members of deceased hospice patients, services tailored to children and hospice-unaffiliated community members also emerged. The format of bereavement services demonstrated the widest variability. Commonly reported formats included

written materials, support groups, and phone calls. Most hospices employed multiple formats. Although findings are consistent with prior research, the variability in each domain complicates rigorous investigation of which aspects offer the greatest benefit to bereaved family members.

EXPLORING THE CONCEPT OF THE ETHICAL WILL AS A WAY TO LEAVE A LEGACY OF VALUES: A SCOPING REVIEW

Sarah Neller,¹ Gail Towsley,² and Mary McFarland,¹ *1. University of Utah, Salt Lake City, Utah, United States, 2. University of Utah College of Nursing, Salt Lake City, Utah, United States*

Ethical wills communicate a legacy of values through non-legal emotional and supportive instruction to others and are distinct from legal or living wills. Employed for centuries, little is known about how and why ethical wills are used. We conducted the first scoping review on ethical wills to survey the breadth of published information and identify how they are defined and utilized. We followed the Joanna Briggs Institute methodology for scoping reviews employing an a priori protocol and PRISMA-ScR reporting guidelines. We searched 14 databases in November 2019 and January 2021 without filtering publication date or type. Our final extraction form included frequently used terms describing content, purpose, and outcomes. Two reviewers independently screened 1,568 results. Final extraction included 51 documents from 1997-2020, which were primarily published in lay or peer-reviewed journals within law, estate and financial planning, and religion; only 6 research articles were identified. Most frequently, descriptors characterized ethical wills as a non-material legacy of values, beliefs, wisdom, and life lessons learned written to family or future generations. Ethical wills were utilized most to be remembered, address mortality, clarify life's meaning, and communicate what matters most. They provided opportunity to learn about self, were considered a gift to both writer and recipient and fostered intergenerational interaction and transcendence. Our findings highlight interdisciplinary utilization and dearth of research on ethical wills. Gerontological research is needed to explore ways ethical wills can be used to enhance generativity and intentional living as individuals age and prepare for the end of life.

FAMILY CONFLICT AND OLDER CHINESE AMERICANS' SELF-EFFICACY IN END-OF-LIFE CARE PLANNING: THE ROLE OF ACCULTURATION

Kaipeng Wang,¹ Fei Sun,² Yanqin Liu,³ and Carson De Fries,¹ *1. University of Denver, Denver, Colorado, United States, 2. Michigan State University, East Lansing, Michigan, United States, 3. Mayo Clinic Arizona, Scottsdale, Arizona, United States*

Family involvement in end-of-life (EOL) care is critical to ensure older adults' health and quality of life. Older adults' self-efficacy in discussing EOL care plans with family members can facilitate family involvement in EOL care planning. Research shows that family relationships are associated with self-efficacy in discussing EOL care with family members among older Chinese Americans. However, the roles of family conflict and acculturation remain unknown. This study examines the association between family conflict and

self-efficacy in discussing EOL care with family members and whether such an association differs by acculturation levels among older Chinese Americans. Data were collected from 207 Chinese Americans aged 65-102 in two metropolitan areas in 2017. Ordinary least squares regression was conducted to examine the association between family conflict, acculturation, and self-efficacy in discussing EOL care with family. Family conflict was negatively associated with older adults' self-efficacy in discussing EOL care with family. More specifically, the negative association between family conflict and self-efficacy in discussing EOL care with family members was more pronounced for those with higher levels of acculturation. Findings highlighted differential effects of family conflict on self-efficacy of EOL care plan discussion for older adults with different acculturation levels. Those with higher acculturation may be more independent in their EOL care planning and aware of the possible negative effects of family conflict in their EOL care planning discussions. Acculturation needs to be considered by geriatric health providers to develop family-centered interventions in improving end-of-life care planning for this population.

THE EFFECTS OF RELIGIOSITY ON DEPRESSION TRAJECTORIES BEFORE AND AFTER WIDOWHOOD

Frances Hawes,¹ Jane Tavares,² Corina Ronneberg,³ and Edward Miller,⁴ 1. *University of Wisconsin-Eau Claire, eau claire, Wisconsin, United States*, 2. *LeadingAge LTSS Center @UMass Boston, Boston, Massachusetts, United States*, 3. *University of Illinois Chicago, Chicago, Illinois, United States*, 4. *University of Massachusetts Boston, Boston, Massachusetts, United States*

Widowhood is associated with decreased emotional well-being, particularly increased depression. Religiosity may help improve mental health among widowed individuals. However, longitudinal studies exploring the role of religiosity on emotional well-being among widowed older adults is lacking, as are studies which examine this relationship using different dimensions of religiosity. This study analyzed data from the 2006-2016 waves of the nationally representative Health and Retirement Study (HRS). Trajectories of depression among older adults >50 years (N=5,486) were examined to explore patterns of depression among those entering widowhood and the potential impact of religiosity on depressive symptoms during widowhood. Ordinary least squares (OLS) regression analysis was used to examine the association between widowhood and depression as well as the role of religiosity as a moderator of this association. Older adults experienced an increase in depressive symptomology after the onset of widowhood, and although the levels of depressive symptomology decrease post-widowhood, they do not return to their pre-widowhood levels. Additionally, high religious service attendance and higher intrinsic religiosity were both associated with lower depressive symptomology. High religious service attendance moderated the relationship between widowhood and depression. The relationship between high religious service attendance and depression was stronger among widowed older adults living alone. This study highlights the long-term effects of widowhood on depressive symptomology among older adults. The findings also suggest that higher religious service attendance can lessen the effects of widowhood on depressive symptoms, especially for

those living alone. These findings may inform intervention development around increased screening and treatment for depression.

Session 4550 (Paper)

Frailty Trajectories

8-YEAR CHANGES IN FRAILTY IN ADULTS: LINKS TO COGNITIVE AND PHYSICAL FUNCTION AND MORTALITY

Felicia Simpson,¹ Jamie Justice,² Judy Bahnson,³ Joni Evans,³ Kathleen Hayden,³ Stephen Krutchevsky,² Karen Johnson,⁴ and Mark Espeland,³ 1. *Department of Mathematics, Winston-Salem State University, Winston-Salem, North Carolina, United States*, 2. *Wake Forest School of Medicine, Wake Forest School of Medicine, North Carolina, United States*, 3. *Wake Forest School of Medicine, Winston-Salem, North Carolina, United States*, 4. *University of Tennessee Health Science Center, Memphis, Tennessee, United States*

Deficit accumulation frailty indices are being evaluated as clinical markers of biological aging. In this context, it is to be expected that changes over time in such indices should be predictive of downstream changes in cognition, physical function, and mortality. We derived a frailty index (FI) based on deficit accumulation in 38 functional, behavioral, and clinical characteristics and examined associations between 8-year changes in FI and subsequent standardized measures of cognitive and physical function and mortality collected over years 8-18. We drew data from the Look AHEAD clinical trial of a multidomain intensive lifestyle intervention (ILI) in 3841 adults, aged 45-76 years at baseline with overweight/obesity and type 2 diabetes mellitus. Greater FI increases tended to occur among individuals who were older, non-Hispanic White, heavier, and who had greater baseline multimorbidity. Greater increases in FI were associated with subsequently worse levels of composite cognitive function and 400m walk speed (all $p < 0.001$). Additionally, compared with the lowest tertile of FI change, hazard ratios [95% confidence intervals] for 10-year mortality for the middle and highest tertiles of FI change were 1.28 [1.03,1.58] and 1.56 [1.24,1.96], respectively. While assignment to ILI was associated with smaller 8-year increases in FI, this did not translate overall to better cognitive functioning compared to the Diabetes Support and Education control condition across years 8-18. Increase in FI over 8 years predicts subsequent reduced function and greater mortality. However, whether interventions generally targeting FI reduce risks for downstream outcomes remains to be seen.

ASSOCIATION OF FRAILTY AND SUICIDE IN ADULTS 65 YEARS AND OLDER

Randall Kuffel,¹ Ruth Morin,² Kenneth Covinsky,³ John Boscardin,³ Yixia Li,⁴ and Amy Byers,³ 1. *San Francisco Veterans Affairs Health Care System, San Francisco, California, United States*, 2. *John D. Dingell VA Medical Center, Detroit, Michigan, United States*, 3. *University of California, San Francisco, San Francisco, California, United States*, 4. *San Francisco VA Health Care System, San Francisco, California, United States*

Nearly 10,000 adults aged 65 years and older die by suicide in US annually. Although prior studies have linked individual diagnostic factors to late-life suicide risk, to our knowledge none have examined how accumulated health burden affects suicide risk. Such a metric could be studied utilizing a frailty index (FI). Our primary study objective was to determine the relationship of FI to risk of suicide. We examined a longitudinal cohort of 2,858,876 veterans 65 years and older from fiscal year 2012-2013 (baseline) through 12/31/2017, linking the VA's suicide and mortality databases with medical record data. FI was defined by 31 variables, including morbidity, function, cognition, mood, sensory loss, chronic pain, and failure to thrive. We used Fine-Gray proportional hazards regression to examine time to suicide attempt (fatal and non-fatal). Our sample's average age was 75 (SD 8), 88% White, 9% Black, and 98% male. Thirty-seven percent of veterans were non-frail, 30% were pre-frail, 17% mildly frail, 9% moderately frail, and 7% severely frail. Over the course of the study, 9,043 veterans had a documented suicide attempt with >60% fatal. After adjusting for race, gender, region, substance use disorder, and PTSD, risk of suicide attempt increased across frailty categories: Hazard ratios increased from 1.37 (95%CI: 1.30-1.45) for pre-frail individuals to 1.57 (1.43-1.72) for severely frail individuals. We found similar results after further adjustment for the Charlson Comorbidity Index, suggesting cumulative deficit FI may be a strong prognostic marker for risk of suicide in adults over 65; informing late-life suicide prevention efforts.

FRAILITY AND MORTALITY IN A COMMUNITY-DWELLING RELATIVELY HEALTHY OLDER POPULATION

A R M Saifuddin Ekram,¹ Joanne Ryan,² Sara Espinoza,³ Michael Ernst,⁴ Anne Murray,⁵ and Robyn Woods,²
 1. Monash University, Monash University, Melbourne, Victoria, Australia, 2. Monash University, Melbourne, Victoria, Australia, 3. University of Texas Health Science Center San Antonio, San Antonio, Texas, United States, 4. University of Iowa, Iowa City, Iowa, United States, 5. Hennepin HealthCare Research Institute, Hennepin HealthCare, Minneapolis, Minnesota, United States

This study examined factors associated with frailty and studied the association between frailty status and mortality in healthy community-dwelling older persons. Participants included 19,114 individuals from the "ASPIrin in Reducing Events in the Elderly" (ASPREE) trial. Frailty was defined using modified Fried phenotype comprising exhaustion, body mass index, grip strength, gait speed and physical activity. A deficit accumulation frailty index (FI) using 66 items was also developed. Correlates of frailty were examined using multinomial logistic regression. The association between frailty status at baseline and mortality was analyzed using Cox regression. At baseline, 39.0% (95% CI: 38.3, 39.7) of participants were prefrail, and 2.2% (95% CI: 2.0, 2.4) were frail according to Fried phenotype, while 40.6% (95% CI: 40.0, 41.3) of participants were pre-frail and 8.1% (95% CI: 7.7, 8.5) were frail according to FI. Older age, female sex, lower education, African-American and Hispanic ethno-racial status, smoking, alcohol use, comorbidities, and polypharmacy were associated with frailty status. Pre-frailty

increased risk of all-cause mortality significantly (Fried HR: 1.48; 95% CI: 1.28, 1.71; FI HR: 1.54; 95% CI: 1.31, 1.81); and the risk was even higher for frailty (Fried HR: 2.24; 95% CI: 1.67, 3.00; FI HR: 2.34; 95% CI: 1.83, 2.99) after adjustment for covariates. Cardiovascular disease (CVD) and non-CVD-related mortality showed similar trends. These results highlight a considerable burden of pre-frailty among a large group of community-dwelling, initially healthy older adults. Both Fried phenotype and deficit accumulation FI similarly predicted all-cause, CVD and non-CVD-related mortality in relatively healthy older adults.

IMPACT OF PHYSICAL AND SOCIAL FRAILITY ON THE UTILIZATION OF NURSING CARE SERVICES IN VERY OLD ADULTS

Jaroslava Zimmermann, University of Cologne, Cologne, Nordrhein-Westfalen, Germany

Frailty, characterized by increased vulnerability to external stressors, has been found to increase the risk of healthcare utilization and nursing home admission. As the age group of 80 years or older remains frequently underrepresented in previous research, this study examined the impact of physical and social frailty on the utilization of nursing care services in very old population of North Rhine-Westphalia. Using data from a representative cross-sectional study, 1,577 community-dwelling and institutionalized individuals aged ≥80 years were included. Physical frailty was defined according to Fried's criteria (exhaustion, weight loss, low handgrip strength, low physical activity). Social frailty was measured with self-reported loneliness, social isolation, and time spent with others. The use of outpatient care services, day care, informal and inpatient care were considered. Multinomial regression was applied to investigate the impact of physical and social frailty on the use of outpatient and inpatient care services, controlling for relevant sociodemographic and health related characteristics. Compared to very old adults who did not use any care services, no association was found between frailty and the use of outpatient or informal care. Comparing nonusers of care services with institutionalized individuals, nursing home residents were less likely to experience physical frailty and pre-frailty, but were more likely to be socially isolated and to feel lonely. These findings suggest that physical frailty might have been successfully prevented in the context of institutional inpatient care. However, early identification and intervention focused on social inclusion of the institutionalized very old individuals are needed to reverse social frailty.

Session 4555 (Paper)

Friendship in Later Life

AN EVALUATION OF SOCIAL BRIDGING AND BONDING MECHANISMS IN THE ASSOCIATION OF SOCIAL NETWORKS AND COGNITIVE FUNCTION

Siyun Peng,¹ Brea Perry,¹ Adam Roth,¹ Max Coleman,¹ and Hope Sheehan,² 1. Indiana University, Bloomington, Indiana, United States, 2. Indiana University, Indianapolis, Indiana, United States

Background and Objectives: Substantial evidence links social connectedness prospectively to cognitive aging

outcomes, but there is little agreement about the social processes or mechanisms that drive this relationship. This study evaluated nine measures of social connectedness, focusing on two distinct forms of social enrichment – access to an expansive and diverse set of loosely connected individuals (i.e., social bridging) and integration in a supportive network of close ties (i.e., social bonding). Research Design and Methods: This study used egocentric social network and clinical cognitive data from 311 older adults in the first wave of the Social Networks in Alzheimer Disease (SNAD) study. Linear regressions adjusting for gender, age, education, and depression symptoms were used to estimate the association between nine measures of social connectedness and global cognitive function, verbal memory, and attention. Results: Measures indicative of social bridging (larger network size, lower density, presence of weak ties, and proportion non-kin) were consistently associated with better cognitive outcomes, while measures of social bonding largely produced null effects. Discussion and Implications: These findings suggest that the protective benefits of social connectedness for cognitive function and memory may operate primarily through a cognitive reserve mechanism that is driven by irregular contact with a larger and more diverse group of peripheral others. Population-level interventions that promote the cultivation of social bridging relationships and activities may have benefits for cognition later in life.

BIG AND MINI: A PROMISING PROGRAM TO LINK GENERATIONS TO COPE WITH SOCIAL ISOLATION

Zhirui Chen,¹ Ling Xu,¹ Noelle Fields,¹ Allen Zhou,² Anthony Zhou,³ and Aditi Merchant,² 1. *University of Texas at Arlington, Arlington, Texas, United States*, 2. *The University of Texas at Austin, Austin, Texas, United States*, 3. *The University of North Texas, Denton, Texas, United States*

Introduction: Social isolation disproportionately affected older adults prior to and especially during the COVID-19 pandemic. To help older adults cope with social isolation, a new program “Big and Mini” was created in April 2020 to link young and older adults together (matched through a custom website developed for this program) and to help increase social connectivity through weekly phone calls. Using a survey with both closed and open questions, this study evaluated participant feedback three months after the program was launched. Methods: 63 Bigs (age 50+) and 53 Minis (age 18+) completed the survey. Stress compared to before COVID-19, social isolation, life satisfaction, intergenerational solidarity, and satisfaction with the program were measured for both the Big and Mini participants. Descriptive, bivariate correlation, group comparison and conventional content analyses were conducted. Results: Results showed that 38.1% of Bigs and 37.7% of Minis felt higher levels of stress than before COVID-19. Both Bigs and Minis had medium levels of social isolation. They also reported high levels of satisfaction with life, satisfaction with the program, and intergenerational solidarity. Content analysis suggested that the reasons to join or expectations of the program were curiosity, friendship, mutually beneficial intergenerational connections, and coping with loneliness. Both Bigs and Minis reported benefits from the learning and sharing opportunities that the program offered. Conclusions: The Big and Mini program offers a promising approach with

mutual benefits for both Bigs and Minis. Strategies to improve the program and implications for other phone-based intergenerational programs are presented.

BUILDING FRIENDSHIPS THROUGH VOLUNTEERING IN LATE LIFE: DOES GENDER MODERATE THE RELATIONSHIP?

Emily Lim,¹ Changmin Peng,¹ and Jeffrey Burr,² 1. *University of Massachusetts Boston, Boston, Massachusetts, United States*, 2. *McCormack Graduate School, Boston, Massachusetts, United States*

Friendship plays a crucial role in maintaining social connectedness in late life. Volunteering helps older adults to stay socially engaged and often times provides the opportunity to meet and make new friends. A small literature suggests that volunteering may be associated with friendship, but many studies are limited by reliance on small, non-probability samples and simplistic analytic approaches. The literature is also unclear on how volunteering behaviors relate to specific characteristics of friendships and whether there are gender differences that condition these relationships. Using the 2014 and 2018 waves of the Health and Retirement Study (N=1,638), we investigate whether volunteer status and hours volunteered in 2014 are associated with friendship characteristics in 2018 (i.e., number of close friends, friendship quality, and contact frequency) among community-dwelling adults aged 50 years and above (M=65.60 years old, SD=8.31). We also examine whether gender moderated these relationships. Volunteer status and hours in 2014 were positively associated with the number of close friends and contact frequency in 2018. Only those who volunteered 200 hours or more in 2014 were positively associated with friendship quality in 2018. Regarding gender differences, men who volunteered 200 hours or more in 2014 had higher friendship quality in 2018 than women, while women who volunteered 100-199 hours in 2014 had greater contact frequency in 2018 than men. Hence, our results suggest volunteering is integral in shaping late-life friendships and volunteering might be more critical for understanding friendship characteristics among older men and women.

SOCIAL ISOLATION AND SLEEP QUALITY OF OLDER ADULTS IN CHINA: DO FAMILY AND FRIENDSHIP ISOLATION DIFFER?

Dan Zhang,¹ Zhiyong Lin,² Feinian Chen,³ and Shuzhuo Li,⁴ 1. *Xi'an Jiaotong University, Xi'an, Shaanxi, China (People's Republic)*, 2. *The University of Texas at Austin, Austin, Texas, United States*, 3. *University of Maryland College Park, University of Maryland, Maryland, United States*, 4. *Xi'an Jiaotong University, Xi'an, Shaanxi, China (People's Republic)*

This study provides one of the first population-based studies investigating associations between social isolation, especially its two sub-dimensions (family isolation and friendship isolation), and sleep quality among older adults in China. We address three major research questions: 1) Does the risk of poor sleep quality vary by social isolation status? 2) Are the associations between social isolation and sleep quality mediated by mental disorders (depressive symptoms and loneliness) and physical impairments

(pain and comorbidity)? and 3) Does the isolation from family members and friends differ in explaining sleep quality? We analyzed data from the 2014 wave of the China Longitudinal Aging Social Survey (CLASS), in which 7,597 respondents (aged 60-98) had complete information on measures of sleep quality (self-rated sleep difficulty), social isolation (using the Lubben Social Network Scale), and other analytical variables. Logistic regression models were estimated to predict the risk of sleep difficulty and Karlson-Holm-Breen (KHB) decomposition method was employed to test potential mediating effects. Results showed that social isolation, both family and friendship isolation, was significantly associated with higher risks of having sleep difficulty. The adverse effect of family isolation was found to be stronger than that of friendship isolation. Although both mental disorders and physical impairments mediated significant shares of associations between social isolation and sleep quality, physical impairments explained a lesser extent of them than mental disorders. These findings will be helpful for health policymakers and practitioners to design effective intervention strategies to help older adults with sleep problems.

Session 4560 (Symposium)

FROM DAY TO DAY TO YEAR TO YEAR: DEVELOPMENTAL ANTECEDENTS AND OUTCOMES OF CHANGES IN EMOTION

Chair: Jeremy Hamm

Co-Chair: Meaghan Barlow

Research shows that emotions play an important role in successful aging. However, less is known about how day-to-day fluctuations and multi-year changes in positive and negative emotions are implicated in adaptive development. Thus, the present studies address the developmental antecedents and outcomes of micro- and macro-longitudinal changes in different positive and negative emotions. Blöchl, Oertzen, and Kunzmann use 12-year data from the Health and Retirement Study to examine whether socioeconomic resources influence trajectories of positive emotion and physical functioning and their interrelations. Hamm, Wrosch, Barlow, and Kunzmann investigate psychosocial and health-related resources that predict two-year stability and change in adaptive and maladaptive daily patterns of calmness, excitement, sadness, and anger. Pauly et al. examine the extent to which health status moderates the association between daily fluctuations in seven affective states and corresponding changes in stress-related cortisol secretion. Turner, Mogle, Hill, Bhargava, and Rabin study how positive and negative emotions experienced in response to daily challenges (memory lapses) mediate the association between age-related challenges and life satisfaction in a coordinated analysis of two datasets. Finally, Barlow addresses the extent to which variations in daily experiences of positive and negative emotions exhibit age-differential associations with daily satisfaction with life (i.e., emotion globalizing). This symposium thus integrates new research on emotional aging and contributes to a deeper understanding of how adaptive development shapes and is shaped by day-to-day fluctuations and long-term changes in different emotions.

ASSOCIATIONS BETWEEN AGE-RELATED CHANGES IN POSITIVE AFFECT AND PHYSICAL FUNCTIONING: THE ROLE OF EDUCATION

Maria Blöchl,¹ Timo von Oertzen,² and Ute Kunzmann,³ 1. *Leipzig University, Leipzig University, Sachsen, Germany*, 2. *Universität der Bundeswehr, Neubiberg, Bayern, Germany*, 3. *Leipzig University, Leipzig, Sachsen, Germany*

Increasing research points to the relevance of educational attainment for positive emotional experiences and physical functioning across adulthood. However, little is known about how age-related developments in positive affect and physical functioning differ by educational attainment. This study used longitudinal data of 10,893 individuals (60–80 years) from the Health and Retirement Study to examine whether educational attainment moderates trajectories of positive affect and physical functioning and their interrelations over 12 years. Initial results from multiple-group bivariate growth models revealed that individuals with less formal education have lower positive affect and poorer physical functioning at baseline. There was, however, no evidence that longitudinal changes in positive affect, longitudinal changes in physical health, and coupled changes between both variables varied with educational attainment. These initial findings suggest that lower educational attainment is primarily related to lower levels of positive affect and physical functioning, but not to greater age-related declines or their interrelations.

DISCRETE EMOTION PROFILES IN OLD AGE: STABILITY AND CHANGE FOR BETTER OR WORSE

Jeremy Hamm,¹ Carsten Wrosch,² Meaghan Barlow,³ and Ute Kunzmann,⁴ 1. *North Dakota State University, Fargo, North Dakota, United States*, 2. *Concordia University, Montreal, Quebec, Canada*, 3. *University of California, Berkeley, University of California, Berkeley, California, United States*, 4. *Leipzig University, Leipzig, Sachsen, Germany*

Although discrete emotions can change in salience across adulthood, little is known about developmental shifts in the co-occurrence of multiple discrete emotions. The present study (n=389, Mage=73) adopted a person-centered approach to identify stability and change in commonly-occurring profiles of calmness, excitement, sadness, and anger. Daily emotions were assessed over 1-week periods at baseline and two years later. Latent class analyses yielded consistent 3-profile solutions at both waves: a positive emotion (high calmness-moderate excitement-low sadness and anger), a mixed emotion (moderate/high calmness-moderate excitement, sadness, and anger), and an apathetic emotion profile (low calmness, excitement, sadness, and anger). Latent transition analyses revealed both stability (82% remained in the same profile) and change (18% changed profiles) in profile membership. Higher baseline optimism and fewer chronic conditions were associated with adaptive changes in profile membership. Findings point to the importance of considering the co-occurrence of distinct emotions in studying emotional aging.

DISCRETE AFFECTIVE STATES, CORTISOL, AND SELF-RATED HEALTH IN OLD AGE

Theresa Pauly,¹ Oliver Schilling,² Ute Kunzmann,³ Hans-Werner Wahl,⁴ Nilam Ram,⁵ Denis Gerstorff,⁶ and

Christiane Hoppmann,⁷ 1. *University of Zurich, University of Zurich, Zurich, Switzerland*, 2. *University of Heidelberg, Heidelberg, Baden-Wurtemberg, Germany*, 3. *Leipzig University, Leipzig, Sachsen, Germany*, 4. *Heidelberg University, Heidelberg, Baden-Wurtemberg, Germany*, 5. *Stanford University, Stanford, California, United States*, 6. *Humboldt University of Berlin, Humboldt University of Berlin, Brandenburg, Germany*, 7. *University of British Columbia, University of British Columbia, British Columbia, Canada*

Old age is a developmental phase in which physical vulnerability increases and discrete affective states are uniquely important. The current project combines data from four studies (total N = 476 participants) to investigate within-person fluctuations in salivary cortisol (a marker of physiological arousal), seven discrete affective states, and the moderating role of self-rated health. Each participant provided affect reports and collected salivary cortisol 5-7 times a day for a 7-day period, and rated their health status. Multilevel models showed that cortisol levels were decreased in moments when participants felt happier, more relaxed, and more interested than usual and increased in moments when participants felt angrier, more nervous, more overwhelmed, and sadder than usual. Associations of happy, nervous, overwhelmed, and sad with cortisol were more pronounced in participants of better as compared to those of worse self-rated health. Findings suggest that higher HPA reactivity may indicate preserved health in older adults.

POSITIVE AND NEGATIVE AFFECT MEDIATE THE RELATIONSHIP BETWEEN MEMORY LAPSES AND LIFE SATISFACTION

Jennifer Turner,¹ Jacqueline Mogle,² Nikki Hill,² Sakshi Bharhava,³ and Laura Rabin,⁴ 1. *Pennsylvania State University, State College, Pennsylvania, United States*, 2. *Penn State University, University Park, Pennsylvania, United States*, 3. *Pennsylvania State University, University Park, Pennsylvania, United States*, 4. *Brooklyn College, The City University of New York, Brooklyn, New York, United States*

Aging is associated with declines and challenges, yet better subjective well-being. Life satisfaction is one aspect of well-being that may be sensitive to daily challenges. Daily memory lapses (e.g., forgetting words or meetings) are common and relevant for many adults. How individuals emotionally respond to challenges like memory lapses is a factor that could determine whether these experiences affect well-being. In a coordinated analysis of two datasets (N=561; ages 25-93 years) using multilevel modeling, we examined whether affective changes related to memory lapses mediated the relationship between memory lapses and life satisfaction. Results were similar across datasets: memory lapses were associated with reduced positive affect and increased negative affect. These associated affective changes also mediated the relationship between lapses and life satisfaction. We discuss the potential implications of our findings for linking proximal events and distal outcomes, and potentially intervening and identifying common challenges to mitigate broad reductions in well-being.

AGE DIFFERENCES IN EMOTION GLOBALIZING ACROSS THE ADULT LIFESPAN

Meaghan Barlow, *University of California, Berkeley, University of California, Berkeley, California, United States*

Emotion globalizing, the extent to which current emotions impact satisfaction with life, is associated with poorer psychological well-being. Given extant aging theories and research highlighting age-related changes in emotional experiences and emotion regulation, the present study examined age differences in positive and negative emotion globalizing across the adult lifespan. Participants (N = 145 females; aged 23-79) completed assessments of positive emotion (i.e., amused, energetic, calm, happy, interested, excited, and content), negative emotion (i.e., anxious, lonely, sad, annoyed, angry, and distressed), and life satisfaction for 16 days. Multilevel model analyses revealed age differences in negative, but not positive, emotion globalizing. More specifically, older individuals reported lower levels of negative emotion globalizing, as compared to younger individuals. These findings highlight the need to explore downstream consequences of emotion globalizing across the lifespan, as this could unveil novel pathways towards successful aging.

Session 4565 (Paper)

Health and Social Services

A NURSE-LED CONCEPTUAL MODEL TO INFORM PATIENT-CENTERED TYPE 2 DIABETES MANAGEMENT IN PUBLIC CLINICAL SETTINGS

Stella Bosun-Arije,¹ and Candidus Nwakasi,² 1. *Manchester Metropolitan University, Manchester Metropolitan University, England, United Kingdom*, 2. *Providence College, Providence, Rhode Island, United States*

Globally, there is an increased need to provide patient-centered care for people diagnosed with Type 2 diabetes mellitus (T2DM). In Nigeria, a poorly financed health system worsens the difficulties associated with managing T2DM in clinical settings, resulting in a detrimental effect on patient-centered care. We aimed to develop a conceptual model to promote patient-centered T2DM care in clinical settings. We explored nurses' contextual perceptions of clinical practices and operations that are relevant to T2DM management across public hospitals in Lagos, Nigeria. Identifying a nurse-led intervention is critical to care optimization for people diagnosed with T2DM. Using a qualitative research, we used semi-structured questions and the Constant Comparison Method to interview 17 practice (registered) nurses with over 1-year experience working in public hospitals across Lagos, Nigeria. The Framework Method was used for data analysis. The nurses provided insight into four areas of patient-centered T2DM management in clinical settings. They are: empowering collaboration, empowering flexibility, empowering approach, and empowering practice. The nurses discussed an empowering pathway through which health settings could provide patient-centered care to individuals diagnosed with T2DM. The pathway includes the integration of macro, meso, and micro levels for patient management. Their views informed the development of a conceptual model for

the optimization of patient care. The model developed from this research sits within the Patient-Centered Care model of healthcare delivery. The model has the potential to inform patient-centered care in countries with poorly financed healthcare systems, and developed countries with comparatively better healthcare.

EXAMINING THE RISK OF POTENTIALLY PREVENTABLE HOSPITALIZATION IN ADULTS WITH CONGENITAL AND ACQUIRED DISABILITIES

Elham Mahmoudi,¹ Paul Lin,² Anam Khan,³ and Neil Kamdar,² 1. *University of Michigan, Commerce Township, Michigan, United States*, 2. *University of Michigan, Ann Arbor, Michigan, United States*, 3. *University of Michigan School of Public Health, Ann Arbor, Michigan, United States*

Introduction: Adults with congenital (cerebral palsy/spina bifida (CP/SB)) or acquired disabilities (spinal cord injury (SCI) or multiple sclerosis (MS)) are more likely than those without disability to develop medical complications. Little is known about potentially preventable hospitalizations (PPH) among adults with disabilities. PPHs are preventable if a patient had timely access to care. Our objective was to estimate PPH risk for each of the aforementioned disabilities. **Methods:** We used private payer claims data from 2007-2017 to identify adults (18+) with diagnoses of CP/SB (n=10,617), SCI (n=5,173), and MS (n=6,198). Adults without these disabilities were included as controls. We propensity score matched individuals for age and sex. Logistic regression models with repeated measures were subsequently applied, adjusting for age, sex, race/ethnicity, health indicators, U.S. census divisions, and socioeconomic variables. **Odd ratios (OR)** were compared over 4-years of follow up. **Results:** Adults with CP/SB, SCI, and MS had higher odds of any PPH compared with adults without disability [CP/SB: (OR=4.10; 95% CI: 2.31-7.31); SCI: (OR=1.67; 95% CI: 1.21-2.32); and MS: (OR=1.48; 95% CI: 1.00-2.25)]. Use of preventative services reduced the PPH risk. For example, wellness visit reduced the odds of PPH by almost half [CP/SB: (OR=0.52; 95% CI: 0.41-0.67); SCI: (OR=0.57; 95% CI: 0.45-0.71); and MS: (OR=0.53; 95% CI: 0.40-0.66)]. **Conclusions:** Adults with disabilities are at greater odds of PPH compared to adults without disabilities. Clinical guidelines for use of preventative care for adults living with disabilities need to be accordingly updated.

MEDICATION MANAGEMENT AND THE ROLE OF THE GERIATRIC PHARMACIST IN INTERDISCIPLINARY CARE TEAMS

Christine Jensen,¹ Lauren Burnette,¹ and Faika Zanjani,² 1. *Riverside Center for Excellence in Aging & Lifelong Health, Williamsburg, Virginia, United States*, 2. *Virginia Commonwealth University, Richmond, Virginia, United States*

Among adults 65 and older, 30% are taking at least five medications to treat acute and chronic health conditions (Gavin, 2020). As the number of medications increases, the more complex the regimen tends to be, which increases risks with proper management and unwanted side effects. Our interdisciplinary geriatric assessment team has been conducting medication reviews for individuals living with dementia, where geriatric pharmacists meet with these individuals and their family caregiver. These sessions build a

trusting relationship, where older adults are able to receive education about their prescription and over-the-counter medications, address any concerns and reach shared goals. Pharmacists routinely recommend deprescribing, and all recommendations are sent to the older adults' primary care provider. After the initial appointment, a follow-up takes place six months later to re-examine adherence to recommendations and assess outcomes. Since April 2019, our pharmacists have served over 300 individuals, where nearly 90% would recommend this review to others. Pharmacists have recommended over 250 medication changes, averaging 2.53 per person. A statistically significant decrease in prescription medications (from 12.48 to 12.16) has been identified, in addition to a trending decline for over-the-counter medications (3.91 to 3.79). Medication reviews have successfully reduced the overall number of medications, as 36% of recommendations have been accepted by the patient and their healthcare provider. Comprehensive medication review programs, where pharmacists are integrated into an interdisciplinary care team, offer high quality, best practice healthcare, where safety and quality of life is improved for older adults.

PREDICTORS OF CARE MANAGEMENT UTILIZATION

Margaret Danilovich,¹ and Sharmila Prabhu,² 1. *CJE SeniorLife, Skokie, Illinois, United States*, 2. *Loyola University, West Bloomfield, Michigan, United States*

Care management is the process of planning and coordinating care to assist individuals or families in managing their health. This may involve managing inpatient or outpatient medical care or helping with other household, legal, or financial needs. Care management service providers are challenged in knowing how best to allocate limited resources (i.e. care manager time) to best meet client needs. Research shows predictors for increased care management needs include advanced age, multiple comorbidities, frequent care transitions, and private insurance coverage, but the association of objectively measured functional assessments and care management hour utilization is unknown. This secondary data analysis aimed to identify factors that predict the amount of care management service among low-income older adults enrolled in a care management program. We used de-identified care management data from the electronic health record at 1 social service agency. We used multivariate regression to predict the number of hours of care management utilization from demographics, comorbidities, intake ADLs/IADLs, physical health, and self-reported quality of life. We found moderate to strong correlations between physical health and quality of life (r=0.58) and activities of daily living and instrumental activities of daily living (r=0.81). Baseline self-reported quality of life predicted the number of hours of care management utilization (p=.03; beta = 6.75). Quality of life can be useful in predicting the number of service hours that a particular client may require from a care management program and should be considered as an intake question to assist social service providers in allocating hours adequately to clients.

STRENGTHS-BASED INTERPROFESSIONAL PRACTICE AND EDUCATION: TRANSFORMING CARE THROUGH DISRUPTION

Teri Kennedy, *The University of Kansas Medical Center, Kansas City, Kansas, United States*

This is a conceptual paper proposing a new model of Strengths-Based Interprofessional Practice and Education (SB-IPE), incorporating appreciative inquiry and narrative, and its application to improve health and social care practice and policy for older adults. Within people, families, communities, and teams are people who understand their assets and culture, hold a collective wisdom derived from their individual biographies and shared history, and are deeply invested in their success. This wisdom and experience can be mined for strengths and best practices to improve health and social care for older adults and their families. The conceptual framework of the model and relationship between concepts are explained, reviewing and synthesizing relevant literature on the strengths perspective, interprofessional practice and education, evolution of the patient voice, appreciative inquiry, and narrative to leverage the voices and experiences of older adults, their families, and interprofessional teams. Providing person-, family-, and community-centered health and social care through SB-IPE involves eliciting, listening to, and processing stories and narratives, then coalescing and co-creating person/family/team narratives throughout the trajectory of care. Appreciate inquiry and narrative can be harnessed to imagine an improved experience of care for older adults and their families. Incorporating the potential disruption of the voices and perspectives of older adults and their families offers value for health and social care delivery and policy innovation. Application of the SB-IPE model holds promise for harnessing these voices and collective experiences leading from disruption to transformation of health and social care practice, health professions education, policy, and research.

Session 4570 (Symposium)

HOW DOES AGING IN PLACE HELP US UNDERSTAND LONELINESS DURING THE COVID-19 PANDEMIC?

Chair: Judith Robertson Phillips

Co-Chair: Cassandra Ford

Discussant: Thomas Prohaska

Co-sponsored by the Disasters and Older Adults, Loneliness and Social Isolation, and Rural Aging Interest Groups, five presenters will highlight multiple circumstances regarding the intersection of social isolation or loneliness and the impact of COVID-19. Haverhals and colleagues interviewed veterans and their caregivers to identify the impact of changes in care delivery and social isolation as a result of the pandemic. Findings indicated differences in feelings of isolation among individuals living in their own home or assisted living facilities. Hua et al. examined whether individuals in long-term care communities were lonelier than individuals in the community during the pandemic using data from the NHATS COVID-19 module with higher levels of loneliness reported from individuals living in more restricted communities. Henning-Smith and colleagues explored differences in social activities among rural and urban participants in the COVID-19 Coping Study. Their study provides awareness into the ways rural and urban older adults stayed connected during the pandemic. Peterson et al. examined the effect of COVID-19 on care in Florida nursing homes and assisted living communities and on residents' anxiety with higher levels of anxiety reported by residents in nursing homes. Using the Coping with Loneliness, Isolation and COVID19

Global Survey, O'Sullivan and colleagues utilized the lens of 'place' to examine factors associated with those experiencing loneliness and/or social isolation during the pandemic with insights from a public health perspective. Collectively, these presenters will provide evidence of the challenges associated with older adults' social isolation and loneliness throughout the COVID-19 pandemic.

DOES PLACE MATTER WHEN UNDERSTANDING LONELINESS AND SOCIAL ISOLATION?

Roger O'Sullivan,¹ Annette Burns,² Christina Victor,³ Thomas Prohaska,⁴ Brian Lawlor,⁵ and Gerry Leavey,⁶
 1. *Institute of Public Health in Ireland, Belfast/Dublin, Dublin, Ireland*, 2. *Institute of Public Health in Ireland, Dublin, Dublin, Ireland*, 3. *Brunel University London, Uxbridge, England, United Kingdom*, 4. *RRF Foundation for Aging, Fairfax, Virginia, United States*, 5. *Trinity College Dublin, Dublin, Dublin, Ireland*, 6. *Ulster University, Belfast, Northern Ireland, United Kingdom*

Physical distancing and restriction of movements as measures to prevent the spread of Covid-19 required people to change their work, home and social lives. Loneliness and social isolation have emerged as key public health issues during the pandemic. Traditionally when considering loneliness the focus is often on individual factors rather than within the context of structural and environmental dimensions. This paper will utilise data from the Coping with Loneliness, Isolation and Covid-19 global online survey which had over 20,000 global responses from people aged 18+ in 2020. Analysis will use the lens of 'place' and the 5-item UCLA scale and 6-item Lubben social network scale to understand the social and demographic characteristics and structural and environmental factors associated with those experiencing loneliness and/or social isolation in rural and urban areas both before and during the pandemic. The paper will conclude with key messages from a public health perspective.

LONELINESS AND SOCIAL CONNECTEDNESS AMONG RURAL OLDER ADULTS SINCE THE COVID-19 PANDEMIC ONSET

Carrie Henning-Smith,¹ Gabriella Meltzer,² Lindsay Kobayashi,³ and Jessica Finlay,³
 1. *University of Minnesota School of Public Health, Minneapolis, Minnesota, United States*, 2. *Department of Social and Behavioral Sciences, New York University, New York, United States*, 3. *University of Michigan, Ann Arbor, Michigan, United States*

Rural areas have a higher proportion of older adults aging in place. Rural areas also face structural barriers to supporting social connectedness among older adults, including transportation barriers, greater geographic distances, and access to technological connectivity. This research aims to discuss rural-specific risks of loneliness and social isolation among older adults, as well as rural/urban differences in loneliness and social isolation among older adults using the national COVID-19 Coping Study. Cross-sectional bivariate analyses highlight rural/urban differences in social activities during the pandemic. For example, rural older adults were more likely to use social media daily, compared with urban older adults (67% vs. 61%, $p < 0.05$), but were less likely to have phone or video calls with others daily (21% vs. 26%, $p < 0.001$). We will also share results of differences within

rural older adults in loneliness, isolation, and social activities by socio-demographic characteristics in order to design targeted interventions to improve connectedness.

SOCIAL ISOLATION IN LONG-TERM CARE FACILITIES RELATED TO COVID-19: EFFECT ON RESIDENT ANXIETY AND CARE

Lindsay Peterson,¹ Nazmus Sakib,² and Joseph June,³ 1. *University of South Florida, Bradenton, Florida, United States*, 2. *Department of Industrial and Management Systems, University of South Florida, Tampa, Florida, United States*, 3. *University of South Florida, Tampa, Florida, United States*

Loneliness is a common problem in long-term care. It has been associated with a higher risk of depression, aggressive behaviors, and anxiety and may be a risk factor for cognitive decline. Loneliness can exacerbate social isolation. The COVID-19 emergency brought on measures in Florida, beginning in March 2020, to separate nursing home (NH) and assisted living community (ALC) residents from each other and family members to limit virus spread. This study examines results of a survey with Florida NH (N=59) and ALC (N=117) administrators concerning effects of these measures. Scaled (1-5, lowest to highest) data indicate that resident anxiety was higher in NHs (M=3.40) than ALCs (M=3.17). Care disruptions related to limited resident-to-resident contact also were worse in NHs (M=3.74) than in ALCs (M=3.21), while care disruptions related to loss of family support were higher among ALCs (M=3.19) than in NHs (M=2.86). Implications of these findings will be discussed.

IMPACT OF SOCIAL ISOLATION DUE TO COVID-19 ON VA HOME-BASED PRIMARY CARE VETERANS AND CAREGIVERS

Leah Haverhals,¹ Chelsea Manheim,¹ Nelly Solorzano,¹ Juli Barnard,² and Tamar Wyte-Lake,³ 1. *Denver Center of Innovation for Veteran Centered and Value Driven Care (COIN), Denver, Colorado, United States*, 2. *Department of Veterans Affairs, Aurora, Colorado, United States*, 3. *US Department of Veterans Affairs, U.S. Department of Veterans Affairs (VA), California, United States*

In December 2020 we began conducting phone interviews with Veterans, and their caregivers, receiving care through the United States (US) Department of Veterans Affairs (VA) Home Based Primary Care (HBPC) program. Our goal was to describe experiences of Veterans and caregivers managing changes in care delivery related to the COVID-19 pandemic and navigating increased social isolation due to social distancing. We interviewed 38 Veterans (average age 78) and caregivers (average age 62) across seven VA HBPC programs. Findings showed those living in their own homes found increased isolation more manageable than those living in assisted living facilities, which restricted visitors. Caregivers had a harder time managing isolation than Veterans, as Veterans were used to being primarily homebound. Veterans and caregivers relied on increased phone communication with their HBPC teams, with some began participating in virtual visits. Implications include insights into better supporting older, homebound adults and their caregivers during disasters.

COMPARING LONELINESS AMONG INDIVIDUALS IN LONG-TERM CARE SETTINGS AND THE COMMUNITY

Cassandra Hua, *Brown University, Providence, Rhode Island, United States*

We used the NHATS COVID-19 module to examine whether individuals in long-term care communities were lonelier than individuals in the community during the pandemic. Additionally, we examined whether individuals in long-term care communities with more restrictive policies concerning visitors and communal activities were more likely to experience loneliness than individuals in communities with less restrictive policies. Approximately 45% of individuals in long-term care communities (n=134) felt at least a moderate amount of loneliness during COVID-19 when compared to 34% of individuals in the community (n= 2,666) (p<.05). However, the association was no longer statistically significant after adjusting for age, race, and sex. Among individuals in long-term care communities with the most restrictive policies, 48% experienced loneliness compared to 44% individuals in less restrictive communities. However, this finding was not statistically significant. Discussion will focus on similarities and differences within these populations that could have led to these results.

Session 4575 (Symposium)

INNOVATIVE GERONTOLOGY IN HIGHER EDUCATION: TRANSFORMATIVE EFFECTS OF THE PANDEMIC

Chair: Pamela Saunders

Co-Chair: Yoon Chung Kim

Discussant: Debra Dobbs

Gerontology in higher education is experiencing an exciting inflection point rising from the COVID pandemic pushing us to adapt our teaching modalities. Many educators have developed innovative learning experiences making use of creativity, virtual reality, online discussion boards, virtual tours, Jam Boards, videos, and breakout rooms. This symposium will bring together gerontologists and educators to discuss their educational innovations. Dr. Saunders will discuss the use of virtual reality in a Geriatrics clerkship experience to enhance knowledge, empathy, and attitudes towards older adults. Dr. Hanna and Ms. Kim will present the use of a virtual avatar to explore aging identity. Professor Barsness will discuss the participation of older adults from the community as subject matter experts. Ms. Redlich will share her virtual internship experience of exploring the intellectual and social benefits of adult study abroad. Although the pandemic was challenging to gerontological education, substantial transformations have been accomplished. The innovations described in this session broadened engagement of students with older adults to identify their strengths and challenges to flourish in the "New Normal."

TRANSFORMING EDUCATION USING VIRTUAL REALITY: GERIATRICS CLERKSHIP BEFORE AND DURING PANDEMIC

Pamela Saunders, *Georgetown University, WASHINGTON, District of Columbia, United States*

Since 2006, the Georgetown University School of Medicine has offered a two-week elective in Geriatrics for third-year medical students. Students rotate through diverse clinical experiences, including general geriatrics, geriatric neurology, physical medicine & rehabilitation, memory disorders, Parkinson's and dementia, and palliative care. In addition, students learn about arts, humanities & ethics, communication skills, and taking the patient's perspective. In Fall 2019, pre-pandemic, we added virtual reality (VR) experiences focused on hearing & vision loss, Alzheimer's disease, and end-of-life conversations created by Embodied Labs. Curricular goals included increasing students' empathy and sensitivity, decreasing ageism & stereotyping, and increasing clinical knowledge. Findings suggest regardless of pandemic (pre vs. during) or modality (in-person vs. Zoom) that after participating in the VR labs, students are slightly more comfortable taking care of older adult patients with dementia as well as hearing & vision loss, and participating in end-of-life conversations.

LEARNING HUMANITIES AND ETHICS OF AGING THROUGH THE LENS OF AN AVATAR CREATION

Gay Hanna, and Yoon Chung Kim, *Georgetown University, Washington DC, District of Columbia, United States*

The main goal of teaching the humanities and ethics of aging is to understand the perspectives of older individuals as they address the challenges and opportunities presented across the aging spectrum. To encourage understanding of this humanistic and ethical process, students were given an assignment to select a profile of an older person with pre-selected characteristics that they then develop into their avatar, a virtual companion, to accompany them through the course. This assignment included three iterations of the avatar narrative related to what is studied in class around major life transition points related to work, housing, and end of life. These assignments included the creation of Mind Maps which illustrate their avatar's ongoing concerns related to their environment including their social determinants of health. The avatar's formative development throughout the course brought forward discussions around identity, safety, autonomy, and person-centeredness in terms of gerontological practice and policy.

OLDER ADULTS AS VIRTUAL SUBJECT MATTER EXPERTS IN COVID GRADUATE EDUCATION

Sonya Barsness, *Georgetown University, Washington DC, District of Columbia, United States*

COVID-19 has further illuminated the need for educational approaches in gerontology that are person-centered and experiential. Ideally, this includes in-person experiences with students and older adults. Through their classroom participation as subject matter experts in aging, older adults share their personal experiences, and react to gerontological theories and ideas. Shared learning offers a platform for exploration of shared humanity, so that older adults are not seen as the "other", but "us". This prepares a generation of gerontologists to identify and reject ongoing ageism, again highlighted by the pandemic. COVID-19 has also challenged educators to offer these experiential opportunities. In this presentation we will outline how older adults from a Continuing Care Retirement Community participated

virtually in a graduate course. We will discuss how their virtual involvement was structured, how their real-time COVID experiences were integrated, and share feedback from older adult participants and students on their shared learning experiences.

STUDENT PERSPECTIVE: INTERNSHIP EXPLORING INTELLECTUAL AND SOCIAL BENEFITS OF ADULT STUDY ABROAD

Kim Redlich, *Georgetown University, Washington DC, District of Columbia, United States*

Older adult participation in lifelong learning programs – such as university continuing education opportunities and the Age-Friendly University global network – has grown steadily over the last few years. Many of these programs are characterized by mixed-age classrooms in which undergraduate students share space and learning, remotely during Covid, with older adult participants who pay a nominal fee. Survey findings will be presented from older students involved in two university programs in this category: Temple University's "senior scholars" program and Georgetown University's "senior auditors" program, specifically related to the concept of adult study abroad. Adult study abroad is a new offering that combines the intellectual and social benefits of stimulating coursework with the transformative power of travel, and how the merging of these pursuits can produce purpose, meaning and community, especially for older adults. It is typically residential, academic, intergenerational, and of longer duration than a typical tourist experience.

Session 4580 (Symposium)

LINKING OLDER ADULTS' DAILY ACTIVITIES WITH WELL-BEING AND COGNITION: EXAMINING MODERATORS AND MEDIATORS

Chair: Christina Roecke

Co-Chair: Minxia Luo

Discussant: Thomas M. Hess

Increasingly more studies are showing that daily activities can be beneficial to wellbeing and cognitive abilities of older adults, but discussions about through which psychological mechanisms daily activities are associated with wellbeing and cognitive health have been scarce. This symposium, including three ambulatory assessment studies and one cross-sectional study, presents emerging theoretical hypotheses and recent empirical findings on this matter. Specifically, with 5-6 days of observations from 313 older adults, Brown and colleagues show that greater daily activity diversity is related to older adults' higher overall cognitive functioning (executive functioning, memory, and crystallized intelligence). Hueluer and colleagues examine the moderating role of interaction modality on the relation of daily social interactions with wellbeing using data from 116 older adults over 21 days. Their results show that more face-to-face interactions — but not telephone or digital interactions — are associated with higher positive affect and lower loneliness. With data from 153 older adults over 15 days, Luo and colleagues show the mediating effect of positive affect in the association between momentary working memory performance and subsequent social activity engagement. Sharifian and colleagues show the mediating effects of solitary-cognitive activities in the association between depressive symptoms and

global cognition, using cross-sectional data from 453 older adults, and also examine the moderating role of race. Finally, Tom Hess will serve as a discussant and provide an integrative discussion of the papers, informed by his extensive work on daily activities, motivation, and aging.

MOMENTARY WORKING MEMORY AND MOMENTARY ACTIVITIES IN HEALTHY OLDER ADULTS: THE MEDIATING ROLE OF AFFECTIVE STATES

Minxia Luo,¹ Robert Moulder,² and Christina Röcke,²
1. *University of Zurich, Zurich, Zurich, Switzerland*, 2.
University of Zurich, Zurich, Zurich, Switzerland

Research has shown cognitive ability in older age is associated with activity engagement, but little is known about what psychological mechanisms are linking the two constructs. This study investigates an emotional pathway, in which affective states mediate the temporal associations between momentary working memory and momentary activities in older age. We examined data from 153 healthy older adults aged 65 to 91 who completed a smartphone-based ambulatory assessment survey seven times a day over 15 days. In each assessment point, participants reported their momentary activities (e.g., social activities, mentally stimulating activities) and affective states (i.e., positive affect, negative affect) and took a working memory task. Initial results suggest that during an approximate time period of six hours (i.e., across three assessment points), working memory performance influences subsequent likelihood of social activity engagement. Moreover, positive affect mediates this temporal association. Results will be discussed in the context of cognitive aging research.

SWITCHING UP HOW YOU GET IN YOUR STEPS: DAILY ACTIVITY DIVERSITY AND COGNITIVE FUNCTIONING

Colette Brown,¹ Sangha Jeon,¹ Yee To Ng,² Soomi Lee,³
Susan Charles,¹ and Karen Fingerma,⁴ 1. *University of California, Irvine, Irvine, California, United States*,
2. *University of Texas at Austin, Austin, Texas, United States*, 3. *University of South Florida, Tampa, Florida, United States*, 4. *The University of Texas at Austin, Austin, Texas, United States*

Active lifestyles are related to better cognitive health. More work is needed, however, to examine whether participating in a variety of daily activities (i.e., activity diversity) has unique importance beyond amount of activity. The current study examined associations between daily activity diversity and cognitive functioning among community-dwelling older adults (N = 313, ages 65-90). Participants completed a cognitive battery, then responded to ecological momentary assessments of their participation in 10 common activity types (e.g., exercise, chores, social visits, volunteering) every 3 hours for 5-6 days, and wore accelerometers to track daily step counts and duration of activity. Multiple regression models revealed that greater daily activity diversity related to higher overall cognitive functioning, executive functioning, memory, and crystallized intelligence. These associations remained significant after adjusting for step count and duration of activity. Findings suggest daily activity diversity has unique importance beyond sheer amount of activity for cognitive health in later adulthood.

DAILY SOCIAL INTERACTIONS AND WELL-BEING IN OLDER ADULTS: THE ROLE OF INTERACTION MODALITY

Gizem Hueluer,¹ Birthe Macdonald,² and Minxia Luo,³ 1.
University of Bonn (Germany), 2. *University of Zurich, Zurich, Zurich, Switzerland*, 3. *University of Zurich, Zurich, Zurich, Switzerland*

Older adults increasingly use digital communication technologies to stay connected to others. In the present study, we examine the role of social interactions for older adults' daily well-being focusing on three interaction modalities (face-to-face, telephone, and digital). We use data from 116 participants (age: M = 72 years, SD = 5, range = 65 to 94; 41% women), who reported on their social interactions and well-being over 21 days. Our findings show that frequency of face-to-face interactions is more consistently related to well-being than telephone or digital interactions. On days where participants report more face-to-face social interactions than their own average, they report higher positive affect and lower loneliness than usual. Similar effects are not found for telephone or digital interactions. In summary, our findings suggest that face-to-face social interactions are uniquely relevant to older adults' daily well-being. We discuss implications of these findings for future research.

DEPRESSIVE SYMPTOMS, LEISURE ACTIVITY ENGAGEMENT, AND GLOBAL COGNITION IN NON-HISPANIC WHITE AND BLACK OLDER ADULTS

Neika Sharifian, A. Zarina Kraal, and Laura Zahodne,
University of Michigan, Ann Arbor, Michigan, United States

Prior research has linked more depressive symptoms to worse global cognition in older adulthood through lower leisure activity engagement. Less is known regarding which types of activities drive these associations. Additionally, depressive symptoms disproportionately affect cognition in Non-Hispanic Blacks (NHB) versus Non-Hispanic Whites (NHW). This cross-sectional study used data from the Michigan Cognitive Aging Project (n=453, 52% NHB, Mage=63.60 years) to examine whether distinct leisure activities (solitary-cognitive, solitary-creative, community-social, physical, intergenerational-social, cognitive-games) mediated the association between depressive symptoms and global cognition and whether race moderated these associations. Lower engagement in solitary-cognitive activities partially mediated the negative association between depressive symptoms and global cognition. In multi-group models, this indirect effect was only evident in NHBs, who showed a stronger negative association between depressive symptoms and activity engagement than NHWs. While cross-sectional, findings indicate that depressive symptoms may negatively impact cognition by reducing engagement in activities that promote cognitive reserve.

Session 4585 (Symposium)

NOVEL GENETIC AND COGNITIVE FINDINGS FROM THE LONG LIFE FAMILY STUDY

Chair: Mary Wojczynski
Co-Chair: Nancy W. Glynn
Co-Chair: Evan Hadley

The Long Life Family Study (LLFS), funded by the National Institute on Aging, is an international collaborative

study of the genetics and familial components of exceptional longevity and healthy aging. We phenotyped 4,953 individuals from 539 two-generational families (1,727 proband; 3,226 offspring) at baseline (2006-2009). A second visit (2014-2017) was conducted for 2,904 (478 proband; 2,426 offspring) participants. The longitudinal, comprehensive in-person visits measured domains of healthy aging, including physical performance, cognition, and blood markers. Extensive genetic analyses were performed using the baseline blood draw, including genotyping with the Illumina 2.5M Human Omni array, linkage analyses with the families, whole genome sequencing using the TopMED protocol, and metabolomic assays. Collectively, this symposium will present novel findings that elucidate new potential genes and genetic interactions, investigate metabolomics profiles among APOE4 carriers, and refine phenotypic cognition definitions. Specifically, Dr. Santanasto will share results flanking the mesothelin gene associated with longitudinal gait speed. Then, Dr. An will share his findings of a new intronic variant in PKD1L2 gene associated with adiponectin, a marker of insulin resistance. Next, Dr. Arbeev will discuss genetic interactions between candidate genes for physiologic dysregulation and candidate genes for Alzheimer's disease (AD, UNC5C gene). Ms. Yao will examine metabolomic profile differences between APOE4 carriers who develop AD and those who do not. Lastly, Mr. Xiang will introduce a method for combining multiple cognitive tests into a more sensitive overall cognitive score. As Discussant, Dr. Evan Hadley will share insights and propose future directions for LLFS.

NOVEL POSITIONAL CANDIDATE GENE FOR GAIT SPEED CHANGE IN OLDER ADULTS: THE LONG LIFE FAMILY STUDY

Adam Santanasto,¹ Mary Wojczynski,² Ryan Cvejkus,³ Bharat Thyagarajan,⁴ Kaare Christensen,⁵ Nicole Schupf,⁶ E. Warwick Daw,⁷ and Joseph Zmuda,³ 1. *University of Pittsburgh, Pittsburgh, Pittsburgh, Pennsylvania, United States*, 2. *Washington University School of Medicine, Washington University School of Medicine, Missouri, United States*, 3. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 4. *University of Minnesota, Minneapolis, Minnesota, United States*, 5. *Department of Public Health, University of Southern Denmark, Odense, Syddanmark, Denmark*, 6. *Columbia University, Mailman School of Public Health, New York, New York, United States*, 7. *Washington University in St. Louis, St. Louis, Missouri, United States*

Gait speed is a heritable, robust predictor of longevity in older adults. Using genome-wide linkage analysis in 2379 individuals from 509 families (64±12 years; 45% men), we identified a locus on chromosome 16p linked to gait speed change over 7±1 years (logarithm of the odds score [LOD]=4.2). Gait speed change was calculated using a two-stage growth curve mixed-model. DNA sequencing was completed to identify single nucleotide variants (SNVs) in the linkage region. Association analyses between the 24039 SNVs in the ~1.6mBP region (3.7-5.3mBP) and gait speed change were performed adjusting for age, age², sex, height, field center, familial relatedness and population substructure. Eleven families (188 individuals) accounted for most

of the linkage signal (LOD=6.06). Associations between SNVs flanking the Mesothelin (MSLN) gene and gait speed change were identified (lead SNV rs56850119: $\beta = -0.5 \pm 0.1$, $p = 6.4 \times 10^{-7}$). Thus, MSLN is a potential positional candidate gene for mobility decline with aging.

LINKAGE GUIDED SEQUENCE ANALYSIS REVEALED A NOVEL GENE PKD1L2 FOR ADIPONECTIN: THE LONG LIFE FAMILY STUDY (LLFS)

Ping An,¹ Joseph Lee,² Jason Anema,³ Lihua Wang,¹ Warwick Daw,⁴ Kaare Christensen,⁵ Joseph Zmuda,⁶ and Michael Province,⁷ 1. *Washington University School of Medicine, St. Louis, Missouri, United States*, 2. *Columbia University, New York, New York, United States*, 3. *Washington University School of Medicine, St. Louis, Missouri, United States*, 4. *Washington University, St. Louis, Missouri, United States*, 5. *Department of Public Health, University of Southern Denmark, Odense, Syddanmark, Denmark*, 6. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 7. *Washington University School of Medicine, Washington University School of Medicine, Missouri, United States*

Adiponectin is involved in regulating insulin resistance (IR) and is a potential regulator of healthy aging and lifespan. To identify novel variants associated with adiponectin, we further assessed our previously identified linkage peak on 16q23.2 (LODs=3.8). We used sequence data of 632 participants (age, 24-110 years) from 47 families of European ancestry in the Long Life Family Study, a study with familial clustering of exceptional longevity in the US and Denmark. Adiponectin levels were log-transformed, and adjusted for age, sex, sites, and PCs for ancestry. We found a variant in the PKD1L2 (rs527459046, $p=2 \times 10^{-8}$, MAF=3%, $r^2=1.5\%$, accounting for linkage=28%). The PKD1L2, 1.4 Mb upstream of the CDH13 (adiponectin receptor gene) is expressed in heart, liver, and adipocytes, known to function as an ion-channel regulator or a GPCR regulator for aging-related lipolysis, IR, and adiponectin/leptin secretion. Haplotyping, epistatic and bioinformatic analyses will be engaged to capture additional/functional variants and regulatory networks.

GENES INVOLVED IN PHYSIOLOGICAL DYSREGULATION AND DECLINE IN RESILIENCE: ROLE IN ALZHEIMER'S DISEASE

Konstantin Arbeev,¹ Svetlana Ukraintseva,¹ Olivia Bagley,¹ Hongzhe Duan,² Deqing Wu,¹ Igor Akushevich,¹ Alexander Kulminski,² and Anatoliy Yashin,¹ 1. *Duke University, Durham, North Carolina, United States*, 2. *DUKE UNIVERSITY, Durham, North Carolina, United States*

Our recent GWAS of a composite measure of physiological dysregulation (PD) in the Long Life Family Study (LLFS) found that the top genes associated with age-related changes in PD are involved in biological pathways relevant to maintaining neural networks and brain resilience. In our prior work, PD itself was linked to resilience-related traits. Alzheimer's disease (AD) is a heterogeneous trait and it may involve an accelerated decline in resilience with age as a contributing factor. We proposed that genes associated with aging-changes in PD and brain resilience may contribute to AD risk. We investigated interactions between SNPs in such

candidate genes with AD in LLFS and Health and Retirement Study (HRS). Our analysis revealed significant interactions between SNPs in UNC5C and other genes with AD, in both LLFS and HRS. These findings support roles of genetic interactions with UNC5C gene (implemented in axon growth and neuronal apoptosis) in AD.

METABOLOMIC PROFILE DIFFERENCES BETWEEN DEMENTED AND NON-DEMENTED APOE4 CARRIERS IN THE LONG LIFE FAMILY STUDY

Yujing Yao,¹ Mohit Jain,² Joanne Murabito,³ Joseph Zmuda,⁴ Kaare Christensen,⁵ Michael Province,⁶ Zhezhen Jin,⁷ and Joseph Lee,⁷ 1. *Columbia University Mailman School of Public Health, New York, New York, United States*, 2. *University of California at San Diego, La Jolla, California, United States*, 3. *Boston University, Framingham, Massachusetts, United States*, 4. *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*, 5. *Department of Public Health, University of Southern Denmark, Odense, Syddanmark, Denmark*, 6. *Washington University School of Medicine, Washington University School of Medicine, Missouri, United States*, 7. *Columbia University, New York, New York, United States*

The apolipoprotein ε4 (APOE4) is the most prevalent genetic risk factor for late-onset Alzheimer's Disease (AD). Here we assessed the metabolomic profile differences between APOE4 carriers who develop AD vs. who do not in a sample of 142 participants, aged 65-99 years in the Long Life Family Study (LLFS). Of 7,321 metabolites, we applied a generalized estimating equation model and identified 137 metabolites significantly associated with AD. Subsequent multivariate analyses were performed for prediction and clustering recognition. Among annotated metabolites, 8 metabolites in the eicosanoids and docosanoids group, 3 metabolites in the fatty acids group, and arabitol were associated with elevated risks of AD (OR: 1.6-2.3). On the other hand, a different set of metabolites were associated with reduced risks of AD (OR: 0.34-0.64). These metabolomic profile differences can be used to help with early diagnosis in the population of older APOE4 carriers in the pre-clinical stage.

DISCOVERING MODALITY OF COGNITIVE FUNCTION USING CLUSTERING ANALYSIS

Qingyan Xiang,¹ Stacy Anderson,² Thomas Perls,¹ Marianne Nygaard,³ and Paola Sebastiani,⁴ 1. *Boston University, Boston, Massachusetts, United States*, 2. *Boston University School of Medicine, Boston, Massachusetts, United States*, 3. *Department of Public Health, University of Southern Denmark, Odense, Syddanmark, Denmark*, 4. *Tufts Medical Center, Physician Organization, BOSTON, Massachusetts, United States*

In this study with Long Life Family Study (LLFS) participants, we aimed to identify patterns of performance on cognitive function assessments as specific cognitive signatures. We hypothesize that such signatures can be correlated with biomarkers and clinical outcomes. More than 4,700 LLFS participants were administered, at enrollment, a series of neuropsychological tests that measure various cognitive domains. We performed a cluster analysis to group LLFS subjects into clusters characterized by combinations of six neuropsychological test scores. The analysis resulted in 10

clusters of varying size with different cognitive signatures that (1) significantly correlated with physical and pulmonary function, and 31 blood biomarkers and (2) predicted mortality and incident medical events such as dementia, cardiovascular diseases, etc. We conclude that cluster analysis of multiple neuropsychological tests discovers cognitive signatures that are more specific than individual cognitive domains and that these can be correlated with blood biomarkers, incident medical outcomes and mortality.

Session 4590 (Paper)

Older Adults and Hospitalization

EMERGENCY DEPARTMENT ADMISSIONS AMONG OLDER ADULTS LIVING ALONE WITH MULTIMORBIDITY

Jon Barrenetxea,¹ Cynthia Chen,² Woon-Puay Koh,² Feng Qiushi,² Kelvin Bryan Tan,³ Kevin Chua,² and Rachel Tong,³ 1. *Duke-NUS Medical School, Singapore, Singapore*, 2. *National University of Singapore, National University of Singapore, Singapore*, 3. *Ministry of Health, Singapore, Singapore, Singapore*

Older adults living alone are at higher risk of mortality, morbidity and healthcare utilization. As more older adults live alone, Emergency Department (ED) admissions could rapidly increase, particularly among those with multimorbidity. We studied the association of living alone on ED admissions among older adults with multimorbidity. We used data from 16,785 older adults of the population-based Singapore Chinese Health Study (mean age: 73 years, range: 61-96 years) who were interviewed in 2014-2016 for living arrangements and medical history. Participants were followed-up for one year on ED admission outcomes (number of admissions, inpatient days and hospitalization costs). We used multivariable logistic regression to study the association between living alone and ED admission, and ran two-part models (probit & generalised linear model) to estimate the association of living alone on inpatient days and hospitalization cost. We found that compared to living with others, living alone was associated with a higher odds of ED admissions [Odds Ratio (OR) 1.28, 95% Confidence Interval (CI) 1.08-1.51], longer inpatient days (+0.61, 95% CI 0.25-0.97) and higher hospitalization costs (+322 USD, 95% CI 54-591). Compared to those living with others without multimorbidity, living alone with multimorbidity was associated with higher odds of ED admission (OR 1.64 95% CI 1.33-2.03), longer inpatient days (+0.73, 95% CI 0.29-1.17) and higher hospitalization costs (+567 USD, 95% CI 230-906). In conclusion, living alone is associated with higher odds of ED admission, longer inpatient days and higher hospitalization costs among older adults, particularly among those with multimorbidity.

HOSPITAL-ASSOCIATED DISABILITY ASSOCIATED WITH DELIRIUM AMONG OLDER ADULTS

Richard Kennedy,¹ Hyun Freeman,² Roy Martin,¹ Caroline Whittington,² John Osborne,² Alayne Markland,² Thomas Buford,¹ and Cynthia Brown,³ 1. *University of Alabama at Birmingham, Birmingham, Alabama, United*

States, 2. University of Alabama at Birmingham, University of Alabama at Birmingham, Alabama, United States, 3. Louisiana State University Health Sciences Center - New Orleans, New Orleans, Louisiana, United States

Hospital-associated disability (HAD), defined as a loss of activities of daily living (ADLs) occurring during hospitalization, is a common complication among older adults. Delirium is also a common complication during hospitalization and is associated with multiple long-term sequelae. We sought to determine the effect of delirium and known covariates on the risk of incident HAD in hospitalized older adults. We examined electronic health record (EHR) data for 35,201 older adults ≥ 65 years of age admitted to the general inpatient (non-ICU) units of UAB Hospital from January 1, 2015 to December 31, 2019. Delirium was defined as a score ≥ 2 on the Nursing Delirium Screening Scale (NuDESC) during hospital admission, and HAD defined as a decline on the Katz ADL scale from hospital admission to discharge. Generalized linear mixed models were used to examine the association between delirium and HAD, adjusting for covariates and repeated observations for individuals with multiple admissions. We found that 21.2% of older adults developed HAD during their hospitalization and experienced higher delirium rates as compared to those not developing HAD (25.2% vs. 16.3%). Presence of delirium, medical comorbidity score, baseline cognitive status, and baseline ADL function were associated (all $p < 0.001$) with incident HAD. Mediation analyses also showed that 8% of the effect of comorbidity on incident HAD was due to delirium ($p < 0.001$). Reducing rates of delirium can be one component of a comprehensive approach to reduce rates of HAD in older adults.

PREDICTING UNSCHEDULED EMERGENCY DEPARTMENT REVISITS LEADING TO ACUTE HOSPITAL ADMISSIONS AMONG OLDER ADULTS

Tony Rosen,¹ Yufang Huang,² Matthew McCarty,³ Michael Stern,³ Yiye Zhang,⁴ Daniel Barchi,⁵ Rahul Sharma,³ and Peter Steel,³ 1. Weill Cornell Medical College / New York-Presbyterian Hospital, PELHAM, New York, United States, 2. Weill Cornell Medicine, New York, New York, United States, 3. New York-Presbyterian Hospital Weill Cornell Medical Center, New York, New York, United States, 4. Weill Cornell Medical College, New York, New York, United States, 5. New York-Presbyterian Hospital, New York, New York, United States

Background: Unscheduled emergency department (ED) revisits leading to acute hospital admission (RVA) are tantamount to a failed discharge, associated with physician error, mis-prognosis, and inadequate care planning. Previous research has shown RVA to be associated with adverse outcomes such as ICU admissions, long hospitalizations and mortality. Given the limited impact of pre-existing screening tools for older adults, we developed and validated a machine learning model to predict individual patient risk of RVA within 72 hours and 9 days of index ED visits. Method: A machine learning model was applied to retrospective electronic health record (EHR) data of patients presenting to 2 geographically and demographically divergent urban EDs in 2019. 478 clinically meaningful EHR data variables were included: socio-demographics, ED and comorbidity diagnoses, therapeutics, laboratory test orders and test results, diagnostic imaging test orders, vital signs, and

utilization and operational data. Multiple machine learning algorithms were constructed; models were compared against a pre-existing adult ED-RVA risk score as a baseline. Results: A total of 62,154 patients were included in the analysis, with 508 (0.82%) and 889 (1.4%) having 72-hour and 9-day RVA. The best-performing model, combining deep significance clustering (DICE) and regularized logistic regression, achieved AUC of 0.86 and 0.79 for 72-hour and 9-day ED-RVA for older adult patients, respectively, outperforming the pre-existing RVA risk score (0.704 and 0.694). Discussion: Machine learning models to screen for and predict older adults at high-risk for ED-RVA may be useful in directing interventions to reduce adverse events in older adults discharged from the ED.

REJECTION OF CARE IN HOSPITALIZED PERSONS LIVING WITH DEMENTIA: THE IMPACT OF NURSE COMMUNICATION

Clarissa Shaw,¹ Caitlin Ward,² Jean Gordon,² Kristine Williams,³ and Keela Herr,² 1. University of Iowa College of Nursing, Iowa City, Iowa, United States, 2. University of Iowa, Iowa City, Iowa, United States, 3. University of Kansas School of Nursing, Kansas City, Kansas, United States

Rejection of care (RoC) by persons living with dementia (PLWD) has yet to be measured in the hospital setting. Elderspeak communication (i.e., baby talk or infantilization) is an established antecedent to RoC in nursing home dementia care. The purpose of this study was to determine the impact of elderspeak communication by nursing staff on RoC by hospitalized PLWD. Eighty-eight care encounters between 16 PLWD and 53 nursing staff were observed for RoC using the Resistiveness to Care scale in one Midwestern hospital. Audio-recordings of the care encounters were transcribed verbatim and coded for semantic, pragmatic, and prosodic features of elderspeak. Over one-quarter (28.7%) of the duration of nursing staff speech towards PLWD constituted elderspeak and nearly all (96.6%) of the 88 care encounters included some elderspeak. Almost half of the observations (48.9%) included RoC behaviors by PLWD. Rejection of care was modeled as present or absent using a GEE method. Characteristics of the PLWD (e.g., pain, delirium) and the observation (e.g., environmental simulation) were evaluated as potential covariates. After adjusting for pain, length of stay, and gender, a 15-percentage point decrease in the proportion of elderspeak communication by nursing staff reduced the odds of RoC by 62% (OR=0.38, 95% CI=0.21-0.71, $p=.002$), and a one unit decrease in pain reduced the odds of RoC by 63% (OR=0.37, 95% CI=0.22-0.63, $p<.001$). This study identified that pain and elderspeak are two modifiable factors of RoC. Person-centered interventions are needed that address communication practices and approaches to pain management for hospitalized PLWD.

UNDERSTANDING THE ROLE AND VALUE OF PROCESS QUALITY INDICATORS IN HOSPITALIZED OLDER SURGICAL PATIENTS

Janani Thillainadesan,¹ Sarah Hilmer,² Alison Mudge,³ Sarah Aitken,⁴ and Vasi Naganathan,⁴ 1. Concord Hospital, NSW, New South Wales, Australia, 2. The University of Sydney, St Leonards, New South Wales, Australia,

3. *Royal Brisbane and Women's Hospital, Royal Brisbane and Women's Hospital, Queensland, Australia*, 4. *University of Sydney, Concord, New South Wales, Australia*

Background Despite the development of geriatrics surgery process quality indicators (QIs), few studies have reported on these QIs in routine surgical practice. Even less is known about the links between these QIs and clinical outcomes, and patient characteristics. We aimed to measure geriatrics surgery process QIs, and investigate the association between process QIs and outcomes, and QIs and patient characteristics, in hospitalized older vascular surgery patients. Methods This was a prospective cohort study of 150 consecutive patients aged ≥ 65 years admitted to a tertiary vascular surgery unit. Occurrence of geriatrics surgery process QIs as part of routine vascular surgery care was measured. Associations between QIs and high-risk patient characteristics, and QIs and clinical outcomes were assessed using clustered heatmaps. Results QI occurrence rate varied substantially from 2% to 93%. Some QIs, such as cognition and delirium screening, documented treatment preferences, and geriatrician consultation were infrequent and clustered with high-risk patients. There were two major process-outcome clusters: (a) multidisciplinary consultations, communication and screening-based process QIs with multiple adverse outcomes, and (b) documentation and prescribing-related QIs with fewer adverse outcomes. Conclusions Clustering patterns of process QIs with clinical outcomes are complex, and there is a differential occurrence of QIs within older vascular surgery patients, suggesting process QIs alone may be unreliable targets for quality improvement. Prospective intervention studies are needed to understand the causal pathways between process QIs and outcomes to help prioritize care processes that are most clearly linked to improved outcomes.

Session 4595 (Symposium)

PREPARING FOR THE NEW NORMAL: CHRONICLING THE IMPACT OF COVID-19 ON OLDER ADULTS AND PROVIDERS

Chair: Rose Ann DiMaria-Ghalili

Discussant: Justine Sefcik

COVID-19 and social distancing heralded an unprecedented change in the way older adults and health care providers live, work, socialize and manage their health. Early "calls-to-action" included the call for researchers to chronicle the impact of the COVID-19 pandemic on care of older adults to inform models of care and best practices in the new normal. This symposium explores the impact of COVID-19 on the health of older adults across the care continuum and healthcare delivery augmented by technology. The perspectives of older adults living in the community and providers who care for this population are highlighted. Additionally, there is a focus on the most vulnerable, those living in skilled care facilities and continuing care retirement communities. Fisher analyzes the key themes in 37 COVID-19 video communiques over 11 months at a continuing care retirement community. Sefcik explores coping strategies including outdoor activities among community-dwelling older adults. DiMaria-Ghalili examined patterns of physical and mental health, technology usage and loneliness in older adults,

including those living in the community and a continuing care retirement community. Using longitudinal data and COVID-19 supplemental survey data from the National Health and Aging Trends Study, Huh-Yoo discusses disparities in on-line patient-provider communication and implications for the Post-COVID era. Coates discusses the facilitators and barriers perceived by interdisciplinary providers deploying telehealth during the COVID-19 pandemic and implications for healthcare delivery in older adults. The symposium will conclude with a discussion by Dr. Sefcik on the implications for research, practice and policy in the post COVID-19 era.

PHYSICAL AND MENTAL HEALTH, TECHNOLOGY USE, AND LONELINESS IN OLDER ADULTS DURING THE COVID-19 PANDEMIC

Rose Ann DiMaria-Ghalili,¹ Martha Coates,² Zachary Hathaway,³ Katelyn Moore,³ Yaegin Park,³ Jenny Tsui,³ and Justine Sefcik,¹ 1. *Drexel University, College of Nursing and Health Professions, Philadelphia, Pennsylvania, United States*, 2. *Drexel University, Bryn Mawr, Pennsylvania, United States*, 3. *Drexel University, Philadelphia, Pennsylvania, United States*

Social isolation is a negative outcome of COVID-19. This study examined patterns of physical and mental health and technology use in older adults, and loneliness during the COVID-19 pandemic. We recruited 115 community-dwelling older adults 65 and older (72% female) from the Pennsylvania region via Research Match (N=84) or from a retirement community (N=31). A significant association between loneliness and worsening of health during the pandemic was observed, Fisher's Exact Test 6.90, $p=.03$. Those who were lonely demonstrated significantly lower Mental Component Summary Scores ($M = 42.75$, $SD = 11.55$) compared to those who were not lonely ($M = 55.34$, $SD = 7.66$), $t(49) = 5.84$, $p < .01$. Those reporting loneliness were more likely to use a new electronic device to communicate with family during COVID-19 pandemic, $X^2(1, N = 107) = 6.24$, $p = .01$. These findings suggest the important role of technology to decrease loneliness in older adults during a pandemic.

ASSESSING COPING STRATEGIES AND OUTDOOR ACTIVITIES AMONG OLDER ADULTS DURING THE COVID-19 PANDEMIC

Justine Sefcik,¹ Martha Coates,² Sarah Wetzel,³ Janvi Patel,³ Keyanna Bynum,³ K. Linh Pham,³ and Rose Ann DiMaria-Ghalili,¹ 1. *Drexel University, College of Nursing and Health Professions, Philadelphia, Pennsylvania, United States*, 2. *Drexel University, Bryn Mawr, Pennsylvania, United States*, 3. *Drexel University, Philadelphia, Pennsylvania, United States*

Information is lacking on how older adults are coping during the pandemic. We explored coping strategies including outdoor activities among community-dwelling older adults (N = 115) 65 and older (mean age 76.45, 71.3% female). Using conventional content analysis, we analyzed responses to: 1) How are you coping with COVID-19? and 2) How often are you going outside during the pandemic and for what reasons? Most common activities are connecting with family and friends (some in person, others on the phone or virtually), reading, tv, game playing, and learning something new (e.g. webinars, online classes). The majority are going

outside every day, with walking being the most common activity. Only a few are restricting their out of home activities to essential tasks (e.g. going to the doctors, pharmacy, getting groceries). Findings suggest that many older adults are engaging in positive coping activities. Assessing coping strategies can give insight into wellbeing.

EXPERIENCES OF INTERDISCIPLINARY PROVIDERS DEPLOYING TELEHEALTH DURING THE COVID-19 PANDEMIC

Martha Coates,¹ Katelyn Moore,² Zachary Hathaway,² Gloria Gonzalez-Kruger,² Kymberlee Montgomery,² and Rose Ann DiMaria-Ghalili,³ 1. *Drexel University, Bryn Mawr, Pennsylvania, United States*, 2. *Drexel University, Philadelphia, Pennsylvania, United States*, 3. *Drexel University, College of Nursing and Health Professions, Philadelphia, Pennsylvania, United States*

The expansion of telehealth services during COVID-19 is critical for healthcare delivery. This study describes the facilitators and barriers experienced by providers integrating telehealth during COVID-19. The sample consisted of 441 interdisciplinary providers (RNs, APNs, PAs, DPTs, RDs, mental health counselors) who were faculty or alumni of a college of nursing and health professions and completed the online telehealth provider survey. 53% of respondents were nurses/APNs, 59% implemented telehealth within the first week of federal legislation, and 48% received telehealth training once the pandemic started. Respondents reported telehealth changed several services provided during the pandemic (e.g., increased prescription of longer-term medication refills, increased counseling sessions). The greatest reported barrier to utilizing telehealth during the pandemic was the older adults' ability to utilize technology. Understanding the facilitators and barriers experienced by providers during COVID-19 will lead to more robust healthcare delivery models to enhance health outcomes in older adults.

UNCERTAIN TIMES: A CONTINUING CARE RETIREMENT COMMUNITY'S COVID-19 COMMUNICATION RESPONSE

Kathleen Fisher,¹ Justine Sefcik,² Martha Coates,³ Minjung Shim,¹ Don McEachron,¹ and Rose Ann DiMaria-Ghalili,² 1. *Drexel University, Philadelphia, Pennsylvania, United States*, 2. *Drexel University, College of Nursing and Health Professions, Philadelphia, Pennsylvania, United States*, 3. *Drexel University, Bryn Mawr, Pennsylvania, United States*

The purpose of this qualitative inquiry was to explore conversational video recordings by top administrators from a faith based Continuing Care Retirement Community (CCRC) to help residents, staff, and family members manage the associated uncertainties of the pandemic. Six interdisciplinary researchers explored 37 video communiques from March 2020 to February 2021. Data was independently coded using latent content analysis with the team building consensus on major themes. Themes identified were: Building Trust through Transparency, We're in this Together, Power of One/Individual Responsibility, Converting Challenges into Teaching Moments, and Gratitude/Resilience. Findings suggest attempts to inform, reassure, and encourage maintaining a safe environment (e.g., using masks, restricting visitors,

vaccine promotion) for residents, staff, and family members, was met through these conversational videos. Leadership of this CCRC exemplified the mission to provide transparent information during the pandemic, serving as a model to inform other CCRCs' communication during this pandemic and other crisis situations.

DISPARITY ON ONLINE PATIENT-PROVIDER COMMUNICATION AND IMPLICATIONS FOR A POST-COVID ERA

Jina Huh-Yoo,¹ Michael LeVasseur,¹ Martha Coates,² Justine Sefcik,³ and Rose Ann DiMaria-Ghalili,³ 1. *Drexel University, Philadelphia, Pennsylvania, United States*, 2. *Drexel University, Bryn Mawr, Pennsylvania, United States*, 3. *Drexel University, College of Nursing and Health Professions, Philadelphia, Pennsylvania, United States*

Online patient-provider communication (OPPC) increases access to health-related information, enhances self-care, and reduces healthcare expenditures. We investigated OPPC and technology use changes during 6 years. This descriptive cohort analysis involved data collected from the National Health and Aging Trends Study (NHATS) between 2011-2016 and during the pandemic (2020). NHATS consist of a nationally representative sample of Medicare beneficiaries. From a total of N=2,389, we assigned cohorts as those who: (1) own computers (High-Tech, 56.1%), (2) own cell phone only or don't own computer nor cell phones (Low-Tech, 20.2%), and (3) just adopted cell phone or computers (Transition, 23.7%). Only the High-Tech users increased OPPC by 75% over 2011-2016; others remained the same. During the pandemic more participants used mobile technology and internet. Newly adopting technology on its own does not automatically increase OPPC. It is important for Transition users to access training and support to benefit from OPPC.

Session 4600 (Symposium)

QUALITATIVE RESEARCH WITH LGBTQ OLDER ADULTS AND OLDER ADULTS LIVING WITH HIV/AIDS DURING COVID-19

Chair: Sara Bybee

Co-Chair: Austin Oswald

In this symposium, researchers will discuss conceptual and practical challenges to conducting qualitative research with older LGBTQ+ adults and older adults living with HIV/AIDS during the COVID-19 pandemic. Researchers who conduct studies with LGBTQ+ populations and with older adults living with HIV/AIDS already face challenges in recruiting and retaining large enough sample sizes. Social distancing guidelines during the pandemic prohibited many researchers from conducting in-person studies. Conducting health and social science research entirely online may have its challenges when working with these older adult populations, but it may also present new opportunities for reaching hidden or hard-to-reach groups. Presenters draw on their recent experiences conducting semi-structured interviews, online surveys, and qualitative analyses of public records to illuminate the complex considerations of conducting research remotely with LGBTQ+ older adults and older adults living with HIV/AIDS. Presenters also discuss how conducting remote research with these populations may require

methodological changes in study design in order to collect the most meaningful and reliable data from research participants. Ultimately, COVID-19 has required researchers to alter or change their methods of conducting research. As the internet becomes more heavily relied upon for conducting research, it is imperative that scholars in LGBTQ+ aging and HIV/AIDS consider the potential challenges and opportunities that online research presents for their studies, and for research participants who are living with HIV/AIDS or who identify as LGBTQ+.

RECRUITING AND CONDUCTING ONLINE DYADIC SEMI-STRUCTURED INTERVIEWS WITH LGBTQ+ COUPLES FACING ADVANCED CANCER

Sara Bybee,¹ Kristin Cloyes,² Lee Ellington,¹ Brian Baucom,³ Katherine Supiano,⁴ and Kathi Mooney,¹ 1. *University of Utah, Salt Lake City, Utah, United States*, 2. *University of Utah, Portland, Oregon, United States*, 3. *University of Utah Department of Psychology, Salt Lake City, Utah, United States*, 4. *University of Utah, Salt Lake City, Utah, United States*

In this study, LGBTQ+ adult couples facing advanced cancer were recruited online. Eligible couples were sent a direct link to electronic consent and surveys in REDCap®. Participants were then invited to complete a 45-minute dyadic semi-structured interview regarding their experience of coping with cancer as a couple. This study faced difficulties in recruiting LGBTQ+ couples, and also faced the challenge of identifying and managing online responses from individuals misrepresenting themselves, and from automated accounts or “bots”. LGBTQ+ aging scholars must acknowledge how conducting research remotely with LGBTQ+ adults may necessitate changes in study design, such as changes to recruitment and more comprehensive eligibility screening designed to prevent and detect the collection of untrustworthy data. Ultimately, protecting the integrity of participant data in online research supports research accessibility and inclusion for LGBTQ+ older adults, and is the first step in conducting research that promotes health equity.

CONDUCTING COMMUNITY-BASED QUALITATIVE RESEARCH WITH LGBTQ OLDER ADULTS OF COLOR DURING COVID-19

Austin Oswald,¹ and Aundaray Guess,² 1. *CUNY Graduate Center, New York, New York, United States*, 2. *GRIOT Circle, Brooklyn, New York, United States*

COVID-19 continues to transform the way scientists conduct research with study participants, particularly older adults who are at high risk of becoming seriously ill from the virus. For older adults who may be negatively affected by the digital divide, inclusive data collection practices become even more nuanced. Qualitative researchers moving their research into digital spaces must think critically about their use of technology, and how it affects the quality of data as well as the participant experience. This presentation highlights ethical and methodological considerations from a completely digital, community-based, qualitative research study conducted alongside LGBTQ older adults of color during COVID-19. Strategies to build and strengthen community partnerships are discussed along with challenges and opportunities for collecting data in the current digital landscape.

Publicly available records are identified as a potential data source to understand the lives of LGBTQ older adults of color when in-person research is not feasible.

LGBTQ OLDER ADULT RECRUITMENT IN THE MIDST OF A COVID-19 LOCKDOWN: REMINISCENCES OF A POST-DOCTORAL FELLOW

Robert Beringer, *University of Victoria, Victoria, British Columbia, Canada*

Within days of obtaining ethics approval for a qualitative study “Optimizing LGBTQ Engagement with Hospice and Palliative Care in the Island Health Region” our local Covid-19 lockdown began. It took several months to have new Covid-19 research protocols (Zoom Town Hall meetings/Zoom or telephone interviews) approved. Being impatient, I teamed with another group of researchers to launch “Covid-19: Your Current Experiences and Planning for the Future,” an online survey with a large qualitative component where we planned to oversample LGBTQ respondents. In time both projects were approved, and here I reflect on recruitment lessons learned. These include my perceptions how Zoom Town Hall meetings and interviews differ from those I’ve conducted in-person, reflections on how to use social media (including targeted Facebook advertising) to recruit participants, and sadly, how to manage anti-LGBTQ sentiment that resulted from even the most targeted advertising.

QUALITATIVE RESEARCH WITH HIV+ OLDER ADULTS LIVING IN RURAL AREAS: METHODOLOGICAL CONSIDERATIONS DURING COVID-19

Erin Robinson, *University of Missouri, Columbia, Missouri, United States*

Older adults living with HIV/AIDS (OALWHA) in rural areas of the U.S. are a highly marginalized community. Intersectional stigma related to age, HIV status, geography, sexual orientation, gender identity, and race oftentimes create a complex lived experience for this population group. While there is a significant need for qualitative research that highlights the intersecting stigmas experienced by OALWHA in rural areas, recruitment challenges exist. Fear of being outed in their rural communities, due to their HIV status and LGBTQ+ identities, makes many OALWHA reluctant to participate in research. However, there is much resiliency in the population as well, especially during the COVID-19 pandemic. In fact, as research approaches have pivoted to phone/virtual data collection during the pandemic, this can help promote anonymity among this population group. This presentation will detail methodological considerations for recruitment, data collection, and analysis for qualitative research with OALWHA in rural areas of the U.S.

Session 4605 (Symposium)

SOCIAL RELATIONS, STRESS, AND RACIAL HEALTH DISPARITIES

Chair: Kristine Ajrouch

Co-Chair: Noah Webster

Discussant: Toni Antonucci

This symposium brings together four papers that address racial health disparities by investigating stressful aspects of

social relations at different points in the life course. Cleary and colleagues focus on racial disparities in psychological health by testing cross-sectional effects of intergenerational stress over time. In particular, they investigate effects of network composition on the relationship between mothers' stressors and their children's depressive symptoms at three time points over 23 years. Camacho and colleagues use longitudinal data from the National Social Life, Health and Aging Project to examine cognitive decline among U.S. African-American, Latino, and White adults aged 60 and above. Results indicate loneliness predicted greater global cognitive decline over time in all groups. However, race differences in this association were found across cognitive function domains. Turner and colleagues consider dementia caregiving challenges among non-Hispanic Blacks. Data from five focus groups were analyzed to reveal distinctive challenges to caregiver health during the COVID-19 pandemic including increased burden and barriers to service access. Finally, Sol and colleagues examined the bidirectional association between loneliness and self-rated health over time among a racially diverse sample. Findings illustrate racial patterns in how loneliness at midlife influences health in later life. Antonucci will discuss the role of stress from social relations as a means to fully understand racial disparities in health across the life course.

MATERNAL STRESS, FAMILIAL TIES, AND CHILDREN'S WELL-BEING ACROSS 23 YEARS

Jennifer Cleary,¹ Jasmine Manalel,² and Simon Brauer,¹
 1. *University of Michigan, Ann Arbor, Michigan, United States*, 2. *National Human Genome Research Institute, Bethesda, Maryland, United States*

According to the family stress model, parental stress impacts child well-being through several mechanisms, which may be amplified in ethnic/racial minority families given increased experiences of stress. We extend this model to examine associations between maternal stress and child well-being at three points spanning 23 years, beginning when children were aged 8-12 years and mothers were aged 24-59 (n=193 dyads). Preliminary results indicate that maternal stressors are associated with increased depressive symptoms in childhood (B=3.56, p<0.001), and this association was stronger among Black children compared to White (B=4.12, p<0.001). Effects of maternal stress on children's depressive symptoms strengthened among White children with proportionally larger kin networks (B=0.05, p<0.001). However, this association weakens as children enter adulthood. Future work will focus on identifying social resources that account for changes in the intergenerational effects of stress.

CHALLENGES IN RESOURCE UTILIZATION FOR CAREGIVERS OF PERSONS WITH DEMENTIA: A QUALITATIVE STUDY

Robert Turner,¹ Jen Weaver,¹ Eric Owens,¹ Meredith Boe,¹ Jessica Bride,¹ Maritza Dowling,² Christina Prather,³ and Melinda Power,¹ 1. *The George Washington University, Washington, District of Columbia, United States*, 2. *George Washington University - School of Nursing, Washington, District of Columbia, United States*, 3. *The GW Medical Faculty Associates, Washington, District of Columbia, United States*

This study highlights primary caregivers' experiences with health department policies designed to support people with cognitive impairment/Alzheimer's Disease and Related Dementias (ADRD). Caregivers were defined as individuals aged 45-85 that provide at least 10 hours of unpaid care. Five, 90-minute focus groups were conducted virtually with 24 caregivers of individuals with cognitive impairment/ADRD. Transcripts were analyzed thematically. Caregivers were primarily Black females (75%) with at least a high school education (42%). Care recipients were likely to be community-dwelling parents (71%), with moderate or advanced (79%) dementia. Caregivers described challenges with accessing resources intended for care recipients, especially as cognitive impairment worsened. Caregivers reported providing care 24/7 as traumatizing. Home-based personal aides and companionship services did not reduce this burden. COVID-19 impacted caregivers and care recipient's access to resources increasing burden. Policies need to be flexible for ever-changing needs of individuals with ADRD and support the overall well-being of the caregivers.

LONGITUDINAL ASSOCIATIONS BETWEEN LONELINESS AND SELF-RATED HEALTH

Ketlyne Sol, Simon Brauer, and Toni Antonucci, *University of Michigan, Ann Arbor, Michigan, United States*

Cross-lagged structural equation models examined the bidirectional association between loneliness and self-rated health over three time points. We adjusted for age, gender, network size, and depressive symptoms at baseline. At baseline, the sample was 28% Black and 40% male. Average age at time 1 was 46 years, 56 years at time 2, and 63 years at time 3. Results indicated that loneliness at time 1 was associated with loneliness at time 2; loneliness at time 2 was associated with loneliness at time 3. We had similar findings for associations among self-rated health. However, only one of the cross-lagged paths was significant. Specifically, more loneliness at time 2 was associated with worse self-rated health at time 3. These associations did not vary across black and white race. Findings indicate that loneliness at later midlife may be detrimental to later life health, regardless of race.

LONELINESS AND CHANGES IN COGNITIVE FUNCTIONING AMONG RACIALLY DIVERSE OLDER ADULTS IN THE UNITED STATES

David Camacho,¹ Kelly Pacheco,² Charles Henderson,³ M. Cary Reid,⁴ and Elaine Wethington,⁵ 1. *University of Maryland, Baltimore, Baltimore, Maryland, United States*, 2. *New York University, New York University, New York, United States*, 3. *Cornell University, Cornell University, New York, United States*, 4. *Weill Cornell Medicine, Weill Cornell Medicine, New York, United States*, 5. *Cornell University, Ithaca, New York, United States*

Longitudinal studies examining the association of loneliness with cognitive decline rarely include older members of racial minorities. Guided by a Minority Stress Framework, we used Waves 2 and 3 from the National Social Life, Health, and Aging Project to assess whether loneliness (UCLA-3-items) at W2 predicts cognitive decline (Chicago Cognitive Functioning Measure) among US African-American, Latino, and white older adults (ages≥60). We included interactions of W2 loneliness with race in examining changes in cognitive

functioning. Estimates were (N=1,950) adjusted for demographics, chronic disease, depression, and social connectedness. In all groups, loneliness was positively associated with greater global cognitive decline over the 5-year interval. However, analyses of different domains of cognitive functioning (e.g., executive functioning, memory) suggested that this association differs by cognitive domain and race. Future research on interventions to prevent cognitive decline should consider targeting loneliness, include diverse older adults, and examine global and specific domains of cognitive functioning.

Session 4610 (Symposium)

STRATEGIES TO DESIGN TECHNOLOGY PROMOTING SOCIAL PARTICIPATION OF PEOPLE WITH DEMENTIA AND THEIR CAREGIVERS

Chair: Karin Wolf-Ostermann

Discussant: Jane Flanagan

Community-dwelling people with dementia and their caregivers face increasing challenges to active social participation as the condition progresses. Potential difficulties include disclosing the condition, navigating through available support and sustaining interpersonal relationships. Dementia-friendly support services and interventions targeting caregiving dyads can promote social participation. Interventions serve as a communication channel for the dyads to engage, interact and partake in their community. Technology as a facilitator is gaining momentum; increasing evidence suggests that technological solutions contribute to promoting social health for people with dementia and family caregivers. Patient and public involvement and rigorous evaluations of solutions are needed to ensure successful implementation of dementia-friendly technologies. This symposium, presented as a part of the Marie-Curie Innovative-Training-Network action, H2020-MSCA-ITN, grant agreement number 813196, comprises four pertinent presentations. The first presentation outlines the effectiveness of technological interventions to improve social participation of older adults with and without dementia, and barriers and facilitators these interventions present. The second presentation describes disclosure decisions faced by dyads and Patient and public involvement findings on how an existing empowerment intervention supporting disclosure decision-making can transfer to an online environment. The third presentation reports on findings from a study evaluating a tablet-based activation system designed to engage caregiving dyads in social sessions. The final presentation lifts the focus towards how existing online environments can be adapted through dementia-friendly privacy policy agreements, and thereby support social participation of this user group online. Our discussant, Jane Flanagan, synthesizes the presentations and leads a discussion of future directions for policy and practice.

TECHNOLOGY-DRIVEN DYADIC INTERACTION SUPPORT FOR COMMUNITY-DWELLING PEOPLE WITH DEMENTIA AND FAMILY CAREGIVERS

Viktoria Hoel,¹ Karin Wolf-Ostermann,² Lars Steinert,¹ and Tanja Shultz,¹ 1. *University of Bremen, Bremen, Bremen, Germany*, 2. *University of Bremen, University of Bremen, Bremen, Germany*

People with dementia and their family caregivers struggling with the impacts of the condition on cognitive abilities, experience deterred social interactions and strained relationships. Technology can potentially sustain the relationship by engaging dyads in joint activities and supporting their interaction. This study aimed to evaluate the impact of a tablet-based activation system, I-CARE, specifically designed to engage people with dementia in meaningful activities. In this intervention, community-dwelling people with dementia and their family caregiver engaged in joint activities supported by the I-CARE system. Quantitative measures on quality of life, relationship quality and caregiver burden are collected, while semi-structured interviews explore the impact of Covid-19, as well as what motivates the participants to invite technology into their dyadic interactions. Our findings provide important insight in how technology can support social health and relationship sustenance of dyads living with dementia, and what implications Covid-19 has for their social participation in society.

INDIVIDUALS' DECISION TO DISCLOSE A DIAGNOSIS OF DEMENTIA AND THE DEVELOPMENT OF AN ONLINE EMPOWERMENT INTERVENTION

Gianna Kohl,¹ Mauricio Molinari Ulate,² Jem Bhatt,³ Jennifer Lynch,⁴ Katrina Scior,³ and Georgina Charlesworth,³ 1. *University College London, University College London, England, United Kingdom*, 2. *University of Salamanca, Salamanca, Castilla y Leon, Spain*, 3. *University College London, London, England, United Kingdom*, 4. *University of Hertfordshire, Hatfield, England, United Kingdom*

Learning to live with a diagnosis of dementia is a complex process. Many people affected by dementia choose not to disclose the diagnosis to others and avoid social activities due to fear of others' adverse reactions. This in turn can limit their social participation and negatively affect their psychosocial health. A systematic review explored factors influencing the decision to disclose or conceal a dementia diagnosis to one's social network, including individuals' attitudes and experiences regarding this decision. The sixteen studies included reveal the complexity of this decision. Findings highlight the role of stigma and individuals' wishes to remain 'normal', but also the need of explaining what has changed. Results were further discussed with people with dementia and informal caregivers as part of patient and public involvement. End users expressed their attitudes, needs, and wishes towards the design of an online empowerment intervention supporting disclosure decision-making in people affected by dementia.

TECHNOLOGICAL INTERVENTIONS AND SOCIAL PARTICIPATION IN COMMUNITY-DWELLING OLDER ADULTS WITH OR WITHOUT DEMENTIA

Pascale Heins,¹ Lizzy Boots,² Wei Qi Koh,³ An Neven,⁴ Frans Verhey,² and Marjolein de Vugt,² 1. *Maastricht University, Maastricht, Limburg, Netherlands*, 2. *Alzheimer Centrum Limburg, Maastricht University, Maastricht, Limburg, Netherlands*, 3. *National University of Ireland Galway, Galway, Galway, Ireland*, 4. *UHasselt - Hasselt University, Transportation Research Institute (IMOB), Diepenbeek, Limburg, Belgium*

Social isolation is a growing health issue in community-dwelling older adults with and without dementia as it can negatively affect their health and well-being. Consequently, psychosocial interventions targeting their social participation are increasingly gaining importance. So far, however, little is known about the potential of technological interventions in this population. Therefore, this systematic review explored the effectiveness of technological interventions in improving social participation of community-dwelling older adults with and without dementia. Records identified through five scientific databases were independently screened by two reviewers. A total of 36 studies published between 2005 and 2020 were included in a narrative synthesis. Studies differed widely in study design, type of technology, used outcome measures, and methodological quality. However, the findings highlight the potential role of technological interventions in improving different dimensions of social participation. At the same time, barriers and facilitators of these interventions to social participation were identified.

USER-CENTERED DESIGN OF A DEMENTIA-FRIENDLY PRIVACY POLICY FOR THE FINDMYAPPS INTERVENTION

David Neal,¹ Yvonne Kerkhof,² Teake Ettema,¹ Karin Dijkstra,² and Rose-Marie Dröes,¹ 1. *Amsterdam UMC, Amsterdam, Noord-Holland, Netherlands*, 2. *Saxion University of Applied Sciences, Deventer, Overijssel, Netherlands*

The ability of people with dementia and their caregivers to successfully navigate online environments is increasingly important to their social health. However, uncertainty about privacy online is an important barrier. Theoretically, access to published privacy policies should allow users of websites or software applications to make informed decisions. In practice, such documents are often complicated texts, and consequently even less accessible to people with cognitive impairment than to the general population. We present results from a multi-stakeholder, user-centred design process, towards an accessible alternative: a ‘dementia-friendly privacy policy’. Three design sprints took place in 2021, led by participants of the ‘Smart Solutions Semester’ at Saxion University of Applied Sciences in the Netherlands, in collaboration with cognitively unimpaired laypeople, people with dementia, informal caregivers, and expert stakeholders. Outputs were specifications for the solution, low-fidelity prototypes and high-fidelity prototypes, respectively. The dementia-friendly privacy policy is now ready for implementation and further evaluation.

Session 4615 (Symposium)

THE BLUES AND OLDER MINORITY MUSICIANS XXVIII: MORE THAN JUST MUSIC

The GSA “‘Bo Diddley’ Track” goes virtual again to present its 28th consecutive Annual Scientific Meeting of outstanding music, personal and musical narrative, and fun regardless of hurricanes, recessions, riots (ok-ok-so it was just a little good-natured audience rowdiness at one of the performances at GSA). Instead of the Rhythm Room or Warsaw Wally’s in Phoenix, the program returns to Chicago

on 11/13, 6pm Eastern with the “Sweetheart of the Blues” - Shirley Johnson, one of the famous “Mojo Mamas” performing regularly at BLUE Chicago since the 1990s. Like so many Blues artists, she started in church at age 10 and later, influenced by Mahalia Jackson, Koko Taylor, Etta James, and Ruth Brown, her music is described as a “gritty, big-voiced blues singer” who also reaches heights of “soulful and smooth”. She turns everything she does into a work of art. Grab your favorite beverage and join us for rousing music and a great party. No rioters allowed!

Session 4620 (Symposium)

THE IMPACT AND RESPONSE TO CLIMATE CHANGE AS LIVED BY OLDER ADULTS

Chair: Robin Fenley
Co-Chair: Toni Antonucci
Discussant: Robin Fenley

A growing body of literature documents the domino effects of climate change on the planet and all life. Chief among these changes is the rise in global temperatures, triggering record numbers of heatwaves, and stronger, more dangerous hydrologic events. While climate change looms as a preeminent threat to our planet and future, the public health and human rights ramifications are already apparent. As with many issues in this realm, the effects are felt to a greater degree by our aging populations. As disasters grow in frequency, the more vulnerable populations are at greater risk for more serious outcomes – and will suffer disproportionately from the effects of climate change – resulting in greater inequalities. With the consequences of climate change growing more drastic, these outcomes can be expected to climb unless sufficient measures are enacted to combat global warming. In this symposium we will highlight the link between climate change and its impact on the human rights of older adults, and how climate change threatens progress across the Sustainable Development Goals (SDG) - a blueprint for a more equitable and healthier planet - if decisive actions are not taken. This symposium will demonstrate what valuable opportunities exist to accelerate progress by leveraging the links between SDGs to combat inequalities and climate change. Panelists will discuss the adverse effects of climate change, the human rights and psychological impacts on older adults, and potential action steps and strategies for older persons to become empowered as advocates for climate change reform.

PSYCHOLOGICAL RISK AND RESILIENCE OF OLDER PEOPLE’S EXPOSURE TO CLIMATE CHANGE

Toni Antonucci, *University of Michigan, Ann Arbor, Michigan, United States*

Climate change places older people at physical and psychological risk. Even small changes in temperature (+/- 1 degree) results in increased morbidity and mortality. Further, the burden of climate change is not borne equally. The stress and mental ill health associated with disasters are especially borne by women, older adults, persons of color, low-income populations, those with preexisting conditions, poor support networks, and those residing in sub-standard housing. Older people are disproportionately represented in these

groups, but interventions can ameliorate these risks. At the same time, older people, with the wisdom of experience, can be important assets for families and communities struggling with the effects of climate change. Both addressing the vulnerabilities and enhancing the strengths of older people can serve to meet the immediate needs and the long-term SDGs goals of (3) health and well-being (5) gender equality (10) reduced inequalities (11) sustainable cities and communities (13) climate action.

ADDRESSING THE ADVERSE EFFECTS OF CLIMATE CHANGE ON THE HUMAN RIGHTS OF OLDER PERSONS

Erin Burk-Leaver, *International Association of Gerontology and Geriatrics, Denver, Colorado, United States*

The common consequences of climate change events include: displacement, loss of sustainable shelter and housing, and limited access to medical care and other resources such as food, clean water, and sanitation services. These adverse effects coincide to an alarming degree with the human rights most essential to those in vulnerable or marginalized groups, including older populations. Whether through displacement or disruption of supply, the stressors of climate change events greatly exacerbate older populations' vulnerability, especially when compounded by negative social determinants of health, such as existing social, political, and economic barriers to successful aging. Using the SDGs as a framework to develop policies around (13) climate action and the use of improved (9) industry, innovation, and infrastructure to create (11) sustainable cities and communities, it is possible to establish (10) reduced inequalities to promote overall (3) good health and well-being in our older populations.

ACTION STEPS AND STRATEGIES TAKEN BY OLDER PERSONS TO PREVENT AND MITIGATE EFFECTS OF CLIMATE CHANGE

Martha Bial, *Fordham University, West Harrison, New York, United States*

While the vulnerability of older persons to climate change is recognized by many scholars, there has been less attention to contributions older adults make to the fight against climate change, and their motivations to engage in that fight. Motivations include concern for the environment they will leave to their descendants. Contributions include freed up time, and skills gained in personal or work history to educate others on the issues and to organize and advocate for policy change. This presentation will highlight several national and international organizations of older people devoted to educating community groups, monitoring water quality and changes in wildlife habitats, and testifying before legislative bodies in campaigns for increased environmental regulation. Some of these organizations are intergenerational, providing additional benefits in cross-generational social exchange. Such activities are in line with SDGs 13 (action on climate change), 11 (sustainable cities), 12 (sustainable consumption) and 17 (expanding multi-stakeholder partnerships).

EMPOWERING CAREGIVERS IN THE MIDST OF CLIMATE CHANGE

Carole Cox, *Fordham University, Fordham University, New York, United States*

More than 2.7 million children in the United States are raised in kinship families, with the majority of these caregivers, grandparents. Nationally, 1 in 11 children is raised in a kinship family, among Black children, the ratio is 1 in 5. Many of these families struggle economically, welcoming their young relatives into small, often substandard public housing where nonexistent or inadequate heating and cooling exacerbate attempts to moderate extreme temperatures in crowded apartments. For others, responsibility for the children follows the loss of life or permanent disruption of family composition due to weather events such as hurricanes or tornadoes. Grandparent resilience is reflected in their commitment to the well-being of these children, especially observed throughout COVID-19. This presentation will demonstrate that a Grandparent Empowerment Program is an effective strategy to tap into their strength as advocates for adequate health care, educational opportunity, resources, and a world free from climate disruption.

Session 4625 (Symposium)

TRANSCENDING THE CORPOREAL IN LATER OLD AGE?

Chair: Paul Higgs

This symposium addresses the older body and later life. It focusses on the cultural and social implications of the corporeality of the ageing body. Specifically it seeks to explore the degree to which it is possible to transcend the constraints brought about by the body in later old age. Drawing the distinction between the third and fourth ages for understanding contemporary ageing the papers address three important dimensions of later old age. The first presentation by Gilleard directly addresses the corporeality of late old age noting its seeming undesirability and limitation. Gilleard posits that not only does the ageing body impact on the lived experiences of those in later old age but also acts as a cultural reference point for the representation of this period of the life course. Eliopoulos presents preliminary results from her qualitative study on social exclusion of individuals aged over 80 living in remote island environments of the Pacific Northwest. The research considers how such environments might, even in the absence of high levels of health and social care resources, mitigate some of the constraints associated with the ageing body. The chair, Paul Higgs will discuss the issue of ageism and how it is abstractly inscribed on the ageing body; often with little reference to the lived experiences of older people themselves. He will call for a more reflexive approach to ageism. Overall, the symposium seeks to draw gerontological attention to the complexities and possibilities surrounding the ageing body at later ages.

THE 9TH DECADE AND BEYOND: THE PERILS OF THE NARRATIVE OF DECLINE

Elaine Eliopoulos, *University College London, University College London, England, United Kingdom*

Twenty-three participants ranging in age from 80-102 years living on remote islands in the Pacific Northwest, USA reported the privileges of their current years. The aim of the study was to explore lived bodily experience and its impact on social exclusion. Participants utilized a

unique visual methodology by photographing their experiences which highlighted daily life. While acknowledging that their years 'before' were different, and that life going forward may present unwelcome challenges, life in the now brought new joys and self-determination, despite various bodily compromises. Their perceptions of their bodies defied the dominant narrative of decline. These important findings warrant further investigation of the ways in which this emerging cohort views the challenges of aging bodies and their ability to remain socially connected. The role the dominant narrative of decline plays in their lives may prove to misdirect supports.

THE CORPOREALITY OF LATE AGE

Chris Gilleard, *University College London, UCL, England, United Kingdom*

In a study of over a thousand Germans, Paul Baltes and his colleagues observed that most respondents saw age 80-84 as the preferred age to reach before dying. Living beyond 85 was only desired by a minority. Perhaps this is because this age seems to many the point when bodily disease and physical weakness render life not just unpleasant but actively burdensome. Such views underpin the social imaginary of an undesirable fourth age. This paper discusses the significance of corporeality as both representation and lived experience, raising the question of whether the disparity between real and imagined corporealities resides as much from an 'other' within as without.

Session 4630 (Symposium)

VIEWS OF AGING DURING THE CORONA PANDEMIC

Chair: Jennifer Bellintier

Co-Chair: Anna Kornadt

In the Covid-19 pandemic, media stories and government reports have emphasized the heightened risk of being "old" and placed a spotlight on the way we think and talk about older adults and aging. In this symposium we investigate how the pandemic and the public discourse about older adults has shaped views of aging in different countries. Bellintier et al. report on German children's views of older adults before and during the pandemic. Children placed greater distance between themselves and older adults both before and after the pandemic, suggesting early ageism in children that predates the pandemic. Levy et al. provide experimental evidence that media stereotypes about aging and Covid-19 influence the mental health of older American adults, both in positive and negative. Schwartz and Ayalon found that greater perceptions of age-based discrimination in the healthcare system by Israeli adults 50+ were significantly related to greater Covid-19 worries. Greater worry can motivate older adults to take precautions, but be detrimental if it becomes too high. In line with this finding, Tingvold et al. found in a study with older adults from Luxembourg that more Covid-19 worry predicted feeling older four months later, but only for those in worse health. Finally, Terracciano examined longitudinal change in subjective age and found that American adults reported feeling younger after the emergence of Covid-19 than before, suggesting that perceptions of aging partly reflect a coping process to counter the negativity in the media.

A MULTI-METHOD EXAMINATION OF AGEISM IN CHILDREN BEFORE AND DURING THE PANDEMIC

Jennifer Bellintier, Jenny Jaquet (née Bauer), and Lena-Emilia Schenker, *Friedrich Schiller University Jena, Jena, Thuringen, Germany*

The pandemic has made age more salient. Access to vaccines, mandates to wear masks, and recommendations for contact restrictions have all varied by age. Developmental intergroup theory proposes that greater salience of a feature can lead to greater stereotyping and prejudice. We investigated this with a multi-method assessment of ageism in children (N = 57, ages 4-8), where data collection occurred both before and during the pandemic. In simulated behavioral measures, children preferred to sit closer to younger adults (mean distance = 1.8 seats) versus older adults (mean distance = 2.8 seats), and, for a simulated treasure hunt, they chose 3.36 younger, versus 1.63 older, teammates. Explicit (picture ratings) and implicit (IAT) ratings also significantly favored younger adults. These preferences were not exacerbated by the pandemic. Although ageism is present at young ages, we found no evidence that this has thus far worsened in the pandemic.

SELF- AND OTHER-DIRECTED AGEISM AND WORRIES CONCERNING COVID-19 HEALTH CONSEQUENCES

Liat Ayalon,¹ and Ella Cohn-Schwartz,² 1. *Bar Ilan University, Ramat Gan, HaMerkaz, Israel*, 2. *Ben-Gurion University, Beer-Sheva, HaDarom, Israel*

Worries associated with COVID-19 health consequences are well-justified. They may motivate people to take safety precautions, but may hinder if they become too intense. Current research examined mainly age and gender as potentially associated with worries. This study instead, focuses on self-perceptions of ageing (SPA) and perceived age discrimination as potential predictors of worry, in light of the ageism pandemic which co-occurred with the COVID-19 outbreak. The study is based on a national representative sample of 1,092 adults aged 50+ in Israel. Phone interviews were conducted between March – May 2020, when Israel gradually moved from strict to partial lockdown. Our findings show that SPA and age-based discrimination in the healthcare system were significant predictors of worries. The findings point to the potentially negative impact of the ageism pandemic in relation to worries. Interventions that address ageism directed by self or others might alleviate people's worries in the COVID-19 pandemic.

IMPACT OF MEDIA-BASED AGE STEREOTYPES ON OLDER INDIVIDUALS' MENTAL HEALTH DURING THE COVID-19 PANDEMIC

Becca Levy,¹ E-Shien Chang,² Sarah Lowe,³ Natalia Provolo,³ and Martin Slade,³ 1. *Yale University, Woodbridge, Connecticut, United States*, 2. *Weill Cornell Medicine, New York City, New York, United States*, 3. *Yale University, New Haven, Connecticut, United States*

During the COVID-19 pandemic, stigmatization of older persons has increased in traditional and social media. It was unknown whether this negative messaging could be detrimental to the mental health of older individuals, and whether the relatively uncommon positive messaging about older

individuals could benefit their mental health. To address these gaps, we designed age-stereotype interventions based on actual news stories that appeared during the pandemic. As expected, the exposure of older individuals to the negative-age-stereotype-messaging interventions led to significantly worse mental health (more anxiety and less peacefulness), compared to a neutral condition; in contrast, the positive-age-stereotype-messaging interventions led to significantly better mental health (less anxiety and more peacefulness), compared to a neutral condition. The results demonstrate the need for media messaging aimed at empowering older individuals during the pandemic and beyond.

SUBJECTIVE AGE CHANGES DURING THE COVID-19 PANDEMIC

Antonio Terracciano, *Florida State University, Florida, United States*

Aging is associated with an increased risk of COVID-19 morbidity and mortality. In this study, we tested whether the pandemic influenced how old individuals felt by examining longitudinal within-person changes in subjective age. We tested two alternative hypotheses: (a) people felt increasingly older in response to the stress generated by COVID-19; (b) people felt increasingly younger due to psychological distancing from older age. We tested these hypotheses in a large US sample of adults assessed once before and twice during the COVID-19 pandemic. Multilevel analyses indicated that people reported feeling younger with the emergence of COVID-19. We further tested demographic, health, and psychosocial predictors of changes in subjective age. Overall, the findings supported the hypothesis that subjective age partly reflects a coping process of psychological distancing from older age, a process that parallels physical and social distancing.

EXPLORING THE RELATIONSHIP BETWEEN SUBJECTIVE AGE AND WORRY FOR OLDER ADULTS IN TIMES OF A PANDEMIC

Maiken Tingvold,¹ Anna Kornadt,² Isabelle Albert,² Elke Murdock,³ Martine Hoffmann,⁴ and Josepha Nell,⁵
 1. *University of Luxembourg, University of Luxembourg, Grevenmacher, Luxembourg*, 2. *University of Luxembourg, Esch-sur-Alzette, Luxembourg*, 3. *University of Luxembourg, Esch-sur-Alzette, Diekirch, Luxembourg*, 4. *RBS, Itzig, Diekirch, Luxembourg*, 5. *University of Luxembourg, Esch-sur-Alzette, Grevenmacher, Luxembourg*

Given the role of age as a risk factor in the covid pandemic, we examined the longitudinal cross-lagged relationship between subjective age and Covid-related worry, and possible moderators of this relationship. Data were obtained at two-time points (June and October 2020) by a phone/online survey, from N = 611 older participants (Mage = 69.92 years). Participants felt on average 10 and 8.5 years younger than their chronological ages at the two-time points, respectively. Younger subjective age at T1 increased the level of worry at T2 irrespective of age, perceived control and subjective health. Higher worry increased subjective age at T2, but only for those with worse subjective health. Our results show that subjective age and Covid-related worry interact over time. This relation needs to be

explored further in order to understand the relationship between subjective age and well-being especially, but not only in the pandemic context.

Session 4635 (Symposium)

HEALTH AND AGING DISPARITIES AMONG LATIN AMERICAN OLDER ADULTS: FINDINGS FROM STUDIES IN BRAZIL, COLOMBIA, AND MEXICO

Chair: Margarita Osuna

Aging in Latin America is occurring rapidly, in a context of high levels of poverty and inequality. This symposium is focused on population health and the health-disparities found in some of Latin America's largest middle-income countries, Mexico, Brazil, and Colombia. This symposium contains presentations on different health-related issues affecting older adults, which can have further implications for wellbeing, health, and disease risk. The papers in this symposium examine a variety of health-related dimensions and disparities among older Latinos that include physiological functioning, cognition, and oral health. Using the Mexican Health and Aging Study (MHAS), Sheehan investigates the associations between personal and familial educational attainment on sleep quality. Also using MHAS, Milani. Using data from the Brazilian Longitudinal Study of Aging, Farina examines the relationship between race and cognition. Garcia uses data from the Colombian Survey of Health, Well-Being, and Aging to study the relationship between Motor Cognitive Risk Syndrome (MCRS) and cognition and frailty. Using the same dataset, Osuna examines variation in oral health in Colombian older adults and the impact this has on their wellbeing. Results indicate which population subgroups in Latin American have increased risk for poorer health and which dimensions of health have gender, race and socioeconomic disparities. The findings highlight the importance of understanding the conditions under which Latin American older adults are aging and the implications this can have in the future.

ORAL HEALTH-RELATED QUALITY OF LIFE IN COLOMBIAN OLDER ADULTS

Margarita Osuna,¹ Piedad Suarez,² and Jennifer Ailshire,³
 1. *USC, University of Southern California, California, United States*, 2. *University of Southern California, University of Southern California, California, United States*, 3. *University of Southern California, Los Angeles, California, United States*

Despite its importance for health and wellbeing, oral health quality of life (OHQoL) has received little attention in lower-income countries, such as Colombia. This study describes the prevalence of older adults' OHQoL and variability by socioeconomic status. We use data from the 2015 SABE-Colombia (N=18,700), a nationally representative survey of community-dwelling Colombians ages 60 and older. We used the Simple Count Geriatric Oral Health Assessment Index (SC-GOHAI), a self-reported measure of frequent oral health problems such as chewing, swallowing, and speaking designed to assess OHQoL. The scale ranges from 0-12; higher scores indicate worse OHQoL. About 69% of older Colombians reported at least one OHQoL

problem. The most common issues were difficulty chewing hard food and speaking. High education and income were associated with better OHQoL and smoking were associated with worse OHQoL. Oral health may therefore reflect another dimension of social and health inequality for older Colombians.

THE INFLUENCE OF GENDERED SOCIAL POSITION ON COHORT DIFFERENCES IN SMOKING AMONG OLDER MEXICAN ADULTS

Sadaf Milani,¹ Jaqueline Avila,² and Rebeca Wong,¹
1. *University of Texas Medical Branch, Galveston, Texas, United States*, 2. *Brown University, United States*

Disparities throughout the life course, including social position, result in gendered pathways to health, which ultimately result in gender disparities in late life. Using data from the Mexican Health and Aging Study, we explore the concept of gendered social position over the life course (educational achievement, marital history, employment history) and its association with smoking status in old age (current, former, never). We compare two cohorts by gender, those aged 60 to 71 in 2001 (n=4,383) and 60-71 in 2012 (n=5,970), as these cohorts experienced vastly different life courses. Overall, current smoking decreased from 2001 to 2012, but men consistently report higher rates of current and past smoking, compared to women. This presentation will widen the lens of gender to consider the influence of social position established over the life course, on gender differences in smoking, a risk factor for poor health and function in old age.

THE LIFE COURSE ORIGINS OF THE RACE DISPARITY IN COGNITIVE FUNCTIONING IN BRAZIL

Mateo Farina, *University of Southern California, Los Angeles, California, United States*

Background: Cognitive health is a major concern for understanding population health in Brazil. Race inequalities have been found for several health outcomes but less is known about older adult cognitive health. Health inequalities have been tied to several life course factors, but less is known about how the racial stratification in Brazil may contribute to race disparities in cognitive health. Method: Data come from the Brazilian Longitudinal Study of Aging. We used nested regression models to examine the life course origins of the race differences in cognitive functioning. Results: Whites had better cognitive functioning than non-Whites. Education reduced these differences by about half. Health behaviors and cardiometabolic conditions had little to no impact. Discussion: Race differences in cognitive functioning in Brazil are in large part attributable to educational opportunities. These findings point to the importance of cognitive development in childhood to understand racial disparities in later life cognitive health.

DOES FAMILIAL EDUCATIONAL ATTAINMENT PREDICT SLEEP QUALITY TRAJECTORIES FOR OLDER ADULTS IN MEXICO?

Connor Sheehan,¹ and Margarita Osuna,² 1. *ASU, Tempe, Arizona, United States*, 2. *USC, University of Southern California, California, United States*

Researchers have stressed the importance of sleep for healthy aging and longevity. However, there are few

population-level studies of sleep quality focusing on older adults in Latin America and Mexico in particular. The objective of this study is to examine the associations between personal and familial educational attainment on sleep quality. We utilized data from the 2001-2015 Mexican Health and Aging Study (N=4,164; MHAS). Our sample consisted of older adults (aged 50+), married with children. We predicted longitudinal reports of restless sleep across four waves of MHAS using mixed-effects logistic regression. We found that lower levels of respondents' education, their spouses' education, and their children's education were associated with lower levels of sleep quality. When the measures of education were included in the same model, one's own education and children's education remained significantly associated with quality sleep. Our results stress the importance of familial educational attainment for sleep in Mexico.

MOTORIC COGNITIVE RISK SYNDROME: PREVALENCE AND COGNITIVE PERFORMANCE

Elkin Garcia-Cifuentes, Isabela Marquez, and Carlos Cano, *Pontificia Universidad Javeriana, Pontificia Universidad Javeriana, Distrito Capital de Bogota, Colombia*

Cognitive decline and dementia have a significant impact on older adults. Motor Cognitive Risk Syndrome (MCRS) is a pre-dementia stage where slow gait speed and subjective memory complaints are present. MCRS increases the risk of frailty, dementia, disability, falls and overall mortality. We used data from the SABE Colombia study (Health, Well-Being, and Aging) conducted in 2015 in adults aged 60 years and older. After adjusting for confounding variables MCRS was associated with MMSE (OR 0.90, CI 0.82-0.99), pre-frail (OR 9.1, CI 3.26-25.47) and frail (OR 21.38, CI 6.30-72.57). This study found a prevalence of 5.45% of MCRS in Colombian older adults. We found an association between cognitive performance (MMSE), frailty and MCRS. Our results increase the awareness of a pre-dementia stage different to Mild Cognitive Impairment (MCI), as these individuals are at greater risk than those with MCI to develop dementia.

Session 9000 (Poster)

Acute Care and Hospitalization

65 & THRIVE: IMPROVING PATIENT LENGTH OF STAY, READMISSION, AND QUALITY OF CARE BY BECOMING AN AGE-FRIENDLY HOSPITAL

Tracey Vien,¹ Stella Bobroff,² and Ricardo De Ocampo,²
1. *Kaiser Permanente Med Group/Southern California, Los Angeles, California, United States*, 2. *Kaiser Permanente, Los Angeles, California, United States*

Data indicates that older persons will increase in numbers along with having an increase of life expectancy in the United States. Kaiser Permanente Los Angeles Medical Center's Utilization Department developed "65 & Thrive"—an age-specialized initiative to provide holistic care that preserves independence, quality of life, prevents functional and cognitive decline, and promotes both patients and their families to continue thriving. The initiative's focus is guided by

the 5 M's model on mobility, medication, mentation, multi-morbidity, and what matters. Case management staff were given age-sensitivity trainings, improved workflows and made assessments that identified, addressed, and secured resources for patients throughout their hospitalization. Silver Angel volunteers were specially trained to prevent physical and mental decline and focused on activities to prevent delirium, depression and falls. The volunteers visited with patients daily for these interactions. The initiative was piloted in April 2020 on a stroke telemetry unit and since then the hospital has seen a significant decrease in the overall annual readmission rates by 3.1% when compared to 2019. The average length of stay for older adult patients; however, increased from 4.05 to 4.83 days unfortunately due to COVID-19. This initiative demonstrates the necessity to expand "65 & Thrive" throughout the hospital and ultimately to other Kaiser Permanente medical centers to best provide holistic care to older adults.

A DELIRIUM RISK STRATIFICATION TOOL AND INTERDISCIPLINARY ROUNDS TO PREVENT DELIRIUM IN HOSPITALIZED OLDER ADULTS

Jennifer Woodward, and Tru Byrnes, *Atrium Health, Charlotte, North Carolina, United States*

Delirium is a disturbance of attention accompanied by a change in baseline cognition that is commonly seen in acute care settings, and effects up to 80% of ICU patients. The development of delirium has adverse effects on patient outcomes and high health care costs. Of patients aged 65+ admitted to our hospital in 2019, non-delirious patients had a five-day length of stay (LOS) compared to a 10-14 days LOS in delirious patients. A five days LOS increase adds an additional \$ 8,325 per patient for an extra annual cost of 15 million dollars. Additionally, delirium is often not recognized. A prior retrospective study showed that 31% of older adults seen by a Geriatrics provider were diagnosed with delirium, while only 11% were detected by nurse's CAM screen. Given the need to improve delirium detection and management, a QI project was undertaken with a goal to recruit an interdisciplinary team, create a risk stratification tool to identify patients at substantial risk for developing delirium, and develop a delirium prevention protocol. Patients with a score of ≥ 4 were initiated on a nurse driven delirium protocol that included a delirium precaution sign and caregiver education. 6 months data has shown increased delirium detection of 33%, a reduction in 7.7 days LOS, reduced SNF discharge by 27%, and a significant LOS saving of 231 days. The results were statistically significant, $p < 0.04$ for LOS reduction. The cost avoidance in LOS alone were \$384,615 for delirium patients.

ARE STAKEHOLDER PRIORITIZED POST-ACUTE CARE PRACTICES DOCUMENTED AND DO THEY IMPROVE OUTCOMES?

Natalie Leland, Stephanie Rouch, and Elizabeth Skidmore, *University of Pittsburgh, Pittsburgh, Pennsylvania, United States*

The receipt and intensity of rehabilitation services, such as occupational and physical therapy, have been associated with lower risk of readmissions. Yet, little is known about the care. This study quantified the frequency of documented

post-acute care (PAC) stakeholder-prioritized practices and their associations with hospital readmissions. A PAC stakeholder advisory board (e.g., physicians, rehabilitation providers across settings) prioritized key practices to evaluate. Medicare claims and electronic medical records were used to construct an episode of care for patients age 65 or older. Eligible patients were discharged from one of nine acute hospitals to a PAC setting (i.e., inpatient rehabilitation, skilled nursing, home health) within one large health system between August 2016 and August 2018. Descriptive statistics characterized the cohort and frequency of documented practices. Logistic regression examined associations among the practices and readmissions, by setting. Stakeholders prioritized (a) education, (b) cognition assessment and treatment, and (c) medication management. Among these PAC patients ($n=3,227$) there was variation in documentation for each practice by setting. Documentation of medication management at any point during the stay ranged from less than 1% to 54% of patient stays among settings. There was a significant relationship between the practices and readmissions. Within inpatient rehabilitation, every additional day patient and caregiver education was documented by occupational therapy was associated with 21% lower odds of readmission ($p<0.05$). This study highlights the variability in documentation of stakeholder-prioritized practices across PAC and their associations with readmissions. Future work is needed to enhance the systematic delivery and documentation of these practices.

CHANGES IN FUNCTIONAL STATUS AMONG CLUSTERS OF OLDER ADULTS AFTER HOSPITALIZATION FOR PNEUMONIA

Chan Mi Park,¹ Hye Chang Rhim,² Eun Sik Lee,³ Wonsock Kim,⁴ Jong Hun Kim,⁵ and Dae Hyun Kim,⁶
 1. *Harvard T.H.Chan School of Public Health, Brookline, United States*, 2. *Harvard University, Orlando, Florida, United States*, 3. *Korea University Anam Hospital, Korea University Anam Hospital, Seoul-t'ukpyolsi, Republic of Korea*, 4. *Eulji Medical Center, Eulji Medical Center, Kyonggi-do, Republic of Korea*, 5. *CHA Bundang Medical Center, CHA Bundang Medical Center, Kyonggi-do, Republic of Korea*, 6. *Hebrew SeniorLife, roslindale, Massachusetts, United States*

Little is known about how social determinants, comorbidity, and disability status are associated with functional recovery after an acute illness. A prospective cohort study was conducted between 2019-2020 at a university hospital in Korea, to investigate functional recovery after hospitalization for pneumonia in older adults with different degrees of social deprivation, disabilities, and comorbidities. K-means cluster analysis was used to identify groups of patients based on social deprivation score, activities of daily living, instrumental activities of daily living, physical limitation score, and Gagne comorbidity index. Four groups were identified: Group A: non-disabled group with limited social support ($n=61$ [30.3%]); Group B: multimorbid but non-disabled group with social support ($n=45$ [22.4%]); Group C: multimorbid and disabled group with social support ($n=38$ [18.9%]); Group D: multimorbid and disabled group with limited social support ($n=57$ [28.4%]). Functional status, defined as ability to perform 21 activities and physical

tasks independently, was measured via telephone interviews at 1, 3, and 6 months after discharge. Group-based trajectory model identified four functional status trajectories: excellent (n=29 [14.4%]), good (n=51 [25.4%]), fair (n=58 [28.9%]) and poor (n=63 [31.3%]). The most common functional trajectory by four groups was good trajectory (59%) in Group A, excellent trajectory (48.9%) in Group B, fair (50%) and poor trajectory (50%) in Group C, and poor trajectory (77.2%) in Group D. Our results suggest that most patients without disability recover functional status after pneumonia, despite multimorbidity or limited social support. Social support seems to be more important for those with multimorbidity and disability.

NATIONAL NORMS FOR THE ELIXHAUSER AND CHARLSON COMORBIDITY INDEXES AMONG HOSPITALIZED ADULTS

Christine Loyd,¹ Garner Boogaerts,² Yue Zhang,¹ Richard Kennedy,¹ and Cynthia Brown,³ 1. *University of Alabama at Birmingham, Birmingham, Alabama, United States*, 2. *University of Alabama at Birmingham, University of Alabama at Birmingham, Alabama, United States*, 3. *Louisiana State University Health Sciences Center - New Orleans, New Orleans, Louisiana, United States*

Multimorbidity has become the defining focus of in-patient geriatric clinical practice and research. Comorbidity assessment burden is often completed using the Elixhauser (ECI) and Charlson comorbidity indexes (CCI), which can predict mortality risk, hospital length of stay and readmission, and healthcare utilization. Yet, the national norms for ECI and CCI have not been reported. Therefore, this study aimed to report comorbidity score national norms of hospitalized patients based on age, race, and sex. Using the 2017 US National Inpatient Sample, ICD-10 coding data from 7,159,694 adult patient's (≥18years) was abstracted to calculate ECI and CCI scores. Scores were stratified into 5-year age increments from age 45-89. Adults aged <45 and >89 were included in the analysis, however not age-stratified. Overall mean comorbidity score for the population using the ECI was 2.76 (95%CI 2.76, 2.76) and CCI was 1.22 (95% CI 1.22, 1.22). Mean scores for both indexes increased with age until age 90, and this increase was independent of race and sex (all p-values<0.001). Some individual comorbidities increased with age including congestive heart failure and dementia, while others including diabetes and chronic obstructive pulmonary disease increased with age but peaked between 60-74 years and declined in older age. Importantly, a report of US national norms for comorbidity burden among hospitalized adults can provide a reference for determining if clinical and research populations have greater or lesser comorbidity than typical hospitalized adults for their age, race, and sex.

OLDER ADULTS' PERCEPTIONS OF DISPOSITION DECISIONS FROM THE EMERGENCY DEPARTMENT

Karen Valcheff,¹ and Hoffart Nancy,² 1. *University of North Carolina -Chapel Hill, Greensboro, North Carolina, United States*, 2. *University of North Carolina, Greensboro, Greensboro, North Carolina, United States*

Patient-centered care strives to improve older adult outcomes from the emergency department (ED). Appropriate

disposition decisions from the ED for older adults are becoming increasingly complex and challenging. The purpose of this study was to explore the perceptions of older adults as to their disposition from the emergency department, the decision making process, and their engagement in that process. The Three-Talk Shared Decision Making (SDM) model guided the study. A qualitative approach was used to interview seven older adults two days after being treated in the ED. Transcribed data were thematically analyzed using MAXQDA to identify codes, patterns, and themes. Analysis revealed that the Three-Talk SDM model was not being used. Participants identified only one option regarding their disposition from the ED and perceived they had little voice in decision making. They reported a variety of emotional reactions, feelings of helplessness and empathy regarding the decision making process. Three factors that participants perceived as vital to them before making a disposition decision were safety, pain relief, and a definitive diagnosis. The findings of this small sample are clinically meaningful. These older adults wanted to be heard regarding their treatment and disposition decisions. Findings indicate the need for provider education about the use of a model such as the Three -Talk SDM. Further research is needed to look at both the older adult and provider's perception of the ED disposition decision. Additional strategies and skills are warranted to enhance shared decision making in the ED with the growing aging population.

PAIN ASSESSMENT AND DOCUMENTATION FOR OLDER ADULTS PRESENTING WITH NON-SURGICAL CONDITIONS IN EMERGENCY ROOM

Raza Haque,¹ Mara Bezerko,² Lauren Tibbits,¹ and Karen Tate,¹ 1. *Michigan State University, East Lansing, Michigan, United States*, 2. *Michigan State University, College of Human Medicine, Michigan, United States*

Pain is one of the most common reasons for Emergency Department (ED) visits among older adults. However, timely pain assessment and management in this population in ED is a challenging task due to many factors ranging from; sensory, cognitive impairments, chronic pain, reliability of assessment tools, multimorbidity and system factors such as triage-based dynamic ED workflow. Where the implementation of the EMR was anticipated to improve patientcare, literature has indicated the barriers in effective utilization of the EMR for this purpose. We posit that pain assessment and documentation could be variable among older adults presenting with non-surgical conditions. Objectives:1. To examine the proportion of documented initial pain assessment of nonsurgical older adults visiting emergency department 2. To examine the number of initial pain assessments documented in the chart by the five major categories of ICD-10 diagnoses upon discharge. Methods: A retrospective exploratory chart review of 4613 emergency room visits for first pain assessment in the EMR conducted for all adults 65 years or older, presenting with non-surgical conditions, who were discharged same day at an urban teaching hospital. Results: In our study 75.72% of encounters reviewed had a documented pain assessment. Completed pain assessments for the corresponding five most common non-surgical diagnostic categories presenting to our ED: Abdominal pain (92.59%), MSK (92.11 %), chest pain (83.92%), dyspnea (80%) and falls (79.46%). Conclusion:

Frequency of pain assessment and the management process of older adults presenting with non-surgical conditions in the institution studied was variable and differed based on presenting conditions.

PREDICTING FACTORS OF CLINICAL OUTCOMES IN TRAUMATIZED ADULTS AND OLDER ADULTS

Pornthip Suyasith,¹ Prangtip Chayaput,² Orapan Thosingha,³ Suzanne G. Leveille,⁴ and Jatuporn Sirikun,⁵ 1. *University of Massachusetts Boston, Bangkok, Samut Sakhon, Thailand*, 2. *Faculty of Nursing, Mahidol University, Bangkoknoi, Bangkok, Samut Sakhon, Thailand*, 3. *Faculty of Nursing, Chulabhorn Royal Academy, Laksi, Bangkok, Samut Sakhon, Thailand*, 4. *CNHS, UMass Boston, CNHS, UMass Boston, Massachusetts, United States*, 5. *Faculty of Medicine Siriraj Hospital, Bangkoknoi, Bangkok, Samut Sakhon, Thailand*

To investigate factors predicting hospital mortality and hospital length of stay (LOS) in traumatized adults and older adults, we conducted a three-year retrospective study at an academic hospital, Bangkok, Thailand. We reviewed medical records of 627 trauma patients admitted to the ED. Subjects were classified into 2 groups: adults (≥ 55 y), and older adults (≥ 65 y). Data were collected for demographic and clinical characteristics, physiologic deterioration using the Modified Early Warning Score (MEWS), severity of injury using the Circulation Respiration Abdomen Motor and Speech Score (CRAMS), and outcomes of hospital mortality and LOS. Multivariable logistic and linear regression models were performed. For hospital mortality, an elevated MEWS (Older adults [n = 267]: MEWS ≥ 3 , OR=4.80, 95%CI, 1.02-22.56 vs Adults [n = 360]: MEWS ≥ 4 , OR=11.63, 95%CI, 1.94-69.82) and CRAMS (Older adults: CRAMS ≤ 9 , OR=19.21, 95%CI, 2.78-132.98 vs Adults: CRAMS ≤ 6 , OR=18.58, 95%CI, 3.40-101.65) were strongly predictive, adjusted for demographic and clinical data. For LOS, road traffic accident (RTA) (Older adults: $\beta=0.80$, 95%CI, 0.31-1.29, $p < .01$ vs Adults: $\beta=0.44$, 95%CI, 0.21-0.67, $p < .001$) and falls (Older adults: $\beta=0.88$, 95%CI, 0.44-1.32, $p < .001$ vs Adults: $\beta=0.33$, 95%CI, 0.02-0.65, $p < .05$) were associated with LOS, adjusted for demographic and clinical data. MEWS and CRAMS predicted hospital mortality, and RTA and falls predicted LOS in both age groups. Results support the need for interventions for close monitoring and medical management for older traumatized patients based on CRAMS and MEWS assessment to decrease the risk of death, and targeting those sustaining falls and RTA to reduce prolonged LOS.

Session 9005 (Poster)

Adult Development

A SCOPING STUDY OF LOW-WAGE WORKERS' RETIREMENT IN THE U.S. AFTER THE GREAT RECESSION

Hyesu Yeo, *University of Georgia, Athens, Georgia, United States*

Background Retirement comes with high risks for low-wage workers because of their cumulative disadvantages, and the Great Recession aggravated this population's working

lives. However, there has been a lack of research about this vulnerable population's retirement. The purpose of this scoping study is to offer a comprehensive understanding of low-wage workers' retirement after the Great Recession. Methods Based on the rigorous method of scoping review by Arskey and O'Mally, the researcher systematically searched, selected, and synthesized literature. The articles were collected from eight databases and were published in January 2008 - February 2019. The search terms included terms related to retirement and low-wage. After systematically reviewing titles, abstracts, and full-texts from 5,268 articles, the final chart contains sample characteristics, definitions of low-wage workers, policy/programs, etc., from 23 peer-reviewed empirical studies. Results The results indicated that: 1) Most of the retirement studies covered middle-wage class workers, excluding low-wage workers because of their lack of retirement affordability; 2) There was no common definition of low-wage workers among scholars; 3) 11 studies assumed Social Security is the only retirement income for low-wage workers, and 12 studies investigated how to improve the workers' participation in other retirement programs; 4) Most studies were economic-centered; 5) Low-wage workers had different socioeconomic and labor market characteristics. Conclusion and Implications First, a consensus on the definition of low-wage is required to improve policies and programs associated with this population's retirement. Second, the life-course perspective approach from various disciplines is necessary to improve low-wage workers' retirement, considering diverse backgrounds.

A STUDY OF SOCIAL ISOLATION, MULTIMORBIDITY AND MULTIPLE ROLE DEMANDS AMONG MIDDLE-AGE ADULTS BASED ON THE CLSA

Lun Li,¹ Andrew Wister,² and Barbara Mitchell,² 1. *University of Simon Fraser, Vancouver, British Columbia, Canada*, 2. *Simon Fraser University, Vancouver, British Columbia, Canada*

Our understanding of the influence of concurrent multiple social and family roles on social isolation among the middle-aged generation remains limited. Given the increasing complexity of parenting, caregiving and working patterns over recent decades in many countries, and greater concern of multimorbidity in mid-life, this study examines the longitudinal effects of these contexts on social isolation among middle-aged persons. We apply Linear Mixed Models to analyze a sub-sample of 29,847 middle-aged (aged 45 to 64) participants drawn from the Baseline and Follow-up 1 waves of the Canadian Longitudinal Study on Aging. Separated analyses were conducted for participants with or without multimorbidity in order to identify patterns across these groups. Both middle-aged participants with and without multimorbidity experienced greater social isolation over time. Among participants without multimorbidity, holding multiple roles serves as a protective function to prevent social isolation over time. Among participants with multimorbidity, the parenting role remain as a protective factor; however, the caregiving role increases the risk of social isolation over time. This study confirms several life-course transitions from middle age to older age, including increased risk of social isolation and caregiving demand, and decreased parenting and working involvement. Different associations were uncovered

among middle-aged persons occupying multiple roles on social isolation with and without multimorbidity over time. The findings emphasize the necessity to study multimorbidity as a salient contextual factor, and to provide enhanced support to multimorbid middle-aged individuals with increasing family caregiving demands.

ASSOCIATION BETWEEN MUSIC ENGAGEMENT AND MORTALITY IN MIDDLE-AGED AND OLDER ADULTS IN THE US

Andrew Fiscella, Britney Veal, Ming Ji, and Hongdao Meng, *University of South Florida, Tampa, Florida, United States*

Music engagement is a universal human activity that transcends cultural and geographic boundaries. Current evidence suggests that music engages many diverse brain networks with wide-ranging effects on physiological, cognitive, and affective processes. As a result, music activity engagement may be associated with enhanced cognitive reserves and reduced stress. However, it remains unclear whether music activity engagement is associated with any survival advantage in the general population. This study tested this hypothesis in a nationally-representative sample of middle-aged and older adults in the U.S. A cohort of 3,540 respondents from the Health and Retirement Study was followed from 2002 to 2018. Music engagement was measured by self-reported participation in passive and/or active music activities. Potential confounders included socio-demographics, health and functional status, and health-related behaviors. We plotted the Kaplan-Meier survival curves by music engagement level and used Cox proportional hazards model to examine the independent effect of music engagement on mortality. Musical engagement levels were significantly associated with mortality in both the unadjusted and adjusted analyses. Respondents who reported engaging with music at a moderate or high level had lower mortality risk as compared to those who did not (HR=.83, $p=0.015$; HR=.78, $p=0.003$, respectively). These findings suggest that music engagement in the middle to late life may have an independent beneficial effect in promoting longevity. Future research should examine whether this observed effect was causal and existed in other populations. If confirmed, interventions should be designed to promote music engagement among middle-aged and older adults.

IDENTITY, INTEGRITY, AND RELIGIOUS DOUBT IN LATER LIFE

Phoebe Clark,¹ Michiko Iwasaki,² Edward Thompson,³ and Andrew Futterman,⁴ 1. *Loyola University MD, Gaithersburg, Maryland, United States*, 2. *Loyola University MD, Department Of Psychology, Maryland, United States*, 3. *College of the Holy Cross, Broadview Heights, Ohio, United States*, 4. *Loyola University MD, Loyola University MD, Maryland, United States*

Erik Erikson argued that for religiously involved individuals, the resolution of two stages – Identity vs. Role Diffusion and Integrity vs. Despair – are of critical importance in adult development. Adults typically confront their parents' religious affiliation in adolescence and young adulthood as they establish themselves as independent actors in the world, and in later life, older adults confront their own lived lives, and

evaluate in light of their religious commitments whether they have lived meaningfully and with integrity. To examine Erikson's views of religious development, we completed open-ended interviews of 278 community-dwelling older adults (55-101 years). In these interviews, participants describe the development of their religious faith, the nature and development of their religious questioning and doubt, and the relationship between their faith and doubt over their life span. Participants were from Northeast U.S., and were denominationally, racially, and ethnically diverse. More extensive religious doubts were reported during young adulthood regarding the meaningfulness of religion in their family of origin. By contrast, religious doubts are reported less during later life, and more emphasis is placed on the value of religious involvement for themselves and their families. This pattern varies between young-old (under 75 years) and old-old (over 76 years): whereas the young-old seem to be working through their religious doubts, the old-old are more focused on the value of their religious faith. These findings are discussed in terms of Erikson's developmental theory and with respect to cohort differences in religious belief and practice.

LINKAGES COLORADO: EVALUATION OF INTERGENERATIONAL PROGRAMS TO IMPROVE CONNECTIONS ACROSS ALL AGES

Carson De Fries,¹ Leslie Hasche,¹ Rachel Cohen,² Andrew Steward,³ and Matthew Schilz,¹ 1. *University of Denver, Denver, Colorado, United States*, 2. *Aging Dynamics, Pine, Colorado, United States*, 3. *University of Denver, Lone Tree, Colorado, United States*

LinkAGES Colorado is a collaborative group of multi-sector organizations (e.g., libraries, non-profit service organizations, nursing homes) that uses a capacity-building approach to support the offering of intergenerational programs and evaluation of outcomes over time and across programs. Since 2018, LinkAGES has implemented 20 intergenerational programs involving various activities (e.g., music and art therapy, sharing cultural traditions), across settings, and across modalities (in-person and online). Ages of program participants ranged from 5 months to 96 years old. This study evaluated change in connectedness between generations over time. Participants ($n=118$) completed pre- and post-program ratings on social connection (i.e., level of intergenerational engagement, self-perception of extent of feeling connected, and self-perception of impact on someone from another generation) on a 4-point Likert scale. Paired sample t-test results indicated that programs significantly improved engagement and perceived impact. Using multiple regression analyses, we tested change over time for each outcome controlling for participant age group, program host setting, and program modality. A greater positive change in level of engagement occurred for older adults and in-person programs. Additionally, feelings of connection and perceived impact significantly improved over time when controlling for age group, program modality, and program host setting, with age group as a significant covariate. This study demonstrates the impact of intergenerational programs on social connectedness across a wider network of organizations than much of the extant literature. While the positive outcomes are promising and consistent across LinkAGES programs

and existing literature, further exploration of age group differences should be considered.

RETIREMENT FINANCIAL PLANING AND LIFE SATISFACTION

Mengya Wang,¹ Suzanne Bartholomae,² and Jonathan Fox,¹
1. *Iowa State University, Ames, Iowa, United States*, 2. *Iowa State University, Ames, Iowa, United States*

Abstract#8232; Retirement has been considered as a major transition in one's life. Financial security in retirement is a major concern for many Americans. Evidence has shown that being financially#8232;prepared for retirement could have a significant, positive impact on one's life satisfaction. Employing data from the 2012 and 2018 National Financial Capability Study (N=1023), this#8232;study analyzes the relationship between participants' retirement planning in 2012 and their financial satisfaction in 2018. An Ordinary Least Squares regression is used in the current study.#8232;This study found relatively low retirement preparedness levels (retirement planning, retirement#8232;saving, retirement plan: employer-based or individually held, investment) among the participants#8232;in 2012. Based on the descriptive results, adults closest to retirement (ages 55 to 64) are more#8232;likely to be planning compared to the other groups, as are adults who were married, highly#8232;educated, males, and white. According to the linear regression results, this study found that adults#8232;who had a retirement savings goal, had a retirement plan (employer- based or individually held),#8232;made regular contributions to retirement plans, and owned investments in 2012 are more likely#8232;to be satisfied with their personal financial condition in 2018. As expected, individuals with#8232;higher incomes, larger net worth, and those who are older are significantly more likely to be#8232;financially satisfied. However, even after controlling for these variables, results show that planning#8232;does indeed impact the level of financial satisfaction. Our findings highlight the importance of#8232;policies and programs to support Americans with retirement planning.

Session 9010 (Poster)

Ageism and Attitudes Toward Aging

AN AGING NURSING WORKFORCE: THEMATIC ANALYSIS FROM THE NURSTORY PROJECT

Raeann LeBlanc, *University of Massachusetts, Amherst, Royalston, Massachusetts, United States*

Background: Nursing in the United States of America is an aging workforce. This study sought to better understand the lived experience of aging nurses. Because nurses work in systems where other forms of interpersonal power dynamics may influence internalized and external stereotype an approach based on intersectional theory was applied. Methods: A qualitative thematic narrative analysis of an existing data set of first-person digital stories in the Nurstory project, authored by a group of nurses, was the data source. An emergent coding method was applied. The collection of five digital stories were analyzed. Results: All stories were first person accounts of experiences that represented their internalized reflections and elements of ageism in how their age

interacted with their work environment. Dominant themes included: 1) Role constriction 2) Strength 3) Tired and (re) Tired 4) Age perceived and 5) Loneliness. Conclusions: These aging nursing stories add to the contextual layers of the aging healthcare workplace and aging nursing workforce. These individual experiences offer a nuanced understanding of the internalized responses to aging and ageism. These stories highlight socially constructed and socially reinforced attitudes that are complicated by the personal and occupational expectations of nurse's work, their role and embedded hierarchies in healthcare. Stories such as these are important individual and collective indicators of lived experiences that offer a deeper understanding into the intersections of social identity and aging, that when listened to, can offer insight and a way forward in addressing the stereotype, discrimination and social inequities of ageism.

ASSESSING FRONTLINE PERSONNEL'S RECOGNITION OF AND RESPONSE TO CASES OF ABUSE IN LATER LIFE

Sarah Marrs, Courtney O'Hara, Ruth Anne Young, Miranda Yelvington, Dejah Patterson, Annie Rhodes, and Edward Ansello, *Virginia Commonwealth University, Richmond, Virginia, United States*

Abuse in later life is experienced by 10% of adults over age 60 (Acierno et al., 2010). Unfortunately, it is estimated that for every one reported case, around 20 remain unreported (APA, 2012). A primary reason for this disparity is the absence of training provided to professionals working at the frontline of elder abuse, such as law enforcement professionals, health care professionals, and aging and victim service providers (e.g., Rose et al., 2016). This leaves the workforce best positioned to intervene in cases of abuse in later life lacking knowledge around what constitutes the different types of abuse and what they should do if they suspect abuse (Rosen et al., 2018). A critical first step to developing the evidence-based training needed to reconcile this gap is to gain a better understanding of the current landscape within this workforce. This qualitative study explored the knowledge and attitudes towards abuse in later life as well as current practices and policies for reporting abuse among law enforcement professionals (n = 1), health care professionals (n = 2), and aging (n = 5) and victim (n = 4) service providers. Participants (N = 12) represented urban (n = 4), suburban (n = 5), and rural settings (n = 2). Themes emerging from the focus groups highlight a number of barriers to identifying and reporting abuse for professionals in each discipline. Our findings also provide strong evidence of the need to intervene and diminish the impact ageist attitudes and behaviors can have on older adults.

COLLEGE STUDENTS LIFE COURSE DRAWINGS AND THEIR DESCRIPTIONS

Amy Schuster,¹ Katherina Terhune,² Tina K. Newsham,³ M. Aaron Guest,⁴ Renee DuMont,⁵ Lauren Hackett,⁵ J.R. Patton,⁵ and Kebafe Segosebe,⁴ 1. *Clemson University, Clemson, South Carolina, United States*, 2. *Northern Kentucky University, Lexington, Kentucky, United States*, 3. *University of North Carolina Wilmington, University of North Carolina Wilmington, North Carolina, United States*, 4. *Arizona State University, Phoenix, Arizona, United States*,

5. *University of North Carolina Wilmington, Wilmington, North Carolina, United States*

Drawing as a qualitative method has been employed to elicit views on aging. The subject matter of the drawings, without an explanation from participants, can be misinterpreted. Therefore, in this research, we explored college students' drawings of the life course and the extent to which the content of these drawings corresponded to their written descriptions. A content analysis was performed on 524 college students' life course drawings and their descriptions. Participants drew, on average, five life stages. The majority (75%) of the human beings represented were alone in each life stage. Twelve percent of the drawings were non-human representations of the life course (e.g., flower, tree). The majority of the images (85%) included in the drawings were not mentioned in the written descriptions, for example, hair changes (e.g., from long and straight to curly and short for women). Some physical characteristics (e.g., wrinkles [29%], hunched back [22%]) and some contexts (e.g., tombstones [37%], nursing home [100%]) were present in both the drawing and descriptions. Findings highlight which ideas associated with aging participants thought needed an explanation and which they might have seen as intrinsic to aging, warranting no explanation, emphasizing the importance of examining both drawn and written content when using drawing as a method in aging research. A more thorough and precise examination of the beliefs and perceptions of college students, who will serve as future professionals working with older adults, allows for the development of educational and engagement strategies that accurately target commonly held misperceptions regarding aging.

NARRATIVE IMAGINATION: DISMANTLING OLD AGE THROUGH THE LITERARY FOODSCAPE IN LORE SEGAL'S "THE ARBUS FACTOR"

Eva-Maria Trinkaus, *University of Graz, Graz, Steiermark, Austria*

Being able to take another person's perspective and understanding the Other is a crucial element of reading, understanding, and processing literature. Especially in the context of old age, many literary texts play into the culturally constructed (cf. Gullette 2004) and biased understanding of old age as decline narrative, rather than reading an old person's story as a narrative of possibility. In her short story "The Arbus Factor" which was first published in *The New Yorker* in 2007, Lore Segal offers a different perspective on aging. Through creating a space, coming into existence through foodways and food practices, which in my dissertation I will refer to as 'literary foodscape,' she offers a setting and backdrop for the characters to construct a discourse of possibility, creation, and new opportunities at a later stage in life. Segal wittily dismantles age-related stereotypes and opens up a discourse that goes beyond an easy categorization. This paper is going to analyze the ways in which a literary text, through the 'literary foodscape' is able to rewrite a culturally engrained perspective, and offers a different and more accurate understanding of what it means to be old. Gullette, Margaret Morganroth. *Aged By Culture*. The University of Chicago Press. 2004.

TOWARD INTERVENTIONS TO REDUCE INTERNALIZED AGEISM

Andrew Steward, *University of Denver, Lone Tree, Colorado, United States*

Ageism is an insidious form of injustice that is internalized from an early age with accumulating negative health impacts across the lifespan. Internalized ageism is associated with numerous public health outcomes, including physical and mental health, functional impairment, cognition, cardiovascular stress, hospitalizations, and longevity. Research has begun to document how ageism negatively impacts health through psychological, behavioral, and physiological pathways. Yet, limited research has addressed interventions to reduce internalized ageism. This study integrates stereotype embodiment theory, theories of successful and productive aging, and recent scholarly literature to present a conceptual model with potential downstream, midstream, and upstream interventions at micro, meso, and macro levels. Micro interventions include: social, physical, and cognitive engagement, as well as stress management. Meso interventions include: education, intergenerational contact, and narrative reframing. Macro interventions include anti-ageism policy, such as amendments to the Age Discrimination in Employment Act (ADEA). The conceptual model is described in detail, and implications for practitioners are discussed. The need to examine how policy influences health through the three pathways in stereotype embodiment theory is discussed. This study provides a working model for scholars and practitioners to use when considering paths toward reducing internalized ageism and optimizing well-being for aging adults.

Session 9015 (Poster)

Ageism and COVID-19

"ESPECIALLY FOR PEOPLE OUR AGE": EXPLORING THE CORRELATES OF AGEISM DURING THE COVID-19 PANDEMIC

Jennifer Sublett,¹ Michael Vale,² and Toni Bisconti,¹ *1. The University of Akron, Akron, Ohio, United States, 2. Sacred Heart University, Trumbull, Connecticut, United States*

The COVID-19 pandemic has presented an unprecedented context for older adults where they may feel patronized, isolated, and fearful because of their greater risk of getting COVID-19 and being targets of ageism. Previous researchers have linked ageism negatively with health and well-being; although, the majority of this research has highlighted the negative, or hostile, aspects of ageism, and excluded the overaccommodative and patronizing qualities of benevolent ageism. Since the start of the pandemic, both forms of ageism have been noted to be more salient with claims of an ageism outbreak (Ayalon et al., 2020). The correlates of ageism during the COVID-19 pandemic are widely unknown, and the goal of this study was to explore whether experiences of ageism were related to different affective and health-related responses to the pandemic. In a sample of older adults (N=65) collected in September 2020, we found that benevolent ageism positively correlated with pandemic specific experiences of pity ($r=.27, p<.05$), loneliness ($r=.30$,

$p < .05$), worry ($r = .40$, $p < .01$), and negatively related to self-reported physical health ($r = -.31$, $p < .05$) and emotional well-being ($r = -.26$, $p < .05$). Hostile ageism did not relate to pity, but positively correlated with loneliness ($r = .25$, $p < .05$) and worry ($r = .37$, $p < .01$), and negatively related to physical health ($r = -.27$, $p < .05$) and emotional well-being ($r = -.38$, $p < .01$). This work provides preliminary evidence of how the lives of older adults have been influenced by COVID-19 and the resulting ageism outbreak. Future research should continue this avenue of study with more expansive and inclusive samples and approaches as the pandemic is not over.

"IT ISN'T GOING TO LAST FOREVER!" THE EFFECTS OF COVID-19 PANDEMIC ON OLDER ADULTS

Chih-ling Liou, *Kent State University, North Canton, Ohio, United States*

The media puts a spotlight on older adults' vulnerability to COVID-19 with limited consideration on how they view and cope with this crisis. This study is to give older adults voices to share their experiences of this pandemic. Data were collected using semi-structured interviews with 46 adults between the ages of 66 and 97 from the midwestern United States. Participants were asked to share how the pandemic affects them, their vision for the future, and how they cope during the pandemic. Although they worried about their health, felt isolated and missed seeing family and friends, most participants shared an optimistic view for the future. Some said that they are looking forward to receiving the vaccine, some believed that the effects of the pandemic are just temporary, and others compared that of the pandemic to the wars and other types of hardships which were much worse. Strategies for coping during the pandemic vary from spiritual practices to positive thinking, from exercises to new hobbies, and from calling family members to cutting down on the news. The results also show that the oldest-old and old-old participants seem to be better at regulating their negative effects compared to the young-old. One female participant in her 90s shared that she does not worry about the pandemic because there is nothing that she can do about it. Older adults' adaptability during the COVID-19 pandemic should be better understood to reverse the image of their vulnerabilities and promote late-life coping during crises.

AGE AND AGEISM IN THE COVID-19 PANDEMIC: WHAT DOES THE DATA SHOW?

Usha Dhakal,¹ and Suzanne Kunkel,² *1. Miami University, Oxford, Ohio, United States, 2. Miami University Scripps Gerontology Center, Oxford, Ohio, United States*

Gerontologists were quick to call out the resurgence of ageism that was reflected in the paternalistic, overgeneralized, and deficit views of aging that dominated discussions about age-associated risks of the disease and its consequences. One manifestation of the blunt and potentially ageism-promoting use of age in data about the virus is the failure to routinely distinguish the independent role of age alone, separate from its association with comorbidities. A related problem is the use of broad age categories, which can also mask the role of specific comorbidities. To address that gap, this study uses data from Centers for Disease Control and Prevention, as of Feb 21, 2021 to calculate age-specific COVID-19 death rates (ASDR) and compare the extent to which comorbid conditions potentially associated with COVID-19 deaths

were listed on death certificates. Findings showed that the ASDR was significantly higher for those 85 years and over (2249.96 per 100,000); the rate was 802.66 for 75-84 and 312.78 per 100,000 for 65-74. Death certificate information revealed that influenza and pneumonia was the major contributing comorbidity to COVID-19 deaths across all three age groups; (listed on 49% of the death certificates for those 65-74 who died with COVID-19, 46% of those 75-84, and 38% of those 85 and over). Future studies should be more precise about the use of age/age groups, about the rationale for those designations, and about the impact of age separate from comorbidities. Broad use of an arbitrary age as a proxy for frailty and illness contributes to ageism.

AGEISM AND UNDERGRADUATE ATTITUDES TOWARDS OLDER ADULTS DURING COVID-19

Adam Shea,¹ Aiping Yu,¹ and Jessica Strong,² *1. University of Prince Edward Island, University of Prince Edward Island, Prince Edward Island, Canada, 2. University of Prince Edward Island, Charlottetown, Prince Edward Island, Canada*

The COVID-19 pandemic has shed light on the far reaches of ageism in our society. The current study sought to better understand ageist beliefs in Canadian undergraduate students during the pandemic. As part of a larger survey on ageism, we conducted a thematic analysis on open-ended responses to the following questions: 1) "Has your relationship with older adults in your life changed as a result of the COVID-19 pandemic?" and 2) "Have you noticed that attitudes or opinions towards older adults in your community have changed as a result of the COVID-19 pandemic?" Students felt that older adults should be treated differently during the pandemic because they are seen as "high risk" or "vulnerable." Furthermore, students felt that they needed to be more cautious around older adults because older adults need to be taken care of. Students expressed fear about transmitting the virus to older adults in their lives so chose to isolate from grandparents or avoid older adults in the community in an effort to keep them safe. Finally, examples of negative and positive ageism were present in responses. Negative ageism was seen in comments about how older adults were going to die anyway, the assumption that older adults need more help, and the belief that older adults should be staying home during the pandemic. Positive ageism was present where students realized the importance of their relationships with the older adults in their lives. Results are discussed using the framework of implicit and explicit ageism.

AGEISM PREDICTS PRIORITIZING COVID-19 VACCINES FOR OLDER ADULTS AND LTC RESIDENTS

Carly Pullen,¹ Jenessa Steele,² and Julie Hicks Patrick,³ *1. West Virginia University, Morgantown, West Virginia, United States, 2. Radford University, Radford, Virginia, United States, 3. West Virginia University, Morgantown, West Virginia, United States*

Ageism and ageistic stereotypes regarding older adults have become widespread and influence many policies and practices. Benevolent ageism includes attitudes or behaviors that appear overtly positive but are actually patronizing (Cary et al., 2017). Hostile ageism, usually expressed through negative stereotypes, highlights older adults' poor physical

and mental functioning (Cary et al., 2017). The aim of the current study was to examine the role of benevolent and hostile ageism on perceptions of vaccination priority during the COVID-19 pandemic. As part of a larger longitudinal study on perceptions of aging, measures of benevolent and hostile ageism were collected in January 2020, before the pandemic began in the US. In March 2021, the same participants were asked to identify top vaccine priorities by ranking groups (e.g., adults 65 and older, school teachers, etc.). Participants who put older adults in the lowest priority group expressed more benevolent ageism before the pandemic than those who put older adults in the top priority group, $F(2, 88) = 3.93, p < .05$. Participants who put older adults in the lowest priority group expressed more hostile ageism prior to the pandemic, compared to those who put older adults in the top priority group, $F(2, 88) = -3.34, p < .05$. Similar to Vale and colleague (2020) findings, our results suggest that ageism influences people's ideas about triage for the vaccine. Notably, neither form of ageism related to prioritization for other high-risk groups, including members of racial/ethnic minority groups or health care workers.

EXAMINING ATTITUDES AND EXPERIENCES OF AGEISM DURING COVID-19: ARE THEY ON THE RISE?

Michael Vale,¹ Jennifer Sublett,² and Toni Bisconti,² 1. *Sacred Heart University, Trumbull, Connecticut, United States*, 2. *The University of Akron, Akron, Ohio, United States*

Gerontologists have warned of rising ageism amidst the COVID-19 pandemic. Older adults have been portrayed as a homogenous group given their health vulnerabilities and have been viewed with mixed perceptions. For instance, the pandemic has been viewed as an “old person’s” disease and older adults have been inherently linked to imposing health and safety lifestyle changes. Others have responded with acts of overaccommodative care that have minimized older adults’ autonomy. Taken together, there have been inferences of increased hostile and benevolent ageism. Currently, these claims lack empirical data, and the goal of this study was to examine if attitudes and experiences of ageism are on the rise. Across two studies, we examined young adults’ (N=268) attitudes of older adults and older adults’ (N=65) experiences of ageism before and after the start of the pandemic. In study 1, we examined ageist attitudes at 3 time points (2017, 2019, 2020) from separate, but equitable, college samples and found that hostile ageism was higher during the pandemic ($F(2,265)=5.48, p<.001$) and benevolent ageism demonstrated no differences. In study 2, we explored older adults’ experiences of ageism pre-and post-pandemic onset (2019, 2020) and, found that they reported experiencing less hostile ageism ($t(64)=2.45, p<.05$), with no differences in experienced benevolent ageism. Our findings suggest an increase in hostile ageist views, but a decrease in experiences, partially supporting the alleged claims of rising ageism. Nevertheless, the last year of the pandemic is dynamically contextualized and research should elaborate on the extent and consequences of this rise.

MEDIA PORTRAYALS OF EMERGING AND OLDER ADULTS DURING COVID-19: PERCEPTIONS OF BIAS AMONG COLLEGE STUDENTS

Taylor Pestritto,¹ Mikala Mikrut,² Kirsten Graham,² and Katherine King,³ 1. *William James College, Newton, Massachusetts, United States*, 2. *Southern Utah University,*

Cedar City, Utah, United States, 3. *William James College, William James College, Massachusetts, United States*

This study explores media consumption and perceptions of media bias against both older adults and emerging adults during the COVID-19 pandemic. As part of a larger study, 99 students with a mean age of 20.54 (SD = 2.97) completed an online survey in early 2020. Individuals whose media consumption had increased were significantly more likely to report that young adults have been portrayed worse, and older adults better, since the start of COVID-19. Qualitative responses demonstrated broad awareness of ageist and adultist themes in media portrayals of both age groups, e.g., that young adults are careless and reckless whereas older adults are vulnerable and in need of protection. Results suggest that the media is perceived to be perpetuating age-related biases and may be enhancing intergenerational discord at a time when generational unity is needed.

PEOPLE INTERNALIZED MORE ATTITUDES TOWARD AGING DURING THE PANDEMIC

Helene Fung,¹ Hiu Ling Vivian Tsang,² and Chunyan Mai,³ 1. *The Chinese University of Hong Kong, Shatin, N.T., Hong Kong, Hong Kong*, 2. *Hong Kong Metropolitan University, The Chinese University of Hong Kong, Hong Kong*, 3. *the Chinese University of Hong Kong, Hong Kong, Hong Kong*

Older adults are viewed as being vulnerable to COVID-19. Previous research revealed that individuals would internalize or dissociate with attitudes toward aging when they aged. In this study, data collected before the COVID-19 pandemic were compared with those collected during the pandemic to assess whether the pandemic might make older adults internalize or dissociate with attitudes toward aging to a greater extent. 123 Hong Kong participants (50.4% females, $M=60.59 \pm 13.28$ years old) were recruited in a two-wave survey (wave 1 in 2018 and wave 2 in 2020) on attitudes toward aging and future self-views. After comparing the correlations between attitudes toward aging and future self-views in the two waves, we found stronger positive correlations between these 2 variables in wave 2 than in wave 1 in the personality and finance domains, but not in the family, independence, or health domains. These findings suggest that internalization of attitudes toward aging might be domain-specific. The pandemic might make older adults more likely to internalize positive personality attitudes toward aging and negative finance attitudes toward aging into their future self-views. Professionals may consider utilizing the internalization process to promote a positive attitude toward aging during the pandemic.

Session 9020 (Poster)

Ageism and Perceptions and Attitudes About Aging

“SPEND YOUR SPOONS WISELY”:

CONCEPTUALIZATIONS OF TIME, ENERGY AND AGING INVISIBLY WITH CROHN’S DISEASE

Ginny Natale,¹ and Manacy Pai,² 1. *Stony Brook University, Stony Brook, New York, United States*, 2. *Kent State University, Kent, Ohio, United States*

An increasing number of people with chronic medical disabilities are living longer and into old age due to the growing

medical and technological advancements over the past half century. We used grounded theory to examine the lived experience of aging “with” a disability in a non-elderly population. On average, participants were 37 years of age at the time of interview. The average time since diagnosis was 17 years and ranged from 3 to 34 years. Many worked full-time outside of the home and some held advanced or graduate degrees. Of the 35 participants interviewed, three-quarters expressed worries about the future and aging, specifically related to physical limitations of having CD. The other 25% talked about learning to accept the diagnosis and ‘moving forward’ with their life as they age. All participants described the difficulties of fatigue and energy limitations. Planning of life was limited to 24 hours — a direct consequence of functional limitations of a relapsing-remitting disease. The most prominent theme that emerged from participants’ narratives to explain aging invisibly with a chronic illness was quantifying energy into ‘spoons’, a way of measuring the stock of their energy on any given day. These findings translate into important insights into the process of aging for those who live and age “with” Crohn’s as their everyday lives are immersed in managing the varying whims of this illness.

AGE NORMS AND THE SPIRIT OF CAPITALISM

Jeremiah Morelock, *Boston College, Woburn, Massachusetts, United States*

Adulthood is often associated with hard work, in contrast to childhood and later life, which are associated with play, education, and leisure. Yet the work-fixated sense of adulthood is about more than just age norms. Like any such ethos, it is situated in socioeconomic history. Workers are forced to work hard, the work ethic framing their exploitation within an aura of moral righteousness. According to Weber the normative weight commonly associated with ‘hard work’ derives from the advent of Protestantism in the late middle ages. Weber says that this new worldview birthed the ‘spirit of capitalism,’ and set the stage for the modern world to take shape. In the seventeenth century—hence roughly coinciding with mercantilism and the Reformation—was the invention of the modern concept of childhood, i.e. the radical division of childhood from adulthood. This period also inaugurated the European Enlightenment, where reason was elevated as a supremely honorable aspect of humanity, in many ways as a new source of this-worldly pseudo-salvation. ‘Adulthood’ was infused with these values—the ideal [male] adult is rational, responsible, hard-working, self-sufficient, and financially secure. It was adulthood, more than and in contrast to other times of life (e.g., childhood and later life), that absorbed and normalized the new economic and cultural trends. The moral elevation of hard work, combined with the greater demarcation of adulthood in contrast to childhood and later life, set up children and older adults to take on a status of moral inferiority due to their exclusion from the working world.

ALLOPHILIA AND EXPERIENCE: PREDICTORS OF FEAR IN DEVELOPING DEMENTIA

Amber Rusch, Michaela Clark, Moyosoreoluwa Jacobs, Carmen Thomassy, and Julie Hicks Patrick, *West Virginia University, Morgantown, West Virginia, United States*

Fear of developing dementia is common and has been linked to delays in seeking medical attention (Arlt et al.,

2008). We used data from 320 adults (M age = 39.7, SD = 12.3, range 20 – 70) to examine the ways in which objective knowledge and subjective experience with dementia influence positive attitudes toward persons with dementia. We further examined how these constructs related to fear of developing dementia. A path analysis showed the model fit the data well, $X^2 (DF = 1) = 0.74$, $p = .39$; RMSEA < .001. Objective knowledge and subjective experience were significantly associated with higher allophilia. Allophilia and subjective experiences were associated with personal fear. However, allophilia decreased fear, whereas subjective experiences were associated with increased fear of developing dementia. To clarify these findings, we conducted a moderated regression in which age was examined as a moderator of the relation between allophilia and fear as well as the relation between subjective experience and fear. Significant results were obtained [$F (5, 294) = 10.41$, $p < .001$; $R^2 = .15$]. Age moderated the effect of personal experience on fear. Stronger effects emerged for adults in their 20s compared to those in their 40s; similarly, age exerted a stronger effect for those in their 40s than for those in their 50s. Regarding age effects on the relation between allophilia and fear of dementia, for adults in their 20s and 40s, allophilia reduced fear of dementia. For adults in their 50s, allophilia was associated with higher fear.

ATTITUDES ABOUT DEMENTIA IN DIFFERENT STAGES OF ADULTHOOD

Melissa O'Connor,¹ Megan Pedersen,² and Susan McFadden,³ *1. North Dakota State University, Moorhead, Minnesota, United States, 2. North Dakota State University, Fargo, North Dakota, United States, 3. University of Wisconsin Oshkosh, Oshkosh, Wisconsin, United States*

Research on attitudes toward dementia has often focused on younger and older adults; few studies have also included the age groups of established and middle adulthood. The current study utilized data from community-dwelling adults aged 18-95 ($n=567$) residing in two Midwestern states. Participants were divided into four age groups: emerging/young adulthood (ages 18-29), established adulthood (ages 30-45), middle adulthood (ages 46-64), and older adulthood (age 65+). ANOVA models were used to examine age group differences on the following outcomes: factual knowledge about dementia (total score on 14 true-false questions); attitudes toward dementia (total score on the 20-item Dementia Attitudes Scale); and a single item, “I am afraid of losing my memory” (rated on a 5-point scale). The effect of age group was significant in all models ($p < 0.01$ for all). Emerging/young adults had significantly more knowledge about dementia, but less positive attitudes toward dementia, relative to established, middle-aged, and older adults. Attitudes and knowledge did not differ between established, middle-aged, and older adults. By contrast, older adults reported significantly more fear of memory loss than emerging/young, established, and middle-aged adults; fear did not differ between the latter three age groups. There were no significant interactions between age group and sex in any of the models. Implications of these findings are discussed.

AWARENESS OF AGE-RELATED CHANGE AND ITS RELATIONSHIP WITH INDUCTIVE REASONING AND AGEISM

Abigail Voelkner,¹ and Grace Caskie,² 1. *Lehigh University, Easton, Pennsylvania, United States*, 2. *Lehigh University, Bethlehem, Pennsylvania, United States*

Subjective aging is important due to its relationship with well-being. Diehl and Wahl (2010) proposed Awareness of Age-Related Change (AARC) as a measure of subjective aging; their theoretical model proposed that cognition's relationship to AARC is mediated by ageist experiences. The current study tests this model and proposes an alternative model where cognition is hypothesized to mediate the relationship of ageist experiences to AARC. Inductive reasoning was used to measure cognition due to its susceptibility to ageism. Participants were 283 older adults aged 66-90 years ($M=69.08$, $SD=3.36$) without a dementia diagnosis or cognitive impairment. Inductive reasoning was measured by Word Series, Number Series, Letter Sets, and a composite score. AARC total losses, cognitive losses, total gains, and cognitive gains were used. Age, gender, and education covariates were included. Analysis of Diehl and Wahl's (2010) model showed that the composite and individual reasoning measures had negative direct effects on all AARC measures. Ageism mediated the effect of the composite and individual reasoning measures on AARC total and cognitive losses. In the alternative model, ageist experiences had positive direct effects on AARC total and cognitive losses. The composite, Number Series, and Letter Sets mediated the effect of ageism on all AARC measures. Word Series mediated the effect of ageism on total and cognitive losses. Overall, inductive reasoning seems to play an important role in understanding the relationship of ageism with AARC. Thus, inductive reasoning abilities may be a potential intervention point to cultivate well-being. Future research should assess additional domains of cognition.

C-REACTIVE PROTEIN MEDIATES THE ASSOCIATION BETWEEN SUBJECTIVE AGING AND INCIDENT HEART DISEASE

Hanamori Skoblow, and Christine Proulx, *University of Missouri, Columbia, Missouri, United States*

Recent studies have shown that negative perceptions of subjective aging are associated with a heightened risk of cardiovascular events (Stephan et al., 2020) and increased C-reactive protein (CRP), a biomarker associated with inflammation (Stephan et al., 2014). Because inflammation is deleterious to cardiovascular health, CRP might mediate the association between subjective aging and cardiovascular disease. The purpose of this study was to examine the association between subjective aging (i.e., negative self-perceptions of aging [SPA] and subjective age) and incident cardiovascular disease (e.g., heart attack, angina, congestive heart failure), and to determine whether CRP mediates this relation. We used up to five waves of repeated measures data from the Health and Retirement Study (HRS, 2008 - 2016) with adults aged 50 to 101 ($n = 9,531$). Two separate models were conducted in MPlus with bias-corrected bootstrap confidence intervals and controls for respondent age, sex, education, race, ethnicity, body mass index (BMI), diabetes, hypertension, depressive symptoms, and physical

inactivity. There were significant indirect effects of both SPA and subjective age on incident cardiovascular disease through CRP (indirect effect SPA model = .02, CIs [.01, .03], $p < .05$; indirect effect subjective age model = .05, CIs [.02, .10], $p < .05$). In both models, CRP fully mediated the association between subjective aging and incident cardiovascular disease. Taken together, these findings underscore the importance of considering older adults' views of aging for understanding physical health and suggest that interventions aimed at improving views on aging may reduce inflammation and promote cardiovascular health.

DAILY PERCEIVED STRESS AND PHYSICAL HEALTH SYMPTOMS: MODERATION BY SELF-PERCEPTIONS OF AGING

Dakota Witzel,¹ Shelbie Turner,² and Karen Hooker,¹ 1. *Oregon State University, Corvallis, Oregon, United States*, 2. *Oregon State University, Oregon State University, Oregon, United States*

Research suggests increased daily perceived stress is related to worse physical health outcomes such as poor eating and exercise behavior (Li et al., 2019) and lower perceived health (Whitehead & Blaxton, 2020). While long-term implications for increased perceptions of stress on physical health are becoming clear (e.g., Rueggeberg et al., 2012), less is known about associations between daily perceptions of stress and subjective levels of physical health symptoms. Moreover, positive perceptions of one's own aging may buffer perceived stress's impact on physical health. Indeed, self-perceptions of aging (SPA) impact how people prepare for age-related stressors (Kornadt et al., 2015), and are associated with physical health trajectories (Luo & Li, 2020). Using a 100-day microlongitudinal study of 103 older adults, we examined the 1.) impact of both between- and within-persons associations of perceived stress on physical health symptoms and 2.) the potential moderating associations of SPA on perceived stress and physical health symptom associations. Preliminary models suggest that on days when people perceived more stress, they show a .03 increase in reporting physical health symptoms compared to days when they do not report more perceived stress ($p < .0001$). Further, people who experience more perceived stress on average, reported .06 more physical symptoms across the study period ($p < .0001$). While SPA did significantly predict physical health symptoms ($p = .004$), the association between perceived stress and physical health symptoms was not dependent on SPA ($p > .05$). Future directions may include exploring associations between daily stressful experiences, perceptions of stress, and valence of SPA.

DIFFERENT STROKES FOR DIFFERENT FOLKS? EXAMINING A NEW MEASURE FOR AGE-RELATIVE SEXUAL ATTITUDES

Allyson Graf,¹ Kinsey Bryant-Lees,¹ Tracy Cohn,² and Maggie Syme,³ 1. *Northern Kentucky University, Highland Heights, Kentucky, United States*, 2. *Radford University, Radford, Virginia, United States*, 3. *Hebrew Senior Life, Boston, Massachusetts, United States*

Recent research suggests increasingly permissive attitudes towards sexual activity in later life. Harboring more conservative beliefs especially as one reaches older age,

however, may translate into how one views and navigates sexual health changes. A sample of participants ($N = 706$; Mage = 52.72 years, $SD = 9.57$, range = 36-79; 60.8% male) was recruited through Amazon's Mechanical Turk to complete a survey on sexual beliefs about age and aging. Participants completed two versions of the Relative Sexual Attitudes Scale (RASA), wherein they were prompted to consider either "someone their own age" or "an older person" in response to items assessing sexual attitudes. Multi-group confirmatory factor analysis was used to confirm the original five-factor structure, reduce the total items from 31 to 25, and establish measurement equivalence for the 36-54 year-old and 55+ year-old samples. Through a series of profile analyses investigating each subscale, scores did not significantly differ between the two prompts, although significant age-group differences were found with the 36-54 year-old age group reporting more open attitudes than the 55+ year-old age group across all subscales, except the traditional mores subscale. Sexual attitude subscale scores also differed by gender, engagement in partnered sexual activity, and whether one had spoken to a health professional about their sexual health in the past year. The findings support use of the RASA for adults 36 and older and highlight applications to understanding differences in sexual health into later life.

LACKING WARMTH AND COMPETENCE: HOW YOUNGER ADULTS UTILIZE "OK BOOMER" ACCORDING TO THE STEREOTYPE CONTENT MODEL

Katelyn Frey,¹ Michael Vale,² and Toni Bisconti,³ 1. *University of Akron, Akron, Ohio, United States*, 2. *Sacred Heart University, Trumbull, Connecticut, United States*, 3. *The University of Akron, Akron, Ohio, United States*

Younger adults have coined the popular retort "OK Boomer," referring to the 76 million Baby Boomers born between 1946-1964. The Stereotype Content Model (SCM) is a framework used to assess stereotypical perceptions of various groups, and older adults generally fall in the paternalistic "high warmth/low competence" quadrant. The stereotypes behind "OK Boomer" could correspond to any of the four quadrants of the SCM. The present study's goals were to determine the parameters for using the phrase, how hostile and benevolent ageism may underlie its use, and whether or not the eponymous "Boomer" fits into the same cluster in the SCM as older adults in general. In a sample of 316 participants (18-33; $M = 23$; $SD = 5.25$), we found that age was related to using "OK Boomer" such that being younger is associated with feeling more comfortable using the phrase in front of anyone ($r = -.208$, $p < .01$), using the phrase more frequently ($r = -.218$, $p < .01$), and sharing "OK Boomer" memes, pictures, and jokes online ($r = -.203$, $p < .01$). Hostile ageism, but not benevolent, was associated with an increased likelihood of saying "OK Boomer" in front of anyone ($r = .256$, $p < .01$), to use it more frequently ($r = .242$, $p < .01$), and to share "OK Boomer" jokes online ($r = .301$, $p < .01$). Content analysis results indicate that "OK Boomer" does not correspond to the paternalistic quadrant of the SCM due to Boomers' perceived low warmth.

POSITIVE AND NEGATIVE AFFECT INFLUENCES ATTITUDES TOWARD AGING

R INTRIERI, and Paige Goodwin, *Western Illinois University, Macomb, Illinois, United States*

The Aging Semantic Differential (ASD; Rosencranz & McNevin, 1969) is one of the most widely used measures in the aging literature to measure attitudes rather than knowledge or beliefs about aging. Originally 32-items the ASD has been reduced through careful factor analysis to 20-items representing 4 factors representing: Instrumentality, Autonomy, Acceptability, and Integrity. Latent summary scores were created for each factor, with lower scores representing more positive attitude toward older adults. Despite its widespread use there are no published studies that examine the relationships between the four ASD factors and Positive and Negative affect. Positive and Negative affect are related to and represent the core aspects of Extraversion and Neuroticism. The prime objective of this study was to assess the relationships between Positive and Negative affect and the four ASD factors. The sample comprises 1189 undergraduate participants with a mean age of 22.02 ($SD=6.27$). The sample included 611 men and 578 women. Results showed the path model fitted the data well ($CFI = 953$, $TLI = .944$, $RMSEA = 0.066$, $SRMR = 0.035$). Positive affect was significantly related to Instrumentality, Acceptability, and Integrity ($\beta = -0.073$, ($SE = 0.034$); $p=0.034$; $\beta = -0.141$ ($SE = 0.033$), $p=0.0001$; $\beta = -0.146$ ($SE = 0.032$), $p=0.0001$). These results show that higher positive affect was related to more positive beliefs about Instrumentality, Acceptability, and Integrity. Negative affect was significantly related to Integrity ($\beta = 0.079$, ($SE = 0.032$); $p=0.012$) indicating that greater negative affect was related to more negative beliefs about bodily integrity.

SELF-PERCEPTIONS OF AGING AMONG DEMENTIA CAREGIVERS: EVIDENCE FROM THE UK PROTECT STUDY

Shelbie Turner,¹ Serena Sabatini,² Helen Brooker,³ Anne Corbett,⁴ and Adam Hampshire,⁵ 1. *Oregon State University, Oregon State University, Oregon, United States*, 2. *University of Exeter, Exeter, England, United Kingdom*, 3. *Exeter, University of Exeter, England, United Kingdom*, 4. *University of Exeter, University of Exeter Medical School, England, United Kingdom*, 5. *Imperial College London, London, England, United Kingdom*

Contact with older adults impact the perceptions people have towards their own aging self (Jarrott & Savla, 2015) and how they prepare for their own age-related change (Kornadt et al., 2015). Caregivers have close, intimate contact with older adults, yet no research explores how that contact may impact caregivers' perceptions of their own aging. In this exploratory study, we compare perceptions of one's own aging between current and previous formal caregivers, non-formal caregivers, and never-caregivers. We utilized data from 1978 informal caregivers, 247 formal caregivers, and 5586 never-caregivers of the 2019 wave of the UK Protect Study. We conducted ANCOVA tests to compare global levels of Awareness of Age-Related Change (AARC) gains and losses, AARC gains and losses specific to cognition, attitudes towards one's own aging, and felt age across the three subgroups of participants with different caregiving roles. Omnibus results suggested that there were significant group differences ($p < .05$) in global levels of AARC gains and losses, AARC gains specific to cognition, and attitudes towards one's own aging ($p < .05$) for female, but not male, caregivers. However, effect sizes were either small or negligible. Therefore, despite frequent contact with older adults, dementia caregivers may not have

better or worse self-perceptions of aging than non-caregivers. Such findings may be reflective of intergenerational ambivalence, and future work should consider how the nature of the caregiving situation (i.e. relationship quality, intensity of the care, caregiver burden) shapes caregivers' perceptions of their own aging, especially over time as caregivers navigate their own aging processes.

SUBJECTIVE AGING IN CONTEXT: NEIGHBORHOOD SOCIAL ENVIRONMENT AND SELF-PERCEPTIONS OF AGING AMONG OLDER ADULTS

Eunyoung Choi, Elizabeth Zelinski, and Jennifer Ailshire,,
University of Southern California, Los Angeles, California, United States

Self-perception of aging (SPA), one's attitude toward one's own aging, has been associated with health and well-being in later life. Whereas existing literature identifies individual-level predictors of SPA (e.g., education and health), little is known about the role of neighborhood context. The present study examines whether 1) neighborhood social environment is related to SPA and 2) age moderates this relationship. Our analytic sample includes 11,394 adults aged 50+ from the 2014 and 2016 waves of the Health and Retirement Study (Mean Age=68, SD=10.14, range 50-98). Indicators of neighborhood social environment include (a) perceived neighborhood social cohesion (the trust and social ties among community residents), (b) neighborhood friends, and (c) relatives living in the neighborhood. Regression analyses were performed to investigate the associations of each neighborhood-level indicator with the positive and negative dimensions of SPA. The models controlled for demographic, socio-economic, and health covariates. Greater neighborhood social cohesion ($B=0.13$, $SE=0.01$, $p<.001$) and having neighborhood friends ($B=0.14$, $SE=0.02$, $p<0.001$) were associated with higher levels of the positive SPA. As for the negative dimension of SPA, neighborhood social cohesion was the only significant predictor ($B=-0.13$, $SE=0.01$, $p<0.001$). Furthermore, we found significant interaction effects between neighborhood social cohesion and age: higher neighborhood cohesion was associated with more positive ($B=-.003$, $SE=.00$, $p<.001$) and less negative SPA ratings ($B=-.003$, $SE=.00$, $p<.001$) at younger ages than older ages. Our findings provide insights into how neighborhood social context shapes subjective aging, suggesting that a socially cohesive neighborhood may promote more favorable perceptions of aging, particularly for younger residents.

THE IMPACT OF MENTAL HEALTH STIGMA AND AGEISM ON STUDENTS' INTENTION TO WORK WITH OLDER ADULTS: A MIXED METHODS DESIGN

Cindy Woolverton,¹ Katelind Biccum,² Aiping Yu,² Lanlan Xin,² and Jessica Strong,³ 1. *Michael E. DeBakey VA Medical Center, Houston, Texas, United States*,
2. *University of Prince Edward Island, University of Prince Edward Island, Prince Edward Island, Canada*,
3. *University of Prince Edward Island, Charlottetown, Prince Edward Island, Canada*

Approximately 20% of older adults have a mental or neurological disorder which can cause significant disability. With a growing older adult population, there is a need for providers receiving specialized training in aging to provide

quality care. However, there continues to be shortages of students seeking careers in geriatrics and especially in working with older individuals with mental health (MH) concerns. The present study explored the relationship between MH stigma, ageism and intention to work with older adults among undergraduate students. Undergraduate students ($N=188$) completed a battery of questionnaires including intention to work with older adults, positive and negative attitude towards older adults, and open-ended questions exploring MH stigma views. Regression results indicated that MH stigma, positive, and negative attitudes significantly predicted intention to work with older adults, ($F(3, 182) = 8.51$, $p = .000$). Examination of the coefficients revealed that positive attitudes significantly predicted intention to work with older adults ($t=4.38$, $p=.000$), and MH stigma demonstrated a trend towards significance ($t=1.90$, $p=.059$). Open-ended responses were analyzed using qualitative description methods which revealed themes consistent with negative and positive stereotypes, MH problems going undetected, and need for additional support in recognizing and treating MH conditions among older adults. Positive attitudes are an important predictor in students' intention to work with older adults, and MH stigma may be an important factor to explore further. Qualitative themes also describe how MH concerns are an important area to focus on among older adults, although there continues to be evidence of aging stereotypes.

THE ROLE OF AGING ANXIETY, AGEISM, AND HEALTH LOCUS OF CONTROL ON MIDDLE-AGED ADULTS HEALTH OUTCOMES AND BEHAVIORS

Hannah Bashian,¹ and Grace Caskie,² 1. *Lehigh University, Boston, Massachusetts, United States*, 2. *Lehigh University, Bethlehem, Pennsylvania, United States*

Older adults with more ageist attitudes and aging anxiety and who endorse an external health locus of control (HLOC) have poorer mental and physical health and less engagement in healthy behaviors than those who report less ageist attitudes, aging anxiety, and endorse an internal HLOC. However, middle-aged adults have not been examined in this literature. Using Terror Management Theory as a framework, this study examined the relationship of middle-aged adults' aging anxiety, ageist attitudes, and HLOC with health behaviors and mental and physical health outcomes. 391 middle-aged participants (40-55 years) completed measures of ageist attitudes, aging anxiety, HLOC (Internal, External, and Powerful Other), engagement in health behaviors, mental health, and physical health. The path analysis model demonstrated acceptable fit, $\chi^2(2)=7.794$, $p=.02$, CFI=.99, TLI=.92, RMSEA=.09). For health behaviors, eight of the 10 paths were significant; higher aging anxiety, higher ageist attitudes, and less endorsement of internal HLOC were related to less engagement in healthy behaviors. For mental health and physical health, five of the 10 paths were significant; in general, higher aging anxiety, higher ageist attitudes, and less endorsement of internal HLOC were related to poorer mental and physical health. This study demonstrated that middle-aged adults' aging anxiety, ageist attitudes, and health locus of control are related to their health behaviors and mental and physical health. Furthermore, higher endorsement of specific forms of ageist attitudes and aging anxiety were related to worse reported mental and physical health and to

less engagement in health behaviors. Implications of these findings will be discussed.

WHAT IS THE RELATIONSHIP BETWEEN FUNCTIONAL LIMITATIONS, PAIN, AND SELF-PERCEPTIONS OF AGING?

Jillian Minahan Zucchetto,¹ and Ashley Blasi,² 1. *Fordham University, United States,*

2. *Fordham University, Bronx, New York, United States*

Self-perceptions of aging (SPA) influences health and mortality during older adulthood (e.g., Kotter-Grühn et al., 2009; Sargent-Cox et al., 2012). Westerhof and Wurm (2015) found that increasing functional limitations (FL) worsened older adults' SPA. Additional research is needed to identify other factors that influence SPA. Although pain is common among older adults and is a frequent cause of disability (e.g., Brooks et al., 2019), it has not been examined as a factor influencing SPA. Pain is often misperceived as an inevitable part of aging because of widely held negative stereotypes about aging (Thielke et al., 2012). The experience of pain may activate internalized negative stereotypes about aging, which may worsen SPA. Thus, this study investigated: 1) the relationship between chronic and recent pain, FL, and SPA, and 2) the interactive effect of FL and pain on SPA within a sample of community-dwelling adults aged 65 years and older. This study included 5,126 participants from the 2014 wave of the Health and Retirement Study. Controlling for covariates, chronic pain ($\beta = .09, p < .001$) and recent pain ($\beta = .12, p < .001$) were associated with negative SPA and were stronger than FL ($\beta = .04, p < .01$). There was also a small interaction between FL and recent pain on SPA ($\beta = -.03, p < .01$) such that the negative impact of FL on SPA was stronger among individuals who reported low pain. These findings highlight the importance of pain in older adults' evaluation of their own aging.

Session 9025 (Poster)

Aging and Chronic Health Conditions I

BLOOD PRESSURE CONTROL AND CARDIOVASCULAR AND MORTALITY RISK IN VA NURSING HOME RESIDENTS

Xiaojuan Liu,¹ Sei Lee,² Michael Steinman,² Laura Graham,³ Yongmei Li,¹ Bocheng Jing,⁴ and Michelle Odden,¹ 1. *Stanford University, Stanford, California, United States,* 2. *University of California San Francisco, San Francisco, California, United States,* 3. *VA Palo Alto Health Care System, Menlo Park, California, United States,* 4. *San Francisco VA Medical Center, San Francisco, California, United States*

Optimal blood pressure (BP) control in nursing home residents is controversial and this population has been excluded from trials. We evaluated the associations of BP level with cardiovascular (CV) events and all-cause mortality across antihypertensive medication categories in Veterans Affairs (VA) nursing home residents. Data for 18,589 residents aged 65 years and older was obtained from the VA Corporate Data Warehouse from October 2006 through September 2017. Baseline systolic BP (SBP) and diastolic BP (DBP)

were divided into categories and analyses were stratified by antihypertensive therapy (0, 1, and ≥ 2 medications). Over a median follow-up of 1.8 years, CV events occurred in 3,519 (19%) residents and 15,897 (86%) residents died. In participants on no BP medications, high SBP (>150 mmHg) was associated with a greater risk of CV events (adjusted [cause-specific] hazard ratio, 1.39; 95% confidence interval, 0.94-2.06) compared with normal SBP (110-130mmHg). By contrast, in participants on ≥ 2 BP medications, the subgroup with low SBP (<110 mmHg) had a higher CV risk (1.38; 1.20-1.57). For DBP, in participants without BP medications, there were no differences in CV risk across DBP subgroups. Whereas among those on 1 or ≥ 2 medications, DBP <60 mmHg was associated with a higher CV risk (1.26; 1.03-1.55 and 1.35; 1.18-1.54, respectively) compared with normal DBP (70-80 mmHg). Participants with low SBP (<110 mmHg) and DBP (<70 mmHg) had an increased mortality risk regardless of the number of medications. These findings suggest a potential risk of low BP among nursing home residents on multiple antihypertensive medications.

BONE-ACTIVE MEDICATION UTILIZATION FROM 2013-2017 AMID BENEFICIARIES AGED 65+ WITH MEDICARE PART D BY PROVIDER TYPE

Jennifer Kirk,¹ Sean Fleming,² and Denise Orwig,³ 1. *University of Maryland, Baltimore & Baltimore County, Herndon, Virginia, United States,* 2. *University of Maryland Baltimore, University of Maryland Baltimore, Maryland, United States,* 3. *University of Maryland, Baltimore, Baltimore, Maryland, United States*

As the United States' population increasingly consists of older adults aged 65+, an increase is expected in the prevalence of osteoporosis and the number of osteoporotic fractures. Bone-active medications (BAM) delay osteoporosis progression and prevent fragility fractures, but historically low treatment persistence rates and drug utilization for BAM exist among at-risk older adults. This research assessed for differences in the BAM utilization rates over five-years in Medicare Part D by provider type: geriatric specialists (GERO), generalists, specialists, nurse practitioners (NP), and physicians' assistants (PA). This longitudinal retrospective analysis included providers with at least one BAM prescription among beneficiaries aged 65+. An analysis of response profiles was used to model the mean BAM utilization rates overall and by provider group. Of the 50,249 providers included in this analysis, 88.15% were generalists, 5.76% specialists, 1.48% GERO, 2.73% NP, and 1.87% PA. From 2013-2017, the prevalence of BAM utilization was 6%. Over the five years, BAM utilization rates did not change significantly, but provider-specific rates were significantly different ($F=12.53, p<.001$). Provider-specific utilization rates were inconsistent with the highest utilization rates and most considerable variation observed among specialists (14.95%). PAs and NPs' BAM utilization rates were stable at around 9.02% and 9.20%, but GERO and generalists exhibited the lowest utilization rates, 4.86% and 5.79%, respectively. While specialists had the higher-than-expected utilization rates, the overall and provider-specific BAM utilization rates were low and did not increase over time. Further research is needed to identify how provider-related factors, like geographic region and clinical training, influence underutilization.

CHANGES IN THE USE OF INTENSIVE AND SUPPORTIVE CARE WITH HEART FAILURE IN THE LAST MONTH OF LIFE BETWEEN 2001 AND 2013

Piling Chou,¹ and Peichao Lin,² 1. *Kaohsiung Medical University, Kaohsiung, Taiwan, Kaohsiung, Taiwan (Republic of China)*, 2. *Kaohsiung Medical University, Kaohsiung, Taiwan (Republic of China)*

Background: Heart failure (HF) is a global epidemic affecting the elder globally. It is uncertain what care patients with heart failure receive at their end of life and what care trends are in the last month of life. **OBJECTIVES:** This study's objective was to investigate the changes in the use of intensive and supportive procedures for Taiwanese patients with heart failure in their last month of life during 2001-2013. **METHODS:** Analysis of claims data of 25,375 patients with heart failure obtained from the National Health Insurance Research Database was performed to investigate the changes in the use of intensive and supportive procedures for Taiwanese patients with heart failure in their last month of life during 2001-2013. **RESULTS:** Over the whole study period, 53.3% of patients with heart failure were admitted to intensive care units in their last month of life. The percentages of patients receiving mechanical ventilation (54.3%-41.5%), cardiopulmonary resuscitation (41.5%-16.7%), decreased over time. The percentages of patients receiving artificial hydration and nutrition (52.5.9%-56.8%) and extracorporeal membrane oxygenation (ECMO) (0.52%-1.78%) increased over time. Patients under 75 years old were more likely to be admitted to intensive care units. **CONCLUSION:** Over time, supportive procedures increased, and intensive procedures decreased in patients with heart failure in the last month of life. This study highlights a need for research, guidelines, and training in how to provide palliative care for end-stage patients with heart failure.

COMMUNITY-ACADEMIC PARTNERSHIP TO IMPROVE NUTRITION AND BLOOD PRESSURE IN SENIORS: OUTCOMES & IMPACT OF COVID-19

Dozene Guishard,¹ Rhonda Kost,² Jonathan Tobin,³ and Kimberly Vasquez,⁴ 1. *Carter Burden Network, New York, New York, United States*, 2. *Rockefeller University, New York, New York, United States*, 3. *Clinical Directors Network, New York, New York, United States*, 4. *The Rockefeller University, New York, New York, United States*

The Dietary Approaches to Stop Hypertension ("DASH diet") has been proven in research settings to lower blood pressure, but its implementation is untested among seniors in congregate meals settings. We report the planning, implementation, impact of COVID-19, and results of an Administration of Community Living-funded study to test whether two evidence-based interventions - DASH-alignment of congregate meals, and home blood pressure self-monitoring, can lower systolic blood pressure and increase blood pressure control among community-dwelling seniors.. Congregate meal menus were aligned with the DASH eating plan, through collaboration of Bionutrition professionals on the research team, CBN food services leadership, and the NYC Department for the Aging. Seniors provided feedback on the DASH-modified meal options. The intervention began on October 15, 2019 (Site 1) and February 3, 2020 (Site 2). The study was interrupted by the COVID-19 pandemic in

March 2020, when congregate meals ceased, and when approximately 75% of primary outcome data were collected. Modified implementation permitted completion of modified study outcomes. Preliminary analyses suggest that some participants were able to lower their blood pressure in this program. The DASH diet implemented in the congregate meal setting, along with programs to support BP self-efficacy through modification of existing programs, may be a valuable and scalable model to reduce cardiovascular risk among community-living seniors.

DEVELOPMENT AND VALIDATION OF MULTIMORBIDITY INDEX PREDICTING MORTALITY AMONG CHINESE OLDER ADULTS

Yan Luo,¹ Zi-Ting Huang,² Hui-wen Xu,¹ zi-shuo Chen,¹ He-Xuan Su,¹ Hui Liu,³ and Beibei Xu,³ 1. *Peking University School of Public Health, Beijing, China (People's Republic)*, 2. *Peking university School of Public Health, Beijing, Beijing, China (People's Republic)*, 3. *Peking University Medical Informatics Center, Beijing, Beijing, China (People's Republic)*

This study aimed to construct a multimorbidity index among Chinese older adults. Participants aged 65-84 years (n=11,757) from the Chinese Longitudinal Healthy Longevity Survey (CLHLS). Fourteen self-reported chronic conditions were assessed at baseline. Outcome was all-cause mortality within five-year follow-up. We used restrictive association rules mining to identify the patterns of multiple chronic conditions associated with mortality. The weights of conditions and disease combinations were assigned using logistic regression adjusted by age and sex in training set. Multimorbidity index (MI) with individual diseases and multimorbidity index incorporating disease combinations (MIDC) were developed. We compared the performance of MI and MIDC with condition count and XGBoost algorithm in the validation set. There were no significant differences of c-statistics between condition count (0.687) and MI (0.692) or MIDC (0.689). The c-statistic of XGBoost algorithm (0.675) was the lowest among all models. The Integrated Discrimination Improvement (IDI) and categorical Net Reclassification Index (NRI) for MI (IDI: 0.01, P < 0.001; NRI: 0.01, P = 0.127), MIDC (IDI: 0.004, p = 0.002; NRI: 0.02, P = 0.033), and XGBoost model (IDI: 0.02, P < 0.001; NRI: 0.03, P = 0.004) were significantly positive compared with condition count. However, no significant differences for IDI and NRI were observed between MI and MIDC. Among Chinese older adults, weighted multimorbidity index with individual disease can better predict five-year mortality risk over condition count. There was little improvement in the predictive performance of the index after considering the joint effects of disease combinations.

EVIDENCE-BASED INTEGRATIVE HEALTH CARE TO PROMOTE QUALITY OF LIFE IN OLDER ADULTS WITH CANCER

Robin Majeski,¹ and Delia Chiamonte,² 1. *University of Maryland, Baltimore County, Catonsville, Maryland, United States*, 2. *Greater Baltimore Medical Center, Towson, Maryland, United States*

Cancer disproportionately affects older adults and presents significant challenges to patients' quality of life. Use of

complementary medicine is increasing among older adults with cancer and these modalities have the potential for both benefit and harm. Thus, it is important that health care professionals are knowledgeable about the evidence-supported benefits and risks of complementary and integrative health approaches in the care of older adults with cancer. Integrative cancer care provides a comprehensive approach to reducing symptom burden in patients suffering with cancer symptoms and side effects of cancer treatment. Symptoms such as pain, fatigue, nausea, sleep disturbance, mood disorder, perceived stress, and reduced quality of life are common in this population. This session will discuss an evidence-based integrative approach to cancer care which incorporates both pharmacologic and non-pharmacologic modalities to decrease symptom burden, enhance patient well-being, and improve quality of life. Non-pharmacologic modalities used in the integrative approach to care will be described and relevant evidence for risks, benefits and indications will be presented. Case studies will be discussed to demonstrate the integration of these techniques into conventional western medical treatment plans for older adults with cancer. Diversity and inclusion issues relevant to integrative medicine for underserved cancer patients will be addressed, as well as recommendations for future research to expand access of underserved populations to evidence-supported integrative cancer care. A resource list will be provided to participants.

FACTORS RELATED TO THE LONELINESS OF OLDER WOMEN WITH HYPERTENSION IN TEHRAN

Ali Darvishpoor Kakhki, Sona Mohammadi, and Reza Miri, *Shahid Beheshti University of Medical Sciences, Tehran, Iran*

Older women have longevity and face with common chronic diseases such as hypertension longer than men. In addition the refusal to accept older women into the mainstream of society can affect the loneliness of older women particularly in developing countries such as Iran. This study was conducted to describe factors related to loneliness of older women with hypertension in Tehran. This descriptive, correlational study was conducted on a sample of 300 older women above age 60 in five regions of Tehran in 2020. A socio-demographic questionnaire and the Russell Loneliness Scale were used for data collection. Content validity and Cronbach's alpha were used for evaluating the validity and reliability of questionnaires. 61% of older women were widowed and 37.3% lived alone with a mean age of 72.16(± 8.5) year. The mean score for loneliness was 66.26 (±13.44) on a 20 to 80-point scale. The scores of loneliness were influenced significantly by not having an income source, no living companion, chronic diseases, hospitalization in last year, family history of hypertension, and duration of hypertension. The best predictors of loneliness were hospitalization in last year, duration of hypertension, family history of hypertension, and chronic diseases. The findings of this study showed that loneliness is very common in older women with hypertension and is related to a number of factors. Monitoring modifiable factors such as hospitalization in the last year and non-modifiable factors such as duration of hypertension will help us to prevent or reduce loneliness in older women with hypertension.

HEALTH TRAJECTORIES AFTER AGE 60: THE ROLE OF INDIVIDUAL BEHAVIOURS AND SOCIAL CONTEXTS

Amaia Calderón-Larrañaga,¹ Xiaonan Hu,¹ Miriam Haaksma,² Debora Rizzuto,¹ Laura Fratiglioni,³ and Davide Vettrano,¹ 1. *Karolinska Institutet, Solna, Stockholms Lan, Sweden*, 2. *Leiden University Medical Center, Leiden, Zuid-Holland, Netherlands*, 3. *Karolinska Institutet, 17175, Stockholms Lan, Sweden*

This study aimed to detect different health trajectories after age 60, and to explore to what extent individual and social factors may contribute to healthier ageing. Twelve-year health trajectories were identified in subjects from the Swedish National Study on Aging and Care-Kungsholmen (N=3108), integrating five indicators related to diseases, physical and cognitive function, and disability by means of nominal response models. Growth mixture models were applied to explore health trajectories in terms of rate and pattern of change. Baseline information about health-related behaviours and social context was collected through standardized questionnaires. The strength of the associations was estimated using logistic regression, and their impact through population attributable fractions (PAF). Three trajectories were identified grouping 78%, 18%, and 4% of people with respectively increasing rates of health decline. Compared to the best trajectory, subjects in the middle and worst trajectories became functionally dependent 12.0 (95%CI:11.4-12.6) and 12.1 (95%CI:11.5-12.7) years earlier, respectively. Insufficient physical activity (OR:3.38, 95%CI:2.58-4.42), financial strain (OR:2.76, 95%CI:1.77-4.30), <12 years education (OR:1.53, 95%CI:1.14-2.04), low social connections (OR:1.45, 95%CI:1.09-1.94), low social participation (OR:1.39, 95%CI:1.06-1.83) and a body mass index ≥25 (OR:1.34, 95%CI:1.03-1.75) were associated with belonging to the middle/worst trajectories. The highest PAFs were observed for insufficient physical activity (27.1%), low education (19.3%) and low social participation (15.9%); a total PAF of 66.1% was obtained when considering all significant exposures together. Complementarily considering life-long factors belonging to the socioeconomic, psychosocial, and behavioural dimensions should be central to any strategy aimed at fostering health in older age.

HYPERTENSION DIAGNOSIS, TREATMENT, AND CONTROL AMONG OLDER CHINESE: TRENDS IN THE HYPERTENSION CARE CASCADE

Erfei Zhao,¹ Qiao Wu,² Eileen Crimmins,² and Yuan Zhang,³ 1. *University of Southern California, Leonard Davis School of Gerontology, Los Angeles, California, United States*, 2. *University of Southern California, Los Angeles, California, United States*, 3. *University of North Carolina, University of North Carolina, North Carolina, United States*

Hypertension is a major risk factor for cardiovascular disease, which is the leading cause of death in China. Older persons are at higher risk of elevated blood pressure and are more likely to have insufficient hypertension care, including delayed diagnosis and poor management. However, we know little about hypertension care among older Chinese at a population level. We use a nationally representative sample of older adults from the China Health

and Retirement Longitudinal Study (CHARLS) in 2011 and 2015 ($n = 9,083$), to clarify the hypertension care cascade for the older population in China by specifying the level of diagnosis, treatment, and control of hypertension. We then examine the characteristics of those (1) who received appropriate hypertension care and (2) whose care improved over time. Diagnosis and care improved between 2011 and 2015. Among those with hypertension, 55% and 67% were diagnosed in 2011 and 2015 respectively; 46% and 60% were treated with modern medication; and 20% and 29% were effectively controlled. Those who had higher income ($OR=1.52$; $P<0.01$) or obese ($OR=2.43$; $P<0.001$) were relatively more likely to be diagnosed, while those living in the western region ($OR=0.65$; $P<0.01$) or living in urban areas with a rural hukou ($OR=0.54$; $P<0.01$) were less likely. Persons age 75+ ($OR=0.55$; $P<0.05$) were less likely to have their blood pressure controlled, while those who had higher income ($OR=1.50$; $P<0.05$) were more likely. The improvement from 2011 to 2015 in hypertension care was concentrated among those that are obese or living in the West.

IS CANCER HISTORY RELATED TO NEUROLOGIC SPECIALTY CARE IN PATIENTS WITH DEMENTIA?

Mackenzie Fowler, Kristen Triebel, Gabrielle Rocque, Ryan Irvin, Richard Kennedy, and Nicole Wright, *University of Alabama at Birmingham, Birmingham, Alabama, United States*

Background: The incidence and prevalence of aging-related diseases such as dementia and cancer are increasing, as are cancer survival rates. Cancer and its treatments have been associated with cognitive effects for those who later develop dementia. Guidelines have suggested that cancer patients return to follow-up in primary care following remission and be referred to specialists for cognitive complications, but it is unclear how well these guidelines are followed. **Methods:** Electronic health record data at the University of Alabama at Birmingham were extracted from July 2003 May 2020. Rates of specialty care utilization on or after dementia diagnosis were compared by cancer history status in adults 50 years old or older at dementia diagnosis. Predictors of specialty care utilization were examined using logistic regression. **Results:** Rate of specialty care utilization was lower for those with cancer history compared to those without on the date of dementia diagnosis (11.3% vs. 17.1%) and after diagnosis (13.5% vs. 19.2%). Older age at dementia diagnosis, non-Hispanic Black race, anticholinergic burden, socioeconomic status, and vascular risk factors were associated with lower odds of specialty care utilization. Dementia medication use was associated with higher odds of specialty care utilization on and after dementia diagnosis. **Conclusions:** Cancer survivors with a dementia diagnosis are less likely to utilize specialty care than those with no history of cancer. Several factors predicted specialty care utilization. Additional studies should assess potential barriers in referring cancer survivors to specialty care for cognitive impairment.

MARKERS OF GLUCOSE METABOLISM AND MUSCLE STRENGTH DECLINE AMONG THE OFFSPRING OF LONG-LIVED INDIVIDUALS

Iva Miljkovic,¹ Ryan Cvejkus,¹ Adam Santanasto,² Mary Feitosa,³ Karen Schwander,⁴ Mary Wojczynski,⁵

Bharat Thyagarajan,⁶ and Joseph Zmuda,¹ *1. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 2. University of Pittsburgh, Pittsburgh, Pennsylvania, United States, 3. Washington University School of Medicine in St. Louis, St. Louis, Missouri, United States, 4. Washington University, St. Louis, Missouri, United States, 5. Washington University School of Medicine, Washington University School of Medicine, Missouri, United States, 6. University of Minnesota, Minneapolis, Minnesota, United States*

Diabetes has been linked to accelerated muscle strength decline with aging. However, the association between glucose metabolism and muscle strength decline among individuals without diabetes is less clear. We tested whether fasting plasma markers of glucose and insulin metabolism (glucose, insulin, hemoglobin A1c, and soluble receptor for advanced glycation end products (sRAGE)) are associated with grip strength decline among 1415 non-diabetic offspring of exceptionally long-lived individuals who have a low diabetes risk (age range 36-88; mean age \pm SD = 60 ± 8 years; mean BMI \pm SD = 27 ± 4.7 kg/m²; 57% women). Grip strength was assessed using a hand-held dynamometer at two clinic visits over an average of 7.9 years. Multiple linear mixed models were adjusted for age, sex, field center, lifestyle, comorbidities, body weight, height, weight change, and family relatedness. Each standard deviation higher fasting insulin (7.3 mIU/L) was related to greater grip strength decline (-0.38 ± 0.16 kg; $p=0.016$), while each standard deviation higher fasting sRAGE (430 pg/mL) was related to slower grip strength decline (0.36 ± 0.18 kg; $p=0.04$). Our findings suggest that even among non-diabetic individuals from families with a clustering of “healthier” metabolic profiles - insulin metabolism and advanced glycation end products may be important biomarkers of muscle strength decline with aging. Potential mechanisms, including genetic and metabolic mediators underlying the observed associations, warrant further investigation.

OLDER ADULT MAINTAINING AND IMPROVING HEALTH SELF-MANAGEMENT THROUGH PEER SUPPORTED SMART GOAL SETTING

Mary Hynes,¹ Nicole Anderson,¹ Monika Kastner,² and Arlene Astell,¹ *1. University of Toronto, Toronto, Ontario, Canada, 2. North York General Hospital, North York, Ontario, Canada*

Non-medical interventions to address risk factors (such as reducing smoking, increasing physical activity, and tackling limited social interaction) are needed to help tackle escalating social and financial health costs. Peer supported interventions have been used successfully to support persons' health self-management; however, there is limited evidence for group interventions facilitated by older adults. A proof-of-concept study by the first author demonstrated the potential of older adults meeting in groups to each create and follow through with a single SMART goal for any area of health over one-month. This study extends SMART goal setting to enhancing health management over six months. Older adult participants from across Ontario will attend virtual SMART goal setting group sessions followed by six monthly support group meetings where they are free to choose any goal, whether a mitigation or a new behavior. Each month

the facilitator will assist participants to continue, modify, or set a new goal. At the end participants will complete surveys about their satisfaction with the method, their results and their desire to continue with SMART goals. They will also be asked if they would like to facilitate new groups to continue the spread of peer-supported SMART goal groups. This study is designed to empower older adults to maintain or improve management of their physical, psychological, and/or social health. It will reveal the impact of an older adult created and guided group health intervention on feelings of self-efficacy and well-being.

OPPORTUNITIES AND BARRIERS TO MEDICATION SAFETY IN COMMUNITY-DWELLING OLDER ADULTS

Fatoumata Jallow,¹ Elisa Stehling,² Zara Sajwani,³ Kathryn Daniel,¹ and Yan Xiao,¹ 1. *University of Texas at Arlington, Arlington, Texas, United States*, 2. *University of Tx. at Arlington, Arlington, Texas, United States*, 3. *The University of Texas at Arlington, The University of Texas at Arlington, Texas, United States*

Community-dwelling multi-morbid older adults are a vulnerable population for medication safety-related threats. We interviewed a sample of these older adults recruited from local retirement communities and from primary care practices to learn their perceptions of barriers and enablers for their medication safety. The present study is part of the Partnership in Resilience for Medication Safety (PROMIS) study. One of the aims of this project is to identify barriers and opportunities to improve older adults' medication safety. These interviews were conducted during COVID-19 pandemic conditions. Results from this qualitative study suggest that trust between these older adults and their healthcare providers is an essential component of medication safety. Overarching themes include disruptions in medication management, caregivers caring for each other, patient safety practices or habits, and medication management literacy. Participants also shared strain due to lack of skills to navigate telemedicine visits, trust in Primary Care Providers (PCPs) and pharmacists to prescribe and dispense safely for them, reliance on PCPs and pharmacists to give essential information about medications without having to be asked. Our interviews illustrated large variations in older adults' perceived role in medication safety, with some developing expertise in understanding how medications work for them and how long-term medications should be periodically reviewed. The types of information needs and supports from PCPs were likely different. Understanding these barriers and enablers for safe medication management can help us develop medication safety improvements for this vulnerable population.

PULMONARY AND PHYSICAL FUNCTION LIMITATIONS IN AGING MEN WITH AND WITHOUT HIV FROM THE MULTICENTER AIDS COHORT STUDY

Mona Abdo,¹ Ken Kunisaki,² Valentina Stosor,³ Gypsyamber D'Souza,⁴ Madiha Abdel-Maksoud,¹ Todd Brown,⁵ Samantha MaWhinney,¹ and Kristine Erlandson,⁶ 1. *Colorado School of Public Health, Aurora, Colorado, United States*, 2. *University of Minnesota Medical School, Minneapolis, Minnesota, United States*, 3. *Northwestern University Feinberg School of Medicine,*

Chicago, Illinois, United States, 4. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*, 5. *Johns Hopkins School of Medicine, Baltimore, Maryland, United States*, 6. *Colorado School of Medicine, Aurora, Colorado, United States*

We sought to determine effects of age, HIV serostatus, and smoking on the associations between pulmonary function and physical function impairments using Multicenter AIDS Cohort Study data. Associations between physical function outcomes gait speed (m/sec) and grip strength (kg) with normalized pulmonary function tests (diffusion capacity for carbon monoxide (DLCO, n=1,048) and forced expiratory volume in one second (FEV1, n=1,029)) were examined. Adjusted mixed-effects models included interaction terms to assess effect modification. 574(55%) were HIV+, with median age 57(IQR=48,64) and mean cumulative smoking pack-years 12.2(SD=19.0). 349(33%) had impaired DLCO (<80% of predicted) and 130(13%) had impaired FEV1 (<80% of predicted). Participants with impaired DLCO had weaker grip strength than those with normal DLCO (estimate= -3.5[95% CI=-4.6,-2.4]kg; p<0.001). Participants with impaired DLCO had slower gait speed than those with normal DLCO (estimate= -0.04[95% CI= -0.06,-0.02] m/sec; p=0.002). Age modified the DLCO effect on gait (p-interaction=0.01) but not grip (p-interaction=0.09). The association between decreased DLCO and slower gait was more pronounced in older participants. Smoking or HIV serostatus did not significantly modify the DLCO effect on gait (all p-interaction≥0.14) or grip (p-interaction=0.74, p-interaction=0.058, respectively). As with DLCO, participants with impaired FEV1 had weaker grip strength (estimate=-3.0[95% CI= -4.7,-1.3]kg; p<0.001) than those with normal FEV1. FEV1 was not associated with gait speed(p=0.98). Age, HIV serostatus or smoking did not modify the associations between FEV1 and gait speed or grip strength (all p-interaction>0.05). Associations between lower DLCO/FEV1 and decreased physical function suggest that interventions to improve pulmonary function may also preserve physical function with aging.

THE IMPACT OF TOOTH RETENTION ON HEALTH AND QUALITY OF LIFE IN OLDER ADULTS

Adejare (Jay) Atanda,¹ Alicia Livinski,² Darien Weatherspoon,² Paul Fontelo,² and Shahdokht Boroumand,² 1. *National Institutes of Health, Baltimore, Maryland, United States*, 2. *NIH, Bethesda, Maryland, United States*

America is aging rapidly, and older adults (age ≥65 y) are retaining more of their natural teeth, a trend expected to continue. Although much is known about the impact of complete tooth loss on overall health and well-being, less is known about the effect of partial tooth loss. We conducted a systematic review to advance our understanding of the impact of retaining ≥20 teeth on health and quality of life (QoL) in older adults using two tooth retention concepts – shortened dental arch (SDA) and functional dentition (FD). We searched seven scientific databases from 1981–2019 for publications on tooth retention and outcomes and impact on health and QoL. Ninety-six studies were included in this review. Most were assessed with low risk of bias (n=74) and of good quality (n=73) using the revised Cochrane Risk of Bias tool and Newcastle-Ottawa Scale. Tooth retention was defined as FD in 82 studies, SDA in 10 studies,

and four studies used both. Most were cross-sectional and only seven were from the US. We found an increasing trend among published studies in using FD and SDA to describe natural dentition retention (50 articles in 2015-19 vs one in 1995-99). In general, having <20 teeth was associated with increased likelihood for functional dependence, onset of disability, declines in higher-level functioning, and lower QoL. New information is needed to facilitate clinical decision-making, care-giving, and to help health providers better meet the future oral health needs of an aging US population.

USING HEALTH-RELATED QUALITY OF LIFE TO IDENTIFY THE INCIDENT CARDIOVASCULAR DISEASE RISK

Aung Zaw Zaw Phy, ¹ Joanne Ryan, ² David A. Gonzalez-Chica, ³ Nigel P. Stocks, ³ Christopher M. Reid, ² Andrew M. Tonkin, ² Robyn Woods, ² and Rosanne Freak-Poli, ² 1. *Monash University, Melbourne, Australia, Melbourne, Victoria, Australia*, 2. *Monash University, Melbourne, Victoria, Australia*, 3. *University of Adelaide, Adelaide, South Australia, Australia*

Previous studies have revealed that poor health-related quality of life (HRQoL) is associated with a higher risk of hospital readmission and mortality in patients with cardiovascular disease (CVD). The association between HRQoL and incident CVD is still limited for general older people. This study explored the associations between baseline HRQoL and incident and fatal CVD in community-dwelling Australian and the United States older people enrolled in ASPREE clinical trial. A cohort of 19,106 individuals aged 65 to 98 years, who were initially free of CVD, dementia, or disability, were followed between March 2010 and June 2017. The SF-12 questionnaire was used to assess HRQoL, and the physical (PCS) and mental component scores (MCS) of SF-12 were derived using norm-based methods. Incident major adverse CVD events included fatal CVD (death due to atherothrombotic CVD), hospitalizations for heart failure, myocardial infarction or stroke. Analyses were performed using Cox proportional-hazard regression. Over a median 4.7 follow-up years, there were 922 incident CVD events, 203 fatal CVD events, 171 hospitalizations for heart failure, 355 fatal or nonfatal myocardial infarction and 403 fatal or nonfatal strokes. A 10-unit higher PCS, but not MCS, was associated with a lower risk of incident CVD (HR=0.86, 95%CI 0.79-0.92), hospitalization for heart failure (HR=0.72, 95%CI 0.60-0.85), and myocardial infarction (HR=0.85, 95%CI 0.75-0.96). Neither PCS nor MCS was associated with fatal CVD events or stroke. Physical HRQoL can be used in combination with clinical data to identify the incident CVD risk among community-dwelling older people.

Session 9030 (Poster)

Aging and Chronic Health Conditions II

ASSOCIATION OF BODY COMPARTMENT SHRINKAGE WITH SUBSEQUENT HEALTH CARE UTILIZATION IN OLDER MEN

John Schousboe, ¹ Lisa Langsetmo, ² Allyson Kats, ³ Brent Taylor, ³ and Kristine Ensrud, ³ 1. *Park Nicollet Clinic /*

HealthPartners, Minneapolis, Minnesota, United States, 2. *University of Minnesota, University of Minnesota, Minnesota, United States*, 3. *University of Minnesota, Minneapolis, Minnesota, United States*

Both height loss and weight loss among the very old are associated with adverse health outcomes including fractures and mortality. However, it is not clear whether the associations between weight loss and health outcomes are attributable to specific compartmental (fat vs. fat-free) loss or whether they are attributable to overall shrinkage. Our objective was to estimate the associations of compartmental loss and height loss with subsequent total health care costs, acute hospitalizations, and skilled nursing facility (SNF) stays over a three-year follow-up period, adjusted for each other and important covariates (age, race, multimorbidity, IADL impairment, depressive symptoms, walk speed). Our analytic cohort was 1505 older men (mean [SD] age 79.3 [5.2] years) who attended the 3rd Osteoporotic Fractures in Men (MrOS) study visit (V3) and who were enrolled in Medicare Fee for Service (FFS). Annualized changes in fat-free and fat mass (measured with dual-energy x-ray absorptiometry) and height were assessed over a mean (SD) 6.8 (0.3) years prior to V3. Total health care costs, acute hospital stays, and SNF stays were ascertained during 3 years after V3 using linked Medicare FFS claims files. Fat-free mass loss (per SD) was associated with total health care costs (cost ratio 1.10, 95% CI 1.01, 1.19), but not with acute hospital or SNF stays. Fat mass loss and height loss were not associated with health care utilization outcomes after multivariable adjustment. Loss of fat-free mass is modestly associated with higher total health care costs after accounting for age, race, multimorbidity, and IADL impairment.

ASSOCIATION OF OBESITY, MULTIPLE CHRONIC CONDITIONS, AND FRAILITY: THE NATIONAL HEALTH AND AGING TRENDS SURVEY

John Batsis, ¹ Christian Haudenschild, ² Anna Kahkoska, ³ rebecca Crow, ⁴ David Lynch, ⁵ Curtis Petersen, ⁶ and Matthew Lohman, ⁷ 1. *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States*, 2. *University of Minnesota, University of Minnesota, Minnesota, United States*, 3. *University of North Carolina at Chapel Hill, University of North Carolina at Chapel Hill/Chapel Hill, North Carolina, United States*, 4. *VA White River Junction, White River Junction, Vermont, United States*, 5. *University of North Carolina, Chapel Hill, North Carolina, United States*, 6. *Dartmouth College, Lebanon, New Hampshire, United States*, 7. *University of South Carolina, Columbia, South Carolina, United States*

As life expectancy increases, so does the risk of developing multiple chronic conditions (MCC). This is concerning as there is a growing obesity epidemic in older adults which is also associated with developing chronic diseases. Both obesity and MCC also increase the risk of frailty, yet the intersection of the three is not well understood. We evaluated the relationship between obesity, multimorbidity, and frailty using data from adults ≥65 years from the National Health and Aging Trends Survey. Obesity was classified using standard body mass index categories (e.g., ≥30kg/m²) and waist circumference (WC; females ≥88cm; males ≥102cm). MCC was classified as having ≥2 chronic conditions.

Adjusted logistic regression models evaluated the association of BMI or WC categories on MCC (yes/no). An analysis limited to persons with obesity evaluated the relationship between frailty phenotypes (e.g. robust, pre-frail, frail) and MCC. Of the 4,967 participants (59.7% female), 79% resided in a private residence. The 70-79 age category was most prevalent. In those with MCC, there were 1,511 (30.4%) classified as having obesity using BMI, and 3,358 (67.6%) using WC. In those without MCC, there were 287 (17.6%) and 744 (51.7%). Compared to normal BMI, the odds of MCC was 0.71 [0.46,1.09], 1.25 [1.08,1.45] and 2.59 [2.15,3.11] in underweight, overweight and obesity. In pre-frailty and frailty, the odds of MCC were 2.52 [1.77,3.59] and 8.35 [3.7,18.85] in BMI-defined obesity. Using WC, the odds were 2.38 [1.94,2.91], and 5.89 [3.83,9.06]. Obesity using both BMI and WC are both strongly associated with multimorbidity and frailty.

ASSOCIATIONS BETWEEN MEAL PROGRAM PARTICIPATION AND PROTEIN INTAKE IN PEOPLE OVER 65 (NHANES 2013-2018)

Sarah Collins,¹ Robert Blanco,² and Anika Hines,³

1. Virginia Commonwealth University, Richmond, Virginia, United States, 2. VCU, VCU, Virginia, United States, 3. VCU, VCU/Richmond, Virginia, United States

Protein plays a critical role in healthy aging. Little research exists regarding the association between meal program participation and protein consumption among individuals 65 and older. The objective of this research is to provide health professionals with a better understanding of how meal program participation through delivery services or congregate sites may relate to nutritional status. We analyzed cross-sectional data on 2845 individuals ≥ 65 years old who participated in the National Health and Nutrition Examination Survey (NHANES) during 2013-2018. Using linear regression models, we explored relationships between meal participation and covariates (sex, race, marital status, income, and age) on protein intake. Protein intake did not differ significantly between individuals who participated in meal programs and those who did not. However, among individuals who answered whether or not they participated in meal programs, race was significantly associated with decreased protein intake. Non-Hispanic Blacks experienced a two-day average 8.82 grams lower [SE:1.48; $p < .0001$] that their white counterparts. Similarly, Hispanic/Latinos' two-day protein average was 4.29 grams lower [SE:2.05; $p = 0.0426$]. The association between earning an income of $< \$20,000$ per year and protein intake was also statistically significant [β : -8.44. SE:2.4, $p = 0.0014$]. Understanding protein intake among older adults who utilize meal programs is a gap in current literature. Results from this research may inform questions that health professionals should include in their assessments of older adults and provide guidance for nutrition policies and meal programs for people over 65.

ASSOCIATIONS BETWEEN METFORMIN AND ASPIRIN USE ON CANCER INCIDENCE AND MORTALITY IN OLDER ADULTS.

Suzanne Orchard,¹ Jonathan Broder,¹ Jessica Lockery,¹

Peter Gibbs,² Sara Espinoza,³ Michael Ernst,⁴

Robyn Woods,¹ and John McNeil,¹ 1. Monash University,

Melbourne, Victoria, Australia, 2. The Walter & Eliza Hall Institute of Medical Research, Parkville, Victoria, Australia, 3. University of Texas Health Science Center San Antonio, San Antonio, Texas, United States, 4. University of Iowa, Iowa City, Iowa, United States

Diabetes increases risk of malignancies, and this association increases with age. Metformin may protect against cancer development and progression, but results are mixed and limited to younger cohorts. We examined whether metformin, in the presence or absence of aspirin, reduces incident cancer and cancer-related mortality in older adults. ASPirin in Reducing Events in the Elderly (ASPREE) was a primary prevention trial of daily aspirin vs placebo which enrolled community-dwelling adults from Australia (70+ years) and the US (65+ years for minorities) followed for a median of 4.7 years. Invasive cancer was adjudicated by an expert panel. Cox proportional-hazards models, controlling for age at randomization and known cancer risk factors, were used to analyse the relationship between baseline metformin use, randomized treatment arm, cancer incidence (first in-trial cancer) and mortality. For participants with controlled diabetes, there was a significant reduction in cancer mortality in metformin users compared to nonusers (Adjusted [Adj] HR=0.24, 95%CI=0.07, 0.80), but not for cancer incidence (Adj HR=0.61, 95%CI=0.29, 1.27). For participants with uncontrolled diabetes, there was no significant difference in cancer incidence (Adj HR=0.95, 95%CI=0.66, 1.38) or mortality (Adj HR=1.18, 95%CI=0.62, 2.26) between metformin and non-metformin users. Uncontrolled diabetes, irrespective of metformin use, increased risk of cancer incidence and mortality compared to non-diabetics. Aspirin did not modify the effect of metformin on cancer incidence or mortality. Our findings show that metformin may have protective effects against cancer-related mortality for those older persons whose diabetes is well-controlled, and underscores the importance of diabetes control to minimise cancer risk.

CASE STUDY - CANDIDA AURIS IN SKILLED NURSING FACILITY

Nancy Vo,¹ Sayaka Tokumitsu,¹ Armen Melik-Abramians,¹ and John S. Chen,² 1. Kaiser Permanente Los Angeles Medical Center, Kaiser Permanente Los Angeles Medical Center, California, United States, 2. Kaiser Permanente Med Group/ Southern California, Los Angeles, California, United States

Candida Auris (*C. auris*), is a multidrug-resistant organism, first described in Japan 2009, and now a serious, emerging global health threat¹. *C. auris* pathogen can potentiate morbidity and mortality, i.e. lifelong contact precaution isolation, intravenous antifungal treatment, hospitalization and mortality rate of 30-60%¹. Los Angeles County (LAC) developed 15 new cases in May 2020, and 73 cases in July 2020, amidst COVID-19 pandemic². A 88 year old Black female had a positive skin test for *C. auris* by LAC Department of Public Health (DPH) during skilled nursing facility (SNF) admission for hip fracture in September 2020. Patient's risk factors for *C. auris* included: age, kidney transplantation (1998) immunosuppression on tacrolimus, fungal infection on fluconazole, drug-drug interaction between tacrolimus-fluconazole including nephrotoxicity and neurotoxicity, malnutrition, bedbound, Stage 4 sacrococcyx pressure ulcer, osteomyelitis on broad-spectrum antibiotics,

chronic indwelling catheter, and healthcare setting. Our multimorbid and frail patient remained asymptomatic with *C. auris* under an interdisciplinary team approach, including geriatricians, infectious disease, pharmacists, SNF team and local DPH. Our patient's psychosocial isolation and family distress with local DPH guidelines for COVID-19 SNF visitation restrictions were compounded by multifaceted coordination of patient-centered care between SNF team and specialists via telehealth. Further research in the prevention, detection, and management of *C. auris* is warranted to protect our vulnerable SNF residents. 1. Centers for Disease Control and Prevention. (2020). Tracking *Candida auris*. <https://www.cdc.gov/fungal/candida-auris/tracking-c-auris.html> 2. Los Angeles County Health Alert Network. (2020). CHARACTERISTICS AND PROGNOSIS OF LONG-TERM HOME CARE PATIENTS

Takashi Yamanaka,¹ Maiko Mizuki,¹ Kiwami Kidana,¹ and Ryonosuke Yamaga,² 1. *The University of Tokyo, Bunkyo-ku, Tokyo, Japan*, 2. *Tsubasa Home Care Clinic, Funabashi-city, Chiba, Japan*

With demographic aging, many older adults require home medical care. Although home-based primary care is promoted in the United States and Japan, there is insufficient evidence about it. We aimed to study the characteristics and prognoses of long-term home care patients. We prospectively registered 151 patients, estimated to receive physician home visits for more than six months, in a clinic in Chiba, Japan, in 2020. The mean (\pm SD) age was 83.9 ± 10.0 years and ranged from 31 to 102 years. Most patients were men (60.3%) and aged 65 years or above (95.3%). We investigated clinical information, the Edmonton Symptom Assessment System Revised Japanese version (ESAS-r-J), Dementia Assessment Sheet in Community-based Integrated Care System 21 items (DASC-21), EuroQOL 5 dimensions 5-level (EQ-5D-5L) every six months, and the incidence of hospital admission, death, and patient transportation by ambulance. The most frequent diagnoses were dementia (31.1%), bone and articular diseases (17.2%), cerebrovascular diseases (11.9%), organ failure (9.3%), and neurological diseases (9.3%). Most patients (78.2%) showed more than 30 points on the DASC-21, suggesting cognitive impairment. Worse wellbeing, drowsiness, tiredness, anxiety, depression, and pain were the most prevalent symptoms. EQ-5D-5L index values were distributed around -0.02 and $0.4-0.7$. During the first three months of physician home visits, 21.9% of patients had hospital admissions, 12.5% of them died, and 11.7% required hospital transportation by an ambulance. In this study, most long-term home care patients suffered from cognitive impairment. In addition to receiving care for daily life, these patients require intensive medical management.

COST REDUCTION BEHAVIORS AND COST-RELATED MEDICATION NONADHERENCE IN OLDER ADULTS WITH ATRIAL FIBRILLATION

Benita Bamgbade,¹ David McManus,² Becky Briesacher,¹ Darleen Lessard,² Jordy Mehawej,² Mayra Tisminestzky,² Jerry Gurwitz,² and Jane Saczynski,¹ 1. *Northeastern*

University, Boston, Massachusetts, United States, 2. *University of Massachusetts Medical School, Worcester, Massachusetts, United States*

While factors such as forgetfulness may result in medication nonadherence, 2.7 million older adults in the US experience cost-related nonadherence (CRN). Limited research has explored CRN and associated cost-reduction behaviors (CRB) in older adults with atrial fibrillation. The objectives of this study were to 1) describe the prevalence of CRN, CRB and spending less on basic needs to afford medication and 2) examine factors associated with CRB among older adults with atrial fibrillation. Data were drawn from the Systematic Assessment of Geriatric Elements in Atrial Fibrillation (SAGE-AF), a prospective cohort of older adults with atrial fibrillation (>65 years). Using a self-administered survey, all participants completed a validated CRN measure. Chi-square and t-tests were used to evaluate differences in participant characteristics across CRB and significant characteristics ($p < 0.05$) were entered into a logistic regression model. Participants ($N = 1244$) were on average 76 years and 49% were female. Among all participants, 4.2% reported CRN; 69.1% reported CRB; and 5.9% reported spending less on basic needs. Compared to participants who did not engage in CRB, participants who engaged in CRB were less likely to be cognitively impaired and more likely to be a race/ethnicity other than non-Hispanic white; have Medicare insurance; and have comorbidities. CRB were common among older adults with atrial fibrillation and was associated with in-tact cognitive function, the presence of medical comorbidities and non-White race. Clinicians might consider providing patients with cognitive impairment additional support such as patient assistance programs or referrals to pharmacists for medication therapy management to assist with CRB.

HEARING LOSS AND HEALTH CARE SEEKING

Nicholas Reed, *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, United States*

Hearing loss is common among older adults. Hearing loss is associated with increased health care expenditures, risk of 30-day readmission, and longer length of hospital stay. However, little is known about behaviors and attitudes in seeking care. In this cross-sectional analysis, we examined data from the 2016 Medicare Current Beneficiary Survey (MCBS) datasets. Participants are asked to describe their self-perceived trouble hearing. Health care seeking attitudes were assessed on all study participants in 2016 via self-report avoidance or delay of care, personal health concerns, and sharing health status. Multivariate regression models adjusted for demographic/socioeconomic characteristics and general health determinants were used to explore the association between trouble hearing and outcomes. In the 2016 MCBS, 12,140 Medicare beneficiaries, representing 51 million with survey weights, answered questions on help-seeking attitudes. In the sample, 55.6% reported no trouble hearing, while 38.8% and 5.5% reported a little trouble and a lot of trouble hearing, respectively. Those with a lot of trouble hearing were more likely to report avoiding doctors (Odds Ratio [OR] = 1.35; 95% Confidence Interval [CI] = 1.09 – 1.67) and delaying care (OR = 1.47; 95% CI = 1.19 – 1.82). However, no differences were found in

personal health concerns or willingness to share health status with others. Poorer health care seeking behaviors may help explain higher costs associated with hearing loss as avoidance of care can exacerbate health problems. Further work is needed to understand underlying reasons and whether addressing hearing loss modifies the observed association.

ILLNESS PERCEPTIONS AND HEALTH OUTCOMES AMONG COMMUNITY-DWELLING OLDER ADULTS WITH MULTIPLE CHRONIC CONDITIONS

Ayomide Bankole, *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States*

Illness perceptions (IP) has been associated with self-management and health outcomes in individuals with chronic diseases such as heart disease and diabetes; however, there is less research on the relationship between IP and health outcomes in individuals with multiple chronic conditions (MCC). Older adults with MCC are more likely to experience poor outcomes such as hospitalizations and poor self-rated health yet, there is less understanding of the processes associated with these outcomes. The purpose of this study was to (1) explore the relationship between IP and self-rated health among older adults with MCC (2) explore the relationship between IP and the number of hospitalization within the past year among older adults with MCC. Understanding these relationships may be instrumental to designing targeted interventions to improve health outcomes for this population. 116 participants (ages 65-90) completed the illness perception of multimorbidity scale, modified general health subscale of the SF-36 questionnaire, and self-reported number of hospitalizations within the past year. Ordinal logistic regression was used for analysis. Older adults who reported negative IP were likely to report worse self-rated health and this relationship remained significant after controlling for age and number of chronic conditions $\{-0.032$ (95% CI $\{-0.050$ to $0.014\}$ $p < 0.05\}$. There was no significant relationship between IP and the number of hospitalization within the past year. The study results suggest that IP is associated with self-rated health in older adults with MCC. IP may be useful to design targeted interventions to improve self-rated health in this population.

JOINT TRAJECTORIES OF MULTIMORBIDITY, FUNCTION, COGNITION, AND DEPRESSION IN THE HRS (1998-2016)

Corey Nagel,¹ Heather Allore,² Jason Newsom,³ Anda Botosaneanu,⁴ David Dorr,⁵ Stephen Thielke,⁶ Jeffrey Kaye,⁵ and Ana Quiñones,⁵ 1. *University of Arkansas for Medical Sciences, Little Rock, Arkansas, United States*, 2. *Yale School of Medicine, New Haven, Connecticut, United States*, 3. *Portland State University, Portland, Oregon, United States*, 4. *University of Michigan - Dearborn, Dearborn, Michigan, United States*, 5. *Oregon Health & Science University, Portland, Oregon, United States*, 6. *University of Washington, University of Washington, Washington, United States*

There is substantial heterogeneity in the impact of multimorbidity on functional, cognitive, and emotional health. Few studies, however, have examined this simultaneously across these multiple domains. We used finite mixture modeling to identify latent clusters of individuals

following similar joint trajectories of multimorbidity, functional ability, cognitive performance, and depressive symptoms among 11,841 HRS respondents aged 65+ from 1998 to 2014. We identified four distinct clusters of joint trajectories: (1) 32.5% of the sample were characterized by low multimorbidity (mean = 0.60 conditions at age 65; 2.2 conditions at age 90), minimal deterioration in functional or cognitive ability, and low depressive symptoms; (2) 33.5%, had increased multimorbidity compared with the first group (mean = 2.3 at age 65; 4.0 at age 90) but minimal functional or cognitive impairment and low depressive symptoms; (3) 19.9%, had relatively low multimorbidity (mean = 1.3 at age 65 increasing to 2.8 at age 90), but exhibited worsening cognitive performance, increasing functional limitations, and moderate depressive symptoms; and (4) 14.1%, had higher multimorbidity (mean = 3.3 at age 65 increasing to 4.6 at age 90), worsening cognitive performance, substantial functional limitation, and high depressive symptoms. Black and Hispanic race/ethnicity, lower levels of income and education, male gender, and smoking history were significantly associated with membership in classes characterized by higher multimorbidity, cognitive and functional impairment, and greater depressive symptoms. This study provides insight into the heterogeneous trajectories of aging and helps identify older individuals at higher risk for poor aging outcomes across multiple health domains.

METABOLIC COMORBIDITIES AMONG PATIENTS WITH PERIPHERAL ARTERY DISEASE: A NATIONAL POPULATION-BASED STUDY

Gi Wook Ryu,¹ Mona Choi,² and Young Shin Park,² 1. *Namseoul university, Cheonan, Ch'ungch'ong-namdo, Republic of Korea*, 2. *Yonsei University, Seoul, Seoul-t'ukpyolsi, Republic of Korea*

Peripheral artery disease (PAD) is a chronic disease which is associated with old age. PAD was known as an age-related chronic condition. Metabolic comorbid conditions which include hypertension, diabetes, and hyperlipidemia can have negative impacts on blood vessels aggravating PAD in elderly patients. Therefore, metabolic comorbidities need be considered in order to develop intervention for patients with PAD. The aim of this study is to find the characteristics of PAD patients with metabolic comorbidities. This is a retrospective study that used the national claim data of South Korea from 2009 to 2018. The inclusion criteria were adults (20+) and patients diagnosed with PAD as a primary or secondary diagnosis from 2011 to 2017. The frequency of hypertension, hyperlipidemia, diabetes, and metabolic comorbidities in PAD patients was examined. In addition, the difference in the number of metabolic comorbidities according to sex was identified using the chi-squared test. Among the total PAD adult patients ($n=8,478,876$), the number of elderly patients over 60 years old was 4,124,592 (48.7%). Among the total patients, PAD patients with hypertension were the most common at 958,329 (11.30%). Sex was significantly related to having metabolic comorbidities and women showed higher proportion of metabolic comorbidities compared to men ($\chi^2 = 5.02$, $p < .001$). As the frequency of PAD patients with hypertension were the highest, it is necessary to develop a health management program that considers metabolic comorbidities, especially hypertension, in order to manage

PAD disease. In addition, there is a need for special interest in intervening metabolic conditions of female patients with PAD.

MULTIMORBIDITY PROGRESSION AMONG MEDICARE BENEFICIARIES IN THE HEALTH AND RETIREMENT STUDY (1992-2014)

Ana Quiñones,¹ Sheila Markwardt,¹ Heather Allore,² Jason Newsom,³ Corey Nagel,⁴ David Dorr,¹ and Anda Botoseneanu,⁵ 1. *Oregon Health & Science University, Portland, Oregon, United States*, 2. *Yale School of Medicine, New Haven, Connecticut, United States*, 3. *Portland State University, Portland, Oregon, United States*, 4. *University of Arkansas for Medical Sciences, Little Rock, Arkansas, United States*, 5. *University of Michigan - Dearborn, Dearborn, Michigan, United States*

Older adults are at greater risk for developing and accumulating multimorbidity, defined as 2 or more chronic diseases. This study describes the characteristics of multimorbidity progression-based groups using Medicare claims chronic condition warehouse algorithms over a 24-year period. The HRS-Medicare linked data (1991-2015, N=17,895, age 67 years and older) were used in descriptive analyses presented as a Sankey flow diagram. We identified 1,293 (7.2%) beneficiaries who had not yet developed multimorbidity by the end of the observation period (no multimorbidity), 7,552 (42.2%) who started without but developed multimorbidity over the course of observation (incident multimorbidity), and 9,050 (50.6%) who had multimorbidity upon study entry (prevalent multimorbidity). There were notable differences between multimorbidity progression-based groups. Beneficiaries with prevalent multimorbidity were younger at baseline (73.1% in youngest age category [67-69] vs. 50.3% for incident and 66.7% for no multimorbidity), had proportionately higher levels of cognitive impairment (21.6% CIND/dementia vs. 15.4% for incident and 16.8% for no multimorbidity), and greater mean levels of functional impairment and healthcare utilization. Non-Hispanic Black beneficiaries were more represented in prevalent multimorbidity (15.4%) than in the incident (11.8%) and no multimorbidity groups (13.4%). Non-Hispanic White beneficiaries were more represented in the incident (83.5%) than the prevalent (77.2%) and the no multimorbidity (77.7%). Hispanic beneficiaries were more represented in the no (8.9%) than the prevalent (7.4%) and incident multimorbidity groups (4.7%). Results highlight beneficiaries who experience clinically-meaningful transitions to multimorbidity states in late life, allowing new insights and informing interventions to address burdensome changes to their chronic disease status.

OBESITY AND MULTIMORBIDITY IN THE USA: NATIONAL HEALTH AND NUTRITION EXAMINATION SURVEYS 2005-2014

David Lynch,¹ Curtis Petersen,² Hillary Spangler,³ Anna Kahkoska,⁴ and John Batsis,⁵ 1. *University of North Carolina, Chapel Hill, North Carolina, United States*, 2. *Dartmouth College, Lebanon, New Hampshire, United States*, 3. *UNC Hospitals, Chapel Hill, North Carolina, United States*, 4. *University of North Carolina at Chapel Hill, University of North Carolina at Chapel Hill/Chapel Hill, North Carolina, United States*, 5. *University of North*

Carolina at Chapel Hill, Chapel Hill, North Carolina, United States

Declining mortality rates and an aging population have contributed to increasing rates of multimorbidity (≥ 2 chronic conditions) in the United States. Obesity is an important risk factor for the development of chronic diseases. We evaluated the association between obesity and multimorbidity, and how the prevalence of concomitant obesity has changed over time. We used data from 8,883 individuals aged ≥ 60 years with data on body mass index (BMI) and self-reported comorbidities from the National Health and Nutrition Examination Surveys 2005-2014. Logistic regression was used to quantify the association between BMI categories (<18.5 , $18.5-24.9$, $25-29.9$, ≥ 30 kg/m²) and multimorbidity (yes/no). Change in proportions of obesity coexisting with multimorbidity by year was tested through linear regression. All analysis used NHANES survey design and weighting to be representative of the US population. The overall proportion of individuals with concomitant multimorbidity and obesity was 75%. As compared to a normal BMI ($18.5-24.9$ kg/m²), older adults with obesity (BMI ≥ 30 kg/m²) had higher odds of multimorbidity (OR 1.78, 95% CI 1.49, 2.12). Persons with obesity had higher odds of decline in physical (1.41 [1.06, 1.88]), basic (1.56 [1.13, 2.15]), and instrumental activities of daily living (OR 1.58 [1.03, 2.40]). The proportion of individuals with obesity and multimorbidity increased over time, but did not reach significance ($\beta = 0.008$, $p=0.051$). These results emphasize the role of obesity as a contributing factor to the burden of multimorbidity among older adults and underscore the importance of identifying and addressing obesity and multimorbidity via interventions to decrease obesity prevalence.

PANDEMIC-INSPIRED STRATEGIES FOR CROSS-SECTOR COLLABORATION ON FOOD EQUITY ACROSS THE LIFESPAN

Joan Ilardo, and Angela Zell, *Michigan State University College of Human Medicine, East Lansing, Michigan, United States*

Early during the pandemic, access to food by residents across the lifespan was problematic in many communities. We observed well-intentioned responses by community organizations but a lack of centralized coordination across sectors, even as donations and resources significantly increased. Most of the organizations were in various sectors and not aware of the efforts and capabilities of others causing duplication or gaps in services. To prepare for future emergencies, our team created a project to develop and pilot a user-friendly, evidence-based roadmap to guide communities through the process of developing and sustaining effective collaborative partnerships for food and nutrition-related problems they could address together. We will describe the process through which we developed the roadmap structure and recruited stakeholders and content experts for our advisory board. To determine the effectiveness of our interventions, we designed methods with which we can analyze the organizations willing to use the roadmap and participate in the collaborative partnership; how they implement the roadmap; and ways they cope with challenges they face during implementation using strategies in the roadmap. We will describe elements of an effective, efficient roadmap development process using as

many currently available evidence-based resources as possible and creating evidence-informed resources when we identify gaps. Expected outcomes are: 1) format of the final roadmap; 2) types of groups willing to use it; 3) how well the roadmap was implemented; 4) feasibility of continued use of the roadmap by groups over the long term; and 5) potential to expand roadmap use to other communities.

PERCEIVED STRESS AND LIFE STRESSORS IN ADULTS WITH AND WITHOUT FIBROMYALGIA

Ha Nguyen, Courtney Buck, Barbara Cherry, and Laura Zettel-Watson, *California State University, Fullerton, Fullerton, California, United States*

Fibromyalgia (FM) is a widespread chronic pain condition often accompanied by comorbid conditions, such as depression, which may impact perception of stress severity. The current study examined perceived stress and life stressors in adults ages 50 and older with and without FM. It was hypothesized that individuals with FM and/or depression would subjectively rate stressors as more severe than those without. Ninety-four participants (52% with FM, 78% female) aged 50 to 93 ($M = 67.72$, $SD = 9.26$) were administered the Perceived Stress Scale (PSS) to measure perception of stress and an updated version of the Social Readjustment Rating Scale (SRRS) to assess stressors (i.e., major life events). The difference between the SRRS predetermined values and participants' subjective ratings was calculated. Difference scores indicated that self-reported severity exceeded standardized values. Hierarchical regression analyses revealed that older adults and men were less likely to report exaggerated stress severity. Controlling for age and gender, individuals with FM were significantly more likely to report stress severity far above standardized severity scores. Both depression and chronic pain impact stress ratings, but when controlling for the former, FM impact was no longer significant, suggesting that the impact is significantly greater for depression. Results also found a significant interaction between FM status and depression for perceived stress, but not for life event stressors, which may further emphasize the distinctions between the two measures. The findings underline the importance of assessing different types of stress and stressors in individuals with chronic pain and other related comorbidities.

SARCOPENIC OBESITY IN OLDER ADULTS: FINDINGS FROM THE NATIONAL HEALTH AND AGING TRENDS STUDY

Kathleen Dondero,¹ Jason Falvey,¹ Brock Beamer,² and Odessa Addison,³ *1. University of Maryland - Baltimore, Baltimore, Maryland, United States, 2. Baltimore Veterans Affairs Medical Center, BALTIMORE, Maryland, United States, 3. University of Maryland School of Medicine, Baltimore, Maryland, United States*

Sarcopenic obesity increases risk for dysmobility and loss of independence, (Gandham et al., 2021). However, the national burden of sarcopenic obesity and the resultant impacts for older adults has yet to be described. Within a nationally representative sample from the National Health and Aging Trends Study (NHATS), 2066 community-dwelling older adults were obese, representing 12,136,374 individuals in the United States, or 31.8% of all community dwelling older

adults. Based on the European Working Group definition, 18% of the obese older adults were sarcopenic. Sarcopenic obese older adults were more likely to have fallen in the last month and been hospitalized over the prior year. After adjusting for age and sex, sarcopenic obese older adults were 3.7 times more likely (95% CI 2.2-5.0) to have 2 or more comorbid conditions and frailty was 6.4 times more likely (95% CI 4.4-9.5) compared to nonsarcopenic obese older adults. Sarcopenic obese older adults were also more likely to have 1+ ADL disabilities (OR 3.7; 95% CI 2.5-5.4). Further, they were more likely to be socially isolated (OR 2.1; 95% CI 1.3-3.2) and report food insecurity (OR 1.5; 95% CI 0.8-2.9). These findings suggest older adults with obesity and sarcopenia have higher rates of geriatric vulnerabilities, which might indicate a need for caution when recommending weight loss alone as an intervention. A more comprehensive intervention may be necessary to address social and physiological risks. Future studies should examine whether early intervention in sarcopenic obese older adults can reduce chronic health risk and preserve independence.

SOCIAL SUPPORT AND LIVING SITUATION OF OLDER ADULTS WITH HIP-FRACTURE: A RETROSPECTIVE COHORT STUDY

Alexandra Krassikova,¹ Steven Stewart,² Jennifer Bethell,³ Aileen Davis,⁴ and Katherine McGilton,⁵ *1. University of Toronto, University of Toronto, Ontario, Canada, 2. Toronto Rehabilitation Institute, Toronto Rehabilitation Institute, Ontario, Canada, 3. Toronto Rehabilitation Institute, Toronto Rehabilitation Institute, Ontario, Canada, 4. University of Toronto, University of Toronto, Ontario, Canada, 5. KITE-Toronto Rehabilitation, University Health Network, Toronto, Ontario, Canada*

Sustaining a hip-fracture is a life-changing event negatively affecting older adults. Although, social support is a known determinant of health outcomes, the relationship between social support and living situation of older adults with hip fracture remains under researched. For this study social support is conceptualized using the Finfgeld-Connett framework, where social support is seen as being composed of emotional and instrumental support. The objectives were to examine the relationship between two domains of social support and living situation: 1) after discharge; 2) 3-months after discharge; and 3) 6-months after discharge from an inpatient rehabilitation facility in a sample of older adults with hip fracture. Emotional support was measured as frequency of interaction with someone one week prior to hip fracture, whereas instrumental support was measured as help received in instrumental activities of daily living. Logistic regression was performed to examine the association between social support and living situation. Majority of study participants ($N=139$) were older (mean age 81.31), female (77.70%), had no cognitive impairment (68.35%), were not married (58.99%), and lived with someone (51.80%) in their own house (71.95%). Older adults with more emotional support were more likely to be discharged home, however little can be said about the effect of the association (OR 6.80, 95% CI 1.08, 22.31, $P<.001$). Persons receiving more instrumental support had less odds of living at home 3-months (OR 0.41, 95% CI 0.21, 0.78; $P=.007$) and 6-months after discharge

(OR 0.59, 95% CI 0.38, 0.91, $P=0.017$). Social support is important for older adults during recovery.

THE ASSOCIATION BETWEEN MEDICARE ANNUAL WELLNESS VISITS AND DETECTION AND MANAGEMENT OF DIABETES AMONG OLDER ADULTS

Kara Dassel,¹ Abdulrahman Alsulami,² Yao He,³ and Nancy Allen,³ 1. *University of Utah, Salt Lake City, Utah, United States*, 2. *University of Utah, Jeddah, Makkah, Saudi Arabia*, 3. *University of Utah, Salt Lake, Utah, United States*

The rising prevalence of diabetes mellitus (DM) among older adults is an increasing concern in the U.S. and is expected to nearly triple within the next 40 years. The purpose of this study is to investigate the effectiveness of Medicare Annual Wellness Visits (AWV) utilization on the management of DM among Medicare beneficiaries using data from 26,703 Medicare beneficiaries seen at 13 primary care community clinics (clinic visits between 2017 and 2019). A total of 34% of Medicare beneficiaries participated in an AWV. The total sample was, on average, 72.6 years old ($SD=7.0$), 57% female, 84% White, and 91% non-Hispanic and had between zero and three co-morbid conditions. The AWV group was significantly younger (mean difference 2.0 years; $p<.001$) and had fewer comorbid conditions (mean difference 0.1; $p<.001$) than the non-AWV group at their initial visits. Comparing AWV and non-AWV groups at the first patient visit and last patient visit, there were significantly fewer patients with DM in the AWV group compared to the non-AWV groups (19.2% vs. 24.7%; $p<.001$ and 53.5% vs. 59.2%; $p<.001$). DM management was better in the AWV group compared to the non-AWV group at both the first and last patient visits, as exhibited by lower A1C levels ($M=5.9(SD=0.8)$ vs. $M=6.2(SD=1.1)$; $p<.001$ and $M=6.6(SD=0.8)$ vs. $M=6.9(SD=1.4)$; $p=.013$), lower glucose levels ($M=114.0(SD=34.0)$ vs. $M=123.0(SD=51.0)$; $p<.001$), and fewer DM medications ($M=0.1(SD=.4)$ vs. $M=0.2(SD=0.5)$; $p<.001$ and $M=0.2(SD=0.6)$ vs. $M=0.3(SD=0.6)$; $p<.001$). These results suggest that AWV are effective managing diabetes in older adults Medicare beneficiaries.

Session 9035 (Poster)

Aging in Place (BSS Poster)

DISPARITIES IN BASIC HOUSING NEEDS AS A PREDICTOR OF PSYCHOLOGICAL WELL-BEING AMONG OLDER ADULTS

Meghan Custis,¹ Jeongeun Lee,² and Natasha Peterson,³ 1. *Iowa State University, MUSCATINE, Iowa, United States*, 2. *Iowa State University, Ames, Iowa, United States*, 3. *Iowa State University, Iowa State University, Iowa, United States*

Adequate housing and safe environments are among older adults' foundational needs. Prior research suggests minority older adults face significant barriers to accessing affordable and appropriate housing. However, the effects of this environmental press on their psychological well-being are rarely addressed. This project examined racial disparities between minority and white older adults' housing and environment conditions and the differential impact on their psychological

well-being. Using nationally representative data from the National Health & Aging Trends Study (NHATS), older adults' reported rating of the quality of housing conditions, financial security, neighborhood security, and the interviewer's rating of the home environment were analyzed. A total of 4,048 community-dwelling older adults aged 65 and over were selected for analysis. The sample demographics are predominantly white (77.5%), female (61.4%), and residing in the community (82%). Results found minority older adults reported poorer housing conditions, fewer home modifications, and lower financial and neighborhood security, compared to white counterparts. The impact of housing quality was more detrimental to minority older adults' psychological well-being, compared to white counterparts. These findings suggest a significant negative impact of home conditions on the psychological well-being of minority older adults. Home modifications are a viable option to increase or preserve functional status in the home, which could lessen the deleterious effects of environmental press on older adults' psychological outcomes, especially minorities. This study's findings provide information that bolsters our knowledge of housing and environment conditions, which are critical in efforts to reduce health disparities in late life.

ENVIRONMENTAL FEATURES SUPPORTING NON-TRANSPORTATION WALKING IN OLDER DWELLERS IN A HILLY NEIGHBOURHOOD

Ryoichi Nitanaï,¹ Ryogo Ogino,² Daisuke Umemoto,³ Jun Goto,⁴ and Junichiro Okata,⁵ 1. *the University of Tokyo, Tokyo, Tokyo, Japan*, 2. *Saga University, Saga, Saga, Japan*, 3. *The University of Tokyo, Bunkyo-ku, Tokyo, Japan*, 4. *Tokai University, Hiratsuka, Kanagawa, Japan*, 5. *Meiji University, Chiyoda-ku, Tokyo, Japan*

Walking is the basic mode of transportation; however, it is also considered as a recreational and physical activity. For elderly people, non-transportation walking (NTW) is necessary to maintain a good health; thus, irrespective of topography, living in an environment conducive to NTW is essential for the ageing community. This case study explores the features of the physical environment supporting NTW in older people, living in a hilly Japanese neighbourhood. We conducted semi-structured interviews with 23 older participants, with 6 being in their seventies, 13 in their eighties, and 4 in their nineties. We investigated the destinations and routes of their outings for a week, as well as their perception of walkability. Thereafter, we analysed the location of the NTW and the rationale behind the location choice. Consequently, four groups of people were identified based on their walking location: those who walked within a 1 km radius zone ($N=6$), those who walked outside the zone ($N=8$), those who walked both within and outside the zone ($N=3$), and those who did not walk ($N=6$). Moreover, each group had varied expectations regarding the physical environment, which is determined by their motivations and physical conditions, relating to the land use of the location of NTW. This implies the necessity of target identification and a suitable environmental approach for the target to promote NTW among older people in a hilly residential neighbourhood, such as improving comfort and connectedness by installing rest spots for the within-and-outside the zone walking group.

IMPACT OF GREEN SPACE, AIR POLLUTION, AND WEATHER ON COGNITIVE FUNCTION IN MIDDLE AND OLD AGE IN CHINA

Lingling Zhang,¹ Ye Luo,² Xi Pan,³ and Qing Wang,⁴

1. *University of Massachusetts Boston, Boston, Massachusetts, United States*, 2. *Clemson University, Central, South Carolina, United States*, 3. *Texas State University, San Marcos, Texas, United States*, 4. *Shandong University, Shandong University, Jinan, Shandong, China (People's Republic)*

Population aging will inevitably bring an increasing burden of poor cognitive function. The risk factors for cognitive decline have been widely studied. Even though environmental hazards have the greatest adverse impacts on older adults and the existing evidence has shown that green space, air pollution, and weather have an impact on cognitive function, most of the studies were conducted in developed countries and limited to cross-sectional analyses. China has the largest aging population in the world so the research evidence from it can offer an insight to the study in other developing countries facing similar issues and inform future public health policy and disease control. Using the data from a nationally representative sample of adults aged 45 years and older from the three waves of China Health and Retirement Longitudinal Study (CHARLS 2011-2015) and China City Statistical Yearbook, this study estimated multilevel growth curve models for the effects of green space coverage, air pollution, and weather conditions on cognitive function and cognitive decline. It showed that after controlling for sociodemographic characteristics, built area green coverage rate was positively associated with cognition score at baseline, and higher annual minimum temperature was associated with faster decline in cognitive function. These effects did not substantially change after weekly total hours of physical activities and levels of social engagement were added and the interaction effects were examined between environmental conditions with them, respectively. More research on the mechanisms of the effects of environmental factors on cognition is needed such as the subgroup analyses.

INCREASED SELF-EFFICACY AMONG OLDER ADULTS AGING-IN-PLACE DURING COVID-19.

Lee Lindquist,¹ Amber Miller,¹ Ruqayyah Muhammed,¹ Lauren Opsasnick,² Alaine Murawski,¹ and Vanessa Ramirez-Zohfeld,³ 1. *Northwestern University Feinberg School of Medicine, Chicago, Illinois, United States*, 2. *Northwestern University, Chicago, Illinois, United States*, 3. *Northwestern University Feinberg School of Medicine, Northwestern University Feinberg School of Medicine, Illinois, United States*

Self-efficacy is defined as a person's belief in their capacity to execute behaviors necessary to produce specific performance attainments. It also reflects confidence in the ability to exert control over motivation, behavior, and environment. During the COVID-19 pandemic, older adults were stressed with forced isolation, concerns over mortality, and finding alternate means of fulfilling their home-based needs. We sought to assess how COVID-19 pandemic affected the self-efficacy of a cohort of older adults aging-in-place. The LITCOG cohort is a group of community-dwelling older adults (65 years and older) who have had longitudinally assessment of

cognition, health literacy, and functional skills over the past 15 years. As part of a larger study of the LITCOG cohort assessing decision making for aging-in-place, we assessed self-efficacy using validated PROMIS (Patient-Reported Outcomes Measurement Information System) measures with older adults prior to COVID-19 and during the COVID-19 pandemic. Survey results were obtained from 214 subjects (n=66 pre-COVID and n=148 during COVID). Nearly half of the sample (48.2%) had either marginal (25.5%) or low health literacy (22.7%). PROMIS General Self Efficacy was higher among those assessed during the COVID-19 pandemic (45.8 (7.7) pre-COVID vs 43.7 (8.0), p=0.07). PROMIS Self Efficacy for managing social interactions was higher during the COVID pandemic (45.0 (6.1) pre-COVID-19 vs. 48.7 (8.3) during COVID-19, p=0.02). During the stress and social isolation of the COVID-19 pandemic, older adults exhibited increased levels of self-efficacy. Ongoing longitudinal follow-up will determine how this self-efficacy evolves after the COVID-19 pandemic and impacts the ability to age-in-place.

INTRINSIC, EXTRINSIC AND INTERACTION THEORIES ON FALLS AND AGING-IN-PLACE: A C-T-E SCOPING REVIEW

Bonnie Albright, *University of Massachusetts - Boston, Boston, Massachusetts, United States*

As aging in place increases in popularity, it is important to understand potential negative outcomes related to the trend. For this presentation, the conceptual-theoretical-empirical (C-T-E) scoping review technique was used to organize research on in-home falls of community-dwelling older adults. Research and theory were included from the fields of social gerontology, disability, policy, social justice, medicine, rehabilitation, and housing. While research from these multiple fields overlaps, an overarching conceptual framework for organizing this literature was found to categorize the theories into three main conceptual areas. The three conceptual areas are: intrinsic (related to the person only), extrinsic (related to external factors only), and interaction between intrinsic and extrinsic (related to the interaction between the person and external factors). This conceptual framework shares similarities with work by others in use of the terms intrinsic and extrinsic, and it draws on the larger influence of Bronfenbrenner's socio-ecological model. However, this review extends previous work by providing a framework for organizing the contributions to falls research across multiple disciplines.

LIFE-SPACE CONSTRICTION IN AGING ADULTS

Tamatha Arms, *UNC Wilmington, Wilmington, North Carolina, United States*

Community-dwelling aging adults desire to maintain independence and prevent or delay a sequela of declining function and ultimate frailty. Early indicators of potential declines in function and frailty, such as life-space constriction (LSC), are important to identifying early. The purpose of this study was to examine factors associated with LSC and the influence of these factors and LSC on function and frailty. A cross-sectional study using a convenience sample of community dwelling persons 55 and older living in the South was conducted. Results indicated most participants (N = 72)

were female (69%; $n = 50$) and half were White (53.5%; $n = 38$). LSC explained 34% variance in function ($F = 3.805$ (8, 59); $p = .001$) when environmental supports (social network), challenges (driving time it took the participant to get to the nearest full-service grocery store) and individual factors were controlled for. There was a significant difference between Black and White participants with environmental challenges ($p = .001$) and function ($p = .001$). Individual factors included challenges (age-related physiological changes, disease burden, and mental health limitations) and buoy (assistive devices), these explained 22% variance in self-reported frailty ($F = 3.099$ (6, 65); $p = .01$). Number of assistive devices was the only significant predictor of self-reported frailty.

MOVES TO AGE-RESTRICTED HOUSING AND FUNCTIONAL HEALTH TRAJECTORIES AMONG INDEPENDENT LIVING OLDER ADULTS

Noah Webster, and Simon Brauer, *University of Michigan, Ann Arbor, Michigan, United States*

Where independent living older adults live has been found to have strong links with disability. For example, older adults living in age-restricted housing contexts (e.g., retirement communities) have been found to have worse functional health compared to those living in non-age-restricted settings. Theories and empirical research demonstrate positive and negative aspects of living in age-restricted housing. Recent availability of population-level longitudinal data with sufficiently large samples has made examination of this heterogeneity possible. In this study we examine whether a move to age-restricted housing is associated with functional health trajectories and whether age at time of move moderates this link. We examine these questions using nine waves of longitudinal data from a representative sample of 8,687 U.S. adults age 65 and older from the National Health and Aging Trends Study. Spline-like growth curve models were estimated to determine the intercept, slope prior to move to age-restricted housing, and slope after the move. We also tested whether these processes are conditional on age at time of move. Results indicate that regardless of age all respondents experienced a decline in functional health following a move to age-restricted housing. However, there is variation in the steepness of this decline by age at time of the move. People who move to age-restricted housing earlier experience a less steep decline in functional health post-move compared to those who move later. Findings suggest moving to age-restricted housing earlier may enable older adults to utilize resources often available in these settings to prevent steep health declines.

NEIGHBORHOOD WALKABILITY AND PHYSICAL AND MENTAL HEALTH AMONG OLDER ADULTS LIVING IN A DEPRIVED COMMUNITY

Jennifer Blackwood,¹ Rie Suzuki,² Shailee Shah,³ and Noah Webster,⁴ 1. *University of Michigan--Flint, Michigan, United States*, 2. *University of Michigan-Flint, Flint, Michigan, United States*, 3. *University of Michigan-Flint, University of Michigan-Flint, Michigan, United States*, 4. *University of Michigan, Ann Arbor, Michigan, United States*

Background: Identifying the factors to improve the quality of life (QOL) is vital to decrease morbidity and mortality rates among older adults. Although unfavorable neighborhood

features have a significant negative impact on QOL, few studies have investigated these relationships in a deprived community. The purpose of the study was to understand how neighborhood walkability is associated with QOL using the SF-36 among urban-dwelling older adults. Methods: This is a cross-sectional survey. Participants were recruited in 2018 and 2019 at regional health clinics in Flint, MI. To be eligible, participants had to be over 65 years old and Flint residents. Results: Of the 132 participants, the majority were female (66%), African American (77%), single, divorced, or widowed (75%), and educated below GED level (84%). After adjusting for gender, assistive device use, medication, and the Supplemental Security Income receipt, multiple regression analysis revealed that those with better perceptions of land-mixed use and accessibility within their neighborhood were more likely to have better physical health ($\beta = .36$, $p < .05$). However, the perceptions of greater pedestrian safety were associated with the poor physical and mental health (PCS; $\beta = -0.19$, $p < .05$; MCS; $\beta = -0.25$, $p < .05$). Perceptions of the presence of walking hazards and crime were not significantly associated with QOL. Discussion: Findings suggest that neighborhood walkability characteristics are associated with physical health. The development of walking programs with accessible neighborhoods will be urgent to improve the health-related QOL for older adults living in a targeted community.

RACE/ETHNICITY MODERATION ON THE RELATIONSHIP BETWEEN NEIGHBORHOOD MINORITY COMPOSITION AND DEPRESSIVE SYMPTOMS

Seungjong Cho, *Texas Tech University, Lubbock, Texas, United States*

Research showed neighborhood of residence is an important determinant of depressive symptoms. However, the complex effects of neighborhood racial/ethnic composition and individuals' race/ethnicity on depressive symptoms were not fully explored in previous studies. This study tested whether individuals' own race/ethnicity moderates the relationship between neighborhood racial/ethnic composition and depressive symptoms. Applying social disorganization theory, this study investigates the relationships between neighborhood racial/ethnic composition (proportion of racial and ethnic minorities), individual race/ethnicity, and depressive symptoms. This study used a merged data from Health and Retirement Study 2016 and the American Community Survey 2014-2018 ($N = 5,241$; all age 50 or older). This study applied a mixed-effects negative binomial regression model. It has four statistical models by race/ethnicity: (a) non-Hispanic Blacks only, (b) Hispanics only, (c) non-Hispanic Whites only, and (d) combined model. Covariates were included two individual-level variables (age and gender) and three census tract-level variables (the proportions of (a) population of income below the poverty level; (b) population of unemployed; (c) population of aged 65 and over). The results showed none of the neighborhood racial/ethnic minority composition was associated with depressive symptoms for the final combined model. The moderation effects of individuals' race/ethnicity were not significant. Not as a moderator but as the main effect, both non-Hispanic Blacks and Hispanics had higher depressive symptoms, compared to

non-Hispanic Whites. Living in neighborhoods with higher poverty rates and females were also related to higher depressive symptoms. This study contributes to explore the subtle nature of depressive symptomatology and race both at individual-level and neighborhood-level.

RURAL RESIDENTS' HOPES AND FEARS ABOUT AGING IN PLACE: THE NEED TO IMPROVE ACCESS TO AGING RESOURCES

Allyson Brothers, Yuquin Jiao, Sue Schneider, and Kaitlyn Wright, *Colorado State University, Fort Collins, Colorado, United States*

To support older adults' preferences to age in place, home and community-based aging-related resources are available, but are often under-utilized. Many barriers prevent individuals from accessing aging-related resources, especially in rural and geographically isolated locations. Therefore, we set out to better understand the perspectives of community members who plan to age in place in rural areas. We administered a survey as part of a broader university-community partnership called Senior Access Points (SAP), which addresses aging-related resource access. Participants were $N = 210$ individuals living in rural regions across Northern Colorado, ranging from 37 to 94 years old (mean age = 68.91, $SD = 8.85$). We assessed hopes and worries about growing older at home, and awareness of available resources. Two independent coders applied a pre-determined coding scheme, then achieved consensus ratings. An overwhelming majority of participants affirmed the importance of being able to remain in their current home (94.8%) or community (95.3%) as they age. Top hopes for aging in place centered around health/medical; housing/home services; and independent rural lifestyle. The top worries were related to health/medical; housing/home services, and transportation. Resource awareness was low: 43.3% of all participants were not aware of any available resources. Overwhelmingly, rural residents hope to grow older at home, but may not know how to connect to resources that support this goal. The resource needs we identified are being used to inform community-driven approaches to improve both awareness and availability of community resources in these rural communities.

STAGES OF CHANGE IN PHYSICAL ACTIVITY AND NEIGHBORHOOD WALKABILITY AMONG OLDER ADULTS LIVING IN THE URBAN SETTING

Jennifer Blackwood,¹ Rie Suzuki,² Noah Webster,³ and Shailee Shah,⁴ 1. *University of Michigan--Flint, Michigan, United States*, 2. *University of Michigan-Flint, Flint, Michigan, United States*, 3. *University of Michigan, Ann Arbor, Michigan, United States*, 4. *University of Michigan-Flint, University of Michigan-Flint, Michigan, United States*

Insufficient physical activity (PA) is considered an independent risk factor for chronic diseases. Although older adults living in lower-income areas often experience obstacles to walking locally, few studies have compared their walking experiences and the degree of readiness to change on engaging in PA. The purpose of this study was to compare perceptions of neighborhood walkability by the stages of change among older adults living in a lower-income community. Participants were recruited in 2018 at a regional health clinic in Flint, MI. To be eligible, participants had to be over

65 years old and Flint residents. Of the 132 participants, the mean age was 69.74 ($SD=5.00$) years old. The majority of respondents were female (66%); African American (77%); single, divorced, or widowed (75%); and educated below a GED level (84%). The results showed that older adults at the pre-contemplation/contemplation stage (PC/C) were less likely to perceive the availability of sidewalks on most streets and more likely to complain about much traffic along the street than those at the action/maintenance stage (A/M) ($p < 0.05$). After controlling for covariates, multiple regression analysis showed that those at PC/C were less likely to state that their neighborhoods were accessible ($\beta = .17^*$) and to perceive the presence of walking hazard (e.g., lack of sidewalks) ($\beta = -.17^*$). Those who engaged in PA less than 30 minutes per day perceived the neighborhoods were accessible ($\beta = .23^*$). Findings suggest that it is essential to develop friendly support systems and accommodations to encourage walking in lower-income communities.

TESTING FRAILTY, ACCESSIBLE HOUSING, AND CHANGES IN LIVING ARRANGEMENTS USING THE HEALTH AND RETIREMENT STUDY

Bonnie Albright, *University of Massachusetts - Boston, Boston, Massachusetts, United States*

This study examined housing accessibility elements of community-dwelling older adults using the Health and Retirement Study (HRS). Housing accessibility elements were tested as moderators in the relationship between prior frailty and later living arrangements. HRS physical measures were used to construct the Physical Frailty Phenotype and the Continuous Frailty Scale. The analytic method for the study was multinomial logistic regression. Latent class analysis was also used to identify housing accessibility element use-types. Study findings will be presented. Strengths and weaknesses of using the HRS to measure home accessibility and construct frailty scales will also be discussed.

THE RELATIONSHIP BETWEEN FAMILY AND RESIDENTIAL SETTINGS: AGING IN PLACE VS LONG TERM CARE FACILITY IN SOUTH KOREA

JooHong Min,¹ Seung-eun Oh,² and Bon Kim,³ 1. *Jeju National University, Jeju, Cheju-do, Republic of Korea*, 2. *Jeju National University, Jeju National University, Cheju-do, Republic of Korea*, 3. *Jeju National University, Jeju-si, Cheju-do, Republic of Korea*

Objective: This study aims to explore the factors influencing long-term-care beneficiaries' decisions between home health care and institutional care in South Korea. This study further investigated the association between these two types of long-term care services and emotional, financial, and physical burden alleviation among the beneficiaries and their family members. Methods: We analyzed data from 2019 Long-Term Care Survey. Out of 5,606 respondents, 4,079 long-term care beneficiaries and family members were included in this study. Logistic regression models were conducted to understand factors associated with types of long-term care services, and the association between types of long-term care services and burden alleviation. Results: Having a spouse, having children, or a shorter geographic distance between the beneficiaries and their family members were factors associated with higher likelihood of receiving

home health care rather than institutional care. Also, more severe mobility limitation, outpatient care, and fall experiences were associated with higher likelihood of receiving institutional care. Utilization of institutional care was significantly associated with higher alleviation of physical burden. No significant differences between home health care and institutional care were found on emotional and financial burden alleviation. Conclusions: The findings suggest that family resources may be beneficial for older adults to pursue aging in place in later life. However, the physical toll of their family members may exist. Our findings provide evidence to inform public policy decisions on long-term care services for older adults and their family members.

Session 9040 (Poster)

Aging in Place II

GEOGRAPHIC DISTRIBUTION OF AVAILABILITY OF ADULT DAY SERVICES IN MISSOURI

Takashi Amano,¹ Yung Chun,² Sojung Park,³ and Yi Wang,⁴
 1. Rutgers University-Newark, Newark, New Jersey, United States, 2. Washington University in St. Louis, St. Louis, Missouri, United States, 3. Washington university, St. Louis, Missouri, United States, 4. University of Iowa, Iowa City, Iowa, United States

Adult day service (ADS) is an important component of long-term supportive services. Geographic availability of ADS is an essential factor for aging in place especially for people with assistance needs. This study aims to examine the geographic distribution of availability of ADS and its relationship with the disadvantaged characteristics of neighborhoods. Data from the Missouri Department of Health and Senior Services and the American Community Survey were utilized. Geographic availability of ADS was measured as capacity (number of clients served) of ADS centers per week divided by the number of people who were 65 or older and under poverty at the census tract level. To examine neighborhood disadvantaged characteristics, principal component analysis was applied to construct a socioeconomic deprivation index (SDI). Using geographic information systems, we mapped ADS centers, geographic availability of ADS, and SDI scores. Pearson correlation coefficient was calculated between geographic availability of ADS and SDI scores. In 92.3% of the census tracts in Missouri, ADS centers are not available. Further, ADS centers are less likely to locate in rural areas or census tracts with higher numbers of residents 65 or older and poor. Also, lower availability of ADS was associated with higher levels of neighborhood disadvantage at a marginal level ($r = -0.163$). Our findings suggested that strategies should be identified to provide ADS in rural areas, especially in the areas with higher levels of neighborhood disadvantage. Further investigation on the geographic distribution of ADS accessibility and its association with neighborhood characteristics is warranted.

HOUSING, NEIGHBORHOOD FACTORS, AND COGNITIVE STATUS OF OLDER ADULTS LIVING IN HOUSES VERSUS APARTMENTS

Ethan Siu Leung Cheung,¹ and Ada Mui,² 1. Columbia University, New York, New York, United States,

2. Columbia University, COLUMBIA UNIVERSITY, New York, United States

This study examines associations between housing, neighborhood factors and cognitive status among community-dwelling older adults, and how the associations differ between older adults who live in houses and in apartment buildings. Specifically, using the neighborhood stressor theory, three research questions are examined: 1) What individual-level factors predict late-life cognitive status? 2) After controlling for individual-level factors, what housing and neighborhood factors are significant in predicting older adults' cognitive status? 3) How do individual, housing, neighborhood predictors of cognitive status differ between house and apartment residents? Using data from the Wave 3 NSHAP, multilevel linear regression analyses are conducted with the total sample. Results suggest that individual-level factors including young-age, female, white, and having a bachelor's degree are associated with better cognitive status. After controlling for individual-level factors, housing and neighborhood factors including quality maintenance and high level of community safety are associated with higher cognitive scores. In addition to the additive model, we also test the interactive effect between housing type and three level of factors – individual level, housing, and neighborhood factors. Findings suggest that the joint effect of depression and housing type on cognitive status is significant. To explore the last research question, we conduct parallel regression analyses by housing type. Findings suggest that quality maintenance and high level of community safety are associated with higher cognitive scores among house residents only. Findings highlight the predictors of cognitive health vary between older adults living in different residential environments.

MOTIVATIONS TO JOIN AND STAY A MEMBER OF A VILLAGE FOR OLDER ADULTS

Joonyoung Cho, Ruth Dunkle, and Garrett Pace,
 University of Michigan, Ann Arbor, Michigan, United States

People join a customer-driven organization with motivations that may not be static over time, an important issue for long-term organizational viability. In this study, we examined motivations among members of ShareCare, the first Village for older adults in the U.S. Using qualitative data from a random sample of 91 members, we compared motivations for becoming a member and for continuing membership. Motivations to join and continue membership are not necessarily the same. Motivations were categorized as: instrumental, social, and altruistic motivation. We categorized length of membership as short-term: 8-years or less (51.63%) and long-term: 9-years and more (49.37%). While 36% of members joined only for instrumental motivation, 59% continued membership only for instrumental motivation. While about 52% joined with multiple motivations, only 35% of members mentioned multiple motivations when continuing their membership. Finally, 18% of short-term members mentioned altruistic motivation when continuing their membership, while 28% of long-term members mentioned altruistic motivation when continuing their membership. While people's motivation might change over time, altruistic motivation may be the greatest motivating factor for long-term memberships. Long-term members may identify themselves as supporters rather than users of the

organization and cultivate stronger connections with other members over time. Our findings inform how to recruit and retain members in Villages, and customer-driven organizations for older adults more broadly.

RESIDENTIAL ENVIRONMENT, DEPRESSIVE SYMPTOMS, AND ANXIETY SYMPTOMS AMONG COMMUNITY-LIVING OLDER ADULTS

Ethan Siu Leung Cheung,¹ and Jinyu Liu,² 1. *Columbia University, New York, New York, United States*, 2. *Columbia University, Columbia University, New York, United States*

Past literature has suggested significant relationships between neighborhood environment and mental health of older adults. However, the effect of residential environments is underexplored. The present study aims to study: (Q1) how residential built environments are associated with depressive and anxiety symptoms among community-living older adults, and (Q2) whether the associations of their physical and cognitive health status with mental health vary by residential environments. We analyzed data from Round 9 of National Health and Aging Trends Study. Residential environments were indicated by home despair, cluttered home, and existence of entrance ramp. Covariates included age, gender, race, living arrangement, ADL limitations, physical capacity, and cognitive status. The logistic regression results show that higher levels of clutter at home and the lack of entrance ramp were significantly associated with more depressive symptoms and that levels of clutter were positively associated with anxiety symptoms. Residential environments significantly moderated the association between physical health and mental health. With similar physical capacity, older adults with higher levels of home despair and clutter had more depressive and anxiety symptoms. Older adults who had more cluttered home reported significantly higher levels of anxiety than those who had similar ADL limitations, but lived in a less cluttered housing environment. However, we didn't find any moderating effect of residential environments on cognitive impairment and mental health. Our findings promote the necessity for practitioners and policy-makers to consider the effect of residential environments on mental health among both physically healthy and impaired older adults in the United States.

SOCIAL ROLES OF FAMILY AND FRIENDS DIFFER IN SOCIAL NETWORKS OF OLDER ADULTS WHO LIVE ALONE

Sato Ashida,¹ Ellen Schafer,² and Lena Thompson,³ 1. *University of Iowa, Iowa City, Iowa, United States*, 2. *Boise State University, Boise State University, Idaho, United States*, 3. *University of Iowa College of Public Health, Iowa City, Iowa, United States*

Social networks consisting of family and friends tend to better facilitate older adults' emotional well-being than networks consisting of only family or only friends. This study assessed the heterogeneity of older adults' network compositions based on the network members' relationship (family vs. friends) and proximity (local vs. non-local) and evaluated the types of interactions between older adults and types of members. Adults 60 years and older living in a U.S. Midwestern city participated in a one-time structured survey

(n=133), and reported about 1,730 social network members. Compared to participants who lived with others, those who lived alone reported more depressive symptoms and higher frequency of feeling lonely ($p=0.002$). Those who lived alone also had higher proportions of local friends in their networks than those who lived with others ($p=0.02$). Whereas the social roles of family and friends were similar in networks of older adults who lived with others, those who lived alone were less likely to identify family as who they co-engaged in social activities with (local family OR=0.55, non-local family OR=0.27) and who provided companionship (local family OR=0.33, non-local family OR=0.11) compared to their local friends. Having more members who co-engaged in activities was associated with lower depressive symptoms ($p=0.05$) and less frequency of feeling lonely ($p<0.01$). Providing supportive infrastructure for community-based older adults to develop and maintain co-engaging relationships with local friends may be beneficial. Network approaches can be used to identify existing network members who may be inspired to play this role.

UNDERSTANDING MULTIDISCIPLINARY-TEAM PRACTICE IN DEVELOPING HOME ASSESSMENT TOOLS: A SYSTEMATIC REVIEW

Mengzhao Yan,¹ Kathleen Wilber,² and Jon Pynoos,² 1. *University of Southern California, Los Angeles, California, United States*, 2. *University of Southern California, University of Southern California, California, United States*

As widely used instruments to identify risk factors and lay out preliminary plans of how to improve the built environment, home assessment tools play an important role in the process of modifying homes for older adults. Developed by a variety of disciplines and tailored to meet various needs, home assessment tools focus on features in homes and how they meet or hinder an older person's ability to accomplish tasks — in other words, person-environment fit. Based on a comprehensive review of ten evidence-based home assessment tools identified by researchers at the USC Leonard Davis School of Gerontology and the National Council on Aging, we found that a common assessment strategy is the use of multidisciplinary teams (MDTs) in developing and testing the assessment tools to ensure the reliability vs validity of different home modification programs. To understand the nature of MDT practice and derive a set of generalizable protocols for developing person-centered home assessment tools, we conducted a systematic analysis of the ten evidence-based home assessment tools and 41 peer-reviewed journal papers about how the tools were developed, used, and modified. In addition, we applied the RE-AIM framework (Reach, Effectiveness, Adoption, Implementation, and Maintenance) to examine the use of MDTs in developing the tools and carrying out the programs. Based on our analysis, we propose a set of preliminary protocols for developing home assessment tools and a logic model for conducting person-centered home modification programs.

VALIDATION OF A MEASURE OF LONELINESS FOR HOMEBOUND OLDER ADULTS

Keith Chan,¹ Christina Marsack-Topolewski,² Sarah LaFave,³ Maggie Ratnayake,⁴ Jillian Graves,² and Diane Fenske,⁵ 1. *Hunter College, New York, New York, United States*, 2.

Eastern Michigan University, Ypsilanti, Michigan, United States, 3. Johns Hopkins University, Baltimore, Maryland, United States, 4. Lori's Hands, Newark, Delaware, United States, 5. Eastern Michigan University, Eastern Michigan University, Michigan, United States

The pandemic has disproportionately impacted older adults, highlighting the need to address social isolation for this population. Homebound older adults are at risk for loneliness, which is a correlate of poor mental and physical health. COVID-19 has exacerbated effects of social isolation by limiting contact with family and other visitors. In-depth empirical validation of loneliness scales is needed to examine the measurement of this construct for homebound older adults who are aging in place. This study examined the reliability and validity of the UCLA Loneliness Scale (v3) for a community-dwelling population of older adults who received home-based support services due to their homebound status or have chronic illness resulting in ADL limitations. Using in-home interviews, data were collected for 175 older adults using the UCLA Loneliness Scale. Reliability and confirmatory factor analyses were conducted to examine its psychometric properties. Findings demonstrated the scale had good internal consistency reliability ($\alpha = 0.91$). Confirmatory factor analyses indicated a two-factor solution, 1) disconnectedness and 2) connectedness, accounting for 92% of the variability in the 20 items. The lack of meaningful relationships ($\lambda = 0.73$, $p < 0.05$) or having someone to turn to ($\lambda = 0.68$, $p < 0.05$) substantively contributed to disconnectedness. Feeling that there were people to talk to ($\lambda = 0.67$, $p < 0.05$) and turn to ($\lambda = 0.76$, $p < 0.05$) contributed to connectedness. Future research can further examine how quality of relationships and benefits of being connected to others can address loneliness and isolation for this population.

WHO AND WHERE? THE SPATIAL CONTEXT OF RACIAL AND ETHNIC DISPARITIES IN ECONOMIC SECURITY AMONG OLDER ADULTS

Yang Li,¹ Jan Mutchler,² and Nidya Velasco Roldan,³

1. Institute of Social Sciences, 2. University of Massachusetts Boston, Boston, Massachusetts, United States, 3. University of Massachusetts, Boston, Massachusetts, United States

Many older adults experience challenging financial circumstances and do not have sufficient income to afford a basic budget in their home communities. Far higher proportions of racial and ethnic minority older adults live on incomes that fall short of what is needed to make ends meet relative to their White counterparts. We describe racial/ethnic disparities in late-life economic insecurity, which occurs when an older person lacks sufficient financial resources to cover necessary expenses in their home community. Although nationwide half of older singles are economically insecure, Massachusetts (62%), New York (65%), Vermont (57%), and Mississippi (57%) have the highest shares of older adults who experience economic insecurity. Compared to Whites, minority older adults have higher rates of economic insecurity in nearly every state, but racial/ethnic disparities are higher in some locations (Rhode Island, Massachusetts, Mississippi, Louisiana) and lower in others (Oregon, Arizona, Nevada, West Virginia). Disparities in economic insecurity reflect the precarious financial situations experienced by many older

adults, rooted not only in risks and disadvantages accumulated over time, but also in the variable and uncertain social and economic contexts that accompany the aging experience. By situating older adults in their places of residence, we observe that the cost of remaining in community intersect with life-course experiences associated with social identities to produce disparities in economic security at older ages. The geographic variation in cost of living calls for context-specific assessment of economic security to evaluate the adequacy of economic resources and the associated risk of hardship.

Session 9045 (Poster)

Aging, Diversity, and Health Equity

A FOOD BOX INTERVENTION TO REDUCE BLOOD PRESSURE IN NATIVE AMERICAN ADULTS WITH HYPERTENSION: THE CHEERS STUDY

Tori Taniguchi,¹ Joy Standridge,² Tyra Shackelford,² Hilary Brookins,² Tvli Jacob,³ and

Valarie Blue Bird Jernigan,³ *1. Center for Indigenous Health Research and Policy at Oklahoma State University Center for Health Sciences, 2. Chickasaw Nation, Ada, Oklahoma, United States, 3. Oklahoma State University Center for Health Sciences, Tulsa, Oklahoma, United States*

Diet-related chronic diseases, such as hypertension and obesity, are prevalent in Native American (NA) communities where poor food environments are prominent and healthy food access is limited. The Chickasaw Healthy Eating Environments Research Study (CHEERS) is an NIH-funded study aimed to improve Body Mass Index and blood pressure control among NA adults with uncontrolled hypertension. This multi-level randomized trial, guided by a community-based participatory research orientation, was co-created by tribal and university partners and is implemented within the Chickasaw Nation of Oklahoma. We created hypertension-specific food boxes that contained DASH diet foods, coupons for purchasing vegetables and fruits, educational materials, and heart-healthy recipes for supporting healthy eating. Food boxes were packed and shipped monthly to intervention participants with a 30-day supply of: one fruit serving/day, one vegetable serving/day, one serving of unsalted nuts or seeds/day, one serving of beans or lentils/day, and two servings of fatty fish/week. We will present our participatory approach in co-developing the CHEERS study methods, findings with a focus on older adults, and lessons learned. CHEERS is the first innovative food box intervention to be conducted in NA communities. Food box interventions show promise in improving dietary intake and reducing hypertension and obesity in rural and poor food environments.

A RELATIONSHIP-ORIENTED MODEL OF RESEARCH PARTICIPATION: THE BRAIN HEALTH COMMUNITY REGISTRY

Andrea Gilmore Bykovskyi,¹ Haley Fuhr,² Shannon Mullen,¹ Laura Block,¹ Clark Benson,¹ Danielle Harris,¹

Quinton Cotton,³ and Jessica Kendall,² *1. University of Wisconsin-Madison, Madison, Wisconsin, United States, 2. University of Wisconsin-Madison, University of Wisconsin-Madison, Wisconsin, United States, 3. University*

of Wisconsin - Medicine & Public Health, Fitchburg, Wisconsin, United States

Historically excluded and minoritized populations are significantly under-included in health studies of Alzheimer's disease and related dementias (ADRD) despite bearing a disproportionate burden of disease—evidenced by higher incidence, prevalence, and poorer health outcomes. Meaningful progress toward identifying and alleviating causes of health disparities in ADRD necessitate effective and scalable approaches for broadening inclusion in research. Rigorous studies evaluating research participation among minoritized populations are limited and have predominantly focused on individual-level factors and behavioral change (i.e. religiosity, willingness). These approaches frequently overlook the influence of unequally distributed structural and social determinants on participation despite the compounded financial, social, emotional, and logistical consequences that result from ADRD. Using an intersectional and social justice lens, we developed the Participant and Relationship-Oriented Research Engagement Model, which characterizes research as a form of relationship and extends social determinants frameworks to the context of research participation. We report core components of the model and its application in the design and preliminary evaluation of the Brain Health Community (BHC) Registry, which features proactive and systematic evaluation of potential unmet needs among prospective participants, and connections to relevant services (i.e. respite care, adaptive devices). Preliminary testing of the model and participant feedback on the BHC suggest it is a feasible approach to research engagement, and that associated assessment tools and resource protocols are acceptable and sufficiently adaptable to heterogeneous sets of unmet needs. Primary challenges include ongoing assessment of engagement and routine changes in service ability, which can be addressed through community-based resource networks.

ADDRESSING THE SOCIAL AND MEDICAL DETERMINANTS OF HEALTH FOR SAFE MEDICINES USE

June Simmons,¹ Raymond Woosley,² and Ester Seflyan,¹
1. *Partners in Care Foundation, San Fernando, California, United States*, 2. *CredibleMeds, Inc., Oro Valley, Arizona, United States*

Both social and medical factors can negatively affect health outcomes, especially in vulnerable populations. To address these two types of factors in a hospital post-discharge population, two non-profit organizations collaborated to combine their novel decision support programs to address the question: could combined programs have greater potential for improved health outcomes? HomeMeds (HM), a social health program in which trained social services staff make home visits to vulnerable clients, was combined with MedSafety Scan (MSS), a medical health, clinical decision support tool. Data captured in the home visits were entered into the HM and MSS programs to detect those patients at greatest risk of adverse health outcomes due to medications. Patients received a post-discharge home visit by trained social services staff. The number of drugs reported as being taken was on average 10.4, which was less than prescribed at discharge in 62% of patients. Both programs detected serious risk of medication-induced harm, mostly from different causes such as drug-drug interactions or for use not

recommended in older adult. Combined analysis of data from two novel decision support programs yielded complementary findings that together address both medical and social determinants of health. These have the potential to reduce medication-induced harm, costly re-hospitalization and/or emergency room visits and support the further evaluation of this combined approach in other vulnerable populations such as the seriously mentally ill, frail, those confined to home, opioid-dependent or otherwise impaired.

AFRICAN-AMERICAN RACE PREDICTS 1-YEAR COGNITIVE DECLINE AMONG ADULTS WITHOUT MODERATE DEMENTIA

Niser Babiker,¹ Alan Gonzalez,¹ Jovany Soto,² Chengjian Shi,³ Andrey Rzhetsky,⁴ and Megan Huisingh-Scheetz,¹ 1. *University of Chicago, Chicago, Illinois, United States*, 2. *Illinois Institute of Technology, Orland Park, Illinois, United States*, 3. *University of Chicago, Chicago, Illinois, United States*, 4. *University of Chicago, Chicago, Illinois, United States*

Previous literature shows conflicting conclusions about the association between race and cognitive decline, particularly in early impairment. In this study, we aimed to test whether race predicted 1-year change in Montreal Cognitive Assessment (MoCA) score among older adults without moderate-severe dementia. We secondarily explored whether multimorbidity, polypharmacy, depressed mood, antidepressant use, body composition, or frailty changed the association. We analyzed data (n=122) from predominantly African American (AfA, 78.7%) community-dwelling older adults from the south side of Chicago. Participants underwent baseline and 1-year MoCA testing. Age, gender, race, education, monthly income, co-morbidities (Charlson Comorbidity Index), medication use (<5 vs ≥5), depression (PHQ-2), proportion lean mass (DEXA), and the frailty phenotype (range 0-5) were collected at baseline. In a multivariate linear model, we regressed 1-year MoCA score on baseline MoCA score, race, and demographics and then evaluated the impact of each covariate added separately to the model on the race-cognition relationship. The mean MoCA score at baseline was 25.2±0.2 (range 18-30) and 41.0% of participants experienced ≥1 point MoCA decline at 1 year. After adjusting for demographics, AfAs experienced a greater 1-year MoCA decline ($\beta = -1.3$, $p=0.04$) compared to other races. The effect size was unchanged after adjusting for multimorbidity and polypharmacy ($\beta = -1.3$, $p=0.04$), attenuated slightly after adjusting for frailty ($\beta = -1.2$, $p=0.06$), depressed mood ($\beta = -1.2$, $p=0.05$), lean mass ($\beta = -1.2$, $p=0.04$), and attenuated notably after adjusting for antidepressant use ($\beta = -1.0$, $p=0.11$). Findings support the need to further explore racial differences in cognitive decline and potentially related anti-depressant underuse.

ARE ANATOMICAL GIFT DONORS DEMOGRAPHICALLY REPRESENTATIVE OF THE AMERICAN AGING PATIENT POPULATION?

Amanda Collins,¹ and Yasmin Carter,² 1. *University of Massachusetts Boston, Boston, Massachusetts, United States*, 2. *University of Massachusetts Medical School, Worcester, Massachusetts, United States*

Body donation for medical education is voluntary and open to all; however, it is undetermined if the donors studied

at UMass Medical School (UMMS) are demographically representative of the national patient population. If not, medical students are missing the opportunity of experiencing normal variation within the population, which may promote bias in their clinical years. This cross-sectional study compared data from the UMMS Anatomical Gift Program (AGP) with the Health and Retirement Study (HRS) population data. This study examined sex, race, ethnicity, veteran status, and sexual orientation. 5 years (n=540) of AGP data and 3 waves (n=5,037) of HRS data were examined. The results demonstrate that sex differences between the AGP and HRS populations (55% for females vs. 45% for males; $p=.10$) are NOT significant. A significant racial difference between populations is noted ($p=.000$), with 98.3% of the AGP vs. 72.7% of the HRS identifying as white. Veterans are overrepresented in the AGP (22.6% AGP vs. 9.6% HRS; $p=.000$). 12.3% of HRS participants report Hispanic ethnicity compared to 0% in the AGP. In 2016, HRS included sexual orientation, with 92.7% of respondents identifying as heterosexual, 2.6% gay or lesbian, 1.0% bisexual and 1.3% other. No data were collected by the AGP pertaining to sexual orientation and neither database ask about gender identity. Aging populations are not represented in the anatomy labs at UMMS and likely nationally. Efforts are needed to improve this and enhance the education of the medical professionals, while expanding the end-of-life options for all community members.

ASSOCIATION BETWEEN LONELINESS AND DISEASES SELF-MANAGEMENT IN OLDER ADULTS: SYSTEMATIC REVIEW

Emma Cho,¹ Alexandra Garcia,² Ya-Ching Huang,³ and Hsuan-Ju Kuo,² 1. *University of Texas at Austin School of Nursing, Austin, Texas, United States*, 2. *The University of Texas at Austin, Austin, Texas, United States*, 3. *Texas State University, Round Rock, Texas, United States*

Purpose: Older adults with chronic diseases are more at risk for loneliness, and loneliness has a negative impact on health behaviors, which are key to managing chronic diseases. However, little is known about the association between loneliness and self-management behaviors in older adults with chronic diseases. As societies worldwide experience the growth of aging populations who are at higher risk of having chronic diseases as they age, clinicians and researchers should assess and address loneliness of older adults with chronic diseases. **Methods:** This systematic review synthesizes research found in PubMed, MEDLINE, PsychINFO, CINAHL, and SocINDEX. **Findings:** fourteen studies were conducted in four countries and represented n=128,610. Loneliness was measured by three different instruments. Reports of loneliness were frequent and ranged from 7.7% (in a report of severe loneliness) to 43.2% (moderate loneliness) of older adults. Older adults who experienced loneliness were less likely to be physically active, eat a healthy diet, or cope in positive ways and more likely to be female and seek healthcare. **Conclusions:** This systematic review found that loneliness was moderately prevalent, and that loneliness was associated with negative disease self-management behaviors in older adults with chronic diseases. Gaps in the research include a need for studies guided by theoretical pathways, using a consistent, theoretically-based measure of loneliness, and conducted on among people with specific chronic diseases.

ASSOCIATION OF SOCIAL DETERMINANTS, MULTIMORBIDITY, AND FUNCTIONAL STATUS WITH MORTALITY AFTER PNEUMONIA

Chan Mi Park,¹ Hye Chang Rhim,² Eun Sik Lee,³ Wonsock Kim,⁴ Jong Hun Kim,⁵ and Dae Kim,⁶ 1. *Harvard T.H.Chan School of Public Health, Brookline, United States*, 2. *Harvard University, Orlando, Florida, United States*, 3. *Korea University Anam Hospital, Korea University Anam Hospital, Seoul-t'ukpyolsi, Republic of Korea*, 4. *Eulji Medical Center, Eulji Medical Center, Kyonggi-do, Republic of Korea*, 5. *CHA Bundang Medical Center, CHA Bundang Medical Center, Kyonggi-do, Republic of Korea*, 6. *Hebrew SeniorLife, Boston, Massachusetts, United States*

Social support, multimorbidity, and functional status are important determinants of health in older adults, but their prognostic implications remain unclear after an acute illness. We conducted a prospective cohort study of 201 patients 65 years or older who were hospitalized for pneumonia at a university hospital in Korea in 2019-2020. K-means cluster analysis was performed using social deprivation score (range: 0-5), activities of daily living (range: 0-7), instrumental activities of daily living (range: 0-7), physical limitation score (range: 0-7), and Gagne comorbidity index (range: 0-24) (higher scores indicate higher risk). Four groups were identified: 1) Group A: physically limited and non-disabled group with limited social support; 2) Group B: multimorbid but functional group with social support; 3) Group C: multimorbid and disabled group with social support; 4) Group D: multimorbid and disabled group with limited social support. For Groups A through D, the Kaplan-Meier estimates for 6-month mortality were 10.0%, 18.0%, 34.2%, and 43.6%, respectively, and the 6-month mean survival times were 166.4 days (95% CI: 156.1-176.6), 156.9 days (95% CI: 140.8-173.1), 145.2 days (95% CI: 126.6-163.8), and 125.9 days (95% CI: 107.7-144.1), respectively. After adjusting for sex, age, and pneumonia severity score, the hazard ratios for Groups B through D versus Group A were 2.07 (95% CI: 0.70-6.13), 3.14 (95% CI: 1.17-8.42), and 4.38 (95% CI: 1.73-11.04), respectively. Our results suggest that multimorbidity and disabilities were implicated in higher risk of 6-month mortality after pneumonia, and social support may mitigate this risk among those with multimorbidity and disability.

CHRONIC DISEASES AND SELF-REPORTED HEALTH STATUS AMONG AMERICAN INDIAN/ALASKA NATIVE OLDER ADULTS

Ramona Danielson,¹ Collette Adamsen,² and Agnieszka Mason,¹ 1. *North Dakota State University, Fargo, North Dakota, United States*, 2. *University of North Dakota, Grand Forks, North Dakota, United States*

Background: In the 1800s and 1900s, U.S. federal "Indian" policy (e.g., boarding schools, relocation) created historical trauma with impacts that reverberate today, such as the significant health challenges experienced among American Indian/Alaska Native (AI/AN) populations. Our study seeks to better understand the burden of chronic disease, and also resilience, among AI/AN older adults. **Methods:** Data came from Cycle VII (2018-2020) of the National Resource Center on Native American Aging's "Identifying Our Needs: A Survey of Elders" survey of AI/AN adults ages 55+ from primarily rural tribal survey sites (N=20,642). Analysis explored self-assessed health

status (very good/excellent, good, fair/poor) and looked for significant differences in prevalence of chronic conditions a doctor ever told them they had (e.g., high blood pressure, diabetes, depression, arthritis, asthma). Results: Self-reported health among AI/AN adults age 55+ was: 26% very good/excellent, 39% good, and 35% fair/poor. 87% of respondents had 1+ chronic illness; 37% had 3+. Among those reporting very good/excellent health, 75% had 1+ chronic illness and 19% had 3+. High blood pressure was the most common chronic disease, at 56% (44% for very good/excellent compared to 67% for fair/poor), followed by diabetes, at 36% (24% for very good/excellent compared to 46% for fair/poor). Conclusions: All of the chronic conditions examined showed significantly higher prevalence among AI/AN adults 55+ with fair/poor health. Notably, 1 in 5 respondents with 3 or more chronic conditions indicated very good/excellent health, reinforcing that successful aging can still be experienced by those with chronic health conditions.

CONNECTING PATIENT AND PROVIDER BURNOUT TO EYE EXAM FREQUENCY AMONG LATINX OLDER ADULTS WITH DIABETES MELLITUS

Adrienne Martinez-Hollingsworth,¹ Theodore Friedman,² and Mohsen Bazargan,² 1. *Samuel Merritt University, Los Angeles, California, United States*, 2. *Charles R. Drew University of Medicine and Science, Los Angeles, California, United States*

Among Latinx older adults, our current understanding of barriers to eye exam often fails to consider the impact of patient and provider burnout which can decrease treatment adherence and recommendation receptivity in this group. The purpose of this study was to examine correlates of eye exam frequency among Latinx older adults in South Los Angeles and explore associations reflecting patient and/or provider burnout. Data analysis was informed by the Secret Self-Management Loop and the Burnout Dyad conceptual models. This secondary analysis used data collected from a convenience sample of non-institutionalized Latinx adults 55+ in South LA (n=165) and used multinomial regression analysis. Outcome variable is recency of eye exam, independent variables are self-reported health, including diabetes mellitus diagnosis, and either patient or provider burnout (that are functions of grouped demographic or quality of care variables). Variables associated with Provider Burnout, appear to represent a larger influence on eye examination frequency than variables associated with Patient Burnout, with the most influential factor being provider recommendation. A surprising finding was the number of participants who had never received this recommendation from a provider (21%). One-third (32%) of participants with diabetes mellitus had not had an eye examination within 12 months and almost one-fifth (13%) of participants with diabetes who had received this recommendation had not received the exam. Further exploration is needed to support a better understanding of how both patient and provider burnout impacts adherence to eye examination and other preventive care recommendations for diabetes mellitus among Latinx older adults.

DIABETES PREVALENCE AMONG UNDERSERVED OLDER ADULTS IN THE US: THE CASE OF NATIVE HAWAIIANS AND PACIFIC ISLANDERS

Sela Panapasa,¹ William Herman,² and James McNally,³ 1. *Research Center for Group Dynamics, Ann Arbor,*

Michigan, United States, 2. *University of Michigan Medical System, Ann Arbor, Michigan, United States*, 3. *University of Michigan, Ann Arbor, Michigan, United States*

The effects of chronic diabetes among older adults in the United States represent ongoing challenges in diagnosis, treatment, comorbidities, amputations, and the increased risk of death. These challenges are made more complicated among underserved populations due to limited access to healthcare, medication costs, and later diagnosis of the condition. These issues are particularly true for the NHPI population, which has high rates of lifetime diabetes, greater levels of poverty, and inadequate health insurance. Useful statistics about diabetes among the NHPI have been difficult to obtain due to their small population size and lack of inclusion in federal health surveys. While early work by Panapasa examined prevalence among NHPI males in California, no reliable measures of diabetes among older NHPIs existed at the national level. Released in 2017, the 2014 Native Hawaiian Pacific Islander National Health Interview Survey represents the first representative survey of the health and socio-economic correlates for this population, allowing the examination of health conditions such as diabetes at the national level. This presentation will examine the prevalence of diabetes among NHPIs aged 60 and older and the impacts of this disease on overall health and quality of life. The paper will use the NHPI-NHIS to examine the use and access to diabetic medications and overall access to affordable health care. The paper will examine differences by age group, gender, immigration status, and ethnicity. While we know the overall prevalence of diabetes is high, this paper will offer new information on differentials within the older NHPI population.

DOES RACE/ETHNICITY INFLUENCE THE HEALTH OF LGBT OLDER ADULTS? AN ANALYSIS OF ADULTS AGED 50 AND OLDER

Adrielle Magdael,¹ Aditi Parashar,² Aisha Ozair,² and Christi Nelson,³ 1. *USF HPCC/USF School of Aging, TAMPA, Florida, United States*, 2. *University of South Florida, University of South Florida, Florida, United States*, 3. *University of South Florida, Tampa, Florida, United States*

Lesbian, gay, bisexual, and transgender (LGBT) health disparities have been well documented in previous research; however, limited research has been conducted on racial/ethnic differences in health among LGBT older adults. Past research suggests that LGBT adults from racial/ethnic minority groups may encounter more discrimination and stigma than white LGBT adults, resulting in poorer health. This study investigated differences in general health between racial/ethnic groups in LGBT adults aged 50 and older from the 2018 and 2019 Behavioral Risk Factor Surveillance System annual surveys. The average ages were 64.2 years for the lesbian, gay, and bisexual (LGB) participants (n=3636) and 65.4 years for the transgender participants (n=972). For self-rated general health, the chi-square analysis indicated that there were significant differences between the racial/ethnic groups for both LGB and transgender participants, $\chi^2(4, n=3630)=46.47, p<.001$ and $\chi^2(4, n=969)=19.03, p=.001$, respectively. Logistic regression analyses found that, compared to White LGB adults, Hispanic LGB adults had higher odds (aOR=1.8, 95% CI=1.2-2.5) and Asian LGB adults

had lower odds of reporting fair or poor health, (aOR=0.43, 95% CI=0.2-0.9). For transgender participants, Hispanic and Other Race adults had approximately twice the odds of reporting fair or poor health compared to White adults (aOR=2.1, 95% CI=1.2-3.7, and aOR=1.9, 95% CI=1.2-3.0, respectively). In conclusion, the results of this study suggest that cultural differences in racial/ethnic groups may influence the health of the LGBT community, making it an important factor to consider in research on LGBT older adults.

HEALTHCARE DISPARITY AND COMORBIDITY BURDEN IN HEART FAILURE PATIENTS OVER THE AGE OF 80

Anna Blach,¹ Amanda Pangle,¹ Jeanne Wei,² and Gohar Azhar,² 1. *University of Arkansas for Medical Sciences, Little Rock, Arkansas, United States*, 2. *UAMS, Arkansas, United States*

The healthcare industry is currently struggling with providing access and coverage for a rapidly ageing and increasingly diverse population with multiple co-morbid conditions. This retrospective study analyzed the electronic health records of elderly heart failure patients (age range 80-103; mean 87 ±4.9) for common co-morbid conditions of hypertension, hyperlipidemia, dementia and diabetes mellitus. Chart review analysis of 316 patients showed a racial distribution of 251 White vs. 65 Black patients (79% vs. 21%). Male patients were under-represented (B= 13.8% and W= 26.3%). Females patients predominated (B= 86.2% and W= 73.7%). Overall, the prevalence of all four comorbidities was approximately three times higher in Blacks (18.5%) vs. White (7.2%). The proportion of Blacks and Whites with HTN and was comparable at 98.5 and 92.4% respectively. Hyperlipidemia was present in 84.6% Black and 63.3% White. The diagnosis of diabetes was higher in Blacks, 41.5% compared to Whites, 21.9%. The greatest disparity was in the diagnosis of dementia which was higher in Blacks, 61.5% vs Whites, 44.6%. Our study is unique for studying healthcare disparity in octogenarian and nonagenarian residing in a rural setting. Our results also highlight the importance of making a special effort to engage older Black patients in seeking healthcare in addition to designing strategies to reduce barriers that impede access and availability of resources and clinical care, especially in economically underserved regions of the country.

IMPACTS OF SOCIAL CAPITAL FACTORS ON BLOOD GLUCOSE CONTROL AND DEPRESSIVE SYMPTOMS

Tingzhong (Michelle) Xue,¹ Zahra Rahmaty,² Eleanor McConnell,¹ Yingzhi (Lindsay) Xu,³ and Kirsten Corazzini,² 1. *Duke University School of Nursing, Durham, North Carolina, United States*, 2. *University of Maryland School of Nursing, Baltimore, Maryland, United States*, 3. *Duke University, Durham, North Carolina, United States*

Social capital, conceptualized as resources arising from social networks, is receiving increased attention for its role in prevention and management of chronic conditions such as diabetes and depression that commonly co-occur. Although social capital has been linked to control of blood glucose and depression, previous research has not considered these two outcomes simultaneously while distinguishing between cognitive (i.e., perceived social support, shared values and

trust in community) and structural (i.e., social connectedness and participation) domains. This study examined how these two domains of social capital relate to glucose control and depressive symptoms, and whether physical exercise and care access mediate those relationships, using structural equation modeling. The sample included 3,043 older adults aged 57 and above from wave 2 of the National Social Life, Health and Aging Project. Although a higher level of cognitive social capital was associated with higher levels of physical exercise (b=.38, p<.001), access to care (b=.40, p=.007), lower levels of blood glucose (b=-.43, p<.001) and depressive symptoms (b=-.84, p<.001), a higher level of structural social capital was associated only with a higher level of physical exercise (b=.16, p=.002). The mediating effects of physical exercise and access to care were not significant. Findings suggest that cognitive social capital may have greater influence on blood glucose and depressive symptoms than structural social capital, and therefore have different implications for practice, especially in the context of pandemic-related disruptions to social capital. Future research should examine other mediators and investigate how promotion of cognitive social capital might improve health outcomes.

IS RESILIENCE PROTECTIVE OF MOVEMENT-EVOKED PAIN IN OLDER BLACK WOMEN WHO EXPERIENCE DISCRIMINATION?

Mayra Astencio,¹ Emily Bartley,² Staja Booker,³ Kimberly Sibille,⁴ Josue Cardoso,⁵ Adriana Addison,⁶ Roger Fillingim,⁷ and Ellen Terry,⁸ 1. *University of Florida College of Nursing, Miami, Florida, United States*, 2. *University of Florida, Gainesville, Florida, United States*, 3. *University of Florida, GAINESVILLE, Florida, United States*, 4. *University of Florida, University of Florida, Florida, United States*, 5. *University of Florida, Pain Research and Intervention Center of Excellence (PRICE), Gainesville, Florida, United States*, 6. *University of Alabama at Birmingham, BIRMINGHAM, Alabama, United States*, 7. *University of Florida, Gainesville, Florida, United States*, 8. *University of Florida College of Nursing, Gainesville, Florida, United States*,

Older non-Hispanic black (NHB) individuals experience greater pain and more frequent experiences of perceived discrimination compared to non-Hispanic white individuals with knee osteoarthritis. The current study explored whether being resilient buffers against movement-evoked pain (MEP) in NHB women who report everyday experiences of discrimination. In a secondary analysis of the Understanding Pain and Limitations in Osteoarthritic Disease (UPLOAD-2) study, data were collected at the University of Florida and the University of Alabama at Birmingham. Participants were 58 community-dwelling older women who self-identified as NHB and reported knee osteoarthritis. Participants completed the Brief Resilience Scale, a self-report measure of trait resilience. MEP was assessed following the Short Physical Performance Battery. Moderation analyses were conducted to investigate whether resilience moderates the association between experiences of discrimination and MEP. Study site, age, body mass index, and income were included as covariates. Overall, neither everyday experiences of discrimination (b=.292, 95% confidence interval [CI]=-0.415 to 1.000) nor trait resilience was associated with MEP (b=-11.540, 95% CI=-23.583 to

.503). However, there was a significant interaction ($b=1.037$, 95% CI=.150 to 1.925) between experiences of discrimination and trait resilience in predicting MEP. Simple slopes analysis revealed that lower discrimination was associated with lower MEP, but only in women who reported high levels of resilience ($b=1.100$, $p=.014$), but this protective effect of resilience was absent in women reporting high discrimination. Our findings suggest that as discrimination increases, the protective effects of resilience on movement evoked-pain decreases. Therefore, high trait resilience may be protective when experiences of discrimination are low.

LINKING SLEEP AND RACIAL HEALTH DISPARITIES: CHARACTERIZING SLEEP IN THE NATIONAL SLEEP RESEARCH RESOURCE

Alycia Sullivan Bisson,¹ Susan Redline,² and Shaun Purcell,¹
 1. *Brigham and Women's Hospital, Boston, Massachusetts, United States*, 2. *Harvard Medical School, Boston, Massachusetts, United States*

To address the problem of racial health disparities, prior work has studied differences in environmentally-influenced and modifiable health behaviors, like nutrition and physical activity. Mounting evidence suggests that sleep plays a key role in health, including cardiometabolic and neurodegenerative disease. Thus, studies have begun to characterize sleep differences across racial groups. We aimed to better quantify differences in objective sleep that may contribute to racial health disparities. In preliminary analyses, we examined whole-night polysomnography from 728 individuals between the ages of 7 and 86 (M: 41.39, SD: 19.39) in the diverse Cleveland Family Study (45% males, 57% African Americans; AAs). Linear models examined racial differences in a battery of sleep metrics and tested interactions with age. Microarchitecture metrics included NREM spindle and slow oscillations, important to cognitive-aging and cardiometabolic health. AAs spent relatively more time in lighter N2 ($b= 0.295$, $p<.001$) and less time in deeper N3 ($b= -0.364$, $p<.001$) sleep. AAs also had lower NREM spectral power across multiple frequency bands ($p<.001$), and reductions in spindle characteristics including amplitude ($b = -0.537$, $p<.001$) and density ($b = -0.341$, $p<.001$). Metrics showed qualitatively different patterns of interaction with age: e.g., racial differences in N3 duration increased with age, and differences in spindle amplitude decreased with age (interactions $p<.001$), despite marked age-related reductions across all individuals. This work may help to identify specific modifiable aspects of sleep as targets for ameliorating health disparities. Patterns of racial differences over the lifecourse may illuminate different mechanisms being active at different points in development.

MULTIMORBIDITY AMONG DIVERSE COMMUNITIES IN NEW ENGLAND: FINDINGS FROM THE HEALTHY AGING DATA REPORTS

Maki Karakida,¹ Chae Man Lee,¹ Taylor Jansen,¹ Shu Xu,² Frank Porell,³ Nina Silverstein,⁴ and Elizabeth Dugan,¹
 1. *UMass Boston, Boston, Massachusetts, United States*, 2. *University of Massachusetts Boston, Dorchester, Massachusetts, United States*, 3. *University of Massachusetts Boston, University of Massachusetts Boston, Massachusetts, United States*, 4. *University of Massachusetts Boston, Boston, Massachusetts, United States*

The risk for multimorbidity increases with age. Community burden of comorbidities in New England (NE) was assessed by comparing state and community rates of two measures (having no comorbidities and having 4 or more) among Medicare beneficiaries age 65+ in CT, MA, NH, and RI. Data sources were the Medicare Current Beneficiary Summary File (2014-2017) and the American Community Survey (2014-2018). Small area estimation techniques were used to calculate age-sex adjusted community rates. Multimorbidity was measured as people with zero or with 4 or more of the following chronic conditions: Alzheimer's disease, asthma, atrial fibrillation, cancer (breast, colorectal, lung, and prostate), kidney disease, COPD, depression, diabetes, congestive heart failure, hypertension, hyperlipidemia, ischemic heart disease, osteoporosis, arthritis, and stroke. Rates for 4+ conditions: RI 63.8% (45.76-70.69%), CT 61.8% (47.82-70.05%), MA 60.7% (40-74.96%), NH 54.4% (36.67-62.99%). Results were mapped, showing the statewide and regional distribution of rates. Rates were much higher for having 4+ chronic conditions than not having any comorbidities. RI had the highest rates of 4+ and in MA the highest chronic disease rates were found in lower socioeconomic communities. CT has the highest number of diverse older residents and dual-eligible beneficiaries for Medicare and Medicaid in NE. The rates show late-life health disparities that have implications for independent living, quality of life, and mortality suggesting the need for policies to provide equitable access to care and resources to disadvantaged NE communities.

NEEDS ASSESSMENT OF PERIMENOPAUSE RESOURCES AND SERVICES

Genna Losinski,¹ Hilary Hicks,¹ Pilar Thangwaritorn,¹ Ilana Engel,² Alexandra Laffer,¹ Amy Berkley,³ and Amber Watts,¹
 1. *University of Kansas, Lawrence, Kansas, United States*, 2. *University of Kansas, Kansas City, Missouri, United States*, 3. *University of Kansas Medical Center, Kansas City, Kansas, United States*

Studies show that women lack knowledge about perimenopause and feel unprepared to make healthcare decisions during this life transition. Most women want to be involved in their healthcare decisions and need timely, free, and accurate information. We conducted a needs assessment in Douglas County, Kansas by systematically reviewing regional organizations that might offer services and resources related to women's health in midlife. We compared these resources to a benchmark for menopausal care available online nationwide (Gennev.com). We documented the primary purpose of each organization (e.g., cosmetic, wellness, medical care), services and resources offered (e.g., hormone therapy, counseling, non-pharmacological treatments), methods of outreach (e.g., blogs, classes), target audience, costs, and types of service providers (e.g., physician, counselor). We surveyed 9 regional websites: 5 offered medical care, 3 cosmetic and wellness services, 2 were municipal organizations, 2 offered mental health/social support. Four organizations offered services targeted specifically towards perimenopausal women. The most commonly offered services were hormone replacement therapy (44%), nutritional supplements (33%), and weight loss programs (33%). Very few offered educational resources (1) or menopause assessments (1) and none offered tailored psychosocial support for the perimenopause

transition. The services offered were expensive with no free services and very few free resources. Organizations were primarily staffed by medical providers, only 1 organization had Menopause Practitioners certified by the North American Menopause Society. Our results demonstrate a need for comprehensive educational and support services for perimenopausal women to fulfill the need for timely, accessible, and accurate information during this understudied health transition.

NOT OUT-OF-REACH: ENGAGING THE OLDER OLD ISOLATED AFRICAN AMERICANS WITH AND WITHOUT MCI

Laura Struble,¹ Kathleen Potempa,² Benjamin Hampstead,³ Alexis Ellis,⁴ Jessica Pedroza,⁵ Peter Lichtenberg,⁶ and Hiroko Dodge,⁷ 1. *University of Michigan School of Nursing, Ann Arbor, Michigan, United States*, 2. *University of Michigan, University of Michigan, Ann Arbor, Michigan, United States*, 3. *University of Michigan, Ann Arbor, Michigan, United States*, 4. *University of Michigan, Ypsilanti, Michigan, United States*, 5. *University of Michigan, University of Michigan, Michigan, United States*, 6. *Wayne State University, Detroit, Michigan, United States*, 7. *Oregon Health & Science University, Portland, Oregon, United States*

The Internet-Based Conversational Engagement Clinical Trial (I-CONNECT, ClinicalTrials.gov: NCT02871921) is a multi-center randomized, 12-month efficacy study. There is converging evidence that social isolation is a risk factor of cognitive decline and dementia. We hypothesized that increasing social interaction in older adults with normal cognition or mild cognitive impairment (MCI) could improve or sustain cognitive function through internet-based conversational engagement. African Americans (AA) are at higher risk for developing dementia but their participation in clinical trials is low. Objectives: (1) discuss the effective outreach process to recruit urban AA older old adults (mean targeted age of 80+); (2) describe how we retained participants in a yearlong study using technology-based interventions. The most successful outreach and recruitment sources were the voter registration mass mailings and the Healthier Black Elders Research Center. Successful recruitment methods included: hiring diverse staff, compensating participants' time, and adjusting research protocols for opting out of MRIs and genetic saliva samples. Technology intervention strategies included: providing user-friendly Chromebooks and free internet connections, simple instructions with pictures, vision and hearing correction, and in-home training with technology support backup. During the pandemic, we could assist participants in learning to use the laptop remotely. Over 12,000 subjects were contacted, which led to 39 randomized participants. Our retention rate thus far is over 75%. This demonstrates that AA older adults are reachable, willing to participate in research and able to use communication technology with appropriate supports for long-term sustainable interaction that may improve cognition and health equity.

SELF-REPORTED PHYSICAL LIMITATIONS AMONG U.S. VETERANS COMPARED TO NON-VETERANS: FINDINGS FROM NHANES

Ronna Robbins,¹ Monica Serra,² and Odessa Addison,³ 1. *Audie Murphy VA Medical Center, San Antonio, Texas,*

United States, 2. *UT Health San Antonio - Barshop Institute, San Antonio, Texas, United States*, 3. *University of Maryland School of Medicine, Baltimore, Maryland, United States*

Approximately 43% of males over the age of 65 years are Veterans. Veterans may be at elevated risk for functional declines due to barriers to health care access leading to accelerated loss of independence. This compared the prevalence of functional limitations in Veterans and non-Veterans. Data from two National Health and Examination Survey collection periods, administered 2013-2014 and 2015-2016, were used to compare physical functioning data between male Veterans (N=369) and non-Veterans (N=738) matched 1:2 for sex, race, and BMI. Individuals were considered a Veteran if they self-reported having "served in active duty in the U.S. Armed forces." Pearson's chi-square tests were used to assess differences in the prevalence of various self-reported functional limitations between groups. Veterans (mean±SEM: age: 64.5±0.54 years; BMI: 30.0±0.3 kg/m²) were disproportionately affected by self-reported functional limitations caused by long-term physical, mental, or emotional illnesses (8% vs. 3%, p<0.004). Twenty-five % of Veterans reported that these limitations kept them from working compared to 18% of non-Veterans (p<0.003). Veterans (38%) were also more likely to report being limited in the amount of work they could perform compared to non-Veterans (27%) (p<0.01). Additionally, Veterans (20%) were more likely to report the use of special healthcare equipment (i.e. cane, wheelchair) than non-Veterans (12%) (p<0.001). These data suggest that Veterans are at greater risk for functional limitations caused by self-reported long-term physical, mental or emotional illness. Therefore, further research is needed to determine if home- and community-based services could prevent further functional decline, ultimately allowing Veterans to maintain independence.

STRENGTHENING STRATEGIES TO RECRUIT RACIAL/ETHNIC MINORITY POPULATIONS FOR HEALTH RESEARCH STUDIES

Roy Thompson,¹ Thomas Konrad,² and HANZHANG XU,³ 1. *Duke University, Durham, North Carolina, United States*, 2. *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, United States*, 3. *Duke University School of Medicine, Duke University, North Carolina, United States*

With the current spotlight on systemic racism and the need to address health inequities, it is critical to develop culturally appropriate strategies for recruiting research study participants from racial/ethnic minority groups. Empirical studies have highlighted that people from racial/ethnic minority groups have poorer health outcomes compared to non-Hispanic Caucasians. However, racial/ethnic minority groups remain underrepresented in healthcare research. Several factors may contribute to the lower participation of racial/ethnic minority groups. Sequelae of atrocities in healthcare research on African American/Black people in the US during slavery and Jim Crow eras were widespread and persistent. Discrimination against people of Hispanic descent and increased anti-Asian discrimination have also been documented. Fear and mistrust of the health system and researchers have been identified as critical barriers to participation in clinical research for these populations.

Further, health research teams rarely reflect the racial/ethnic diversity of the US population, hindering diversity in recruiting study participants. Inadequate ethnic/racial minority groups participation in study populations not only weakens external validity of empirical studies, but research interventions and policies being implemented may not be culturally appropriate to all populations. Therefore, systemic strategies to improve recruitment of racial/ethnic minority groups should: 1) increase preferential funding to incentivize research teams becoming more racially/ethnically diverse; 2) increase recruitment of racial/ethnically diverse healthcare researchers; 3) use community-based participatory research designs to build trust among racial/ethnic minority populations; 4) provide training on culturally appropriate research study recruitment strategies to the academic communities; 5) apply a prism of intersectionality for representation throughout the research cycle.

SUPPORTIVE HOMES AS MEDIATOR BETWEEN RURAL STATUS AND DISABILITY OF OLDER ADULTS

Bernard Steinman,¹ Bremen Whitlock,² Casandra Mittlieder,² Julie Overton,³ and Jon Pynoos,⁴
 1. *University of Wyoming, University of Wyoming, Laramie, Wyoming, United States*, 2. *University of Wyoming, Laramie, Wyoming, United States*, 3. *University of Southern California, Los Angeles, California, United States*, 4. *University of Southern California, University of Southern California, California, United States*

By definition, older adults living in rural communities have fewer formal resources available to address aging-related functional needs. Supportive environments are frequently relied on in rural settings to help address this discrepancy. The purpose of this study was to assess the role of supportive housing features and home modifications in mediating the association between rurality and disability. We hypothesized that environmental supports would be more crucial in rural settings than non-rural settings. We analyzed data from the National Health and Aging Trends Study (NHATS). Variable selection was guided by the International Classification of Functioning, Disability and Health (ICF), including covariates for sociodemographics, chronic conditions, mobility functioning, and participation. A series of regression models tested mediation by environmental variables of the association between rurality (as determined by the metro/nonmetro file indicator) and ADL/IADL disability. Supportive home environments were operationalized using indicators of whether participants had access to homes from the outside without having to use stairs; presence of a bedroom, kitchen, and full bathroom with a shower or tub on the same floor; and whether bathroom fixtures had been modified with features such as grab bars. Results suggest a statistical relationship between rurality and disability that is explained in part by the presence or lack of supportive home features, and these effects were greater in rural settings. Implications are that older adults who live in rural settings can benefit greatly by supportive environments and modifications in areas of the home that are known to cause difficulty.

Session 9050 (Poster)

All Things Technology and Aging

ASSESSMENT OF SLEEP DURATION BASED ON ANKLE AND WRIST ACTIGRAPHY IN HOSPITALIZED OLDER PATIENTS.

Juliana Smichenko,¹ Tamar Shochat,² Nurit Gur-Yaish,³ and Anna Zisberg,⁴
 1. *University of Haifa, Haifa, Hefa, Israel*, 2. *University of Haifa, University of Haifa, HaZafon, Israel*, 3. *Oranim Academic College of Education, Haifa, HaZafon, Israel*, 4. *University of Haifa, Haifa, HaZafon, Israel*

Poor sleep at time of hospitalization is associated with undesirable outcomes. Most studies performed in the hospital assess sleep by self-report, while only few rely on actigraphy. Although wrist actigraphy is commonly used for sleep assessment in field studies, in-hospital assessment may be challenging and cumbersome due to other more necessary monitoring devices that are often attached to patients' upper limbs, that may in turn affect interpretation of wrist activity-data. Placement on the ankle may be a viable solution. In this pilot study, we aimed to compare total sleep time (TST) using concomitant wrist and ankle actigraphy as well as self-report. Twenty-one older adults (65+) hospitalized in medical units wore ankle and wrist actigraphy devices and subjectively estimated their TST for an average of (2.15±1.01) nights. A total of 45 nights were available for analysis. Average TST in minutes was 332.06±81.58, 427.05±97.74 and 374.28±124.96 based on wrist, ankle, and self-report, respectively. Repeated measure mixed models analysis was performed adjusting for age, gender, and sleep medications. TST was significantly lower using wrist compared to ankle actigraphy ($F(2,102)=7.63$, $p=0.0008$), and both were not different from self-report. No significant within subjects variation and no interaction between device and repeated measures were found. Despite differences between ankle and wrist assessments, all three provide consistent TST estimation within subjects. Self-report provides a stable and accessible assessment of TST, representing a good approximation of ankle and wrist actigraphy. Findings provide preliminary support for the use of ankle actigraphy for sleep assessment in hospital settings.

CIRCADIAN RHYTHM FOR FEMALE ENTERING OLD AGE: EXPLORATION ON THE EFFECT OF EATING BEHAVIOR

Hsiao-Han Tang,¹ and Ching-Ju Chiu,²
 1. *National Cheng Kung University, Institute of Gerontology, College of Medicine, Tainan, Taiwan (Republic of China)*, 2. *National Cheng Kung University, Institute of Gerontology, College of Medicine, National Cheng Kung University, Tainan, Taiwan (Republic of China)*

Unhealthy lifestyle and eating behavior are associated with circadian rhythm disruption which contributes to numerous harmful outcomes. The relationship between circadian rhythm and eating behavior remains unclear. The study aims to investigate different types of eating behavior in middle-aged women and their variation in circadian rhythm. A descriptive, cross-sectional design was used. We recruited a convenience

sample of 150 female aged 45 years or over from the community in southern Taiwan. Sociodemographic status, sleep diary and eating behavior were collected by questionnaires; behavioral circadian rhythm were monitored with the wrist-worn application. Four middle-aged participants were interviewed. Preliminary data show three main findings: (1) Sleep efficiency was decrease with age, (2) First meal within 2 hours after waking up was associated with higher amplitude (2.24 vs 1.43 log count), relative amplitude (0.92 vs 0.71), middle to vigorous physical activity time (101.22 vs 58.41 minute), lower lowest active 5 hr midpoint (2.63 vs 4.34 hour) and acrophase (13.67 vs 15.75), (3) Participants with morning chronotype have less sedentary behavior and higher most active 10 hr during wake time. Age and timing of first meal after waking up seem dominating circadian rhythm. Chronotype might be a significant factor for physical activity level. More data is needed to further confirm the association.

DEVELOPMENT & TESTING OF A COMPREHENSIVE DIGITAL SELF-CARE SUPPORT SYSTEM FOR OLDER ADULTS WITH CHRONIC CONDITIONS

Priya Nambisan,¹ Kurt Stange,² Kalle Lyytinen,² Eva Kahana,² Edmund Duthie,³ and Michael Potnek,⁴
 1. *University of Wisconsin- Milwaukee, Milwaukee, Wisconsin, United States*, 2. *Case Western Reserve University, Cleveland, Ohio, United States*, 3. *Medical College of Wisconsin, Milwaukee, Wisconsin, United States*, 4. *Outreach Community Health Center, Milwaukee, Wisconsin, United States*

This 3-phase study involves the conceptualization and design, development and usability testing of a Comprehensive Digital Self-care Support System (CDSSS) named myHESTIA for older adults with multiple chronic conditions (MCC). The objective of this study was to test whether a CDSSS can be developed for those who are dealing with MCC and whether such a system that is specifically developed for older adult patients will enable daily capture of self-care data. Participants for this 3-phase study included: 10 older adults (age>60) and 10 caregivers in Phase 1; 15 Geriatrics clinicians and 25 community-dwelling low-income older adults in Phase 2; and, 10 older adults (age>60) with MCC in Phase 3. Agile method of system development was used for the design and development of the system. The first two phases involved collecting data for designing and developing myHESTIA. The third phase involved small group usability and feasibility testing, in which the participants used myHESTIA trackers for 4 weeks. Results from phase 3 shows daily inputs were possible and the self-reported data shows that it was not at all difficult for older adults to track their symptoms daily. User experience data (n=10) shows overall positive experience along pragmatic (5.8 out of 7), hedonic (4.6 out of 7), sociability (5.5 out of 7) and usability (6.3 out of 7) experience dimensions. Finally, all the participants (n=10) who completed the phase 3 study reported intention to continue using myHESTIA. Results indicate that it is feasible to design a CDSSS for older adults with MCC.

MEET CAREGIVERS WHERE THEY ARE: A REMOTE INTERVENTION CONNECTING CAREGIVERS TO COMMUNITY RESOURCES

Katherine Thompson,¹ Victoria Winslow,¹ El Pinkerton,¹ Elbert Huang,² Maria De Ornelas,² Soo Borson,³

Jason Molony,⁴ and Stacy Lindau,² 1. *University of Chicago, Chicago, Illinois, United States*, 2. *The University of Chicago, Chicago, Illinois, United States*, 3. *University of Washington School of Medicine, Seattle, Washington, United States*, 4. *The University of Chicago Medicine, Chicago, Illinois, United States*

Informal caregivers of people with Alzheimer's disease and related dementias (ADRD) are a vulnerable, often isolated population with high rates of financial strain and need for community resource supports. Little is known about how best to connect these caregivers to resources, especially during the COVID-19 pandemic. CommunityRx-Caregiver is an evidence-based intervention that connects caregivers to community resources for basic needs, wellness, and caregiving. Using preliminary data from a randomized trial of CommunityRx-Caregiver (N=344), we examined caregivers' baseline confidence in finding community resources and their engagement in the CommunityRx-Caregiver intervention. Caregivers enrolled December 2020-February 2021 (n=26) received (1) personalized lists of community resources via text message (HealthRx), (2) access to an online resource portal (FindRx) and (3) automated texts offering support for finding resources. Most caregivers were female (65%), Black (92%), >60 years old (64%) and 44% reported very good or excellent health. Nearly half of caregivers (46%) were completely confident in finding community resources. Overall, 81% of caregivers engaged with a text message or the FindRx. Nearly two-thirds (65%) of caregivers responded to at least one text message. More than a quarter (27%) used the FindRx tool; 5/7 of those shared FindRx resources with others. Caregivers sought resources including in-home personal care, exercise classes and support groups. Caregivers of people with ADRD, many of whom had low confidence in finding resources, engaged with a multi-modal information technology-based intervention to obtain community resource support. These preliminary findings suggest caregivers were receptive to a remotely-delivered community referral intervention during the COVID-19 pandemic.

NOVEL TECHNOLOGY SUPPORT PROGRAM FOR OLDER ADULT PROGRAM WITH INTERPROFESSIONAL GERIATRICS STUDENTS

Bonnie Olsen,¹ Freddi Segal-Gidan,¹ Erin Thayer,¹ Yeini Guardia,¹ M. Christina Penate,¹ and Alexis Coulourides Kogan,² 1. *University of Southern California - Keck School of Medicine, Alhambra, California, United States*, 2. *USC Keck School Of Medicine, Los Angeles, California, United States*

During the COVID-19 pandemic, many older adults were not receiving primary care services because they could not negotiate the technology for telehealth visits. Coupled with persisting pandemic physical distancing, increased social isolation in older adults was- and continues to be a significant problem. To combat these issues, we aimed to 1) prepare older adults for longitudinal isolation by encouraging social connectedness, and 2) enable older adults to safely access remote primary care services during the pandemic. We paired older adults from 9 housing sites in Los Angeles, CA with health professions graduate students from 9 programs at USC (N = 88 dyads) and provided iPhones to participants without a smartphone. Students educated and

supported older adults about the use of technology to access primary care services and to socially connect with family/friends. When requested, 3 additional students provided enhanced 1:1 technology support. Among the 45 participating older adults who received iPhones (51.1%), 22 requests were made for enhanced technology assistance during the 6-month program. Most requests related to initial setup/navigation of iPhone (81.8%) or video calls (27.3%), where others requested help with Wi-Fi (13.6%), composing emails (4.5%), and adding language/translation features (4.5%). Nineteen (83%) technology support requests were successfully resolved; the remaining were unresolved due to loss to follow-up. Our findings demonstrate that older adults can successfully cross the digital divide when technology support is provided. Additionally, pairing older adults with health professions students is an effective strategy to enable access to remote primary care and social connectedness.

PILOT STUDY OF A NEW TELEHEALTH PROGRAM FOR DEPRESSED OLDER ADULTS: THE POSITIVE EXPERIENCE PROJECT (P.E.P.)

Dolores Gallagher-Thompson,¹ Nancy Morioka-Douglas,² BJ Fogg,³ and Mei-Le Keck,⁴ 1. *Stanford University School of Medicine, LOS ALTOS, California, United States*, 2. *Stanford University School of Medicine, Palo Alto, California, United States*, 3. *Stanford Medicine, Stanford, California, United States*, 4. *Stanford Health Care, Palo Alto, California, United States*

Social isolation, logistical challenges, and limited access to mental health providers who accept Medicare contribute to older adults having a higher risk for untreated depression. Primary care providers (PCPs) are strained due to time demands and lack of training in behavioral activation and similar therapies. This study was designed to reduce depression in older adult primary care patients without burdening their PCPs. We evaluated whether outpatients age 65+ with mild to moderate self-reported depressive symptoms (measured by PHQ-8) benefited from a brief evidence-informed program, the Positive Experience Project (PEP). This is derived from the tenets and practices of both behavioral activation and the “tiny habits” program. The former emphasizes the value of increasing engagement in everyday positive activities to lift mood; the latter provides a method to enhance success by encouraging patients to link these activities with existing habitual behaviors, and to celebrate completion. A script was written for each of four 30-minute sessions conducted in small groups using a telehealth platform. An analysis of patients of the first author yielded 50 eligible patients. 8 were invited to participate and 7 did. The group’s mean PHQ-8 score pre-intervention was 10.1; post-intervention (4 weeks later), the average was 6.1 ($P=.039$). The use of “scripts” that guide the PCP through the visit enhances adoption. And PCPs can bill for these 30-minute sessions, making it feasible to help patients receive treatment for their depression. These promising results are currently being replicated by additional PCPs and their data will be included in the poster presentation.

SPATIAL USAGE AND CIRCADIAN RHYTHM FOR OLDER ADULTS IN THE COMMUNITY IN TAIWAN

Chih-Liang Wang,¹ and Ching-Ju Chiu,² 1. *National Cheng Kung University, Tainan City, Tainan, Taiwan (Republic*
